The governor was now in poſſeſſion of the Iſland Fort, and the commodore of the other three, from whence he kept a ſmart fire on Severndroog; but the governor, truſting to the natural ſtrength of the place, reſolved to maintain it till he ſhould receive ſuccours from Dabul. A number of ſeamen were therefore landed under cover of the fire from the ſhips and the ſhore, who bravely ran up, and with their axes cut open the gates of the ſally-port, and, with little loſs, procured an entrance.

On the eighth of April the commodore anchored off Bancote, now named Fort Victoria, the moſt northern port of any conſequence in all Angria's dominions, which ſurrendered the next day. This place the Eaſt India company, with the free conſent of the Marattas, have taken into their hands, for it has a good harbour, and a conſiderable trade for ſalt and other goods; and beſides, the country abounds with cattle, which are much wanted for the uſe of the garriſon and ſquadron at Bombay. As all other places were by treaty to be delivered up to the Marattas, the commodore ſtruck the Engliſh flag, and gave them up to that people.

In November following the ſquadron under the command of rear-admiral Watſon arrived at Bombay, and on the eleventh of February the admiral and the whole ſquadron, with the ſhips under the command of commodore James, and ſome of the company's armed ſhips, appeared before Geriah, the capital of Angria's dominions. That pirate, terrified at ſeeing ſo large a force upon the coaſt, abandoned his fort, in hopes of purchaſing a peace with the Marattas; who, knowing how to make their advantage of his preſent ſituation and perturbation of mind, turned their thoughts on the riches of their priſoner, for ſuch they conſidered him; and, in order to obtain the plunder of the place, inſiſted on his ſending orders to his brother, who commanded in the fort, to put them in poſſeſſion of it.

The admiral, being informed of theſe clandeſtine proceedings, ſent a ſummons to the fort the next morning, and receiving no anſwer, ſtood into the harbour in two diviſions. The Bridgewater leading his majeſty's ſhips, was followed by the Tyger, Kent, Cumberland, and Saliſbury, with the Protector, of forty guns, belonging to the Eaſt India Company. The King's-fiſher led thoſe of the company, which were the Revenge, Bombay, Grab, and Guardian frigates; with the Drake, Warren, Triumphant, and Viper bomb-ketches. The ſhips ſoon began ſuch a fire as ſilenced both the batteries and the grabs. About four o'clock a ſhell was thrown into the Reſtoration, an armed ſhip taken by Angria from the company, which ſet her on fire; and ſoon after his whole fleet was in a flame.

In the night the admiral landed all the troops under the command of colonel Clive, and the next morning ſent to let the commandant know, that if he did not deliver up the place to the Engliſh in an hour's time, the attack ſhould be renewed, and he muſt expect no quarter. In return, he deſired a ceſſation till the next morning, as he could not deliver up the place without Angria's permiſſion. This being thought a trifling pretence to gain time for giving the Marattas the poſſeſſion of the place, the admiral renewed the attack about four in the afternoon, and in leſs than half an hour the garriſon hung out a flag of truce. It was then expected they would haul down their colours, and admit our troops: but this demand not being complied with, the attack was repeated with ſo terrible a fire, that the garriſon cried out for mercy, which our troops could hear diſtinctly; and ſoon after they took poſſeſſion of the fort.

Colonel Clive had blockaded the fort on ſhore, and prevented the Marattas getting poſſeſſion of the place in a clandeſtine manner. This evidently appeared to be their deſign, ſince they offered the captains Buchanan and Forbes fifty thouſand rupees to ſuffer them to paſs their guard; but they, rejecting the offer with indignation, diſcloſed it to colonel Clive, and then the Marattas found it as impoſſible to elude the vigilance of the commander, as to corrupt the integrity of his officers.

The loſs on both ſides was very inconſiderable; our people found their ſafety in their own bravery and ſpirit, and by driving the enemy from their works with the briſkneſs of their fire. The garriſon had no ſooner abandoned the batteries than they were ſheltered by the height and thickneſs of their walls; for all their ramparts which were not hewn out of the ſolid rock were built of maſſy ſtones, at leaſt ten feet in length, laid end-ways; ſo that the greateſt weight of metal could never have made a breach. It is therefore evident, that the garriſon was ſubdued merely by the terror of ſo unuſual a fire. The Engliſh found in the place above two hundred guns, ſix braſs mortars, a large quantity of ammunition, and above one hundred and twenty thouſand pounds in money and effects.

SECT. XXXIV.

Of the City of Viſiapour, or Viſapore; and a particular Deſcription of Goa, the Capital of the Portugueſe Settlements in India.

VISIAPOUR is the capital of a kingdom of the ſame name, to the eaſt of the territory conquered from Angria. It is ſituated in ſeventeen degrees forty minutes north latitude, on the banks of the river Mendeva: the city is very large and ſurrounded with high walls, and authors repreſent it as being defended by a thouſand pieces of cannon. Without the walls, which are two leagues in circumference, are five ſpacious ſuburbs, which render the whole circuit five leagues. The king's palace is in the middle of the town, from which it is ſeparated by a double ditch, and is three miles in circumference. The houſes are only built of ſtraw and reeds, and the doors ſo ſmall that one muſt ſtoop to enter them. This kingdom is tributary to the Great Mogul, and the people can hardly acquire by continual labour ſufficient to pay the different ſubſidies with which they are oppreſſed, under the pretence of the tribute that muſt annually be ſent to Delli. The inhabitants are ſome of them goldſmiths, others work in braſs, wood, cotton, or ſilk, which they ſend abroad to foreigners, or ſell to thoſe who come thither to buy them. Others trade in diamonds, pearls, or lace; and, though they ſell their goods dear, few acquire a fortune. The plenty of pepper renders it cheap, and the Dutch get conſiderable quantities from this city, and the neighbouring country.

On returning back to the coaſt we come to Goa, which formerly belonged to the ſame kingdom, and is the firſt place of conſequence to the ſouth of the dominions lately in the poſſeſſion of Angria.

Goa, the metropolis of the Portugueſe dominions in India, is ſituated in an iſland about twelve miles long and ſix broad, in fifteen degrees twenty minutes north latitude,

latitude, and in ſeventy-three degrees twenty minutes eaſt longitude from London. This iſland is encompaſſed by a ſalt water river, which falls into the ocean with two mouths a few leagues below the town, where it forms a very commodious harbour capable of receiving ſhips of the largeſt ſize, which lie within a mile of the city. The ſhore of the iſland next the river is adorned with noble ſtructures, as churches, caſtles, and gentlemen's houſes.

The houſes of the city are large, and their out-ſides magnificent, they being all built of ſtone, but are poorly furniſhed within; and their ſtreets are cleaner than the tops of their houſes, where they do all their occaſions. The city contains a large, neat, and rich cathedral, with twenty-ſeven churches and convents, a very fine hoſpital well endowed and richly adorned, the houſe of the inquiſition, and other public buildings.

St. Roch's monaſtery is a magnificent ſtructure, that has a library, an hoſpital, and an apothecary's ſhop well furniſhed. The Dominicans have a very large college, which is a pleaſant magnificent fabric, that has a noble front towards the ſtreet: their church is rich in ornaments and plate; its pillars are gilt, and the martyrology of their order is painted on the walls. The Franciſcans have a ſmall church, which is one of the fineſt in the city, there being ſo much gold about the high altar, and in the eight chapels on the ſides, that it reſembles an entire maſs of that metal. There is a fine church here dedicated to St. Paul, in which lies the body of St. Francis Xavier, the Porrugueſe apoſtle of the Indies. It is viſited by numbers of people with great veneration, who leave ſomething at his ſhrine to pay for the candles and olive-oil that continually burn before it; but none are permitted to have the honour of entering within the iron rails that guard the tomb. It is richly adorned, and the late duke of Tuſcany ſent a magnificent pedeſtal of green jaſper, embelliſhed with a braſs plate, on which the moſt ſignal actions of St. Xavier are finely repreſented. The jeſuits expoſe his relicts on the anniverſary-eve of his feſtival.

Of all the churches in and about Goa none have glaſs-windows, except one in the city dedicated to St. Alexander; the reſt have panes of tranſparent oyſter-ſhells, as have likewiſe all their moſt ſtately houſes. Every church has a ſet of bells, and ſome of them are continually ringing.

The viceroy uſually reſides at the powder-houſe, two miles below the city, where are ſprings of the beſt water in the iſland. He has, however, a very noble palace over one of the city gates, which leads to a ſpacious ſtreet half a mile in length, containing rich ſhops of ſilk, porcelain, drugs, and other valuable commodities, and is terminated by a beautiful church called Miſericordia. In this palace is a long gallery, which contains the pictures of the former viceroys, and has a chair of ſtate at each end. He has another ſeat which he frequents in the ſummer, at a place called Pengeim, which is a mile from the bar.

The market-place, which ſtands near the church of Miſericordia, is about an acre ſquare, and in it are ſold moſt things produced in that country. In the ſhops about it may be had not only the produce of Bengal, but of Europe, China, and other countries. Slaves, cattle, and ſeveral articles of proviſions, are ſold in the market by auction; but they leave off early on account of the exceſſive heat of noon.

The eſtabliſhed religion is that of Rome, the profeſſors of which are the moſt zealous bigots in the world. The court of inquiſition proceeds with the greateſt ſeverity againſt all whom the mercileſs inquiſitors ſuſpect of being guilty of hereſy. The victims of their cruelty, inſtead of being Jews, of which there are not a ſufficient number, have been moſtly taken out of the body of the Indian Chriſtians; for its familiars or emiſſaries have their eyes particularly on the converts, or their deſcendants, eſpecially if any of them are become rich, and will afford a handſome confiſcation to that holy tribunal: but though the ſeverity of the inquiſition ſtrikes an awe both into the clergy and laity, many Gentoos are ſuffered to dwell in the city, where they are tolerated on account of their being more induſtrious than the Portugueſe Chriſtians; but the mercantile part of them are very liable to be inſulted; for it is even dangerous for them to refuſe letting the Portugueſe have their goods, or to aſk for their money when it is due, for fear of the baſtinado, and ſometimes worſe conſequences. This neceſſarily renders the circulation of trade very inconſiderable.

The clergy of Goa are extremely numerous and illiterate. Captain Hamilton ſays he ſtood on a little hill near the city, and counted near eighty churches, convents, and monaſteries within his view; and he was informed, that in the city and in its diſtricts, which extend twenty miles along the coaſt of the continent, and fifteen miles within land, there are at leaſt thirty thouſand monks and churchmen, who live idly and luxuriouſly on the labour of the miſerable laity, for here the tyranny and oppreſſion of the domineering clergy are inſupportable.

The firſt, or grand inquiſitor, is always a ſecular prieſt, who pretends to have the ſole privilege of being carried in a palanquin, and is treated with much greater reſpect than even the archbiſhop, or the viceroys. His authority extends over all perſons, both eccleſiaſtics and laymen, except the archbiſhop, his grand vicar, who is always a biſhop, the viceroy, and the governors who repreſent him; but he may cauſe even theſe to be arreſted, and begin their proceſs, after he has informed the court of Portugal of the crimes laid to their charge. His palace, as well as that of the viceroy, is very magnificent: his houſhold conſiſts of gentlemen, equerries, pages, footmen, and a multitude of other domeſtics. The ſecond inquiſitor is a Dominican, and the other officers, called deputies of the holy office, are taken from among the Dominicans, Auguſtines, and bareheaded Carmelites.

To return to the city: ſome repreſent the walls that encompaſs it as twelve miles round, including within this ſpace ſeveral fields and gardens. Within a muſquet ſhot of the bar is the Black Fort, and about a mile within it is a battery built cloſe to the ſea, on a ſmall promontory, called Nos Senhor de Cabo, and oppoſite to it, on a little hill, which commands that ſide of the river, is another fort. Without that is the Aguada, with a fort on the top of it, and ſeveral batteries at the foot of the high grounds. In the caſtle is a large lanthorn for a light-houſe to direct ſhipping into the road, when about the beginning of September, the land is obſcured by thick clouds. The harbour, in ſhort, is ſo well defended by forts and large batteries, that it is the ſtrongeſt in India.

The iſland produces little corn, but has ſome excellent fruits, and the mangoes, in particular, are ſaid to be the largeſt, and moſt delicious of any in the world.

The moſt ſingular vegetable in the iſland is called the ſorrowful tree, becauſe it flouriſhes only in the night. At ſun-ſet no flowers are to be ſeen, and yet half an hour after it is quite full of them. They yield a ſweet ſmell, but the ſun no ſooner begins to ſhine upon them, than ſome of them fall off, and others cloſe up; and thus it continues flowering in the night during the whole year. It is nearly as large as the prune-tree, and its leaves reſemble thoſe of the orange. The people commonly plant them in the courts of their houſes, in order to have the advantage of their ſhade and ſmell.

The Portugueſe of this city are ſaid to be idle, luſtful, and ſo generally tainted with the venereal diſeaſe, that it is thought no diſgrace.

The chief inhabitants of the iſland are always attended by ſlaves holding umbrellas to ſhade them from the ſun. The women load themſelves with jewels, and roſaries of gold and ſilver, bracelets of gold, pearl necklaces, lockets, and pendants of diamonds. Their ſhifts reach only to their waiſts, over which they wear a cloſe jacket, and a petticoat. They have very rich ſlippers, but wear no ſtockings. Their ſhape and features are agreeable, but their cloſe confinement, whenever they are ſuffered to appear, gives them a very ſtiff and baſhful air. Their chief diverſion is ſinging, and playing on the lute, and their principal buſineſs is making confections, pickles, ſoups, ragouts, olios, and other diſhes, in which they are very expert. But they ſeldom

ſit at table when a ſtranger dines with their huſbands. As to their children, they are ſuffered to run about naked till they are aſhamed of it themſelves.

All butcher's meat is prohibited, except pork, on account of the leanneſs of their cattle, which, when killed, the fleſh reſembles carrion. Green fruit and roots in their proper ſeaſons, with a little bread and rice, are the principal parts of their diet; but in all ſeaſons they regale themſelves with candied and preſerved fruits; their bread is extremely fine. They have great plenty of hogs and fowl, and ſome pigeons; but the clergy feed moſtly on fiſh, which are ſcarce, though the ſea is ſo near, and none muſt preſume to buy them, till they are firſt ſerved, ſo that what comes to the ſhare of the laity is generally ſtale. All the wine drank here is brought from Portugal, except that of the palm, which, together with water, are the only liquors drank in the country, except arrack. The ſoldiers, fiſhermen, peaſants, and handicraftſmen feed on a little rice boiled in water, with a ſmall quantity of ſalt-fiſh, or pickled fruits, and are glad of fair water. The laity are generally lean and feeble; and it is ſaid to be very uncommon to ſee a fat man who does not belong to the church.

SECT. XXXV.

Of the Port of Carwar, the Kingdom of Biſnagar, the Province of Canara, with the Ports of Onoar, Batacala, Barcelor, Mangalor, Cananor, and Tellicherry.

THIRTY-SIX miles to the ſouth of Goa is Carwar, where the Engliſh have a factory, and a ſmall fort, with two baſtions and ſome cannon. The factory is ſituated on the ſouth ſide of a bay, that has a river capable of receiving ſhips of three hundred tons burthen, and is oppoſite a pleaſant iſland, well ſtocked with game. There are in this factory a chief and council to manage the company's trade.

The vallies around the town abound with corn and pepper, which is by ſome eſteemed the beſt in the Indies. In the woods on the mountains are tigers, wolves, monkies, wild hogs, deer, elks, and a ſpecies of beeves of a ſurpriſing ſize. A late author obſerves, that one of theſe being killed, the four quarters weighed above a ton, beſides the head, hide, and guts. The horns were at the roots twenty three inches in circumference, and the marrow-bones ſo large, that the marrow was taken out with a ſilver table-ſpoon; but the fleſh was inferior to common beef. In the woods are three kinds of tigers; the ſmalleſt and the moſt fierce does not exceed two feet high, the ſecond is about three feet in height, and hunts wild hogs, deer, and a little creature called a piſſay, which is of the ſhape of a deer, and has the head of a hog, with two long tuſks, like thoſe of a wild boar, growing upwards, and two others which grow downwards from the upper jaw, reaching to the under part of the lower jaw. This creature is harmleſs and timorous: it is of the ſize of a cat, and feeds on graſs. The third ſpecies of tigers is about three feet and a half high, but ſeldom attacks mankind.

The woods alſo abound with wild peacocks, and other birds, among which are a ſpecies of the ſize of a pigeon, called bill-birds, on account of the largeneſs of their bills, which are of ſeveral forms and colours, and make excellent powder-flaſks.

Mr. Hamilton informs us, that he was once here in the woods with his fuzee, when a ſmall rain falling, happened to damp his powder, which was only wrapped in paper. His gun being thus rendered uſeleſs, he ſtruck into a foot path, that led from the mountain to the factory; but before he had gone far he eſpied a very large tiger in the ſame path, with his face towards him. The tiger, on ſeeing him, ſquatted with his belly to the ground, and wagging his tail, crawled ſlowly to meet him. Our author thinking it in vain to fly, walked leiſurely forward, till coming within ten yards of him, he clubbed his piece, and made all the noiſe he could to frighten him, on which the beaſt ruſhed into a thicket, and leaving the path free, Mr. Hamilton eſcaped with no other harm than being greatly terrified.

As the chief of the Engliſh factory is uſually much eſteemed, he ſeldom goes a hunting without being accompanied by moſt of the people of diſtinction in the neighbourhood, attended by their ſervants well armed, and with hautboys, trumpets, and drums. The men with fire-arms place themſelves at convenient diſtances along the ſkirts of a hill or wood, while others being ſent with loud muſic to rouze the game, ſpread themſelves for a mile or two, and, on a ſignal given, ſtrike up at once, and march towards the place where the muſqueteers attend; when the wild inhabitants of the woods, aſtoniſhed at the unuſual noiſe, fly before the muſic, and fall into the ambuſcade, where many of them are killed.

About two hundred miles to the eaſt of Carwar, and in thirteen degrees twenty minutes north latitude, is the city of Biſnagar, which is alſo called Narſing, and Chandagri. This city, which is the capital of Biſnagar, is built on the ſummit of a high mountain, and encompaſſed with three walls, the outermoſt of which is ſaid to be above nine miles round. The palace of the prince is lofty, ſpacious, and ſurrounded with large and deep ditches. None are ſuffered to enter the fortreſs without his expreſs permiſſion. He allows Europeans, and other ſtrangers, to paſs ſome days in the city in the quality of travellers; but none are permitted to ſettle there for the ſake of trade. However, many have ſtaid there long enough to inform us, that there is no place in the Indies, where juſtice is ſo impartially adminiſtered.

The king of Biſnagar calls himſelf king of kings, and huſband of a thouſand wives; and has ſometimes made war to maintain theſe ridiculous titles. He has ſeveral fortified towns, but his cannon are ſaid to be only formed of thick plates of iron, firmly joined together, and ſtrengthened like butts, with iron hoops. Every year he viſits his kingdom, and reviews his troops, which are ſaid to amount to thirty thouſand cavalry, ſeven hundred elephants, and one hundred thouſand infantry. He has ſeveral other cities, the principal of which are Raſconde, where is one of the richeſt diamond mines in the Indies; Bezouar and Gandecot, famous for the number and ſingularity of the pagodas, and ſeveral other places, whoſe fields produce rhubarb, ginger, pepper, cocoa-nuts, palm-trees, and rice.

Still farther to the ſouth is the province of Canara. Its moſt northerly part is Onoar, which has a river of ſuch depth as to admit ſhips of two or three hundred tons burthen. Here is an ancient caſtle, built by the Portugueſe, when they were lords of the coaſt of India; but the natives blocked them up in the caſtle, till hunger forced them to ſurrender.

This is ſaid to be the country in which the cuſtom of the widows burning themſelves on the funeral-pile of their huſbands was firſt introduced, and where it is ſtill practiſed; but the manner in which it is performed we have already deſcribed in Sect. XI. page 192.

The country of Canara is uſually governed by a female, who keeps her court at a town called Baydour, two days journey from the ſea. She may marry whom ſhe pleaſes, but her huſband never obtains the title of raja, though it is beſtowed on her eldeſt ſon: but, while ſhe lives, neither her huſband nor her ſons have any thing to do with the affairs of government; nor is ſhe under any obligation to burn herſelf when her huſband dies.

The people here pay ſuch obedience to the laws of juſtice and humanity, that robbery and murder are hardly ever heard of among them, and a ſtranger may paſs through the country with the utmoſt ſafety. However, no man is permitted to ride either on an elephant, a horſe, or a mule, except the officers of ſtate and ſoldiers; but others are allowed to ride on buffaloes and oxen; nor are any permitted to have umbrellas carried over them by their ſervants; but if they are incommoded by the ſun, or the rain, they themſelves muſt carry them; but in every other reſpect their liberty is not reſtrained.

The next port to the ſouthward of Onoar is Batacala, where are the remains of a large city that ſtands on a ſmall river about four miles from the ſea. The country produces a conſiderable quantity of pepper, and the Engliſh

A View of Quinte

liſh company had formerly a factory there; but about the year 1670 an Engliſh ſhip which came to trade there having a fine Engliſh bull-dog, the chief of the factory begged him of the captain. Soon after the ſhip had ſailed, the factory, which conſiſted of eighteen perſons, going a hunting, unfortunately took the bull-dog with them, and paſſing through the town, the dog ſeized a cow and killed her. The prieſts, greatly enraged at this profanation, incited the mob to revenge the ſacred animal, which they did by murdering the whole factory; but ſome of the natives, who were friends to the Engliſh, dug a large grave and buried them all in it. Afterwards the chief of the Engliſh factory cauſed a ſtone to be placed over the grave, on which was this inſcription. "This is the burial-place of John Beſt, and ſeventeen "other Engliſhmen, who were ſacrificed to the fury of "a mad prieſthood and an enraged mob." After this the Engliſh never ſettled there, though they frequently go thither to buy pepper.

The next town to the ſouthward is Barcelor, which is ſituated on the banks of a broad river about four miles from the ſea, and a hundred and thirty miles ſouth of Goa. The Engliſh, Dutch, and Danes have factories here; and here the Portugueſe obtain ſupplies of rice, and, in return, ſell the inhabitants horſes, dates, pearls, and other merchandize of the produce of Arabia.

The next ſea-port town towards the ſouth is Mangalor, which is one of the moſt conſiderable places in the kingdom, and is ſituated in thirteen degrees north latitude. It has an excellent road for ſhips to anchor in while the rainy ſeaſon laſts, and carries on a conſiderable trade. The town is ſeated on a riſing ground, and is inhabited by Mahometans and Gentoos, but it is poorly built, and only defended by two ſmall forts. The Portugueſe have a factory here, and a pretty large church, frequented by the Indian converts; but both the prieſts and the laity are very debauched. The plains annually bear two crops of corn, and the higher grounds produce ſandal-wood, betel, and pepper.

Cananor is a large maritime town in a kingdom of the ſame name, and is ſituated in twelve degrees north latitude: it has a very large and ſafe harbour. The Dutch have a fort here of conſiderable extent, and at the bottom of the bay is a town independent of the Dutch, whoſe prince can bring twenty thouſand men into the field. This place formerly belonged to the Portugueſe, who had a ſtrong fort; but in 1660 the Dutch took it, and having added a large curtain, with two royal baſtions, demoliſhed the Portugueſe town.

Tellicherry is ſituated farther to the ſouth, and here the Engliſh Eaſt India company have a factory pretty well fortified with ſtone walls and cannon. The town is ſituated at the back of the fort, and is alſo encompaſſed with a ſtone wall. The eſtabliſhed religion is that of the Gentoos; but there are a few black Chriſtians who live under the protection of the factory, and ſome of them ſerve for ſoldiers in the garriſon.

SECT. XXXVI.

A Deſcription of the remaining Part of the Peninſula of India, particularly the Kingdom and City of Calicut. A remarkable Method of making War in the Dominions of the Raja of Sarimpatam. Of the City of Cranganor; with a particular Account of Cochin, the Capital of the Dutch Settlements on the Coaſt of Malabar; and of the Jews ſettled there. Of Anjengo, and ſome remarkable Circumſtances relating to the Queen of Attinga, and the Government of that State.

CALICUT is the capital of a conſiderable kingdom to the ſouth of Tellicherry, and is ſituated in eleven degrees twenty-one minutes. Its ſovereign bears the title of Zamorin, or Samorin, which ſignifies emperor, and is the moſt powerful of all the Malabar princes; for ſome ſay he is able to bring an hundred thouſand men into the field. The country abounds in pepper, cocoa-trees, ſandal-wood, iron-wood, and timber for building: it alſo produces cotton and precious ſtones. This country is famous for producing the cotton-cloth, which from the name of this country is called callicoe, of which immenſe quantities have been exported from thence to almoſt all parts of the world. There are alſo here monkies of an extraordinary ſize, which jump from tree to tree with ſurpriſing agility.

Some authors ſay, when the Samorin marries he muſt not cohabit with his bride till the namboury, or chief prieſt, has enjoyed her, for which that prieſt receives five hundred crowns; and, if he pleaſes, he may have her company for three nights, becauſe the firſt-fruits of her nuptials muſt be an holy oblation to the God ſhe worſhips. The naires, or nobles, who marry a maid, alſo pay the clergy for doing them the ſame favour. Here the daughters of the naires are allowed to marry a number of huſbands; but of this cuſtom we have already given a particular account in Sect. XI.

The city of Calicut is ſaid to be three leagues in circuit; but is not encompaſſed by a wall. It is ſuppoſed to contain ſix thouſand houſes, moſt of which are placed at a ſufficient diſtance from one another to allow each a garden. A merchant may here purchaſe a houſe for twenty crowns, and thoſe of the common people ſeldom coſt more than two; they are indeed only built of very large bricks dried in the ſun, and do not exceed ſeven or eight feet in height.

This was the firſt place at which the Portugueſe landed in 1498, when they firſt diſcovered India, by doubling the Cape of Good Hope. In 1714 the Samorin quarrelling with the Dutch, they carried on the war, till they obliged him to conſent to allow them ſeven per cent. on all the pepper exported out of his country for ever. This war was a great loſs to the chief of the Engliſh factory at Calicut, who had annually ſold five hundred or a thouſand cheſts of opium into the inland countries; but by the agreement made at the peace, that trade alſo fell into the hands of the Dutch. The Engliſh, however, ſtill export from this place what pepper and Indian goods they can procure. The French have an inconſiderable factory here.

The princes and chiefs of the Malabar dominions, and particularly the Samorin of Calicut, on extraordinary occaſions, make entertainments, to which the whole country is invited; but the expence rather ariſes from the quantity than the quality of the proviſions, which chiefly conſiſt of rice, the grain called dholl, with the ſauce of turmeric, cocoa-nut, and other vegetables, all which are exceeding cheap; and their only liquor is pure water. Theſe entertainments are literally cramming matches: for it is not unuſual for ſome of the gueſts, tempted by this food being at free-coſt, to over-charge their ſtomachs, ſo as to die under it. This, ſays Mr. Groſe, is treated as a matter of pleaſantry; and when they would celebrate the magnificence of one of theſe feaſts, they do it by telling the number that burſt at it.

On the back of the Samorin's dominions, and contiguous to them, is the country of the raja of Sarimpatam, which is ſaid to have been never yet ſubdued. It has been a conſtantly received law with theſe humane and equitable people, never to make any but a defenſive war, and even then not to kill a man though in battle; inſtead of which they practiſe a ſingular method of fighting, which is attended with ſucceſs. Their warriors are trained up to a particular dexterity of cutting off the noſes of their enemies in an engagement; and the dread of incurring this deformity has proved ſufficient to keep neighbours not more martial than themſelves from diſturbing their tranquillity. This, as the above ingenious author obſerves, reminds us of the celebrated ſtratagem of Julius Cæſar, at the battle of Pharſalia, who, riding round the ranks of his hardy veterans, directed them to aim at the faces of the young delicate patricians.

Still farther to the ſouth is Cranganor, which was poſſeſſed and fortified by the Portugueſe ſoon after their arrival in India; but the Dutch took it from them in January 1662. The Dutch found here ſeveral magnificent edifices built by the Portugueſe, particularly a noble college of jeſuits, with a ſtately library belonging to it; and, as this place was a biſhop's ſee, it had a cathedral, and ſix or ſeven other churches, of which the ruins only

remain. Without the walls was alſo the college of Chanote, famous for the reſort of the Chriſtians of St. Thomas, who performed the offices of their religion in the Syriac tongue, and had a Syriac ſchool for the inſtruction of youth.

Fourteen or fifteen miles farther to the ſouth is the city of Cochin, which is ſituated in a kingdom of the ſame name, in ten degrees north latitude. There are two towns of this name, called Old and New Cochin; the former is ſituated up a river half a league from the ſea; and, as the ſea has gained upon the land, the other is not now above a hundred paces from the ſhore.

New Cochin was built by the Portugueſe, who adorned it with ſeveral fine edifices, churches, and monaſteries, to which belonged fine walks and pleaſant gardens. The jeſuits church and college faced the ſea-ſhore, and had a lofty ſteeple. The convent and church of the Auſtin friars ſtood upon the bank of the river. The cathedral was a noble piece of architecture; and the convent and church of the Dominicans were fine buildings, beautified with a double row of pillars of excellent ſtone.

This city is ſo pleaſantly ſituated, that the Portugueſe uſed to ſay, "China is a country to get money in, and "Cochin a place to ſpend it in;" for the great number of canals formed by the rivers and iſlands make fiſhing and fowling very diverting, and the mountains are well ſtored with game.

The Dutch took this city about the year 1662, by the aſſiſtance of ſeveral neighbouring princes; the king of Cochin, in particular, who had been exaſperated at the inſolence of the Portugueſe, beſieged it with twenty thouſand men. The Engliſh had then a factory in the city, but were obliged to remove. It was then a mile and a half long; but the Dutch immediately gave orders for demoliſhing great part of the houſes, and ſeveral of the churches, in order to add to its ſtrength, and render the fortifications more regular. Thus it is now only about ſix hundred paces long, and two hundred broad; yet it is fortified with ſeven large baſtions, and curtains ſo thick, that two rows of large trees are planted on them for ſhade in the hot ſeaſon. Some ſtreets, built by the Portugueſe, were lately ſtanding, with a church for the Dutch ſervice, and the cathedral is now turned into a ware-houſe. The commander's houſe, which is a ſtately ſtructure, is the only houſe built after the Dutch manner, and the river waſhes a part of its walls. Their flag-ſtaff is placed on the ſteeple of the cathedral, on a maſt ſeventy-five feet high, on the top of which is another about ſixty feet; thus their flag may be ſeen at above ſeven leagues diſtance. The garriſon generally conſiſts of three hundred effective men.

Old Cochin, in which the king reſides, has a bazar, or market, in which may be found the produce of the country. It is built on the banks of the river, and has ſeveral pagodas.

This place is remarkable for having been formerly the ſeat of a Jewiſh government, that people being once ſo numerous in this kingdom, that they amounted to above eighty thouſand families, which at preſent are reduced to about four thouſand. They have a ſynagogue about two miles from the city, in which are carefully kept their records, engraved in Hebrew characters on copper-plates, and can ſhew their hiſtory from the reign of Nebuchadnezzar to the preſent time. About the year 1695 M. Van Reede had an abſtract of their hiſtory tranſlated from the Hebrew into Low Dutch. They declare, that they are of the tribe of Manaſſeh, a part of which was by the above haughty conqueror carried to the moſt eaſtern province of his large empire, which it ſeems extended as far as Cape Comorin; and, it is ſaid, they ſpent three years, from the time of their leaving Babylon, in travelling thither. On their entering Malabar they met with a friendly and hoſpitable reception; the inhabitants allowed them liberty of conſcience, the free uſe of their reaſon, and of the power of exerting their induſtry. Hence they increaſed in number and in wealth, till at length, either by their policy or their riches, or by both united, they obtained the little kingdom of Cranganor; when one family among them being highly eſteemed for their wiſdom, power, and wealth, two of the ſons were choſen by their elders and ſenators to reign jointly over the people. But concord, the ſtrongeſt band of ſociety, being ſoon broken, ambition took place, and one of the brothers inviting his colleague to a feaſt, quarrelled with him, and, baſely ſlaying him, reigned alone till the ſon of the deceaſed revenged his father's death, by killing the fratricide, and thus the ſtate fell again into a democracy, which ſtill continues among the Jews ſettled there. But the lands have ſeveral ages ago returned back into the hands of the Malabars, and poverty and oppreſſion have induced many to apoſtatize.

Farther to the ſouth is Anjengo, where the Engliſh have a fort, ſecured by the ſea on one ſide, and a ſmall river on the other; but not a drop of water fit for drinking is to be had within leſs than three miles of the factory.

This place is ſubject to the queen of Attinga, who is the hereditary ſovereign of a ſmall territory. By the conſtitution of the country it muſt be always governed by a queen. It is againſt the law for her to marry; but that heireſſes of her blood may not be wanting, ſhe may chooſe to admit whom, and as many as ſhe pleaſes, to the honour of her bed; her ſeraglio is therefore generally compoſed of the handſomeſt young men of her court. The ſons have the rank of nobility, and none but the daughters have any title to the ſucceſſion.

The cuſtom of the women not being allowed to cover any part of their breaſts, ſo generally practiſed in the countries of Malabar, is here more rigorouſly obſerved than in many other places; and we are informed by Mr. Groſe, that a woman of that country, who had been ſome time in an European ſettlement, where ſhe had conformed to the faſhion, continued the concealment of her breaſts; but coming into the preſence of the queen, ſhe ordered them to be cut off, for daring to appear before her with ſuch a mark of diſreſpect to the eſtabliſhed manners of her country.

To the ſouth of Anjengo is Tegapatan, where the Dutch have a ſettlement near Cape Comorin.

Thus we have finiſhed our intended deſcription of India in general, and of the principal ſettlements on the coaſt, and ſhall conclude with an obſervation from an ingenious author, that from ſuch ſtrange cuſtoms as have been juſt deſcribed, it ſeems natural to infer, that a barbariſm reigns among the Malabars equal to that of the ſavages of America; yet this is ſo far from being true, that they are diſtinguiſhed by their politeneſs, and eſpecially by a ſhrewdneſs in diſcerning their own intereſt, which thoſe who treat with them are ſure to experience. Like moſt of the people of the Eaſt they are grave, know perfectly well how to keep up their dignity, and are great obſervers of ſilence, eſpecially in their public employments, for they deſpiſe and diſtruſt all verboſeneſs in the management of affairs of ſtate, and their harangues are conciſe and pathetic. Thus two ambaſſadors being ſent by the naick of Madura to the king of Travancore, whoſe dominions are ſituated by thoſe of the Samorin, one of them making a long ſpeech, and the other preparing to reſume it where the other had left off, he auſterely admoniſhed him in theſe words, "Do not be long, life is ſhort."

We have now completed our view of India, and ſhould next proceed to Perſia; but as we have already given an account of the iſlands to the eaſt of Cape Comorin, we ſhall firſt give a conciſe account of that amazing cluſter of iſlands called the Maldives.

CHAP.

CHAP. XXIII.

Of the MALDIVIA ISLANDS.

Of their Situation, Extent, Number, and Produce; the Perſons and Manners of the Inhabitants. With a conciſe Account of the Settlement of the Portugueſe there, and their Deſtruction.

THE Maldives were the firſt iſlands diſcovered by the European navigators on their arrival in the Indies. The moſt northern of them are reckoned fifteen leagues from Cape Comorin; they extend from ſeven degrees twenty minutes north to one degree ſouth latitude; but are no where above thirty or thirty-five leagues broad. Within this ſpace are contained ſuch a prodigious multitude of little iſlands, that their number cannot be fixed. The prince, who is ſovereign of them all, takes the title of ſultan of thirteen provinces and twelve thouſand iſlands. There is doubtleſs ſome pride and great exaggeration in this pompous title, which ſtrongly ſavours of oriental vanity.

In this multitude of little iſlands a great number are uninhabited. Some are only covered with herbs and timber; others have no verdure, and are nothing but moving ſand: ſome of theſe laſt diſappear with the flux of the tide; others are daily waſhed away; and thoſe that have only trees and herbs are covered with crabs, large lobſters, and penguins, a ſpecies of birds as large as a gooſe. Not only the deſart iſlands, but thoſe which are habitable, are extremely ſmall, ſince Male, the moſt ſpacious of them, and the place of the king's reſidence, is no more than a league and a half in circumference.

They are divided into thirteen provinces, or diviſions, called by the inhabitants attolons; and are ſeparated from each other by ſtreights, which either their narrowneſs, the rocks, or ſand-banks, render impaſſable to merchant-ſhips. Nature has in a ſurprizing manner fortified theſe iſlands againſt the rage of the impetuous torrents, by encompaſſing them with rocks, which ſerve as a rampart, againſt which the waves daſh in vain: yet they have four openings oppoſite to each other, where the channels which croſs this long and narrow cluſter of iſlands ſerve them for harbours, according to the difference of the ſeaſons.

As theſe iſlands are in the midſt of the torrid zone, it may be imagined that the heat is exceſſive. The days and nights are equal, and the nights are always extremely cool, and attended with a plentiful dew. This coolneſs renders the heat of the day more ſupportable; and, as it refreſhes the earth, the vegetables thrive here as well as in temperate climates.

The rainy ſeaſon begins in April, and laſts ſix months. The fair weather begins in October, after which it never rains, and the wind is always at eaſt, till the approach of the rains.

The ſoil is as fertile as can be deſired, in ſuch things as it produces; which are millet, pulſe of various kinds, and chiefly cocoa-nuts; and, it is ſaid, that there is no country in the world where that fruit is ſo fine and plentiful, and as this alone is ſufficient for all the neceſſaries of man, the expence of living in the Maldivia iſlands is almoſt nothing. With the cocoa-trees they build veſſels of three hundred tons burthen, and from them have all their rigging. They alſo make oil of the fruit for their kitchens and lamps. Oranges, citrons, and pomegranates are no leſs plentiful here. The ſea alſo abounds with variety of fiſh; and on the land are tortoiſes that have large and beautiful ſhells. Black and green amber are found here, and alſo black coral, and the ſhells called couries, or blackmoor's-teeth, which in many parts of the world ſerve inſtead of money.

The Maldivians are a tractable people, eaſily dealt with. They are of an olive complexion, and ſmall of ſtature, but well proportioned. Moſt of them go quite naked, except wearing a cloth about their waiſt; yet they are ſaid to excel in manufactures, and alſo in letters and the ſciences, moſt of the Eaſtern nations, and have particularly a very high eſteem for aſtronomy. They are beſides prudent and ſedate, ſkilled in the management of their naval veſſels, brave and courageous, expert in the uſe of arms, and there reigns amongſt them a well regulated police. The people are of the Mahometan religion, and when one of them has made a voyage to Mecca he has the privilege of wearing a long beard as a ſign of his ſanctity.

The king's revenue chiefly conſiſts in the fifth of the fruits gathered by his ſubjects, and of what they can ſave from veſſels wrecked on their coaſts. The allurement of this ſort of gain has rendered them ſurpriſingly dexterous in recovering goods from the bottom of the ſea.

However, the ſmall profits to be made here is the reaſon why none but the Portugueſe have endeavoured to eſtabliſh themſelves in theſe iſlands. They were diſcovered in 1507 by admiral Soarez, who concluded an alliance with the king of the country, which was confirmed by Segueira, who, according to cuſtom, aſked leave to build a fortified magazine at Male; which was granted without difficulty by the prince, who was delighted with the preſents he had received, and hoped to derive great advantages from an union with a nation then ſo famous. Gomez erected the fort on the ſea-ſide of wood and earth; he having neither ſtone nor lime to raiſe a more ſolid ſtructure. But this work was ſcarcely compleated, when, truſting too much to the reputation of the Portugueſe, and to the friendſhip of the king, he ſhewed that he was diſpoſed to rule both over the foreigners and the natives of the country, and to give the law in matters of commerce. The Mahometans plotted ſecretly againſt him; they attacked the fort ſuddenly, when he had only fifteen or twenty ſoldiers with him; they killed him, and made themſelves maſters of the place. Thus the Portugueſe, by their own pride and folly, loſt that eſtabliſhment as quickly as they had acquired it.

CHAP. XXIV.

Of PERSIA.

SECT. I.

Of its Name, Boundaries, Situation, and Extent. Its Provinces, Climate, Rivers, and Minerals; with a particular Account of the Springs of Naptha, found in Perſia.

PERSIA, according to the Poets, derived its name from Perſeus, the ſon of Jupiter and Danae. Leſs fabulous authors ſuppoſe it derived from Paras, which ſignifies a horſeman, the Perſians being always celebrated for their ſkill in horſemanſhip; but the name is too antient for us to receive any certain account of its origin, and it is to little purpoſe to give an account of the conjectures of authors, when all diſagree.

This kingdom is bounded on the eaſt by the dominions of the Mogul; on the north by Uſbec Tartary, the Caſpian ſea, and Circaſſia; on the ſouth by the Indian ocean and the gulph of Perſia, or Baſſora; and on the weſt by the Turkiſh Empire. This extenſive kingdom is ſituated between the twenty-fifth and forty-fifth degrees of north latitude, and between the forty-fifth and the ſixty-ſeventh degrees of eaſt longitude from the meridian of London. The length and breadth of this kingdom is therefore nearly equal; and were not the north-eaſt parts of Perſia divided from the north-weſt by the Caſpian ſea, the form of this country would be almoſt ſquare. However, it is twelve hundred miles from eaſt to weſt, and nearly as much from north to ſouth.

This extenſive kingdom is divided into the following provinces: on the frontiers of India are Choraſan, part of the antient Hyrcania, including Herat and Eſterabad; Sableuſtan, including the antient Bactria and Candahor; and Sigiſtan, the antient Drangiana.

The ſouthern diviſion contains Makeran, Kerman, the antient Gedroſſia, and Farſiſtan, the antient Perſia.

The ſouth-weſt diviſion on the frontiers of Turkey contain the provinces of Chuſiſtan, the antient Suſiana, Irac-Agem, the antient Parthia, and Curdeſtan, part of antient Aſſyria.

The north-weſt diviſion, lying between the Caſpian ſea and the frontiers of Turky in Aſia, contains the provinces of Aderbeitzen, the antient Media; Georgia, Gangea, and Dagiſtan, part of the antient Iberia and Colchis; Ghilan, part of the antient Hyrcania; Shirvan, and Mazanderan.

The longeſt day in the ſouth of Perſia is thirteen hours and a half, and in the north above fifteen hours. In a country ſo extenſive the air and ſeaſons muſt neceſſarily be very different: thus in the middle of the kingdom their winter begins in November, and continues till March, with ſevere froſts and ſnow, great quantities of which fall on the mountains, but much leſs in the plains. From the month of March till May the wind is generally high, and from thence till September they have a calm ſerene ſky, without even a cloud. In the day-time the weather is pretty hot, but the refreſhing breezes which conſtantly blow in the mornings and evenings, as well as in the night, render the ſummer very tolerable, eſpecially as the nights are ten hours long. The air is ſo pure, and the ſtars ſhine with ſuch luſtre, that people uſually travel in the night; and the air is ſo dry during the fair ſeaſon, that not the leaſt dew or moiſture falls on any thing expoſed to the air. No country is more healthful than the heart of Perſia; and the foreigners, who come there ſtrong and robuſt, generally enjoy a conſtant ſeries of health; but it is obſerved, that thoſe who are ſick at their arrival ſeldom recover.

In the ſouthern part of Perſia the air is very unhealthful in the ſpring and fall, but this is not the caſe in the months of June, July, and Auguſt; the weather, however, is ſo very hot, that both natives and foreigners retire to the mountains. The hot winds which blow from the eaſtward over long tracts of ſandy deſerts are extremely ſuffocating, and ſometimes a blaſt ſtrikes the traveller dead in an inſtant. In the north part of the Perſian dominions, particularly the provinces of Georgia, Shirvan, and Aderbeitzen, though very dry and warm during the ſummer, are ſubject in the winter to ſtorms and tempeſts, and as ſevere a froſt for ſix months together as any countries on the continent in the ſame latitude: but theſe provinces being very mountainous, there is frequently a ſurpriſing difference between the air on the north and ſouth ſides of the mountains, ſo that people in a few miles travelling imagine themſelves in a different climate; but though theſe mountains are cold, they are extremely healthful. On the contrary, the flat country of Ghilan and Mazenderan, which lie near the Caſpian ſea, are very damp and unhealthful; and the inhabitants are obliged in ſummer to retire into the mountains, their water in the low grounds being foul and corrupted.

It has been obſerved, that there is no country in the known world of ſo large an extent as Perſia that has ſo few navigable rivers; for in the heart of that kingdom there is not a ſingle river that will carry a boat of any burthen, and in ſome parts a perſon may travel ſeveral days without meeting with any water at all. Indeed the river Oxus, which ſeparates Perſia from Uſbec Tartary, has a large ſtream; but none of its branches riſe in the Perſian dominions. The rivers Kur and Aras, antiently called the Cyrus and Araxes, which riſe in the mountains of Ararat, and flow through Georgia, Shirvan, and Aderbeitzen, and, after joining their ſtreams, fall into the Caſpian ſea, are much the moſt conſiderable rivers in the dominions of Perſia. There are, however, ſeveral ſmall rivulets which fall from the mountains, and are conveyed to their principal cities.

As water is ſo ſcarce, it is no where huſbanded better, nor have any people more ingenious methods of conveying it to their cities, the corn-fields, and gardens. This is a public affair, and there is an officer in every province to take care of the proper diſtribution of the waters. All their little rivulets and ſprings are turned to thoſe parts of the country where they are moſt wanted; they alſo dig wells of a prodigious depth and breadth, out of which they draw the water with oxen in great leather buckets, which being emptied into ciſterns, is let out as occaſion requires for the ſervice of the country. They have likewiſe vaſt ſubterranean aqueducts, through which water is conveyed to places at the diſtance of twenty or thirty leagues. Theſe aqueducts are two fathoms high, and arched with brick; and at the diſtance of every twenty paces are holes, like wells, made for the more eaſy repairing them. The diſtribution of the river and ſpring-water is made one day to one quarter of the town, and another day to another, when every one opens the canal, or reſervoir, in his garden to receive it; for which a certain ſum is annually paid for every garden to the government, particularly about Iſpahan; and as it is eaſy for a perſon to divert his neighbour's water into his own channel, this crime is ſeverely puniſhed.

As to the Perſian minerals, they have good mines of copper, iron, and lead; ſulphur and ſaltpetre are found in the mountains: they have alſo antimony and emery. There are plains near twenty leagues over covered with ſalt, and others with ſaltpetre and alum. In ſome parts of Carmania the ſalt is ſaid to be ſo hard, that the poor people uſe it inſtead of ſtone in building their cottages.

In the provinces of Fars and Shirvan are found great quantities of bole-armoniac, and a marl uſed by the country people inſtead of ſope.

In the iſland of Wetoy, in the Caſpian ſea, are ſprings of black or dark grey naptha, which boil up higheſt when the weather is thick and hazy. This naptha frequently takes fire on the ſurface, and in great quantities runs in a flame into the ſea, to an almoſt incredible diſtance from the ſhore: but in clear weather the ſprings do not boil up above two or three feet. This oily ſubſtance in boiling over becomes of ſuch a conſiſtence, that by degrees it almoſt cloſes up the mouth of the ſpring; and ſometimes theſe mouths are cloſed up, and hillocks formed over them as black as pitch; but when they are ſtopped up in one place, they break out in another, though ſome that have not been long open form a mouth of eight or ten feet in diameter.

This ſubſtance has a diſagreeable ſmell, and is chiefly uſed by the poor as we uſe oil in lamps, or to boil their proviſions. It burns beſt when mixed with a ſmall quantity of aſhes; and, as they have great plenty of it, every family is well ſupplied. The people keep it under ground in earthen veſſels, at a ſmall diſtance from their houſes, on account of its being very liable to take fire. There is a white naptha of a much thinner conſiſtence in the peninſula of Apcheron, which the people drink as a cordial and medicine, and alſo uſe it externally. It is ſaid to be carried into India, where, being properly prepared, it makes a moſt beautiful and laſting varniſh.

Their marble is either red, white, or black; and ſome is veined with white and red. One ſort of it will ſplit into large flakes or tables, like ſlate; but the beſt, which comes from Tauris, is white mixed with green, and is almoſt as tranſparent as cryſtal. In the country about Tauris is alſo found the mineral azure; but it is inferior to that brought from Tartary. The moſt valuable mines in Perſia are thoſe in which are found turquois-ſtones.

SECT. II.

Of the Face of the Country. The Corn, Plants, Trees, Fruits, and Shrubs of Perſia; particularly of the Senna Tree, the Tree that produces Manna; the Perſian Poppies, and the Manner of extracting Opium from them; the Tree which yields Aſſafœtida, and the Method by which it is obtained. Of the Beaſts of Burthen, particularly of the Perſian Camels, Horſes, and Mules. The Birds, Reptiles, Inſects, and Fiſhes.

AS to flowers, there are few of them in the ſouth part of Perſia, exceſſive heat being as deſtructive to them as extreme cold; but nothing can appear more beautiful than the fields of Hyrcania, where are groves of orange trees, jeſſamines, and all the flowers known in Europe; and the eaſt part of Perſia, called Mazenderan, is one continued parterre from September to April, the whole country being covered with flowers; and though this is their winter ſeaſon, it is alſo the beſt time for fruits. In the other months the heat is ſo intolerable, and the air of the plains ſo unhealthful, that the natives are obliged to retire to the mountains. In Media the fields produce ranunculuſes, anemonies, and tulips. About Iſpahan and ſome other towns, jonquils grow wild: they have alſo violets, lilies, daffodils, and pinks in their ſeaſon, and ſome flowers which laſt all the year round; but they have the greateſt quantity of roſes and lilies, and export a great deal of roſe-water.

In the ſpring there is plenty of yellow and red gilly-flowers, and another red flower reſembling a clove; it is of a beautiful ſcarlet, and every ſprig bearing thirty of theſe flowers, forms a fine head as large as a tennis-ball.

Rice, wheat, and barley, are almoſt the only corn that grows in Perſia; for they have no oats, and little or no rye. Their ſeaſons are different in the north and ſouth, for when they are ſowing in one part of the country, they are reaping in another, and in ſome places the diſtance between ſeed-time and harveſt does not exceed three months.

Moſt of the roots and ſallads of Europe are to be found in their kitchen-gardens; and they have no leſs than twenty ſorts of melons, which the people make their conſtant food. Thoſe that are firſt ripe in the ſpring are round and ſmall, but thoſe that ripen in the latter part of the ſeaſon are the beſt; theſe are as ſweet as honey, and ſome of them are ſo large that they weigh eight or ten pounds. People of quality have them all the year round; for they preſerve them by placing them under ground till the ſeaſon returns. The beſt melons grow in Choraſſan near Tartary, from whence they are carried as far as Iſpahan, for the king's uſe.

Cucumbers are alſo much eaten by the common people; one ſort of them has ſcarce any ſeeds, and is eaten without paring or dreſſing, and is not eſteemed unwholeſome.

They have ſeveral kinds of grapes, and ſome ſo large that a ſingle grape is a mouthful. They keep their grapes all winter, and let them hang a conſiderable time on the vine, wrapped up in linen bags.

Dates are eſteemed the moſt delicious fruit of this country, and are no where ſo good as in Perſia. The pulp which incloſes the ſtone is a clammy ſubſtance extremely ſweet. When ripe they are laid in heaps, and candy or preſerve themſelves without ſugar. The tree which bears them is very tall, but ſlender, and, like other palms, has branches only at the top, and the fruit grows in cluſters of thirty or forty pounds weight. The tree does not bear till it is fifteen years old; but it is ſaid to continue bearing till it is above a hundred.

Perſia has moſt of the fruits of Europe, and if the people underſtood gardening, they would have them in much greater perfection: but they are neither acquainted with grafting, inoculating, or the management of dwarf trees; hence all their trees run up very high, and are loaded with wood. They have, however, excellent apricots of ſeveral kinds, and their nectarines and peaches weigh ſixteen or eighteen ounces each. They have an apricot red within, called the egg of the ſun; theſe are dried and exported in great quantities. They boil them in water, which is thickened by the juice of the fruit, and converted into a perfect ſyrup without ſugar. Apples and pears grow chiefly in the north part of Perſia. They have alſo oranges, quinces, prunes, and pomegranates of ſeveral kinds; and ſuch varieties of fruit, that Mr. Chardin obſerves, he has ſeen above fifty ſorts at an entertainment, ſome of which grew nine hundred miles from the place.

Olives grow near the Caſpian ſea, but they neither know how to preſerve them, nor to extract the oil. Piſtachio nuts are almoſt peculiar to Perſia, and are exported in great quantities. They have alſo plantations of ſugar and tobacco.

They have likewiſe the palm, the cypreſs, and the mulberry, and of the laſt they have large plantations for their ſilk-worms.

The ſenna tree is very large, and commonly riſes forty or fifty feet high: the body is as ſtraight as the maſt of a ſhip, and has no branches but on the head: the bark is of a bright grey, and the wood ſerves for all the purpoſes of building: but the trees moſt common in Perſia are the plane tree, the willow, the fir, and the cornel tree.

There are trees that yield gum-maſtic, and frankincenſe; the latter reſemble a pear-tree, and are chiefly found in Carmania. There are alſo trees that produce manna of ſeveral ſorts; the beſt has a yellowiſh caſt, and a large coarſe grain. There is another ſort called tameriſk, becauſe the tree from which it drops is thus named, and is found in large quantities in the province of Suſiana; and a third ſort, gathered about Iſpahan, falls from a tree which reſembles the tameriſk, but is larger. The leaves during the ſummer drop liquid manna, which the natives take to be the ſweat of the trees, and in the morning the ground under them is perfectly greaſy with it.

Perſia likewiſe affords plenty of other phyſical drugs, as nux vomica, gum ammoniac, a kind of rhubarb, and caſſia. The Perſian poppies are much eſteemed for the quantity and ſtrength of the opium they pro-

duce. In ſome places they grow four feet high, and have white leaves. They extract the juice from them in June, by making little inciſions in the head of the poppy, on which a thick liquid oozes from them, which is gathered before ſun-riſe. It is ſaid to have ſuch an effect upon the people who are employed in this work, that they look very pale, and their limbs tremble. The liquor thus drawn from the poppies ſoon grows thick, and is made into pills.

A great deal of ſaffron is alſo produced in Perſia.

Aſſafœtida is much admired by the natives both of Perſia and India, who frequently eat it with their food. It is a liquor that flows from a plant called hiltot, an inciſion being made in the root for that purpoſe. It thickens after it is drawn, and grows as hard as gum; it is of two kinds, the white and the black, the former of which they eſteem the beſt for eating. The ſmell of this drug is ſo exceeding ſtrong, that it is communicated to ſuch goods as lie near it in the ſhip, let them be wrapped up ever ſo cloſe, and it is almoſt impoſſible to clear them of it.

In the deſarts of Carmania are two ſmall ſhrubs of a poiſonous nature, the firſt called galbad ſamour, or the flower which poiſons the wind, for ſome people imagine that this occaſions thoſe killing winds, which, in the hot ſeaſon, blow in this province. The other ſhrub is called kerzebre, the trunk of which is about as thick as a man's leg, and grows about ſix feet high; its leaves are almoſt round, and it bears a flower reſembling that of the ſweet-briar.

Among the cattle of Perſia the camels, horſes, mules, aſſes, oxen, and buffaloes, are very ſerviceable, and more particularly the camel, which is valuable, both on account of the weight he carries, and the little expence of keeping him. Of theſe camels there are ſeveral kinds, among which thoſe engendered between a dromedary or camel with two bunches on his back, and a female with one, are eſteemed the beſt, and ſold for twenty or thirty pounds each; for they are ſeldom tired, and are ſaid to carry nine hundred or a thouſand weight. Thoſe that travel between Iſpahan and the Perſian gulph are of a much ſmaller ſize, and carry no more than five or ſix hundred weight, yet theſe are almoſt as ſerviceable as the other, for they are much ſwifter, and will gallop like a horſe; but the others ſeldom exceed a foot pace. As theſe ſwift camels are kept by the king and the great men, for carrying their women and their baggage, they are generally adorned with embroidered cloths, and have ſilver bells about their necks. When they are to take their burden the driver touches their knees, upon which they kneel down till they are loaded, and when that is done ſuddenly riſe. They ſuffer them to graze by the road ſide with their loads upon their backs, on weeds and thiſtles; and when they travel through deſarts, in which nothing green is to be found, they feed them with balls compounded of barley-meal and chaff made up into a paſte, and often mix cotton ſeed with it; but, conſidering his bulk, he is the leaſt feeder of any animal. It is a great happineſs, that camels will live two or three days together without water, there being ſcarce any to be met with in the deſarts they are frequently forced to croſs. They ſhed all their hair every ſpring, and become perfectly naked. Of this hair abundance of fine ſtuffs are made. They are extremely tractable, except in their rutting time, which laſts thirty or forty days, and then they are very unruly, on which account their drivers increaſe their burdens to tame them. They go with young eleven months, and ſome ſay twelve.

Aſſes, mules, buffaloes, and oxen, are alſo uſed indifferently for carrying paſſengers or burdens, and their land being plouged by buffaloes and oxen, they are ſeldom killed for food. The aſſes of Perſia are much larger and ſwifter than ours, and will travel very well; but the fineſt beaſts are the horſes, which are very beautiful and well managed. They are finely proportioned, and are light and ſprightly, but are only uſed for the ſaddle: they are never gelt, and always wear their tails at the full length. They are, however, neither ſo ſwift as the Arabian horſes, nor ſo hardy as thoſe of the Tartars. Horſes are very dear in Perſia, ſome being ſold for two or three hundred pounds, and they are ſeldom ſold for leſs than fifty each, which is chiefly owing to the numbers ſent into India and Turky. They have alſo excellent mules, valued at thirty or forty pounds each.

The uſual food for horſes is barley and chopped ſtraw: they have no mangers, but give their horſes their corn in bags, as our hackney coachmen do; but ſometimes they feed them with balls, or barley meal.

There are here great plenty of ſheep and goats, and the natives ſeldom eat any other meat. Their ſheep are large, and remarkable for their fat tails, which commonly weigh eight or ten pounds, and ſome are ſaid to weigh above twenty pounds weight. In ſome parts of Perſia their ſheep have ſix or ſeven horns, ſome ſtanding ſtraight out of their foreheads, ſo that when their rams engage much blood is uſually ſpilt. The Perſian goats are not only valuable for their fleſh, but for their hair or wool, of which conſiderable quantities are exported from Carmania.

There are few hogs, for as the Mahometans have the government of the country, and are taught by their religion to abhor thoſe animals, their Chriſtian ſubjects do not endeavour to breed them, except towards Georgia and Armenia, where the Chriſtians are very numerous.

There are few wild beaſts, either in the ſouthern or middle part of Perſia, where there is no cover for them. They have, however, ſome deer and antelopes, which are nearly of the ſame nature, only they have finer limbs, and are ſpotted. In the woody parts of Curdiſtan and Hyrcania there are lions, tygers, leopards, wild boars, and jackalls, and in Armenia and Media there are abundance of deer, wild goats and rabbets.

They have the ſame ſort of tame and wild fowl as we have in Europe, but have more of them in the north than in the ſouth part of the country. Their partridges are the largeſt and beſt taſted that are any where to be met with.

The pelican, which the Perſians call tacob, or the water-drawer, is a very remarkable fowl: its body is ſaid to be as large as a ſheep, and its head very ſmall; but has a bill ſixteen or eighteen inches long, and as thick as a man's arm, and under it is a large bag, which will hold a conſiderable quantity of water; for they build their neſts in the deſarts, and frequently go two days journey to fetch water for their young ones; and then bring enough in this receptacle to laſt them a conſiderable time.

As to eagles, falcons, hawks, and other birds of prey, there are great numbers of them, and many of them inſtructed to fly at the game. They are taught not only to fly at birds, but at hares, deer, and all manner of wild beaſts; and, by fixing on the animal's head, and beating him with their wings, he is ſo terrified and diſtracted, that the huntſmen and dogs which follow eaſily take them.

They have the ſame ſorts of ſinging birds as we have, and ſome that are taught to ſpeak; but it does not appear that they have any parrots or parroquets. They have birds whoſe plumage has a beautiful mixture of yellow, green, and blue; and have ſuch numbers of ſparrows, that when the harveſt approaches the huſbandmen are obliged to place their ſervants all day in the fields to keep them from the corn.

The country near the Caſpian and Arcanian ſeas is full of ſerpents, toads, ſcorpions, and other venomous reptiles, many of which die in ſummer for want of water, and infect the air of that part of the country. There are ſcorpions in particular of a monſtrous ſize, whoſe ſting is ſaid to be mortal, if proper remedies are not inſtantly applied; and, at beſt, a perſon ſtung by one of them is in ſuch torture, that for ſome time he is raving mad. Muſcatoes are very troubleſome in the flat country near the Caſpian ſea; and there is a white fly, no bigger than a flea, whoſe ſting is like the prick of a pin. Here are alſo millepedes, whoſe bite is as pernicious as the ſting of a ſcorpion.

However, in the heart of Perſia, which is very dry, they are not much troubled with inſects, except their being ſometimes viſited by ſwarms of locuſts, which fly in ſuch numbers,

numbers, that they reſemble a cloud, and obſcure the ſun. Wherever theſe light, they deſtroy the fruits of the earth; but happily certain birds generally viſit the country about the ſame time, and, by eating up the locuſts, prevent the ruin of the huſbandmen.

There are great plenty of ſea-fiſh of almoſt all kinds in the Perſian gulph and the Caſpian-ſea; and the rivers Cur and Arras, which fall into the Caſpian, have plenty of river-fiſh; but they are at too great a diſtance from Iſpahan to ſupply that city, and therefore fiſh is ſeldom taſted there.

SECT. III.

Of the Perſons, Dreſs, Food, Manners, and Cuſtoms of the Perſians.

THE Perſians have agreeable features, and are of a good ſtature, well ſhaped, robuſt, warlike, and hardy. In Georgia and the northern provinces they have a fine complexion, but towards the ſouth are a little upon the olive. However, as many of the great men have for a long time paſt had their wives chiefly from Georgia and Circaſſia, the breed in the ſouthern provinces is much mended. Their eyes and hair are generally black, and the men, in moſt parts of the country, ſhave their heads very cloſe; but the young men have often a lock on each temple, which hangs down, and ſerves as an ornament to their faces. Their cheeks are ſhaved, but the beard of the chin reaches up to their temples. Their mollahs and religious people wear long beards, which they only clip into form; but the common people cut theirs pretty ſhort. None of them ſuffer any hair to grow upon their bodies.

Moſt of them have caps of cloth, which riſe ten or twelve inches, and terminate at the top in four corners. They have a ſhorter cap for ſummer faced with Bokharian lamb-ſkins; their ears, which are very large, are always left bare, and generally hang down, in conſequence of the weight of the caps reſting on them; and, when Mr. Hanway was there, many were proud of ſhewing that they were not cut off. They are fond of having their caps, as well as their outer garments, of a crimſon colour, which has a grand appearance: deep blue, which is ſeldom worn, except in coarſe cloths, is their mourning colour. People of ſuperior rank wear a ſaſh of Kermania wool wrapped about their heads as turbans; ſome of theſe are ſo exceeding fine, as to coſt twenty-five pounds; and the common price for ſuch as are good is eight or ten crowns. Thus their heads are kept very warm; and they ſeldom pull off their caps, but wear them even in the preſence of their king. Next to their ſkins they wear a kind of ſhirt, or veſt, of chequered ſilk or callicoe, generally blue, which they ſeldom or never waſh till it is worn out: it has an open boſom, but neither neck nor wriſt-bands, and is made cloſe to the arm. Over the veſt they wear a waiſtcoat, and upon that a coat, which has cloſe ſleeves and is faſtened before with buttons and loops, and alſo with a ſaſh. This coat is wide at bottom, and hangs a little below their knees. They likewiſe frequently wear a looſe upper coat, which ſome have lined with furs, as ermines, ſquirrels, or ſables. This garment is worn for warmth, and alſo for ſtate; for it is common to ſee a great man ſit in his ſable coat in the height of ſummer; but it muſt be obſerved, that theſe coats reach no farther than the waiſt. Their under garments, whether of ſilk, cotton, or woollen, are quilted, which renders them warm, without being heavy. As their ſhirts have no collars, they always go bare-necked. The ſleeves of their upper garment reach down to their fingers. They ſometimes wear cloth ſtockings, which ſit looſe like boots; but for the moſt part they uſe only woollen ſocks, that reach over the ancles. They wear ſlippers, like women's ſhoes, without quarters. Theſe are of ſhagreen, made of the ſkin of horſes rumps, prepared hard and rough like a ſeal's ſkin; and the heels being high, are calculated to carry them out of the dirt; but are very uneaſy to thoſe who are unuſed to them. Their drawers, or rather trowſers, are more convenient in a hot country than breeches, being without any tight ligatures. For this reaſon, ſays Mr. Hanway, their cloathing in general ſeems more conducive to health and ſtrength than that of the Europeans: the ſaſh round the waiſt may, however, keep their loins too warm; but girding up the loins is a part of dreſs the moſt antient we read of. Under this ſaſh they carry a long pointed knife in a wooden caſe, mounted with gold or ſilver. Their writers carry their ink and pens about them in a caſe, which they alſo put under their ſaſh, or in a pocket under the arm.

In ſhort, with reſpect to the common people, they in general wear two or three light veſtments, which reach only to their knees; ſo that the dreſs of the Perſians gives them a great advantage over the Turks, who wear long effeminate robes.

When thoſe of rank ride they have boots of yellow leather. Their bridles, ſaddles, and houſings, are almoſt covered with gold; and the latter are ſo large, as almoſt to hide the hinder part of the horſe.

The dreſs of the women differs from that of the men, rather for the diſtinction of ſexes, than by affecting any prepoſterous form. They adorn their arms with bracelets, and neither the men nor women wear gloves. The ornaments of their heads conſiſt of jewels diſpoſed in ſeveral different forms: one of theſe is compoſed of a light gold chain ſet with ſmall pearls, with a thin gold plate pendant about the bigneſs of a crown-piece, on which is impreſſed an Arabian prayer: this is fixed to the hair, at the upper part of the temple, and hangs upon the cheek below the ear. The poorer ſort wear the ſame things in baſer metal.

If ever they go into the ſtreets, which the ladies of rank ſeldom do, they wear a white veil, which covers them from head to foot. The girls wear on their heads a ſtiffened cap turned up, with a heron's feather in it. Their hair, being made up in treſſes, falls down their backs to a very great length. The married women ſometimes comb their hair back, and binding it with a broad ribbon, or rich tiara, ſet with jewels, reſembling a coronet, let the reſt of their hair fall gracefully down their ſhoulders, and nothing can appear more becoming.

Black hair is not only the moſt common, but the moſt eſteemed, and the thickeſt and broadeſt eye-brows are moſt admired. If their eye-brows are not black, the women will colour them; and it is not uncommon to paint their faces: they alſo rub their hands and feet with an orange coloured pomatum. Some have feathers ſtanding upright in their tiara, and others have a ſtring of pearls or precious ſtones faſtened to it, and hanging down between their eye-brows; they alſo wear jewels in their ears, and rows of pearls fall down their temples as low as the neck; and in ſome of the provinces that border on India they have noſe jewels. Their necklaces are either of gold or pearl, and fall upon the boſom; and to theſe uſually hangs a little golden box filled with moſt reviving perfumes. The women wear drawers and ſlippers like thoſe of the men.

As both the men and women are dreſſed in the richeſt flowered and brocaded ſilks, it is evident they ſpare no expence in adorning themſelves. Their ſaſhes are alſo brocaded, and are ſaid to coſt from twenty to a hundred crowns; and over this they have frequently another of camels hair, ſo curiouſly wrought, that it ſeldom coſts much leſs. All this, with their rich furniture when they ride out, as they do almoſt every day, keeps them poor; but it is very common for them to feel the effects of poverty at home, while they are loaded with gold and jewels when they go abroad.

In fine, the Perſians obſerve an outward decency in their cloathing; this their very religion ſeems to exact of them. They are neat in their houſes; and even the meaneſt ſort are uſually very clean in their cloaths, which have ſeldom any rent: but if it was not for their repeated bathings, the want of changing their ſhirts would render their perſons indelicate.

As to the food of the Perſians, they uſually drink a diſh of coffee early in the morning, and about eleven o'clock go to dinner, when they eat fruit, ſweetmeats, or curds and milk; but their principal meal is in the evening,

evening, when they have generally a diſh of pilow, which is boiled rice well butterod, and ſeaſoned, with a fowl, a piece of mutton, or kid, ſerved up with it. They boil their rice till the water is perfectly dried away by the time the rice is enough, and then ſeaſon it with ſpices, and mix ſaffron or turmeric with it to make it yellow, or give it what other colour they chooſe.

Their uſual way of dreſſing their fleſh is by cutting it into little ſlices, and then ſkewering them together, broil them over a charcoal-fire; but whether they boil or roaſt, it is always done to rags, or it would be impoſſible to pull the meat in pieces with their fingers, which they are forced to do, as they uſe neither knives or forks.

They are naturally inclined to temperance, and with reſpect to diet ſeem more in a ſtate of nature than the Europeans. They, however, uſe opiates, but not near ſo much as the Turks; and, beſides coffee, they drink ſeveral kinds of ſherbet, and an infuſion of cinnamon with ſugar. Hoſpitality is a part of their religion, and, on occaſions of the leaſt intercourſe, men of any diſtinction invite ſtrangers, as well as their friends, to their table, and take great pride in the teſtimonies of reſpect they ſhew them. The reader will doubtleſs be pleaſed with ſeeing here an account of an entertainment, at which Mr. Hanway was preſent; ſince the deſcriptions given by an author of ſuch veracity ought always to be preferred to the accounts of unknown travellers, who are frequently careleſs and inaccurate, and borrow what they deſcribe from the relations of others.

Supper being brought in, a ſervant preſented a bottle of water, and, with a napkin over his ſhoulder, went to every one in the company, and poured water on their hands to waſh. In the court-yard ſtood a large lamp ſupplied with tallow, and in the middle of the room, upon the floor, was one large wax candle, which they ſnuffed with ſciſſars into a tea-cup of water. A large ſalver, in the form of a tea-board, was ſet before every perſon, covered with a plate of pilow, on which was a ſmall quantity of minced meat, mixed up with fruit and ſpices. There were alſo plates of comfits, ſeveral china baſons of ſherbets, as ſweet, ſour, and other waters, with cakes of rice, and others of wheat-flour, on which were ſprinkled the ſeeds of poppies, and others of the like nature. As they eſteem it an abomination to cut either bread, or any kind of meat after it is dreſſed, theſe cakes are made thin, that they may be eaſily broken with the hand; their meat, which is generally mutton or fowls, is ſo prepared, that they divide it with their fingers. When every thing was ſet before them they ate faſt, and without ceremony, feeding themſelves with their fingers. The Perſians, indeed, are not very nice in their manner of eating, for they greaſe their hands, and beſmear their beards. Supper was no ſooner over than warm water was brought to waſh, which being done, they reſumed their diſcourſe: and it is worthy of remark, that when the oldeſt man in the company ſpeaks, tho' he be poor, and ſet at the lower end of the room, they all give ſtrict attention to his words.

The uſual ſalute in this country is by putting the right hand on the breaſt, and bowing the head; but they never move their turban. Thoſe who are familiar preſs the palm of your hand between the palms of both theirs, and then raiſe them to their forehead, to expreſs the high and cordial reſpect they have for your perſon. They bow before the king, the viceroys of provinces, and other great men, with their faces three times to the ground.

Upon occaſions of mourning and rejoicing, the Perſians do not fail to viſit each other; and people of rank always expect the compliments of their dependants. They are introduced into a large hall, where coffee and tobacco are placed before them; but the great man no ſooner appears than they all riſe up, and he having bowed to them while paſſing by, every one bows much lower to him, and after he has taken his ſeat, makes a ſign to the company to ſit. If the maſter of the houſe be already in his hall, the viſitor comes in ſoftly, and ſtepping to the next vacant place, ſtands with great gravity with his feet cloſe together, and his hands acroſs, till the maſter makes a ſign for him to be ſeated. But when a perſon receives a viſit from his ſuperior, he no ſooner ſees him but he riſes, and meets him half way, and if he has notice of his coming, receives him at the gate. In ſhort, the reſpect ſhewn is in proportion to the quality of the perſons; but they place thoſe for whom they have the greateſt reſpect on their left hand. They ſit croſs-legged, yet have frequently ſtools brought for the Europeans of rank, when they viſit them.

They are extremely fond of tobacco; and ſome of them draw the ſmoke in ſo prodigious a quantity, that it comes out of their noſes. The caalean uſed by the Perſians in ſmoaking is a glaſs veſſel, reſembling a decanter, and filled about three parts with water. Their tabacco is yellow, and very mild compared with that of America. Being prepared with water, and made up into a ball, it is put into a ſilver utenſil, not unlike a tea-cup, to which there is a tube affixed, that reaches almoſt to the bottom of the veſſel. There is another tube fixed to the neck of the veſſel above the water; to this is faſtened a leathern pipe, through which they draw the ſmoke, which, as it paſſes through the water, is cool and pleaſant. The Perſians, ſays Mr. Hanway, have for many ages been immoderately fond of the caalean. Shah Abas the Great made a law to puniſh this indulgence with death; but many choſe to forſake their habitations, and to hide themſelves in the mountains, rather than be deprived of this infatuating enjoyment. Thus this prince could not put a ſtop to a cuſtom, which he conſidered as unnatural, irreligious, and attended with idleneſs and unneceſſary expence.

In their common diſcourſe they frequently introduce moral ſentences, and poetical narrations extracted from their poets, and other writings; and it was formerly their conſtant cuſtom to entertain their gueſts with favourite paſſages out of their poets. They are polite, but at the ſame time are extravagantly hyperbolical in their compliments. The Perſians were once celebrated for their poetic genius; but war, which has deſtroyed their morals and learning, ſeems likewiſe to have damped ther poetic fire. The ancient Perſians are ſaid to have taught their children a moſt exact reverence for truth; but the preſent generation are notorious for their falſhood; and as the above moral hiſtorian obſerves, they poiſon with a ſweetmeat, in always ſaying what is pleaſing, without regarding the truth. They are of a chearful diſpoſition, and yet are rather inclined to ſerioufneſs than loud mirth.

It does not appear that they are vindictive: yet if their kindneſs to their beſt friends happens to be turned by any fortune of war into enmity, they frequently become inſenſible; but this ſeems more owing to a cuſtom of cruelty than to a revengeful temper. But though there are not many inſtances of that placable diſpoſition ſo ſtrongly recommended by the Chriſtian religion, they are in theory friends to this virtue, and in the duty of reſignation apparently exceed the Chriſtians.

SECT. IV.

Of the Language of the Perſians; their Paper, Ink, and Seals; their Manner of Writing, Learning, and Skill in the Sciences; their Diſeaſes, and Methods of Cure.

THE Turkiſh language is the moſt common in Perſia; it prevails on the ſouthern coaſt of the Caſpian ſea, and in thoſe provinces that were formerly conquered by the Turks, as Shirvan and Aderbeitzen; but the illiterate people ſpeak a barbarous mixture, and there is a different dialect in Ghilan and Mazanderan. The pure Perſic is little known but in the ſouthern parts, on the coaſt of the Perſian gulph, on the confines of Arabia, and particularly in Iſpahan. In matters of learning they uſe the Arabian language, in which is depoſited the greateſt part of that knowledge for which the Perſians were once diſtinguiſhed; and polite people being fond of Arabian words, theſe render their diſcourſe the leſs intelligible to their inferiors. As time ſeems to have made no change in the cuſtoms of Aſia, but the ſame manners remain that we read were uſed two thouſand years ago, ſo

ſo the language of the Perſians has the ſame idiom and ſublimity of expreſſion. As to the learned languages familiar to the Europeans, they are unknown in Perſia.

They write, like the Hebrews, from the right hand to the left, and often range their lines in an arbitrary manner; ſo that upon one leaf of paper they ſometimes write in ten different directions, only to ſhew the writer's ability in obſerving the proportion of words.

The Perſians make their paper of cotton and ſilk rags, and after it is manufactured ſet a gloſs upon it with a ſmooth ſtone or ſhell; and, as it is ſoft and liable to be torn, they always roll it up. Their letters of correſpondence are written on ſmall ſlips of paper, generally in few words, and with great exactneſs, no interlineations or blots being ever ſuffered to appear; they are then made up into a roll about ſix inches long, and a bit of paper is faſtened round it with gum, and ſealed with an impreſſion of ink, which has ſome reſemblance of that uſed by our printers, but is not ſo thick. It is compoſed of a mixture of galls, burnt rice, and gums, and anſwers the double purpoſe of ink and wax, as it not only ſerves for writing, but for ſubſcribing with their ſeal. They write with pens made of reeds brought from the ſouthern parts of Perſia; and in their rings they wear agates, which generally ſerve for a ſeal, their name and ſome verſe of the Koran being uſually engraven upon it.

The Perſians, like other Mahometans, conſider paper as ſomething ſacred, and eſteem it as a very ill action either to burn or tear it, and much more to put it to any ignoble uſes; for, ſay they, the name of God, or ſome of his ſaints, may be written upon it, and therefore it would be impious to prophane it in that manner; and if there be no writing upon it, they ſay it is deſigned for great purpoſes, for containing ſubjects of religion, laws divine and human, and other things of great moment, and therefore ought not to be applied to common uſe.

As they have not the art of printing amongſt them, their books are all manuſcripts, and they excel in writing, which they eſteem one of the liberal arts. They are ſaid to write eight different hands, among which that called Neſky, in which the Koran is written, is in moſt eſteem. They ſtand or ſit gracefully, holding the paper in their hands, and write with all imaginable eaſe and diſpatch, though they have no table to lay their paper upon; and it is ſaid, they will tranſcribe a book as large as the Bible, in a fair character, for about ten pounds, provided the paper be found them. They have ſome clerks in all their great towns, but half of them hardly get bread. They uſually write from morning till night for five-pence or ſix-pence a day.

But at preſent the want of literary curioſity, even among people of diſtinction, is very remarkable. Indeed moſt of theſe are of mean birth and education; and, though they have good natural parts, are fallen very low in point of knowledge; which is indeed the leſs ſurprizing, as reading, the firſt ſtep to knowledge, has been of late years little taught either to thoſe bred to arms, or to the vulgar, and is almoſt confined to the mullahs, or prieſts. They alſo fall into a great abſurdity in their manner of inſtructing. I have obſerved their boys, ſays Mr. Hanway, reading leſſons out of the Koran in Arabic, which they do not underſtand; and, to add to this farce, as they ſit they make a motion with their head and body, alledging that this helps ſtudy. Thus does affectation ſupply the place of real learning.

In arithmetic the Perſians make uſe of figures in the ſame manner as we do, and their method of addition, ſubſtraction, multiplication, and diviſion, is but little different from ours; but they go no higher.

As to aſtronomy they underſtand little of either the celeſtial or terreſtrial globes, and their aſtronomers were ſurprized when ſome years ago an European brought a pair of them to Iſpahan; but they have ſince endeavoured to imitate them. They have, however, an aſtrolabe, and can name the ſigns of the zodiac, and are not unacquainted with the other ſtars. Aſtronomy is ſtudied in Perſia merely for the ſake of aſtrology, which they term the revelation of the ſtars. They look upon it as the key to futurity, and conſider a perſon as groſsly ignorant and ſtupid who ſpeaks ſlightly of that pretended ſcience. There are conſtantly a certain number of aſtrologers in waiting at the royal palace, and ſome of the chief of them are always about the king's perſon to inform him of the lucky or unlucky moments, except when he is in the haram with his women, and each of them carries an aſtrolabe in a neat little caſe hanging at his girdle. They are not only conſulted in affairs of importance, but frequently upon trifles; as for inſtance, if the king ſhould go abroad, if it be an auſpicious hour to enter the haram, or a proper time to eat or give audience. When theſe queſtions are aſked, the aſtrologer takes out his aſtrolabe, obſerves the ſituation of the ſtars, and, by the aſſiſtance of his tables, draws his aſtrological concluſions; to which they give entire faith as to an oracle.

They obſerve pretty juſtly the eclipſes of the ſun and moon; but there are inſtances of their being miſtaken half an hour, eſpecially in the eclipſes of the ſun. They imagine that comets portend ſome great calamity, but generally ſuppoſe their malign influences are directed againſt ſome other kingdom rather than their own.

The Perſian almanack is compoſed of a mixture of aſtronomy and judicial aſtrology, it containing an account of the conjunctions, oppoſitions, aſpects, longitudes, latitudes, and the whole diſpoſition of the heavens; with prognoſtics on the moſt remarkable events, as war, famine, plenty, and diſeaſes, with the lucky and unlucky times for tranſacting all affairs; but the authors of them endeavour to deliver themſelves in dubious and equivocal expreſſions, that will bear ſeveral meanings; and if their predictions prove true in any ſenſe, or but in part, they are ſure to meet with applauſe.

The Perſians have ſolar and lunar years, by which they regulate their different concerns. The Perſian year begins at the vernal equinox, when their aſtrologers are employed in making an exact obſervation by the aſtrolabe, of the very moment the ſun coming to the equator enters into Aries. As their lunar year only conſiſts of twelve moons, or three hundred and fifty-three days, their ſolar computation exceeds their lunar at leaſt twelve days. Their epocha, by which they reckon all their years, begins with the Hegira, or flight of Mahomet from Mecca, the place of his birth, to which he was compelled on account of his new doctrine; and which happened in July, ſix hundred and twenty-two years after the birth of our Saviour. Their week begins on Saturday, and the ſeventh day, which is their ſabbath, therefore falls on a Friday, which they call the Day of Aſſembly. Their day conſiſts of twenty-four hours, which they reckon in the ſame manner as the Italians.

Upon New-year's-day the great men wait on the king to wiſh him a happy new year, every one making him a valuable preſent; as do the abſent khans, or cawns, who reſide in diſtant governments. At this time they clothe all their retinue in the gayeſt manner, and the meaneſt of the people endeavour on that day, as much as poſſible, to be new cloathed from head to foot; and the time is ſpent in entertainments and in making preſents to their friends or patrons.

There is no country in the Eaſt where phyſicians are more eſteemed, or that produces a greater variety of phyſical drugs. They are called the preſervers of life, and the king always entertains a conſiderable number of them in his pay; but there are perpetual diſputes between them and the aſtrologers; for when the phyſician has preſcribed and prepared the medicine, the patient muſt wait to fix the lucky moment in which it is to be taken; and if it has not the deſired effect, the aſtrologer lays the blame upon the ignorance of the phyſician; while the phyſician, on the other hand, aſſures the patient, that the reaſon of its having no better ſucceſs, was owing to the aſtrologer's being miſtaken in his calculation.

They form a judgment of a diſeaſe chiefly by feeling the pulſe and inſpecting the patient's urine; and, with reſpect to the female ſex, this is done without their ever ſeeing them; for when a phyſician deſires to feel a woman's pulſe, they give him her hand covered with crape or fine linen through a curtain which hangs between them. They however ſeldom bleed in Perſia, but give emul-

ſions and other potions in a fever, which is the moſt common diſtemper in that country. In their preſcriptions they frequently follow Galen, whom the Perſians call Galenous; their other great maſters in phyſic is Avicenna, the moſt celebrated phyſician and philoſopher in Aſia of his time.

The Perſians are very ignorant in ſurgery, the barbers being the only ſurgeons, and few of them underſtand any thing more than letting blood. Bodies are never diſſected in Perſia, and therefore they can have but little idea of the animal œeconomy: but they have the leſs occaſion for ſurgeons, as the air is ſo good that green wounds heal almoſt of themſelves; and they are exempt from many of thoſe diſeaſes which ariſe from a corruption and flux of humours among us.

The plague very ſeldom viſits Perſia, though the neighbouring kingdom of Turky is ſeldom entirely free from it. They are alſo ſaid to be ſtrangers to the gout, the ſtone, ſciatica, head-ach and tooth-ach; and the ſmall-pox, conſumptions, apoplexy, and falling ſickneſs, are ſcarce known amongſt them.

The diſeaſes to which the Perſians are moſt ſubject are fevers, St. Anthony's fire, dropſies, dyſenteries, the cholic, pleuriſy, and venereal diſeaſe; yet this laſt has not the ſame pernicious effects as in Europe. The people eat, drink, and bathe together while they are afflicted with it, and this may be one means of ſpreading it; but it is ſaid that nobody is there aſhamed of having that loathſome diſtemper. Near the gulph of Perſia they are troubled with a ſmall worm of a prodigious length, which breeds in the legs: theſe are drawn out by twiſting them round a ſtick; but if they happen to break while this is performing, it is of ill conſequence to the patient. The common diſtemper near the Caſpian ſea is the yellow jaundice; and travellers obſerve, that in Hyrcania the people in general have a ſickly yelloviſh caſt.

The Perſian phyſicians, it is ſaid, remove a fever very ſuddenly, by giving the cold ſeeds in water; but then they ſuddenly throw the patient into a dropſy, the moſt fatal diſeaſe in Perſia. For the hæmorrhoids they apply the oil of naptha; in the cholic and other diſtempers they uſe the actual cautery; and in a dyſentery they give ſour milk, boiled with rice till it be dry: but the moſt general remedy is bathing. They never ſuffer their patients to change their linen or cloaths while the illneſs laſts, or to eat either bread or fleſh; for the ſick are permitted to have ſcarce any other food beſides boiled rice, and rice-gruel.

SECT. V.

Of the Trades and Manufactures of Perſia.

EVERY trade has a warden appointed by the government, who takes notice that the rules and orders relating to the profeſſion are duly obſerved; and whoever intends to ſet up a trade regiſters his name and place of abode with this officer. No enquiry is made who was his maſter, or whether he underſtands his buſineſs; nor is there any reſtraint laid upon him to prevent his encroaching on any other profeſſion. They take no apprentices, but hire their ſervants, and allow them wages from the firſt day in which they are entertained. Almoſt every trade is obliged to work for the king whenever he requires it; and thoſe who are exempted from this ſervice pay an annual tax for enjoying this privilege.

The Perſians fall much below the Europeans in painting. Inſtead of imitating nature they ſeem to delight in mis-ſhapen figures, and, like all the other Eaſtern nations, are entirely ignorant of perſpective, and of the proper manner of diſpoſing the lights and ſhades. Their human figures are commonly drawn in profile, for they ſcarce ever draw a full face; and when they do, they ſucceed very ill. Even the figures of animals are ill-performed; but their flowers are pretty well executed, and here they have the advantage of us in the livelineſs of their colours and the dryneſs of the air. Their religion indeed diſcourages all the arts of imitation; for ſome of their rigid doctors prohibit the repreſentation of every created animal. Modelling, ſtatuary, founding, and the curious art of engraving copper-plates, are unknown.

The Perſians excel in making of earthen-ware, in which they almoſt equal the Chineſe; and in the mending of glaſs and earthen-ware by drilling holes through them and faſtening the pieces with wire.

The carpenters are very indifferent artiſts, which is ſaid to be owing to the ſcarcity of timber, little of it being uſed in building; but their joiners and turners are more expert, and are well ſkilled in varniſhing.

Braziers and tinmen work well with their hammers, files, and turning inſtruments. Moſt of the veſſels uſed in their kitchens are made of copper tinned; and among their kitchen furniture they have neither braſs, iron, nor pewter. Their armourers make good ſabre blades, and damaſk them as well as any Europeans. The barrels of their fire-arms are very ſtrong, but the ſtocks are ill contrived. They however, either purchaſe the locks abroad, or employ European workmen in making them.

They are well ſkilled in cutlery-ware, and make good knives, razors, and ſciſſars; they likewiſe make little ſteel mirrors, which are uſed inſtead of looking-glaſſes. Theſe are generally convex, and the air is ſo perfectly dry that they ſeldom ruſt or grow dull.

They are not ſkilled in the art of making looking-glaſſes, but have them from Europe; however, they have a manufacture of glaſs, which ſerves for windows and bottles.

As the Perſians value themſelves on uſing the bow, there are no where better bows made; the chief materials are wood and horn, with ſinews bound round them: they are painted, varniſhed, and made as neat as poſſible. The bow-ſtring is of twiſted ſilk of the thickneſs of a gooſe quill, and their quivers of leather embroidered with ſilk.

Their leather is exactly the ſame as that we call Turky-leather; and, when the trade of Perſia flouriſhed, much of that brought to England as Turky-leather was made in Perſia.

The Perſians are extremely well verſed in embroidery, eſpecially with gold and ſilver on cloth, ſilk, or leather. Their ſaddles and houſings are covered with it, and their ſtitching of the leather exceeds any thing of the kind done in Europe. Their ſaddles are after the Morocco faſhion; the ſtirrups are very ſhort, and where we uſe braſs in our furniture the men of quality have gold.

Their gold wire-drawers are pretty good artiſts, and their lapidaries underſtand the grinding of ſoft ſtones and of cutting them pretty well, but their jewellers and gold-ſmiths are clumſy workmen. The Perſians have not the leaſt idea of enamelling.

Their dying is preferred to any thing of the kind in Europe, which is not ſo much aſcribed to the artiſt as the air, which being dry and clear gives a livelineſs to the colours, and fixes them.

The Perſian taylors are neat workmen, and the men's cloaths are fitted exactly to their bodies without the leaſt wrinkle; and their ſewing exceeds that of our workmen. They alſo work flowers upon window-curtains, carpets, and cuſhions ſo neatly, that they look as if they were painted.

The barbers are no leſs ſkilful, for they ſhave the head at a few ſtrokes of their razor, and have ſo light a hand, that you can ſcarce feel them; they uſe only cold water, and hold no baſon under the chin, but have their water in a little diſh, of the ſize of a tea-cup. After they have ſhaved a man they cut the nails of his feet and hands, then ſtretch his arms, and rub and chafe his fleſh.

The principal manufactures of the country are ſilks, as ſattins, tabbies, taffeties, and ſilk mixed with cotton, or camel or goats hair. They alſo make brocades and gold tiſſues. The gold velvet of Perſia is admirable. All their rich ſtuffs are durable, and the gold and ſilver do not wear off nor tarniſh whilſt the ſtuff laſts, but keep their colour and brightneſs. They alſo make calico cloth, camblets, and ſilk and worſted druggets.

A mer-

A merchant is eſteemed a very honourable profeſſion, and the more ſo as there are no hereditary nobility; for the honours of thoſe in great poſts terminate with their office, and their lives and fortunes are in perpetual danger from the weakneſs or cruelty of the prince.

SECT. VI.

Of the Buildings of Perſia and their Furniture. A Deſcription of the Cities of Iſpahan, Shiras, and Casbin, containing an Account of the Palaces, Moſques, Bagnios, and Bridges of Perſia.

THE houſes of the quality generally ſtand in the midſt of a fine garden, and make little or no appearance to the ſtreet: nothing is to be ſeen but a dead wall with a great gate in the middle, and perhaps a wall within the gate, to prevent people from looking in. Theſe houſes have ſeldom more than one floor. In the front ſtands a ſmall piazza, or cloyſter open before, where they ſit and tranſact their ordinary affairs. On the farther ſide of the houſe is another piazza, and before it a baſon, or fountain of water, beyond which is a walk of fine trees, as there is alſo from the ſtreet to the houſe. Behind the firſt piazza is a large hall 18 or 20 feet high, in which they ſit at great entertainments. At each corner of the hall is a parlour, which alſo ſerves for a lodging room. Between theſe parlours, on the ſides, are doors out of the hall into an open ſquare ſpace as large as the rooms at the corners. There are alſo ſeveral doors out of the hall into the piazzas both before and behind the houſe, ſo that in the hot ſeaſon they have nine or ten doors open into the great hall, and if any air be ſtirring they enjoy the benefit of it. In ſome palaces is a handſome baſon, and a fountain, which plays in the middle of the hall, and contributes greatly to cool the air.

The walls of their houſes are ſometimes built of burnt bricks, but more frequently of bricks dried in the ſun. The walls are of a conſiderable thickneſs, and the roof of the great hall is arched and raiſed five or ſix feet higher than the other rooms. The roofs of the buildings on every ſide of the hall are flat, and there is a pair of ſtairs up to the top, where the Perſians walk in the cool of the day, the roof being ſurrounded with a wall, or with baluſtrades, and ſometimes they carry up a mattreſs, and lie there all night.

The kitchens and other offices are at a diſtance on the right or left; and all the rooms, except the hall, ſtand ſeparate, there being no paſſage out of one into another, but only from the hall. There are ſome chimnies, but uſually inſtead of a chimney they have a round hole about four or five feet broad, and a foot and a half deep, in the middle of the room. In this hole they make a charcoal fire, and then cover the place with a thick board or table about a foot high, ſo cloſe, that no ſmoke can get out, and over that table ſpread a large carpet, under which they put their legs in cold weather, and ſit round it, the ſmoke being carried off by pipes laid under the floor.

Their doors are narrow and ſeldom turn like ours upon hinges; but a round piece being left at the top and bottom of the door, and let into the frame above and below, it turns upon them, and the very locks and bolts are frequently of wood.

The Perſians go early to ſleep. The beds being taken out of niches made in the wall for that purpoſe, are laid on the carpets. They conſiſt of only two thick cotton quilts, one of which being folded double, ſerves as a mattreſs, and the other as a covering, with a large flat pillow for the head. The Perſians uſually ſleep in their under garment and drawers, by which means they are leſs ſubject to catch cold than we, and are much ſooner dreſſed and undreſſed. This is their ordinary method; but their princes and great men who indulge themſelves, uſe ſheets, and other delicate appurtenances of a bed, tho' without any of the parade practiſed in Europe; nor do they crowd their apartments with unneceſſary and ſuperfluous furniture; all they have conſiſting in carpets ſpread on the floor, with cuſhions and pillows to ſit and lean upon.

The floors of the rooms are either paved or formed of a hard cement, on which they lay a coarſe cloth, and over that a carpet. The ſides of ſome of the rooms are lined with fine tiles about a yard high, and the reſt of the wall is either hung with pictures or painted.

Iſpahan, or as it is pronounced by the Perſians, Spahawn, eſteemed the capital of Perſia, is ſeated in fifty degrees eaſt longitude from London, and thirty-two degrees thirty minutes north latitude, in a fine plain almoſt encompaſſed by mountains, at about two or three leagues diſtance, in nearly an oval form. The river Zenderhoud runs by it at the diſtance of about a mile; but there are ſeveral channels and pipes which convey the water from it into canals and baſons, for the ſervice of the court and city. Iſpahan is without walls, and is ten or twelve miles in circumference. It had formerly twelve gates, but four of them are cloſed up, and the others always open. It is probable that it was formerly walled, and there are ſtill the remains of an old caſtle.

The ſtreets are for the moſt part narrow and crooked, and either exceeding duſty or very dirty; for ſcarce any of them are paved, and though the people uſe neither coaches nor carts, yet as all people of rank ride through them, attended by a great train of ſervants, the paſſage is neceſſarily rendered very diſagreeable.

The city has, however, ſome fine ſquares, particularly the royal ſquare, or Meidan, on one ſide of which is the royal palace. This ſquare is one third of a mile in length; and above half as much in breadth; and on the ſides are buildings which reſemble Exeter Exchange in the Strand, they being covered at the top, and have ſhops on both ſides. Every particular trade has a quarter aſſigned for it, and above the ſhops are others, where the mechanics perform their work. There are, however, no windows in theſe buildings; but inſtead of them are great openings at proper diſtances, to admit the light, and people ride through them on horſeback. In the middle of the ſquare is a market for horſes and other cattle, and there all kinds of goods and eatables are expoſed to ſale.

On the ſide next the palace is a fine row of trees, a handſome baſon of water, and ſome braſs cannon taken from the Portugueſe at Ormus. At the ſouth and eaſt ends of the ſquare are placed a moſque, and oppoſite the great gate of the palace are ſeveral ſtreets arched over, which renders them pretty dark. It is remarkable, that their houſes and ſhops are never in the ſame place, and frequently their houſes are half a mile diſtant; however, their valuable effects are locked up at night in cheſts and counters, and it is very rare any thing is loſt.

The foreign merchants leave their goods in the public caravanſeras, which alſo ſerve them for lodging. There are ſaid to be no leſs than fifteen hundred of theſe ſtructures at Iſpahan, built by charitable people for the uſe of ſtrangers, and moſt of them are formed upon the ſame model, and differ only in the dimenſions. They are entered by a handſome gate, on each ſide of which are ſhops, and from thence you come into a ſquare, round which are piazzas, and within lodging rooms, warehouſes, and ſtables for horſes, and other beaſts.

In the principal parts of the town are handſome coffee-houſes, where people meet for the ſake of converſation, and are frequently amuſed by the harangues of their poets, hiſtorians, and prieſts, who hold forth, and expect a ſmall preſent for their inſtructions.

The buildings belonging to the palace, with the adjacent gardens, are three miles in compaſs. Over one of the gates, which opens into the royal ſquare, is a gallery in which the king uſed to ſit and ſee martial exerciſes performed on horſeback. However no part of the palace in which the court reſides, is to be ſeen from the ſquare; but having entered the principal gate, you ſee a hall on the left hand, where, on certian days, the vizier and other judges adminiſter juſtice; and on the right hand, rooms in which offenders are allowed to take ſanctuary. From thence it is a conſiderable diſtance to the hall where the king uſually gives audience. This is a long room well painted and gilt; it is ſupported by forty pillars, and divided into three parts, one a ſtep higher than the other, on which the great officers ſtand according to their rank. On the third aſcent is placed the

the royal throne, which is raiſed about a foot and a half above the floor, and is about eight feet ſquare; on the bottom of it is ſpread a rich carpet, and cuſhions of brocade, upon which this monarch, upon ſolemn occaſions, ſits croſs-legged. The other apartments of the palace, and particularly thoſe belonging to the women, are never entered by any but the eunuchs, and therefore it is impoſſible to obtain an exact deſcription of them; but in general there are many ſeparate pleaſure houſes diſperſed through the gardens, which are adorned with fine walks, fountains, and caſcades; and beyond the gardens is a park, in which the ladies hunt and take their pleaſure with the ſhah or king.

There are above a hundred and fifty Mahometan moſques in the city, covered with cupolas, which appearing through the trees planted in the ſtreets and gardens almoſt all over the town, afford a very fine proſpect. Though no Chriſtians are allowed to enter the moſques, ſome travellers ſay, they have taken a view of them in diſguiſe, and particularly of the great moſque, called the king's, from its being erected by one of their ſovereign princes. The gate which leads to this moſque is covered with ſilver plates, and through it you paſs into a court which has piazzas on each ſide; and in theſe houſes the prieſts lodge. Oppoſite to the great gate are three large doors that open into the moſque, which has three iles beautified with gold and azure. In the middle is a cupola, ſupported by four great ſquare pillars. The iles on the ſides are lower than that in the middle, and the cieling is ſupported by thick columns of free-ſtone. The light is admitted at two great windows towards the top of the middle ile. On the left hand towards the middle is a kind of pulpit, which is aſcended by a flight of ſtone-ſteps. On the out-ſide of the building the bricks and tiles are painted with various colours, and the floor of the moſque being covered with carpets, the people who enter it pull off their ſhoes. It is adorned with neither images nor pictures, nor are there any pews as in proteſtant churches.

At the ſouth end of the royal meidan is a moſque, built with ſtone, and of a circular form: it is however divided into iles, and the walls are lined to the height of fifteen feet with white poliſhed marble. In the midſt of the ſquare before the moſque is a large baſon where the people waſh themſelves before they enter that ſtructure. In ſhort, moſt of the moſques are adorned with cupolas, and have minerets, or ſteeples, which the mollahs aſcend in order to ſummon the people to their devotions, for they make no uſe of bells. This was the ſtate of Iſpahan about the beginning of the preſent century, when it had a hundred thouſand houſes well inhabited, many of which were not much inferior in ſplendor to the royal palace; but its glory has been for ſome years laid in the duſt, and from the dreadful depopulation occaſioned by war, when Mr. Hanway was in Perſia, in 1744, there were ſaid to be in that city not more than five thouſand houſes inhabited.

The many hummums, or bagnios, at Iſpahan are another ſubject of admiration for the traveller. Some of them are ſquare buildings; but moſt of them are circular, and formed of a white well poliſhed ſtone, and the tops covered with blue tile. The inſide conſiſts of three rooms, which receive their light from little round glaſs windows in the arched roof. The firſt is a great room ſurrounded with wooden benches, in which they dreſs and undreſs. The ſecond, which is uſually ſquare, is about ſix feet in diameter, and has a kind of copper three or four feet ſquare ſet in the floor, which is covered with a copper plate, and is heated by a fire underneath lighted on the outſide, that heats both the water and the room. In the third room is the place for bathing. The floors are formed of black and white marble. The Perſians generally bathe every day, for they not only conſider it as extermely refreſhing, but as an act of religion, conducive to health, and an effectual remedy for colds, achs, and many other diſorders.

Early in the morning a ſervant goes up to the terrace on the top of the houſe, and ſounds a ſhell or 'horn, to give notice that the bath is ready. When a perſon comes to bathe, after undreſſing himſelf in the firſt room, he ties a cloth round his waiſt that reaches to his knees, then enters into the ſtove, and ſoon after a ſervant comes and pours water on his ſhoulders, after which he rubs him from head to foot in ſo rough a manner that thoſe unuſed to it think he is about to flea them. He afterwards ſhaves the perſon's head and face if he deſires it, cuts the nails of his fingers and toes, handles and rubs his body, and ſtretches every limb; after which the perſon plunges into the bath, and being wiped on his coming out with a clean linen cloth, he returns into the firſt room and dreſſes.

The men bathe from twilight in the morning till four in the afternoon, and the women go from that time till midnight. When it is the women's time to bathe, all the male ſervants of the bagnio withdraw, and are ſucceeded by females. The ladies are never ſo finely dreſſed as when they come to bathe, this being the only opportunity they have of vying with each other in the article of cloaths; and their perfumes and eſſences are enough to ſtifle a perſon not uſed to them.

Nothing is more admired at Iſpahan by all foreigners than the Charbag, which is a walk above a hundred yards wide, and a mile in length, extending from the city to the river Zenderhoud. On each ſide are planted double rows of trees, and along the middle runs a canal, which, at the diſtance of every furlong, has a large baſon, into which the water falls in a fine caſcade. Both the ſides of the canal and baſons are lined with hewn-ſtone, broad enough for ſeveral men to walk a-breaſt upon them. On each ſide of this walk are the royal gardens and thoſe of the great men which have pleaſure-houſes at ſmall diſtances, and all together form a proſpect as agreeable as can be conceived.

This walk is terminated by a bridge over the Zenderhoud, which leads to the town of Julpha. There are alſo two other bridges, one on the right and the other to the left, which form a communication between the neighbouring villages and the city. The architecture of theſe bridges appears ſomewhat ſingular; for on each ſide, both above and below, are arched paſſages through which people ride and walk from one end of the bridge to the other, as in the covered ſtreets of the city, and at little diſtances are openings to admit the light. The arches are not very high, no veſſels paſſing under them; for neither this river nor any other of the Perſian ſtreams, is navigable. Indeed in ſpring, when the ſnow melts on the mountains, the Zenderhoud makes a pretty good appearance, and is almoſt as broad as the Thames at London; but at the latter end of ſummer the channel becomes ſo ſhallow and narrow, that it does not contain water enough for the gardens that belong to the city. To ſupply this want the people about Iſpahan have abundance of wells of very good water.

On the ſouth ſide of the river ſtands the town of Julpha, which is chiefly inhabited by a colony of Armenians, tranſplanted thither by Shah Abas. This town is about two miles long, and near as much in breadth; and is in general better built, and the ſtreets wider than thoſe of Iſpahan; but the trees planted in the ſtreets, and the large gardens about the houſes, give it the appearance of a country village. There are Georgians, and ſeveral other Chriſtian inhabitants, as well as Armenians. This colony has flouriſhed extremely ſince their being ſettled there, and before the late civil wars in Perſia they were eſteemed the moſt conſiderable merchants in the world.

The city of Shiras, or, as it is pronounced, Sheraz, is ſituated about two hundred miles to the ſouthward of Iſpahan, and is generally reckoned the ſecond city of the kingdom. It is the capital of the province of Fars, the antient Perſia; and ſome imagine it received its name from Cyrus the Great, who is ſaid to have been buried there.

The city is ſeated in a pleaſant and fertile valley, about twenty miles length, and ſix in breadth. Through it runs a rivulet, which in the ſpring ſeems a large river, and is ſometimes ſo rapid as to bear down the houſes in its way; but in the ſummer it is almoſt dry. It is not defended by any walls, and though it is about ſeven miles round it does not contain at preſent above four thouſand houſes; but the greateſt part of this ſpace is taken up with gardens.

The viceroy's palace, the moſques, bagnios, caravanſeras, and vaulted ſtreets, are built after the ſame model as thoſe of Iſpahan. The moſques are here ſo numerous that there is one to every twenty or thirty houſes; and their domes being covered with new-varniſhed tiles, have a pretty appearance among the trees. There is alſo a college for the ſtudy of the liberal arts.

The ſtreets of Schiras are generally narrow and duſty; but there are ſome broad ones that have canals and baſons faced with ſtone. Schiras is moſt remarkable for its gardens. The cypreſs-trees, which form the walks, are the largeſt and talleſt that are any where to be found, and grow in a pyramidical form; intermixed with theſe are ſeveral broad ſpreading trees, and fruit-trees of all ſorts, as oranges, lemons, apricots, cherries, pears, and dates; none of which are planted againſt walls, as with us, but are ranged in lines, and ſometimes irregularly, forming a wilderneſs. They have alſo abundance of fragrant flowers, which are not planted with the ſame regular order as in the gardens of Europe. Their vineyards and their wine are the beſt in Perſia; and the fountains, caſcades, and pleaſure-houſes are not inferior to thoſe at Iſpahan. The king's garden in this city is no leſs than two thouſand paces ſquare, and is ſurrounded with a wall fourteen feet high.

We ſhall now give a deſcription of Caſbin, the chief city of ancient Parthia, the reſidence of many of the Perſian kings, and the burial-place of Hepheſtion, the favourite of Alexander the Great. This city ſtands in a plain, though on very high land, and is ſurrounded with mountains at ſome miles diſtance. The air is fine and ſubtile, and in ſummer heat and cold alternately ſucceed each other; for though the days are very hot, the winds in the night are extremely piercing. This city, before the reign of Nader, had twelve thouſand houſes inhabited; but when Mr. Hanway was there it had no more than eleven hundred, and was reduced to a heap of ruins.

The houſes are for the moſt part below the ſurface of the earth, to obtain the convenience of water, which is brought to them from a conſiderable diſtance in channels; for as we uſually bring water up to our houſes, they level their houſes to the water; which are, however, not the leſs agreeable in hot weather. They are generally built with bricks, dried in the ſun, cemented with a ſtrong mortar. The roofs are flat, and they frequently ſleep on the houſe-top. The buildings are inclоſed with a mud-wall, and conſiſt of two diviſions; the outer ſtands in a large area, and is only a ſpacious room, called the aivan, ſupported with pillars, and open on one ſide: here they diſpatch their buſineſs, and alſo eat when they do not retire to the womens apartment. There are niches in the wall, which anſwer the purpoſe of tables; the floor is generally covered with large worſted carpets, and on the ſides of the room are felts about a yard broad, and generally two or three yards long: theſe are made either with wool or camel's hair, and, being very thick and ſoft, are uſed for ſitting upon. In the wings of this apartment are ſmaller rooms for lodging, and in the ſame yard are apartments for the ſervants, and the ſtables. On the back part of this building is another, likewiſe incloſed by a wall, which, for the ſake of privacy, is generally entered by two turnings. Here is the haram, or womens apartment, into which no man is ſuffered to enter, except the maſter.

The palace built by Nader Shah in this city joins to the old one, and has an avenue leading to it near three hundred yards long, and fifteen or twenty broad, formed of lofty trees. The palace is encompaſſed by a high and thick wall, about a mile and a half in circumference, which has only one entrance. This is an arched gate, the top of which projects, and is ornamented in the Eaſtern manner. Within are four large ſquares, adorned with lofty trees, fountains, and running water, which give the place an awful and majeſtic appearance. The apartments are raiſed about ſix feet from the ground; the aivan, or open hall is in the center, and ſhuts in with falling doors. The apartments are adorned in the Indian taſte, and the cielings formed into ſmall ſquares, embelliſhed with moral ſentences in very legible characters. Moſt of the windows are of thick coloured glaſs, painted with ſuch art, that the glaſs ſeems cut into the ſeveral figures it is deſigned to repreſent. Many of the floors are only formed of hard earth, and others of a compoſition of beaten ſtone. This irregularity is concealed by the conſtant uſe of carpets.

The haram is magnificent, and conſiſts of a ſquare incloſed with a brick wall, thirty feet high and two and a half thick. It has four diſtinct apartments, in ſome of which are fountains that ſerve to moderate the heat of ſummer, by giving the air a refreſhing coolneſs. The rooms are lined with ſtucco-work, painted in the Indian taſte with birds and flowers; in which the colours are beautiful, and ſet off with gilt edgings. The apartments have ſmall chimney-pieces, in a mean taſte; and ſome of them are ornamented with looking-glaſſes in ſmall ſquares, of many different dimenſions, ſet into the walls. There are a few apartments below ground, admirably contrived for coolneſs. Near the haram is the eunuchs apartment, remarkable only for its having but one door, and that a very ſtrong one. Here are alſo ſome old apartments yet ſtanding, built by Shah Abas, in which are ſome bad painting done by European painters.

SECT. VII.

A particular Deſcription of the Ruins of the ancient Palace of Perſepolis, deſtroyed by Alexander the Great: the Tombs of the ancient Perſian Kings, and that of Noxi Ruſtan, ſuppoſed to have been made by Darius Hyſtaſpes.

ABOUT thirty miles from the city of Schiras are magnificent remains of the ancient palace of Perſepolis, wantonly burnt by Alexander the Great. Theſe at a diſtance appear as in a kind of amphitheatre, they being ſeated in a fine plain, and partly encompaſſed by a range of mountains in the form of a half-moon.

This ancient palace of the kings of Perſia, uſually called the houſe of Darius, has part of the walls of three of its ſides ſtill ſtanding. The front extended ſix hundred paces from north to ſouth, and three hundred and ninety from eaſt to weſt. The ſtones of the wall are black, harder than marble, ſome of them finely poliſhed, and many of them of ſuch a ſurprizing ſize, that it is difficult to conceive how the ancient Perſians were able to remove and raiſe ſuch prodigious maſſes. On the front of the building was a ſpacious platform, to which there are ſeveral flights of ſteps, the principal of which is placed between the middle of the front and the north end of the edifice, where two flights wind off from each other to the diſtance of forty-two feet at the bottom. Theſe ſteps are only four inches high, and fourteen in breadth. There are fifty-five of them on the north ſide, and fifty-three to the ſouth; and there are probably others that have been covered by the earth by length of time, as well as a part of the wall which riſes forty-four feet eleven inches high in the front. At the bottom of the two flights is a ſingle flight extending fifty-ſeven feet four inches from one to the other; from thence the two flights are carried off from each other, and returned back from the center at an equal diſtance from the extreme parts of the top. Above theſe flights is a pavement of long ſtones, and another ſingle flight of ſteps ſeventy-five feet wide, anſwering to that at the bottom, and leading up to the grand entrance of the edifice. This upper ſtair-caſe has a noble and ſingular effect, anſwerable to the magnificent remains of the reſt of the building.

The ſpectator, on aſcending the upper ſteps, ſees before him two grand portals, and as many columns. Theſe portals are thirteen feet four inches in breadth, and twenty-two feet four inches in depth. On the inſide, upon a kind of pilaſter on each hand, is a large figure reſembling the ſphynx, in baſſo relievo, fourteen feet and a half high, and twenty-two feet from the fore-legs to thoſe behind. The faces are broken off, and the bodies much damaged; but what is extraordinary, the breaſt and fore-feet project from the pilaſter. Thoſe of the firſt portal are turned towards the ſtair-caſe, and thoſe of the ſecond face the mountain. Thoſe pilaſters

ſtand on a baſe five feet two inches in height, and the firſt portal is thirty-nine feet high.

The two columns that ſtand between the portals are the leaſt damaged, particularly with reſpect to their capitals, and the other ornaments of the upper parts; but the baſes are entirly covered with earth. Theſe columns are fourteen feet in circumference, and fifty-four feet high. There were formerly two others between theſe and the portal, ſeveral pieces of which lie half buried in the earth.

At the diſtance of fifty-two feet to the ſouth of the ſame portal is a large baſon for water, formed out of a ſingle ſtone twenty feet in length, ſeventeen feet five inches broad, and raiſed three feet and a half above the ſurface of the floor. From this baſon to the north wall is an extenſive ground a hundred and fifty paces in length, where nothing is to be ſeen but the fragments of large ſtones, with part of the ſhaft of a column, and the earth is covered with heaps of ſtones as far as the mountain.

To the ſouthward of the portals juſt deſcribed are two other flights of ſteps reſembling the former, the one to the eaſt, and the other to the weſt. On the upper part, the wall is embelliſhed with foliage and the repreſentation of a lion tearing in pieces a bull, in baſſo relievo, much larger than the life. There are likewiſe ſmall figures on the middle of the wall.

On the top of the ſteps is an entrance into an open place paved with large ſtones, in which are two ranges of columns, ſix in each, and twenty-two feet diſtant from each other; but none of them are entire: there are alſo eight pedeſtals, and the ruins of ſome others. At the diſtance of above ſeventy feet were formerly ſix rows of other pillars, ſix in each row, and twenty-two feet diſtant from each other; but, though no more than ſeven of them are now entire, the baſes of all the reſt are ſtanding.

At above ſeventy feet diſtance from theſe laſt rows of columns on the weſt, towards the front of the ſtair-caſe, were once twelve other columns in two ranges, ſix in each, but only five are now remaining. The ground is, however, covered with pieces of theſe columns, and the ornaments that ſerved for their capitals. Between them are pieces of ſculpture, repreſenting camels on their knees, and on the top of one of the columns is a compartment in which camels are alſo repreſented in that poſture.

Farther towards the eaſt you are preſented with a view of ſeveral ruins, conſiſting of portals, paſſages, and windows. The inſides of the portals are adorned with figures in baſs relief. Theſe ruins extend ninety paces from eaſt to weſt, and a hundred and twenty-five from north to ſouth, and are ſixty paces both from the columns and the mountains. In the middle of theſe ruins the earth is covered with ſeventy-ſix broken columns, nineteen of which ſtill ſupport their entablature; their ſhafts are formed of four pieces, beſides the baſe and capital.

To the ſouth of theſe columns, at the diſtance of a hundred and eighteen feet, is an edifice that riſes higher than any other part of the ruins, from its being ſituated on a hill. The front wall, which is five feet ſeven inches high on that ſide, is compoſed of a ſingle range of ſtones, ſome of which are eight feet deep; and the wall extends a hundred and thirteen feet from eaſt to weſt, but has neither figures nor any other ornaments. However, in the middle of the front are the ruins of a double ſtair-caſe, on the ſides of which are ſeveral figures. The reſt of the building was chiefly compoſed of large and ſmall portals, and is entirely deſtroyed. The largeſt of theſe portals is five feet wide, and five feet two inches deep. Among the reſt, two portals appear to the north, with three niches or windows walled up. Under theſe portals are the figures of a man, and two women, down to the knees; for their legs are covered with the earth that is raiſed againſt them. Under the other gate is the figure of a man holding a lion by the mane. To the ſouth is a portal and four open windows, each of which is five feet nine inches wide, and eleven in height, including the cornice; their depth is equal to that of the grand portals. The two ſides of this gate are carved with the figure of a man, with ſomething on his head reſembling a tiara. He is accompanied by two women, one of whom holds an umbrella over his head. On the inſide, three niches are covered with ancient Perſian characters.

To the weſt are two other gates uncovered. Within one of them are the figures of two men fighting with a bull that has a ſingle horn in its forehead: this horn one man graſps with his left hand, while, with his right, he plunges a dagger into his belly. On the other ſide the figure, another man holds the horn with his right hand, and ſtabs the bull with his left. The other gate has the figure of a man fighting in the ſame manner with a winged deer, that has alſo a horn in its forehead. Horns were anciently the emblems of ſtrength and majeſty, and the orientals called Alexander the Horned, becauſe, ſay they, he made himſelf king of the horns of the ſun, that is, of the eaſt and weſt.

Behind this ſtructure are the ruins of another, which exceed it in length by thirty-eight feet. They have alſo niches and windows, the former of which are cut out of ſingle ſtones. A little to the ſouth is a double flight of ſteps, ſeparated by walls embelliſhed with foliage and ſmall figures.

A little farther to the ſouth are ſubterraneous paſſages, into which none of the Perſians dare to enter, though they are ſaid to contain great treaſures. This proceeds from a general perſuaſion, that all the lights carried into them will go out of themſelves. But both Sir John Chardin and Mr. Le Bruyn, far from being intimidated by this opinion, examined theſe paſſages with the utmoſt care, and proceeded through them with lights till they ended in a narrow opening, which extended a great length, and appeared to have been formed originally for an aqueduct; but its ſtraightneſs rendered it impoſſible for them to proceed through it.

On proceeding ſtill farther to the ſouth, you perceive the remains of another edifice, which extends a hundred and ſixty feet from north to ſouth, and a hundred and ninety-one from eaſt to weſt. The portals belonging to it are ſtill to be ſeen, together with ſeven windows and forty incloſures, that were formerly covered rooms. In the middle are the baſes of thirty-ſix columns in ſix ranges, and the ground is covered with large ſtones, under which were aqueducts.

Anciently there ſtood another ſtructure to the weſtward of the laſt-mentioned building. On the ruins of the wall, which ſtill riſes near two feet above the pavement, are cut the figures of men in baſſo relievo, each repreſented with a lance. The ground incloſed by this wall contains a number of round ſtones that were the baſes of columns.

On the eaſt ſide of theſe laſt ruins are the remains of a beautiful ſtair-caſe, ſixty feet in length, reſembling that of the front wall: but though moſt of the ſteps are deſtroyed by time, the wall that ſeparates the two flights is ſtill eight feet in height, and adorned with figures almoſt as big as the life. The front contains the repreſentation of a lion encountering a bull: there are alſo lions of the ſame workmanſhip on the wings of the ſtair-caſe, both of them accompanied with characters and figures almoſt as big as the life. Columns were formerly diſpoſed between this edifice and the other laſt mentioned. Among theſe ruins are four portals, each adorned on the inſide with a man, and two women, who hold over his head an umbrella.

To the north of the two laſt edifices are two portals with their pilaſters, on one of which is alſo the figure of a man and two women, one of whom holds an umbrella over his head, and above the women is a ſmall figure with wings expanded. There are alſo ſeveral other figures in relievo on both of theſe portals, and the earth is covered with fragments and other antiquities.

From hence you proceed to the laſt ruins of the ſtructure on the mountain. On the ſouth ſide are two portals, under each of which a man is ſeated in a chair holding a ſtaff in his right hand, and a kind of vaſe in his left. Behind him is another figure, who has a cloth in his right hand, and ſomething on his head reſembling the tail of a ſea-horſe. Below are three rows of figures with lifted hands; theſe are three feet four inches high, but the man in the chair is much larger than the life. Above are ſeveral ornamental ranges of foliage, the loweſt of which is intermixed with ſmall lions, and the higheſt with

with oxen. These portals are twelve feet five inches in breadth, and ten feet four inches deep, and the highest of the pilasters are from twenty-eight to thirty feet.

On the two pilasters towards the north a man is seated, with a person behind him, like the preceding figures, and behind this are two other men holding in their hands something that is broken; before the figure represented sitting are two other figures, one with his hands placed on his lips with an air of salutation, and the other holding a small vessel. Above these figures is a stone filled with ornaments, and below are five ranges of figures, three feet in height: these are a band of soldiers armed in different manners. From the foot of these mountains you have a full view of all the ruins, except the walls and stair-cases that cannot here be seen.

The principal difference observable in the columns consists in some of them having capitals and others none; and most of them are fluted. With respect to the elevation of those that are perfect, they are all from seventy to seventy-two feet high, and are eighteen feet five inches in circumference, except those near the first portals. The bases are round, and twenty-four feet five inches in circumference; they are four feet three inches high, and the lower moulding is one foot five inches broad. These columns have three sorts of ornaments towards the top, which may be termed capitals.

Besides the basso relievos already described, there are many others, particularly the representation either of a triumph, or a number of people going in procession to carry presents to a king, consisting of a multitude of figures with an empty chariot, a led camel, some led horses, &c.

It is observable, that the drapery of all the human figures in this edifice is extremely singular, and has not the least relation to that of the ancient Greeks and Romans; but their military habits resemble those of the Medes and Persians.

No muscles are visible in the naked parts of the figures, which have a heavy air, and nothing has been observed but the contours; this neglect makes them appear stiff and inelegant. The draperies have the same defect, and the whole has a tasteless sameness. The proportions, however, have been finely kept, both in the great and small figures, which is a proof that those who made them were not entirely destitute of capacity, but were probably obliged to be too expeditious to finish them with proper care. The ornaments are, however, exceeding beautiful, as are also the chairs in which some of the figures are seated, notwithstanding their being now much impaired. It is therefore probable, that some fine fragments have been destroyed. Besides, most of the stones are polished like a mirror, particularly those within the portals, and that compose the windows and pavements. These are of various colours, as white, grey, yellow, red, deep blue, and in some places black; but the stones of which the greatest part of the edifice is formed are of a clear blue. In short, every thing corresponds with the grandeur and magnificence of a great king's palace, to which the images and relievos give a surprizing air of majesty. There is no doubt of their having been very stately portals and grand galleries to afford a communication with all the detached parts of the edifice: most of the columns, whose remains are still so beautiful, were doubtless intended to support those galleries; and there even appears to be still some remains of the royal apartments. In a word, the magnificence of these ruins can never be sufficiently admired; and this structure must undoubtedly have cost immense sums.

Near the mountain are two ancient tombs of the kings of Persia, one to the north, and the other to the south. These are both hewn out of the rock, and are noble fragments of antiquity. Their fronts are covered with figures and other ornaments. The form of both is nearly the same, and therefore it will be sufficient to give a description of one of them; and we shall take that to the north. That part of the sepulchre on which the figures are carved is forty feet wide. The height is nearly equal to the width, and the rock extends sixty paces on each side. A range of four columns supports the entablature: each of their capitals is formed of the heads of two oxen as far as the breast, with the fore legs bent on the top of each column. The gate, which is encompassed with ornaments, is placed in the middle between two of these columns, but is at present almost closed up. Above the columns are the cornice and entablature, adorned with nine small lions on each side in bas relief, advancing towards the middle, where there is a small ornament resembling a vase. Over the lions are two ranges of men, almost as large as the life, fourteen in each range, all armed, and holding up their hands as if to support the building above them; and on the side is an ornament that has some resemblance to a pillar, with the head of some animal that has but one horn. Above is another cornice ornamented with leaves. On the left, where the wall projects, are three rows of niches above each other, each containing two figures armed with lances, and three others on the side armed in the same manner. There are likewise two on the right side with their left hands placed on their beards, and the right on their body. By their side are three others like those on the other side. Above, on three steps, stands a man, who seems to be a king, pointing at something with his right hand, and holding a bow in his left. Before him is an altar, on which an offering is made, and from it the flames are represented ascending.

Two leagues from these ruins is a place called Noxi Rustan, where there are tombs of persons of eminence among the ancient Persians, that resemble those of Persepolis, only they are carved much higher in the rock. This place receives its name from one Rustan, a fabulous person, whose figure is carved there. It is pretended that he was a potent prince of so immense a stature, that he was forty cubits in height, and lived one thousand one hundred and thirteen years.

Before these tombs is a platform, above which their bases rise eighteen feet. The tombs themselves are four times that height, and the rock is twice as high as the tombs, which in the middle extend sixty feet wide. Under each tomb is a separate table filled with large figures in basso relievo, and on two of them are some traces of men fighting on horseback. Between these tombs are three other tables covered with figures, among which is a man on horseback preceded by two others, and followed by a third, which is almost defaced.

These tombs extend two hundred and eighty paces, and at the distance of sixty paces from the first of them is a little square building. Between the two tombs is a man on horseback placed in a nich; his hair falls down on his shoulders, and upon his head is a crown with a bonnet rising above it. He is dressed after the Roman manner, and has a large sword by his side, with his left hand on the hilt, and his right hand presented to a person before him, while a third figure, in a Roman habit, stands with his hands open in the attitude of a suppliant.

Figures half covered with earth are seen on the side of the third tomb, and in the middle of them is a man on horseback, which, the people say, represents Rustan; he is in a Roman dress, and has also a bonnet rising from a crown, with flowing hair, a long beard, and his left hand upon the hilt of his sword; but, notwithstanding the pretence of his prodigious stature, both he and his horse are of the common size. Before him is a woman with flowing hair, wearing a crown: she is dressed like Minerva, and holds up part of her drapery with her left hand. A third figure represents a warrior, with a tiara on his head, and his left hand placed on the hilt of his sword. In another compartment is an imperfect appearance of men fighting on horseback. All these figures are carved in the rock. This tomb of Noxi Rustan is supposed to be that made for Darius Hystaspes, from its perfectly corresponding with the description given of it by Ctesius in his History of Persia, and with that of Diodorus Siculus.

At two hundred paces distance, on the western side of the mountain, are two tables cut in the rock. That to the left represents two men on horseback, one of whom grasps a circle, of which the other has quitted the hold. Some imagine that the first is Alexander, and the other Darius, who by this action resigns to him the empire.

Others

Others imagine that these figures represent two potent princes, or generals, who, after being engaged in a long war, without obtaining any advantage over each other, at last agreed, that he who should wrest this circle out of the hand of his competitor should be acknowledged the victor. But these are at best no more than conjectures.

SECT. VIII.

Of the Exercises, rural Sports, Games, and Diversions used in Persia. Of the Manner of travelling; of their Couriers, and Foot Messengers.

HAVING considered the buildings of the Persians, and the noble antiquities still remaining of the grandeur of the ancient kings of Persia, we shall return to the moderns, and take a view of their exercises and diversions.

As the Parthians were for many ages famous for their skill in horsemanship, and the use of the bow, there are at present no exercises in which the young men of rank, both of that province, and of Persia in general, more excel.

In learning to shoot at a mark, a youth is first instructed to bend the bow, first a weaker, and then a stronger; after which he learns to shoot forwards, backwards, sideways, and almost in every posture. For some time they are exercised in shooting upwards into the air, to try which shoot the highest; after this they are brought to shoot at a mark, and to discharge their arrows with steadiness and truth. In these exercises they use arrows that have blunt iron heads; but for service they have them sharp, and shaped like the point of a javelin.

Their pupils are next taught to mount a horse with dexterity, to sit steadily on the saddle, to gallop with a loose reign, to stop short, and upon the least signal to turn to the right or left.

They are also taught to play at a game that has some resemblance to the game of bandy, only it is performed on horseback. Each person has a short bat in his hand, and a ball being thrown amongst them, they ride after it, and stooping almost to the ground, strike it while on a full gallop, and he who strikes it oftenest before it comes to the end of the place appointed, wins the prize.

They are also taught to manage the sabre, and to throw the lance. The staves they throw by way of exercise are unarmed, and about five feet long, and with these they engage on horseback, and, though they have no steel point, frequently give each other dangerous wounds. After they had gone through these exercises they were formerly permitted to shoot for a prize in the royal meidan at Ispahan, before the king and court, that they might be witness of their activity and address. In that square is a high pole like the mast of a ship, and upon it was set a cup, sometimes of massy gold, especially if the king and great officers intended to shoot at it, as they frequently did before the reign of Nader. Those who contended for the prize rode full gallop with their bows and arrows in their hands, and when they had passed a little beyond the pole, without either stopping or turning their horses, they bent themselves backward, and let fly their arrows at the cup, and he who brought it down gained great honour. By these exercises the Persian troops have rendered themselves extremely formidable, not only when they attack an enemy, but when put to flight.

As to their rural sports, their manner of hunting seems no less remarkable. They have very fleet grey-hounds, but the stags and antelopes they course are so swift of foot, that the hounds cannot come up with them, without the assistance of their hawks. Of these they have various kinds brought from Circassia, the northern part of the empire, and even Russia. These hawks are not only taught to fly at quails, partridges, rabbits, and hares, but even at deer, and the most furious wild beasts. To bring them up to this exercise, they are said to take the skin of one of these beasts, and having stuffed it, fasten a piece of flesh on its head, on which they suffer the hawk to feed while they draw the stuffed skin along upon wheels, to use them to fix themselves on the head, while it moves. When the young hawk has been for some time accustomed to feed in this manner, they carry him to the sport with an old staunch hawk used to the game. The dogs being let loose, the hawks are soon after thrown up, and fastening on the head of the beast, strike their talons into his flesh, and beat their wings about his eyes, so that not being able to see his way, the dogs come up and seize him. They usually carry a small kettle-drum at their saddle-bow to call off the hawks; and it is said that some of them were formerly taught to fly at men.

When the king or the great men go a hunting, the country people, for ten or fifteen leagues round, are ordered to drive all the wild beasts and game into a certain place surrounded with fences and strong nets; and when they are thus inclosed, every person in the company shoots at what he pleases, and there are frequently several hundred killed at one of these hunting-matches; but they generally stay till the person of the highest rank comes up, and discharges an arrow, after which they all let fly as fast as they can, there being generally a strange medley of animals driven in a crowd together, as antelopes, deer, wild boars, wolves, horses, and foxes. They know nothing of hunting by the scent, but they frequently bring up leopards and panthers to hunt, or rather surprize the game, for they creep from one cover to another, till they can leap upon their prey, but never pursue it in a continued course.

The Persians are not much addicted to gaming, and some of the most scrupulous look upon all games of chance as unlawful; however, some play at cards, dice, chess, tables, and other games. People of distinction also divert themselves with the fighting of wild beasts, and the common people amuse themselves with seeing the feats performed by rope-dancers, tumblers, and jugglers.

We shall now take a view of their manner of travelling, in which they differ greatly from the inhabitants of Indostan; for they have no vehicle that has the least resemblance to the palanquin, so adapted to indulge the indolence of the effeminate and luxurious; nor are there any wheel-carriages in the country. The only method of conveyance is by means of camels, horses, mules, and asses. The women of rank, who are as much as possible concealed, are put into a square wooden machine, two of which are hung like paniers on the back of a camel; they are about three feet deep, and just large enough for one woman to sit down in it, and over their head are three or four hoops, like those which support the tilt of a waggon, with a cloth thrown over them.

In times of peace, before the late reigns, and the civil wars that have spread desolation through the country, people usually travelled in caravans, consisting of four or five hundred camels, besides other beasts; this was attended with little expence, there being caravanseras at proper distances, where they had their lodgings gratis, and purchased provisions at the best hand; and though the roads are frequently steep and mountainous, yet such care was taken in laying bridges and causeways, and in levelling and enlarging the ways, that a traveller seldom met with any difficulties but what were easily surmounted.

The Persian couriers are armed with sabres, and wear a white sash girded from their shoulders to their waist, many times round their bodies, which enables them to ride for several days with little fatigue, they take horses wherever they can find them, which are frequently never returned to the owners: they even dismount travellers, and often leave them to walk and carry their baggage. The injustice of this behaviour occasions their being sometimes repulsed and severely treated; though according to the laws an entire submission is required, as they are employed in the king's service. Post-masters are supplied by the king's orders with thirty, forty, or fifty

fifty horſes, according to their appointments; but as the demand is frequently greater than they are able to ſupply, and the ſhah's allowance very ſmall, they are often obliged to abſcond, which is a principal cauſe of the barbarity of the couriers. One of theſe poſt-maſters, ſays Mr. Hanway, being challenged upon this account by Nader, anſwered, "That I have not ſupplied thy cou-"riers with horſes, is moſt certain; becauſe for every "ten horſes thou haſt provided, thou haſt ſent me "twenty couriers: a man had better die at once, than "live to ſerve a raſcal;" and immediately ſtabbed himſelf. The ſhah cried out, "That is a brave fellow, "ſave him:" but it was too late.

Thoſe here called poſt-maſters are only appointed to keep the horſes in readineſs for the king's couriers, and have no concern with the letters of private perſons. Theſe are carried by ſhatirs, or footmen; and if any man has letters to ſend, he diſpatches one of theſe with them on purpoſe. They will travel a thouſand miles in eighteen or twenty days, and not aſk more than twenty-pence or two ſhillings a day for their trouble. They take with them a bottle of water, and a little bag of proviſions, which ſerve them thirty or forty hours. They generally leave the high road, and croſs the country the neareſt way. Some families make this their only employment, and breed their children up to it, by making them practiſe running from their infancy.

The ſhah and the great men have ſeveral of theſe in their retinue; but before a man can be admitted one of the king's running-footmen, he muſt give a very extraordinary proof of his being ſwift of foot; for he muſt run from the great gate of the palace at Iſpahan to a place a league and a half from that city twelve times in a day, and every time bring an arrow delivered to him by thoſe who ſtand at the end of the race, to ſhew that he has run the whole courſe; and this he performs between ſun-riſe and ſun-ſet, that is, in thirteen or fourteen hours at moſt, though it is no leſs than a hundred and eight miles. None but the ſhah's favourite ſervants are admitted to this honour. On the day of trial the elephants and horſemen are drawn up in the royal ſquare, with the drums, trumpets, and other muſic ſounding, as if it was a great feſtival. All the great men make preſents to the ſhatir, and ſeveral of them ride the courſe with him; and the mob, every time he returns, expreſs their ſatisfaction by their ſhouts and acclamations.

Whenever the viceroys and khans admit a ſhatir into their ſervice, they oblige him to run the ſame number of miles, and he is careſſed and preſented with gifts by all their dependents, in the ſame manner as the ſhatirs of the king.

SECT. IX.

Of their Marriages, and Treatment of their Women; their Employments, and of the Death and Funerals of the Perſians.

THE Perſians are allowed four legal wives, but the people in general are far from making uſe of this liberty: and we are informed by Mr. Hanway, that a mullah obſerved to him, that though their law permitted a plurality of wives, and did not reſtrain men in the number of concubines; yet they always conſidered him as the moſt virtuous man who confined himſelf to one wife, without any concubine; and at the ſame time intimated his opinion, that celibacy ſeemed to be a war againſt nature, and was conſequently a crime.

Indeed few men have more than one wife, who, among the great, ſeems to be taken from ſome political view, as the quality or intereſt of her family, and to ſerve as the miſtreſs of the concubines, who wait upon her, though they are equally admitted to their maſter's bed, and their iſſue is no leſs legitimate than her's.

In chooſing a wife they are ſatisfied with the account they receive from others of her beauty and accompliſhments. Love, eſpecially among thoſe of high rank, is the leaſt motive for entering into the marriage-ſtate. This ſhe does not much expect. Her great inducements are the number of ſlaves, the cloaths, the equipage, and the figure the man makes in the world. Indeed if a woman is ſo unfortunate as to feel a very tender paſſion for her huſband, ſhe is commonly unhappy, from ſeeing him leave her bed for that of a ſlave, and perhaps for a common proſtitute; and if ſhe has the boldneſs to expreſs her reſentment, ſhe will probably have the mortification to ſee another wife introduced into the houſe to govern in her ſtead.

The Perſians, when they meet with an advantageous match, marry their children in their infancy, otherwiſe they are in no haſte with reſpect to their ſons; but allow them in the mean time a female ſlave for their bedfellow.

Before marriage the woman is ſtripped naked, and her perſon examined by the mother, or other relation of the man, as the man is by the parents or friends of the woman. A report being made, the woman's parents demand the price; which being paid, the judge, or, where there is none, the prieſt, having received notice that the parties are ready, marries them, often without their having ſeen each other.

The day before the bridegroom takes home his bride, he ſends her a habit, ornaments, and jewels, ſuitable to her quality; and the next day, towards the evening, he goes on horſeback, with the richeſt furniture he can procure, attended by his friends, with muſic and dancing-girls, to fetch her home. She meets him part of the way mounted on a camel or horſe; but ſo veiled that her face cannot be ſeen. She is attended by her relations and friends in their gayeſt equipage, with her ſlaves, cloaths, and baggage. Both companies being joined, they march to the husband's houſe with lighted torches and muſic playing before them, and followed by the mob, who, with joyful acclamations, expreſs their wiſhes for the happineſs of the new-married pair.

On their arrival at the houſe the bride is led to her apartment, and the husband ſoon follows her. This is in general the firſt view he has of her face. The company ſpend the remainder of the evening, and ſometimes ſeveral days ſucceſſively, in feaſting and rejoicing at the houſe; but the men and women are in ſeparate apartments; and if it be the wedding of a man of quality, the muſic, the dancing-girls, and the mob, are alſo generally well entertained. But marriage does not give the women any liberty; for they, to all appearance, are conſidered as little more than ſervile creatures, formed for the pleaſure and indulgence of their lord.

"Happy were it for the Chriſtian world, ſays a pious "and moral hiſtorian, if women were more generally "taught from the earlieſt time of life, that rebellion "againſt husbands in Europe is, at leaſt, as great a "crime as Aſiatic tyranny over wives; and the thoughts "of the latter muſt neceſſarily make them ſhudder. "Women are not often taught the doctrine of ſubordi-"nation otherwiſe than by cuſtom, which they ſome-"times call, and much oftener think, an arbitrary in-"vaſion of their rights; the underſtanding and the "heart ought to ſubſcribe to this doctrine, in order to "eſtabliſh this rule of conduct upon a ſolid baſis. This "women might more generally comprehend, that ſub-"ordination is neceſſary to the very being of govern-"ment; that the pre-eminence which men enjoy, conſiſts "chiefly in a ſuperior toil; that whether a man has the "mind of an angel, or a brute, ſtill the gentle paſſions, "and the ſubmiſſive conduct of a wife, muſt eſtabliſh "her power in the heart of her husband, more perma-"nently than all the arts of pride and rebellion; thus it "muſt be if ſhe means to poſſeſs his affections; and if "ſhe does not mean it, he has the greater reaſon to "maintain that ſuperiority with which nature has in-"veſted him. And as Providence has appointed man "the guardian and protector of woman, he ought there-"fore to be the chief object of her love."

The Perſians of rank have alſo a kind of concubines, whom they agree with either for life or a certain time. Theſe contracts are alſo regiſtered before a magiſtrate, and where a man parts with one of theſe, ſhe muſt remain ſingle forty days before ſhe enters into a contract with another, to ſee if ſhe be with child; for in that caſe the firſt man muſt keep her till ſhe is brought to bed, and afterwards take care of her children. A man

may also take his slave to his bed, but he may dispose of her as he pleases without any ceremony, and yet their children inherit according to their seniority; and if the son of a slave be the eldest, he has an elder brother's portion.

With respect to the children, every person has a right to dispose of his effects to such of them, and in such proportions, as he thinks fit, except that he is limited by the marriage-contract to leave a certain part to his legal wife, which descends to her issue. But where the father makes no will, and is under no obligation to leave any part of his fortune to any particular woman and her children, the eldest son takes two-thirds of his estate and effects, and the rest is divided among the younger children without distinction.

Divorces are easily obtained, especially where both parties agree to part: the wife usually alledges, that the husband takes up too much time with his slaves and concubines to afford her due benevolence, or else that he is impotent; in either of which cases a divorce is readily granted, and both the man and woman are at liberty to marry again.

It will not be improper here to take some notice of the employments of the women. Those of Ghilan are very industrious; for the common sort are often seen abroad, without veils, planting rice, and performing other offices of agriculture; and within doors they are employed in spinning and working in different manufactures: but women of superior quality work very little, if at all. Quintus Curtius observes, that Alexander sent Darius's mother several pieces of purple, and other vestures, which he had received from Macedon, that if the manufacture pleased her, she might cause her grand-children to make them for her diversion. This was refused as a great indignity, it being esteemed mean and dishonourable for ladies in Persia to work in wool. Alexander excused himself as being ignorant of their customs, alledging, that his sister had worked the robe in which he was arrayed. The Persian ladies, says our author, are still of the same opinion; nor is this surprizing, if we consider that in Europe, where industry is reckoned a principal virtue, there are many woman whose birth, fortune, and beauty might challenge the highest attention, who rather choose to be ignorant of the essential duties of life, than of its vain ceremonies and amusements.

The females who do not labour in the field are seldom seen abroad, except in a morning before the sun rises, and then they are covered with veils which reach down to their feet. When they travel on horseback, every lady of distinction is not only veiled, but generally has a servant who runs or rides before her to clear the way; and, on such occasions, the men, even in the market-places, always turn their backs till the women are past, it being thought the highest ill manners to look at them. "But "this awful respect, says Mr. Hanway, is only a proof "of the slavery in which they are doomed to live. The "care which they take to conceal their faces, to avoid "the imputation of acting indelicately, and contrary to "custom, has made so strong an impression on them, "that I was told of a woman, who being accidentally "surprized in bathing, shewed her whole person, ex-"cept her face; to hide which all her solicitude was "employed."

The girls are esteemed at age when nine years old, and the boys at thirteen; and are no longer under the direction of their guardians: and when a guardian dies, the magistrate, upon examination, will admit them to be of age sooner. The eldest son is always guardian to the younger children, and the infants have the privilege of not having their estates seized for the debts of the deceased till they are of age and able to plead for themselves.

We shall now give some account of their treatment of the dying and the dead, particularly of their several funeral rites.

When a man is thought to be drawing near his last hour, they set up lighted lamps, or make small fires on the terraces of his house, that the people of the neighbourhood and those that pass by may pray for him. The mullah, or priest, is also sent for, who reminds him that it is time to review his past life, and repent of his sins; they likewise make him repeat his creed, that there is but one God, who has neither companion nor equal; that Mahomet was his prophet, and sent into the world to publish the true religion; and that Ali and the eleven Imans are his true successors. When he can speak no longer, they read some chapters of the Koran to him till he expires. His death is immediately known by the groans and lamentations of those about him. The relations immediately set up a great cry, rent their cloaths, tear their hair, and beat their breasts; while the women in particular utter their complaints, and address the corpse with the most tender expressions.

In the mean time the cadi is informed of his decease; on which he gives an order to a person whose office it is to wash the dead, to send some of his people for that purpose. If it be a man he sends men, and if a woman those of her own sex, who immediately strip the corpse, taking all that is upon it for their own use, and then carry the body to a certain pool, or large bason, provided in every town for that purpose in some private place; but the great men have basons in their gardens, over which they pitch a tent for washing any of the family when they die. After they have cleaned the corpse they stop up all the vents, as the mouth, nose, ears, &c. with cotton, that nothing may issue from them. Afterwards the corpse is wrapped up in a new winding-sheet of cotton cloth; and if it be a person of fortune, some passages out of the Koran are stamped upon it. The body is then deposited in some place not near the house; and if it is to be buried at a considerable distance, it is put into a wooden coffin, filled up with salt, lime, and perfumes which is their only method of embalming the dead in Persia, for they never embowel them.

If they are interred not far from the place where they die, they are carried thither directly as soon as they are washed, without much ceremony; and the people who attend the corpse, follow it without the least order. At the interment of persons of distinction, the ensigns of the mosque are carried before them on long pikes; one has at the end of it an iron hand, which they call Ali's hand; others have crescents, and on the rest are written the names of Mahomet, his daughter Fatima, and his twelve successors. They have also silk streamers, and led horses, which carry the turban and arms of the deceased. The neighbours offer their service for carrying the corpse to the grave; and if a man of rank meets a funeral, he will dismount from his horse and assist in carrying the bier.

None are buried in the mosques, but in many places they have their burying grounds at a little distance from the town, by the road side: however, in Ispahan and several other great cities, there are burying-places within the city. Their graves neatly resemble ours, only on the side next Mecca the earth is made hollow, and the corpse laid in it wrapt in its winding sheet without a coffin, with the face towards Mecca. If it be a great man his turban, his sword, his bow and quiver of arrows are laid by him. The reason of their laying him under a hollow place of the earth is from the opinion, that the soul re-animates the body soon after its interment, and is examined by certain angels in relation to his life and manners. The Saieds, who are of the family of Mahomet, never have any earth thrown into their graves, for they are only covered with a great stone. They have generally monuments and tomb-stones as with us, but instead of giving an account of the deceased, they usually engrave upon them some passages of the Koran; or an epitaph, in which, according to the common sense of mankind, life is compared to a flower that blossoms in the spring, and in the summer appears in the full lustre of its beauty; but in autumn begins to wither and decline, and when winter comes on, a gust of wind blows it to the ground, where it lies and rots.

Eight or ten days after the funeral, and on certain festivals, the friends and relations visit the tomb, especially the women with their children, who there renew their lamentations, and beating their breasts expostulate with the deceased upon his leaving them; mean while their friends endeavour to comfort them, and sometimes leave

leave at their grave cakes, ſweetmeats, and fruit, in order to pleaſe the angels who guard the ſepulchre.

They uſually mourn forty days, not by wearing black, which they deteſt as an infernal habit, but by ſhewing the moſt lively expreſſions of grief two or three times a week, and wearing a torn and negligent garb of a dark blue colour. This time being expired, they bathe, ſhave, and dreſs themſelves in their uſual habits. Their wives appear moſt inconſolable, for a widow in Perſia ſeldom marries a ſecond huſband.

The Perſian kings are frequently buried at Kom in great ſtate, as appears from the following account of the interment of Soliman. The corpſe was preceded by one hundred camels and mules, which carried proviſions for a thouſand people, who were to attend it on the road; after which was carried the body in a large litter covered with a pall of cloth of gold, by two camels led by the Nazir or high-ſteward. On the ſide of it went two ſervants burning perfumes in golden cenſers, and a company of prieſts ſinging their prayers. Theſe were followed by an empty litter covered with red and green; then followed all the great officers of the court on foot with their cloaths rent, except the prime miniſter, who was permitted to ride, on account of his great age. Many thouſands of the people joined the proceſſion, and made dreadful lamentations, as for their common parent. In this order they proceeded about a league from Iſpahan to one of the king's country palaces, where the corpſe reſted: and the following night thoſe appointed to attend it proceeded on their journey to Kom, while the great officers returned to Iſpahan to attend the new king. The ſhops were then opened, which had been ſhut ever ſince the people had notice of the king's death, and the court reſumed its uſual ſplendour.

SECT. X.

Of the Religion and Superſtition of the Perſians.

AS to the eſtabliſhed religion of Perſia, the Turks and Perſians equally acknowledge the Koran to be the great law of the prophet Mahomet; but trace their diviſions and inveterate animoſities as high as his immediate ſucceſſors. Ali was Mahomet's brother's ſon, and married to Fatima, the daughter of the falſe prophet. Hence the Perſians infer his right to the ſucceſſion, which was notwithſtanding invaded by his uncles Abubeker, Omar, and Oſman, the brothers of Mahomet, whoſe uſurpation, both as kings and prophets, is approved of by the Turks. Ali, at length, ſucceeded, and the diſpute might have been loſt in oblivion, had he made no different explications of the Koran. This, however, produced no extraordinary effects till the fourteenth century, when Sheffie, a man of an exemplary life, who pretended to a regular deſcent from Ali, began to teach and expound the Mahometan law, and the doctrine of Ali's followers, in preference to the precepts taught by the Turkiſh doctors. This reviving the remembrance of the injury done to Ali by his uncles, the Perſians began to curſe them in their public prayers, and changed the form of the Mahometan creed, by giving Ali the title of the friend of God. Theſe two ſects being thus divided, thoſe who maintained the ſucceſſion of Abubeker, Omar, and Oſman, called themſelves Sunnis, while the followers of Ali took the name of Schias.

The Perſians acknowledge that the Moſaic was the true religion before Chriſt, whom they alſo believe to be a true prophet and teacher ſent from God; but that the religion he taught was contained in a book, which, at Mahomet's coming, was taken by the angel Gabriel into heaven, and the Koran brought down in its ſtead. They alſo, like the other Mahometans, ſay, that Jeſus Chriſt did not die upon the croſs, but as he was going to his crucifixion, he was inviſibly tranſlated to heaven, and that Judas being miraculouſly brought thither in his place, his face appeared like that of Chriſt, and he was crucified in his ſtead. Thus they confeſs the truth of our Saviour's miſſion, but mingle almoſt every thing relating to him with extravagant fictions.

The Mahometans have two articles of faith, and five of practice. That there is no other God but God, and that Mahomet is his prophet; that men ought to obſerve bodily purifications; pray to God at the appointed times; give alms to the poor; faſt all the month of Ramezan, and, if poſſible, go in pilgrimage to the temple of Mecca. To theſe the Perſians add an eighth article, which is, that Ali is the friend of God.

The Perſians maintain that all ſouls were formed long before the creation of the world, and many of their doctors believe the metempſychoſis or tranſmigration of ſouls. Their hiſtory of the creation has many fables, mixed with the truths they have taken from the books of Moſes.

They ſay that both good and evil angels were made of the ſubſtance of light and fire, and being compoſed of ſoul and body, their aërial forms may be ſo condenſed as to become viſible. That the firſt time the evil angels diſobeyed God, the good angels fought them, and brought them captives to heaven, where God pardoned them; but he afterwards creating man, and commanding all the angels to bow before him, the evil angels, filled with pride, again rebelled; upon which they were curſt by the Almighty, who precipitated them from heaven into a place which their fury and deſpair has rendered hell.

They imagine that as ſoon as the deceaſed is laid in his tomb, the grave cloſed, and the company retired, the departed ſoul re-enters the body, and is viſited by two black angels, terrible to behold, the one called Munkir, and the other Nekir, who oblige the perſon to ſit upright, and queſtion him concerning the unity of God, the miſſion of Mahomet, and the good or evil he has performed, which they record in a book to be opened at the general judgment: that in the mean while, the ſouls of the faithful are filled with tranſports of joy; while the wicked endure the dreadful pangs of remorſe. They ſay, the ſoul wanders about till the body is interred; but that it has no ſooner undergone the firſt examination in the ſepulchre, than it enters an aërial body, in which it continues till the general reſurrection, when it will be re-united to its earthly frame.

After the final judgment they maintain, that all men muſt paſs over a certain bridge no wider than a razor's edge, that unbelievers and the wicked will infallibly fall in their paſſage into hell; but that the faithful ſhall paſs the bridge ſwifter than a bird flies through the air, and enter into paradiſe.

They maintain, that the torments of hell conſiſt in being put into the hands of devils, who ſhall hang up the body in dreadful caverns full of dragons, ſerpents, and all manner of noxious and loathſome animals, which ſhall perpetually gnaw it, and fill the ſoul with rage and remorſe. On the other hand, the joys of paradiſe will, according to them, entirely conſiſt in ſenſual delights.

The bleſſed, ſay they, after they have taſted of the fountain of living waters, ſhall ſeat themſelves on the banks of the river of delight, which is ſhaded by a tree ſo immenſely large, that was a man to ride poſt fifty thouſand years he would not paſs the extent of one of its leaves: that Mahomet and Ali ſhall ſerve the happy with the water of this delicious river, mounted on the Pay Duldul, an animal that has the head of a woman, the foot of a ſtag, and the hinder part of a tyger: that they will be attended by innumerable companies of fair celeſtial beauties, with large black eyes, created on purpoſe for the enjoyment of the elect. They alſo maintain, that they ſhall enjoy the free uſe of theſe voluptuous pleaſures, without being capable of ſinning, becauſe nothing is forbidden, nor ſhall they there experience the effects of ſatiety, but their life, and health, and vigour will be everlaſting.

If they be aſked how they can ſuppoſe, that in paradiſe they ſhall be taken up with mere corporal enjoyments, which periſh in the poſſeſſion, they boldly reply, That theſe are not formed to ſupply any neceſſities of nature, but for pleaſure; and that all the delights we taſte in this life, we ſhall enjoy in a much higher degree in paradiſe; for this world, ſay they, is but a type of that, and all that we ſee came from thence, though

though they are extremely degenerated from their excellent original. If it be objected, that if we eat and drink in heaven, we muſt be ſubject to the neceſſities and defilements which follow eating and drinking, they anſwer, that the delicious food of paradiſe ſhall evaporate in a perfumed ſweat through the pores; and that though they ſay the Perſian women ſhall be excluded paradiſe, they only mean that they ſhall not inhabit the ſame paradiſe as the men; but in another place will enjoy equal delights.

There are, however, ſome Perſian doctors, who conſider all the promiſes and threatenings in the Koran in a ſpiritual and allegorical ſenſe, and ſay, that theſe things are thus delivered only to accommodate them to the groſs ideas of the people; but that the happineſs of paradiſe really conſiſts in being employed about objects proper for the ſoul, as in the knowledge of the ſciences, and the ſublime operations of the underſtanding, and that the body ſhall have pleaſures ſuitable to its nature, and enjoy all the delights of which it is capable; but not, as here upon earth, by meat and drink, and ſenſual indulgencies: that hell ſhall conſiſt in regret and deſpair for the loſs of paradiſe, while the body will be afflicted with the moſt excruciating torments, but after what manner they do not pretend to determine.

The Perſians ſometimes exalt Ali above Mahomet himſelf; they even pretend that Ali is not dead, but taken up into heaven, whence he ſhall return and fill the world with his doctrine. They never ſpeak without the utmoſt deteſtation of Abubeker, Omar, and Oſman.

They diſtinguiſh uncleanneſs into two kinds, one of which they eſteem ſinful from its being abſolutely forbidden by their law, as to drink wine and ſtrong drink, to eat pork, &c. while the other only communicates a defilement that renders a perſon unfit to perform certain acts of religion, as to pray to God, or read the Koran, while he continues in this ſtate of uncleanneſs. They not only pretend that it is unlawful to drink wine, but that every thing is defiled in which wine has been put, or on which a drop of it has fallen; nor is it lawful for them to be in a room where wine is kept. But though the drinking of wine be forbidden by their law, and their commentators are very ſevere in their cenſures of thoſe who uſe this indulgence, many of the Perſians, particularly in the army, drink it pretty freely, and alſo intoxicate themſelves with ſpirituous liquors. When they are aſked by a Chriſtian how they diſpenſe with this precept, they anſwer, "In the ſame manner "as you diſpenſe with drunkenneſs, adultery, and for-"nication, which are no leſs forbidden to Chriſtians, "and yet many among you glory in their exceſſive drink-"ing, and in their debauching women."

The bigotted Perſians lay a greater ſtreſs upon the ceremonial part of their law, than on the moral; for their waſhings and purifications muſt be obſerved, whatever elſe they omit. They have the maxim of their prophet frequently in their mouths, that "religion is "founded in purity, and half of it conſiſts in a man's "keeping himſelf undefiled." Their prayers are vain and criminal when offered up with unwaſhed hands, and it is the higheſt prophanation to touch the Koran in ſuch a ſtate. There are indeed ſuch a variety of defilements, that though they are obliged to pray five times a day, it is almoſt impoſſible to prevent their being polluted between one prayer and another.

As the Perſians reckon their day from twelve at noon to twelve the next day, the firſt hour of prayer is exactly when the ſun is in the meridian. The ſecond is in the evening; the third when it is ſo dark that one cannot diſtinguiſh colours; the fourth is to be made on lying down to ſleep, and the fifth in the morning, and may be performed at any time between the diſappearing of the ſtars and noon. All theſe prayers would be an inſupportable burden, conſidering the purifications and other preparations required before they begin their devotions, were they not indulged in ſome particulars: for inſtance, they are allowed to offer up two ſets of prayers at the ſame time; for though that in the morning is performed ſingly, thoſe for noon and the evening may be offered together; and thoſe to be ſaid when it grows dark and at bed-time may alſo be ſaid together; and if they are prevented ſaying their prayers at the appointed times by any preſſing occaſion, they may afterwards ſay them as ſoon as they have an opportunity. Theſe ſet hours of prayer give the Perſians an opportunity of retiring from company whenever they think fit, without being thought guilty of rudeneſs; for nobody is ever importuned to ſtay, when he declares that he is going to his devotions.

The mullahs, and thoſe who have more religion than their neighbours, keep exactly to the five ſtated hours of prayer, and never deviate from them but in caſes of the extremeſt neceſſity.

In moſt Mahometan countries the times of prayer are proclaimed by the officers of the moſques from their ſteeples; but in Perſia thoſe officers declare the time of prayer from the top of the moſques. Upon common days no more than one or two of theſe cryers are employed; but upon feſtivals there are ſometimes ten or a dozen of them, particularly on Fridays, their ſabbath; and it can ſcarcely be conceived how far their voices are heard. They begin with theſe words, "O God, "moſt great!" which they repeat four times, turning to the four winds; then they add, "The teſtimony we "render to God is, that there is no other God but "God. Mahomet is his prophet, and Ali his friend." This they alſo repeat four times as above, and then ſay, "Ariſe, and pray, perform that moſt excellent duty "which Mahomet and Ali, the moſt perfect of created "beings, have commanded." If it be at midnight, which is one of their times for offering up prayers of ſupererogation, or in the morning, they add, "Awake "out of your ſleep;" and having repeated the words, "O God moſt great!" four times, ſing ſome verſes of the Koran, and then conclude with "Omar be ac-"curſed." When the people hear theſe criers, they ariſe up and go to prayers in their houſes, or wherever they think fit.

In performing their devotions they have ſeveral ceremonies, which muſt not be omitted; firſt they put off their ſlippers, and all their ornaments: even their turban muſt have neither gold, nor ſilver, nor embroidery, and therefore they uſually put on a white callicoe turban. They take particular care to wear at ſuch times no ſkins or furs belonging to any beaſt prohibited to be eaten by their law; and always waſh their face, feet, and hands. Every perſon has a little carpet, about five or ſix feet long, and three broad; in this are wrapped the things they uſe at their devotions, as the Koran, which is kept in a little bag by itſelf, an earthen diſh, their beads, a pocket-glaſs, and ſometimes a few tattered relics. Theſe they take out, and having ſpread the little carpet before they begin their prayers, they ſit upon their heels, and range theſe little trinkets in order. They then take the comb and glaſs, and comb their beards; take off their purſe, their ſeals and rings, their ſabre and knife, that they may preſent themſelves before God in the moſt humble manner. Then turning their faces towards Mecca, they begin their prayers; at certain parts of which they ſtand, then kneel, and then proſtrating themſelves on the earth, ſet their foreheads on a bit of clay of about the ſize of a crown-piece.

On theſe occaſions they count their beads on a ſtring, as is the cuſtom of ſome Chriſtians, who doubtleſs learnt it of them, as they did of the neighbouring pagan nations. Though they pray ſo often, their prayers are pretty long, and they ſeem to perform their devotions with inconceivable reverence and attention; nothing can divert them from what they are about; their eyes remain fixed, and every geſture is exceeding juſt and ſuitable to the occaſion; and in ſhort, they perform this duty with greater reverence and attention than moſt Chriſtians. It will not be improper here to add the obſervation of Mr. Hanway, "Though the Perſians, ſays he, are become "extremely immoral, yet they give one proof of reli-"gion vaſtly ſuperior to the Chriſtians: for I never "could obſerve that they mentioned the name of the "Supreme Being, except upon ſolemn occaſions, or at "leaſt in a reſpectful manner."

Prayers for the dead are recommended, but not enjoined by the Perſian religion. They think it an act

Commemoration of Abraham's sacrificing his Son.

of piety to commemorate at certain times their deceaſed friends, and ſome of them are of opinion, that God will increaſe the happineſs, or leſſen the miſery of departed ſouls, in compliance with the earneſt intreaties of their ſurviving friends. None of them, however, pray to their ſaints, or even to Mahomet or Ali, to intercede for them; for they do not believe that they even know what is done upon earth, but as God is pleaſed to reveal it to them.

In all their religious books and diſcourſes charity is warmly recommended, without which their prayers are held to be vain and ineffectual. They diſpoſe of their alms chiefly in public buildings, as in erecting caravanſeras, bridges, cauſeways, ciſterns, receptacles of water, moſques, colleges, and bagnios.

The alms particularly aſcertained are a kind of tythes of cattle, corn, money, and merchandize, only taken out of the neat profits after all rent and charges are deducted, and theſe are not given to the prieſt, but, like their acts of charity, are applied to different purpoſes; as to the maintenance of the Mahometan faquirs, or begging prieſts, to redeeming ſlaves ſeverely treated by their maſters, to the relief of inſolvent debtors, and of ſtrangers in diſtreſs. The reſt are employed in public buildings, in erecting moſques, caravanſeras, &c.

They have no ſet time for circumciſing their children: ſome maintain that it ought to be at thirteen years of age, becauſe Iſhmael was circumciſed at that age; but they generally adminiſter it when the child is four or five years old, on account of its being leſs painful and hazardous than when they are older. Some barber performs the operation, and applies ſtyptics and aſtringents to ſtop the bleeding. They obſerve neither any particular day nor hour for performing this ceremony, but do it when and where they pleaſe. However, on the circumciſion of a great man's ſon, a mullah comes to his houſe, and reads in the Koran during the operation; but they have no office on purpoſe for it. The reſt of the day is ſpent in rejoicings.

The Perſians have ſeveral faſts, the moſt remarkable of which is that named Ramezan, from the name of the month in which it is held, and which laſts from the beginning to the end of it. When this moon firſt appears, it is proclaimed by the holy criers in great numbers on the terraces of their moſques, as a ſurprizing piece of news, and this publication is accompanied with their ſinging hymns on the occaſion; the people anſwer in joyful cries, and illuminate the ſtreets; while the horns ſound from the terraces of the bagnios, to give notice that the baths are ready; for all their acts of devotion begin with waſhing themſelves. Every one is obliged to faſt during the month of Ramezan, from break of day till ſun-ſet, during which time they are not even allowed to eat or drink any thing, or to waſh their mouths, or even their faces, leſt it ſhould be any refreſhment; and ſome even make a ſcruple of ſwallowing their ſpittle, or opening their mouths to let in the air. All amorous commerce is prohibited even in words and looks. At ſun-ſet, when they are allowed to eat, this is proclaimed from the moſques; then the people having performed their purifications, and ſaid a ſhort prayer, begin to eat ſome light food, as fruit and ſweetmeats, and ſome time after go to ſupper, in which they ſpend more time than uſual; for they eat very ſlowly to prevent any ill conſequence from a full meal after ſo long a faſt. Thoſe who live by their labour generally make a meal about two hours before day; and then lie down to ſleep. Thoſe of diſſolute morals feaſt all night, and ſleep the greateſt part of the day; ſo that in many places the Ramezan rather reſembles a feſtival than a faſt, with this only difference, that like the debauchees in this part of the world, they turn day into night. Thoſe who live regularly riſe in the morning to go to bathe, in order to purify themſelves from all pollution, and both their habits, their countenances, and diſcourſes are ſuitable to the occaſion. Great part of the day is ſpent in retirement, praying, reading the Koran, and other books of devotion; and though they do not ſcruple to tranſact buſineſs, they are more cautious of converſing with people of a different religion, leſt they ſhould be defiled, and rendered unfit for their devotions. In the day-time fewer people are to be ſeen in the ſtreets than in the other months; but in the evening crowds of people appear in the markets and other places of reſort: hence it is ſometimes called the feaſt of candles, from the multitude of lights ſet up in all parts.

The Perſians are alſo required once in their lives to make a pilgrimage to Mecca, the place of Mahomet's birth, where is a little chapel, called the houſe of God, which, according to tradition, was built by Abraham, and to which all the Mahometans pay an extraordinary veneration. Of this chapel we ſhall give a particular deſcription when we come to Arabia.

The principal religious feſtivals of the Perſians are thoſe in commemoration of Abraham's ſacrificing his ſon, and that of the martyrdom of the two Imans, Hoſſein and Haſſein. Thoſe who keep the feaſt of the ſacrifice riſe early in the morning, and ride out of the city at break of day, in order to ſacrifice a ſheep or goat, after which they cauſe ſeveral to be killed in their own houſes, and diſtribute them among the poor. In every great town there is alſo a general ſacrifice of a camel, at which, it is ſaid, the king himſelf aſſiſts, when at Iſpahan. This feſtival is performed in the following manner.

On the firſt day of the month Zilhah, one of the king's camels is delivered to the people, who, having dreſſed him up with garlands and ribbons, lead him through the city, preceded by trumpets and other muſic. This is done every day till the tenth, the people all the while following the beaſt in crowds, with loud acclamations; and he is even brought into the houſes of all the great men, that the women of their harrams may ſee him unperceived, while the mob who attend the proceſſion receive money or good cheer at every houſe.

The day of ſacrifice being arrived, the camel is led to a field near the city, to which the king ſometimes comes in his cap of ſtate, attended by all his courtiers, whoſe turbans are adorned with precious ſtones, and who are attended with a magnificent retinue. They then make the camel lie down on his belly, with his head towards Mecca, ſeveral men holding him with ropes to prevent his ſtirring; and being ſurrounded by the king and the officers of his court on one ſide, and the prieſts on the other, who offer up certain prayers on the occaſion, the beaſt is ſtruck on the left ſhoulder with a lance, and immediately after his head is cut off and preſented to the king: the body and the four quarters are given to the five great wards into which the city is divided, and the people carry them away in triumph amidſt ſongs and rejoicings. A certain family in every ward has the privilege of keeping the ſacred fleſh, and the chiefs of theſe families make an entertainment for thoſe who aſſiſted at the ſacrifice, they being furniſhed with proviſions for that purpoſe by the wealthy people in the neighbourhood, to whom in return they ſend little morſels of the camel ſacrificed the preceding year; for the quarters of the camel are always ſalted, and kept till another camel is ſlain. Thoſe who get the leaſt piece to eat, imagine that it is accompanied with every bleſſing.

The next great feſtival, which, in many reſpects, has the appearance of a faſt, is in memory of the death, or martyrdom, as they term it, of their patriarch Hoſſein, who was ſlain in a battle with the califf of Damaſcus, who contended with him for the empire, in the ſixty-firſt year of the Hegira. They ſay, that after he had loſt the battle, he retreated with his broken troops into a deſart near Babylon; but, when he had been purſued fourteen days, was overtaken by his enemies, and died bravely fighting and covered with wounds.

This feſtival continues ten days, during which no trumpets or muſical inſtruments are ſounded, and thoſe who obſerve it ſtrictly neither ſhave nor go to the bagnio. At this time they never begin a journey, nor even undertake any important affair. Many of them rend their cloaths, paint their ſkins black, and appear with ſorrowful countenances. The ſtreets from morning till night are filled with people, ſome almoſt naked, others ſtained with blood, and others in armour with naked ſwords in their hands: ſome ſeem faint and ready to periſh, and, with all the ſigns of anguiſh and deſpair, cry out as loud as poſſible, Hoſſein! Haſſein! This

Haſſein was the eldeſt brother of Hoſſein, who was ſlain in the ſame war. What the people endeavour chiefly to expreſs is the heat and thirſt with which Hoſſein was afflicted in the deſart, which, they ſay, was ſo great, that his tongue hung out of his mouth. If they meet either a Pagan or a Chriſtian they cry, Curſed be Omar; to which the other, if they would not be inſulted, muſt reply by repeating the ſame words. During the ten days of mourning there are altars at the corner of every ſtreet, and a place incloſed and hung round with ſhields, fire-arms, colours, ſtandards, drums, trumpets, and all kinds of war-like inſtruments. In the night-time the ſtreets are illuminated, and their doctors preach to the people on the ſubject of the feſtival, inflaming their rage againſt the enemies of their ſaint. It is impoſſible to conceive the grief and anguiſh expreſſed on theſe occaſions; they beat and utter lamentations, as if under the deepeſt affliction. On the firſt days of the feaſt their preachers entertain them with an account of the birth of Hoſſein, in which they relate a thouſand fabulous circumſtances. In the latter part of the feaſt they expatiate on Hoſſein's reſignation, in voluntarily devoting himſelf to death. They pretend that four thouſand angels in vain offered him their aſſiſtance; and that one in particular, in the form of an hermit, brought him a cup of water when he was ready to expire with thirſt; but Hoſſein, refuſing to accept it, told him, if he pleaſed he could command a brook of water to iſſue out of the earth; and then touching the ground with his finger, there ſprung up a large fountain; but declaring, that it was decreed he ſhould die under his misfortunes, he never attempted to quench his thirſt. The ſermon being over, the people renew their cries of Hoſſein, Haſſein, till being ſpent with this exerciſe, they return home and feaſt. During this feſtival the Perſians are extremely charitable, and think it a crime to refuſe alms to the poor. Before the houſes of the great ſtand veſſels of ice and water, that none may ſuffer by thirſt; and the king daily entertains at leaſt four thouſand people, who attend the proceſſion. A number of machines and pageants are carried at this feaſt; and among the reſt open chariots and biers, in which are the repreſentations of the mangled bodies of Hoſſein and his friends. This feſtival ſeems ſolely intended to keep up, from political views, an inveterate hatred againſt the Turks, whom they eſteem their natural and moſt formidable enemies.

As the religion of the Perſians leads them to conceive the moſt wild and extravagant ideas of the agency of inviſible beings, theſe have an influence on their conduct in private life, and the moſt amazing ſuperſtition tinctures all their actions; and, by ſtrongly influencing their hopes and fears, frequently prevents their taking thoſe rational meaſures which alone can enable them to eſcape the misfortunes they dread. Hence, inſtead of having recourſe to the dictates of reaſon, and the meaſures inſpired by prudence, they have recourſe to charms and amulets, formed of inſcriptions on paper, and ſometimes on precious ſtones; thus certain paſſages of the Koran, worn in a little bag about the neck, are eſteemed a ſovereign remedy againſt diſeaſes and inchantments. Sneezing is held a moſt happy omen, eſpecially when often repeated; the hands with the fingers interchanged, and ſome particular poſture of the body, are eſteemed full of magic power; and, if uſed maliciouſly, of dangerous conſequence. Mr. Hanway mentions an officer whom he travelled with, and that was going to the ſhah to anſwer for his conduct, who endeavoured to learn by heart a prayer compoſed by Hoſſein, which, if repeated right in the preſence of the king, he imagined would divert his wrath; but if falſly, increaſe it. This officer had another ſpell which he propoſed to uſe; this was the repetition of ten particular letters in the alphabet, as he entered the royal tent, cloſing a finger at each, and keeping the firſt claſped till he came before the throne, when he was ſuddenly to open his hands, and by the diſcharge of this magic artillery, to ſubdue the king's wrath. As the minds of the Perſians are tainted with an extravagant fondneſs for the marvellous, they imagine that the meteors, which reſemble falling ſtars, and are vulgarly called ſo, are the blows of angels on the heads of the devils who would pry into the ſecrets of paradiſe. Cats are held in great eſteem, but dogs in abomination: ſo that though they uſe them ſometimes at their diverſions, they are never permitted to come into any room. The Turks are not much behind them in this folly: in the reign of Shah Abas the Grand Signior ſent to that prince to deſire, that as none but their prophet and his children had been dreſſed in green, none of his ſubjects might be permitted to wear that colour, eſpecially in ſtockings. To this Shah Abas, who was a man of underſtanding, made anſwer, that if the Grand Signior would prevent the dogs piſſing on the graſs in Turky, he would comply with the requeſt.

SECT. XI.

Of the Religions tolerated in Perſia; particularly of the Gebers, or Gaurs; with an Account of an extraordinary Phænomenon called the everlaſting Fire.

UNDER Indoſtan we have given a particular account of the Parſees of India, who were once driven from Perſia, and are of the ſame religion as the Gebers, or Gaurs, only differing in ſome points of ſmaller moment. They are both deſcended from the antient Perſians, and both are of the religion of the antient Magi, the followers of Zoroaſter; both conſider light as the moſt perfect ſymbol of true wiſdom and intellectual endowment, and darkneſs the repreſentation of ignorance, vice, and every thing hurtful and deſtructive; both abhor the worſhip of Idols, and adore God under the form of fire, conſidering the brightneſs, activity, purity, and incorruptibility of that element, as bearing the moſt perfect reſemblance of the nature and perfections of God; and therefore ſhew a particular veneration to the ſun, as the nobleſt repreſentative of the all-wiſe and all-perfect Creator. The Parſees of India, however, cenſure their brethren of Perſia for corrupting the antient doctrine, and introducing an evil principle into the government of the world. This many authors repreſent as the antient doctrine; ſome aſſert, that the followers of Zoroaſter held a co-eternity of theſe principles, which they termed Oroozm and Harriman, which the Greeks called Oroſmades and Arimanius; while others ſay, that, according to the Perſian mythology, Oroozm firſt ſubſiſted alone; that by him both the light and darkneſs were created; and that Harriman was created, or rather aroſe from darkneſs: that good and evil being thus mixed together, they would continue till the end of all things, when each ſhould be ſeparated and reduced to its own ſphere.

But what is moſt remarkable with reſpect to theſe people, is commonly called the everlaſting fire, a phænomenon of a very extraordinary nature, about ten Engliſh miles from Baku, a city ſituated in the north of Perſia, by an excellent haven of the Caſpian ſea. This object of their devotion is on a dry rocky ſoil, where there are ſeveral antient temples built with ſtone, ſuppoſed to have been all dedicated to fire, moſt of them arched, and only ten or fifteen feet high; among which is a temple, in which the Gebers ſtill preſerve the ſacred flame, which they pretend has continued burning ever ſince the flood; and they believe it will laſt till the end of the world. It riſes from the end of a large hollow cane, which is ſtuck in the ground, in a blue flame, in colour and gentleneſs not unlike a lamp that burns with ſpirits, but ſeemingly more pure. Here are generally forty or fifty poor devotees, who come hither in pilgrimage.

At a ſmall diſtance from this temple is a cleft of a rock, in which is an horizontal gap two feet from the ground, near ſix long, and about three broad, from which riſes a conſtant flame, of the colour and nature of that juſt deſcribed. In calm weather it burns low, but when the wind blows, it ſometimes riſes eight feet high; and yet the flame cannot be perceived to make any impreſſion on the rock. The Gebers here alſo pay their adorations, and ſay, that if theſe fires are ſtopped in one place, they will riſe in another.

What appears ſtill more extraordinary, there is undoubted proof that theſe fires conſtantly burn without any ſupply being added by the people to feed the flame; for Mr. Hanway obſerves, that for above two miles round this place, the earth has this ſurprizing property, that by taking up two or three inches from the ſurface, and applying a live coal, the part ſo uncovered takes fire almoſt before the coal touches the earth: the flames heat the earth without conſuming it, or affecting what is near it. Yet this earth carried to another place does not produce the ſame effect. If a cane, or even a paper tube be ſet about two inches in the ground, and cloſed with earth below, on touching the top of it with a live coal, and blowing upon it, a flame inſtantly iſſues, without injuring either the cane or the paper, provided the edges be covered with clay. This method they uſe for light in their houſes, which have only the earth for their floor; three or four of theſe lighted canes will boil a pot, and thus they dreſs their proviſions. The flame may be extinguiſhed in the ſame manner as that of ſpirits of wine. The ground is dry and ſtony, and the more ſtony any particular part is, the ſtronger and clearer is the flame; it has a ſulphureous ſmell, like naptha; but it is not very offenſive.

By means of this phænomenon, lime is burnt to great perfection, the flame communicating itſelf to any diſtance, where the earth is uncovered. The ſtones muſt be laid one upon another, and in three days time the lime is completed. Near this place are found ſprings of naptha, and brimſtone is dug up.

Since the greateſt part of the Gebers were driven out of Perſia by Shah Abas, there have been few of them who have openly profeſſed their religion in that kingdom; there is, however, a village near Iſpahan inhabited by them, from whence it receives the name of Guebarabad.

There is alſo a ſect in Perſia named Souffees, who, though they outwardly conform, for the ſake of peace, to the Mahometan religion, have a ſyſtem of doctrines, that contain the pureſt myſticiſm, which contradicting no religion, can put on the forms of all. Their principal aim is to form within themſelves a mental elyſium by an extinction of all the paſſions in ſacrifice to God. In this ſtate of quietiſm they ſay they feel a certain pleaſure, like that felt by the body, when, after its being over-heated, it is cooled by a refreſhing breeze. They recommend three points to be obſerved in the conduct of ſocial life; theſe are a grateful return to friendſhip, and for benefits received; to win all hearts by generoſity, and never to depart from ſweetneſs of temper, truth, and candour.

There are alſo another people in Perſia, whoſe religion ſeems compounded of Chriſtianity, Judaiſm, and Mahometiſm. Theſe are called Chriſtians of St. John, and ſometimes Sabean Chriſtians. They dwell near the Perſian gulph, where there are ſaid to be many thouſand families of them. St. John Baptiſt is their great ſaint, and it is ſaid they acknowledge Chriſt in no other light than as a prophet, and yet pay an idolatrous worſhip to the croſs. They are ſaid to have loſt their ancient ſacred books, and to have only one at preſent, which is filled with Jewiſh and Mahometan legends, and contains their doctrine and myſteries.

There are alſo in Perſia a number of the Armenian and Georgian Chriſtians; but the latter are not found out of Georgia, the ancient Iberia.

SECT. XII.

Of the Government of Perſia; the Authority and Titles of the King; the cruel Uſe he makes of his unlimited Power; the Treatment of the Governors of Provinces, and of the royal Infants. Of the Ladies of the Harram and the Eunuchs.

THE Perſian government is monarchical, and in every branch of it ſtrictly deſpotic. The favour of the prince, and of thoſe on whom he devolves his authority, is eſſential to the ſecurity of the great, and particularly of foreign merchants; and this may be beſt preſerved by proper and timely preſents, by a good appearance, and a reſolute diſcreet ſupport of their own dignity. The Perſians are not ignorant of the laws of juſtice and humanity; but war having been for many years their only ſtudy, and a fondneſs for outward ſhew their predominant paſſion, theſe laws are little regarded when they interfere with their inclinations; hence it is ſaid, that a good horſe, a ſilver-mounted bridle, and a girl, will generally induce a Perſian to violate juſtice, and even commit actions for which he is morally certain of death.

The uſual title of the king is Shah, or Shaw, as it is pronounced, which ſignifies the diſpoſer of kingdoms; and is the higheſt title known in Aſia; it being equivalent to that of emperor in Europe. They alſo add to the king's titles thoſe of Sultan, and Khan or Cawn, which is the title of the Tartar ſovereigns. His arms are a lion couchant, looking at the ſun as it riſes over his back.

When his ſubjects addreſs him they ſtile him the ſource of power, majeſty, and glory, equal to the ſun, ſubſtitute of heaven, the head of the moſt excellent religion, prince of the faithful, the father of victory, the ſhadow of Almighty God, and lord of the revolutions of the world. With theſe and the like titles all petitions to the Shah abound; but when they ſpeak to him they uſually ſtile him the lieutenant of God, or the prince by whom God diſpenſes his grace and favour to men.

This prince has the lives and eſtates of his ſubjects intirely at his diſpoſal: there is no prince in the world more implicitly obeyed, even though his orders are ever ſo unjuſt, or given when he is ſo little maſter of his reaſon, that he knows not what he ſays or does. Nothing can ſave the greateſt ſubject, if he reſolves to deprive him of his life or his eſtate; for neither zeal for his perſon, merit, or paſt ſervices, will be of the leaſt avail: if he be in a humour to ruin them, to put out their eyes, or to inflict on them the moſt cruel death, it is done by a word of his mouth, or merely by a ſign, and inſtantly executed without any form of law or evidence of guilt.

The Perſians readily obey all the commands of their prince without reſerve; ſo that if the ſon be commanded to be his father's executioner, or the father the ſon's, it muſt be complied with. Yet they ſay, if he commands any thing contrary to the peculiar tenets of their religion, they are under no obligation to obey him. Several writers mention a miniſter in the Perſian court, whom the king commanded to drink with him; but he excuſed himſelf by ſaying, he had been a pilgrimage to Mecca, and could not drink wine without violating the laws of their religion: to which the king replied, "Thou-"ſands have gone in pilgrimage to Mecca, and yet "drink wine: drink therefore when thy ſovereign com-"mands thee;" but the miniſter ſtill refuſing, the king not only abuſed him in the groſſeſt manner, but made the ſervants throw the wine in his face, and pour it by force into his mouth: then threatened him with immediate death; to which the other returned, that he had a right to his life, but not to his religion, and he choſe rather to die than drink. The king then diſmiſſed him from his employments; but he was ſoon after reſtored, and ſeemed to be doubly honoured by the king for the reſolution he had ſhewn, in refuſing to violate his conſcience.

Scarce any thing appears more tyrannical in the Perſian government, than the cuſtom which has for a long time prevailed, of executing the governors of provinces and great officers of ſtate, without giving them an opportunity of making their defence, or letting them know the crime laid to their charge. It is uſual for the king to ſend every governor a royal veſt, and as theſe are ſent by perſons whom the court intends to favour, the khan or governor always makes them a conſiderable preſent. When this meſſenger comes within two or three miles of the place where the governor reſides, he ſends him word, that he may come and receive the preſent; but inſtead of a royal veſt, he is ſometimes preſented with an halter and diſpatched without farther ceremony.

We are informed by Thevenot, that Shah Sefi, without any provocation, gave orders, that one of the greateſt officers of his court ſhould have his ears cut off in his preſence

preſence by his own ſon, which that unnatural ſon immediately performed; he then commanded him to cut off his father's noſe, and he inſtantly obeyed. The old courtier finding himſelf thus ill-treated by his own ſon, to gratify the caprice of a prince, whom he never intended to offend, entreated that he might be put to death. This favour he eaſily obtained; but the tyrant ordered his ſon to be the executioner, telling him, that when he had cut off his father's head, he ſhould have his whole eſtate, on which the parricide drawing his ſabre, ſevered his head from his body.

A prince of a cruel diſpoſition may here give full ſcope to his inhumanity, and wontonly ſport with the lives he is under the moſt ſacred obligations to protect; he may enjoy the infernal ſatisfaction of making the torments of the guilty a ſubject of mirth; and of wantonly ſacrificing the innocent to his avarice, his humour, or his luſt. Mr. Hanway gives ſeveral inſtances of the cruelty of Nadir, that muſt ſhock every benevolent mind. A perſon, who had collected taxes, was complained of by the peaſants, of whom it appeared he had exacted more than he had accounted for to that prince: this was a capital crime, and he was therefore condemned to ſuffer death. But Nadir, as if he had recollected ſomething particular of this perſon; cried, "I under-"ſtand you can dance well; dance, and I will ſave your "life." The man immediately began to dance, doubtleſs with ſome tranſports of joy; but the ſhah ordered the executioner to ſtrike him on the legs, which preventing his performance, the tyrant cried, "The raſcal "does not dance well; kill him." After his execution he was left near Mr. Hanway's tent, whence his friends removed him in the night.

We ſhall here mention, from the ſame worthy author, another inſtance of the cruelty with which that prince abuſed the deſpotic power with which he was inveſted. The ſhah having appointed a certain captain-general as governor of a province, impoſed on it an exorbitant tax, to be levied in ſix months. At the expiration of the time the governor was ſent for to the camp, and ordered to produce the account. He did ſo, but it only amounted to half the ſum demanded. The ſhah called him a raſcal, and telling him that he had taken the other half of the money, ordered him to be baſtinadoed to death. His eſtate was then confiſcated, but the value of all his effects fell very ſhort of the ſum demanded. The ſervants of the deceaſed being then ordered to come into the ſhah's preſence, he enquired of them if any thing was left belonging to their maſter; to which they anſwered, Only a dog. He then commanded the dog to be brought before him; and obſerved, that he appeared much honeſter than his maſter had been; however, he ſhould be led through the camp, from tent to tent, and beaten with ſticks; and wherever he expired the maſter of ſuch tent ſhould pay the ſum deficient. Accordingly the dog was ſucceſſively carried to the tents of the miniſters, who hearing the caſe, immediately gave ſums of money, according to their abilities, to procure the dog's removal; by which means the whole ſum the ſhah demanded was payed in a few hours time.

The king has no privy council, as in the European governments, but acts according to his own caprice, or as he is adviſed by thoſe about him. That which moſt perplexes the miniſtry is, the cabals carried on by the women in the harram, who frequently thwart their beſt laid ſchemes; and the miniſters not only run the riſque of having their councils rejected, but, if they are contrary to the inclinations of the ladies in moſt favour, they frequently turn to their deſtruction.

By the laws of Perſia the crown is hereditary, but the females are excluded. However, the ſon of a daughter may inherit, though his mother cannot. It is alſo a law in Perſia, that no blind man ſhall be raiſed to the throne: hence, as thoſe males that proceed from the female branches are as capable of ſucceeding as thoſe that ſpring from the males, that horrid policy of putting out the eyes of all that have the misfortune to be allied to the crown, is executed upon every male of the royal family, whether they proceed from ſons or daughters; and as there are no common executioners in Perſia, the orders for putting out the eyes of the royal infants are executed by any one the king chooſes: they are even not contented, as formerly, with extinguiſhing the ſight by holding a hot iron to the eye, but the very eye-balls are ſcooped out with the point of a knife or dagger, juſt as the perſon ſent happens to be provided; and thoſe wretches not being uſed to ſuch operations, the poor helpleſs children are put to an inexpreſſible torture, and ſometimes expire amidſt the moſt excruciating agonies.

But though the crown generally deſcends to the eldeſt ſon, the king has ſometimes cauſed the eldeſt to have his eyes put out, in order to leave it to the youngeſt. Theſe barbarous practices are excuſed by the Perſians, on account of their preventing all diſputes about the ſucceſſion, and the ſpilling of much bloodſhed. They alledge, that, in this reſpect, they are more merciful than their neighbours the Turks, who deſtroy every branch of the royal family; while they, on the contrary, permit them to live, give them wives, and allow them to enjoy in the harram all thoſe pleaſures that can be reliſhed by the blind; but with what agony muſt theſe miſerable princes reflect, if they have the leaſt ſenſe of parental affection, that all the males which proceed from them will be ſerved as they have been, and have their eye-balls torn out too.

When the heir to the throne is marriageable, the ſhah generally gives him the choice of a miſtreſs among the ladies of the harram, and ſometimes of two, or more; he alſo gives him a number of domeſticks ſuitable to his rank, conſiſting of eunuchs and female ſlaves, and an apartment in the harram, to which he is confined. He is there excluded from the converſation of all men, except the eunuchs who are placed about him, and are his tutors; whence, on his ſucceeding to the crown, he is generally as ignorant of the affairs of the kingdom, as if he had dropped from the clouds.

The princeſſes of the royal blood are uſually married, as ſoon as they are of a proper age, to ſome eccleſiaſtic; but never to a miniſter of ſtate, or a man of the ſword, leſt they ſhould be inſpired with ambitious ſentiments. A princeſs is no ſooner brought to bed than the news is immediately carried to the king, who gives his orders according to the humour he happens to be in, or his regard for the parents; and there have been inſtances in which the males were permitted to live and enjoy their ſight.

The princes of the royal blood are called Mirza, as Ibraham Mirza, or Sophi Mirza; the word Mirza ſignifying the ſon of a prince.

In the harram are three ranks of women, the princeſſes who are born there, thoſe by whom the ſhah has any children, and thoſe whom he has never taken to his embraces; beſides theſe, there are a great number of others, who have the common name of ſlaves, and are employed in ſervile offices. When the ſhah dies, the ladies he has converſed with as wives are ſhut up in a quarter by themſelves, and none of them permitted to ſtir out as long as they live, except the mother of the ſucceeding prince, who has generally an almoſt ſovereign authority within the limits of the harram.

There are a great variety of beauties confined in the harram of the king of Perſia, the governors of the provinces continually ſending a freſh ſupply of young virgins from all parts of his dominions. If theſe are informed that any family has a girl of uncommon beauty, they immediately demand her; and the parents are frequently not averſe to parting with their daughter, from the hopes of her being the means of raiſing the whole family; for a young lady no ſooner enters the ſeraglio than a penſion is ſettled upon her neareſt relation: if ſhe ſo far pleaſes the ſhah as to become his miſtreſs, it is increaſed; and if he has children by her, ſhe ſeldom fails to procure the advancement of all her relations. Among theſe beauties are the daughters of the governors of provinces, and of the greateſt lords of the court; but there are many more Georgian and Circaſſian virgins of meaner birth, who, as they excel the reſt in beauty, generally captivate the monarch's heart.

The ladies of the harram ſometimes inſinuate themſelves into the favour of the king's mother, or the mother of the king's eldeſt ſon, in order that by their means they may be married to ſome great Man. The king's mother

keeps up a conſtant correſpondence with the miniſters of ſtate, who, in hopes of advancing their intereſt at court, frequently deſire her to beſtow on them one of thoſe ladies, and happy is ſhe who is thus diſpoſed of; for ſhe not only becomes his legal wife, and the miſtreſs of his houſe, but is treated as the daughter of a king. The women are alſo ſometimes married to clear the palace and leſſen the expence; but thoſe are ſeldom diſmiſſed from the harram who have been with child by the king.

The women are guarded by the white eunuchs, who keep the outward gate; but never come within their ſight: the black eunuchs are ſtationed in the ſecond court, none but the eldeſt and moſt deformed of whom attend the ladies and carry meſſages to them. The third and innermoſt guard are ſaid to be compoſed of women, who are commanded by ſome antiquated matron, who receives orders from the prince himſelf.

The women who frequent the harram relate ſurpriſing things of the jealouſies which ſubſiſt between the ladies there, and of the plots and conſpiracies of one favourite miſtreſs againſt another. Thoſe who give the higheſt entertainment to the ſhah, with their ſinging, their dancing, or their wit, are ſure of becoming the envy of the reſt. The miſtreſſes with which the king is intimate are never very numerous, and the others only ſing, dance, and play before him; but, from the diſtractions he meets with from a variety of concerts, he frequently fixes upon one who may properly be ſtiled the queen of the harram. Amidſt ſuch multitudes of rival beauties the prince is ſenſible he can gain the hearts of a very few, and ſhe whom he moſt admires has perhaps the leaſt affection for him; but happy is the lady whom he really loves, and who can make him believe that ſhe has a real fondneſs for him.

The eunuchs belonging to the king's palaces generally amount to three or four thouſand. Men of the firſt rank have uſually half a dozen in their houſes, and thoſe of inferior quality two or three. The eunuchs are uſually cut when they are between ſeven and ten years of age; for few of them ſurvive the operation if it be deferred till they are fifteen. Theſe unhappy men, if they deſerve the name, who have deſires which they can never gratify, are ſuppoſed to be the beſt guards againſt thoſe who, with the ſame deſires, have the power which they have loſt, and with them envy is a ſpur to vigilance. Beſides, as they can have no views of raiſing families of their own, they are generally very diligent in their reſpective employments, and their whole ſtudy ſeems centered in the deſire of procuring the eſteem and confidence of their lord, which they ſeldom fail to obtain. They are however ſaid to be revengeful, treacherous, and cruel, and that there is ſeldom found a man of true courage among them; but there are ſome inſtances in which they have behaved with great bravery.

SECT. XIII.

Of the Perſian Camp, with a Deſcription of the Tents of the Shah and his great Officers. Of the Camp-Market, and the Removal of the Camp: the rich Horſe-Furniture belonging to the Shah; and the Military Exerciſes of the Perſian Army.

WE ſhall now give a deſcription of the Perſian camp, as it was formed in the time of the late Nadir Shah, which we ſhall do from the account given of it by that accurate writer on the affairs of Perſia, Jonas Hanway, Eſq; In placing it a general regularity is obſerved, in proportion to the ſize and ſhape of the ground. The tents of certain principal miniſters and officers are conſtantly pitched in the front, or to the right and left of the ſhah's quarters, that ſome of them may be always near him. The circuit allotted for the ſhah's own tents was very large; one ſide of the entrance conſiſted of a line of uniform tents, ſerving for guard-rooms; and the other of the tents in which were tranſacted the affairs of the chancery and the like public concerns. About two hundred yards beyond this avenue was a pavilion, in which the ſhah uſually ſat to give audience and tranſact buſineſs. It was oblong, and ſupported by three poles, adorned with gilt balls at the top; the covering was of cotton cloth of a brick colour, and the lining of coloured ſilk. The floor was covered either with carpets or cloths, and the body of the pavilion had on each ſide a kind of alley, through which the attendants might walk round. Sometimes the ſhah ſat on a large ſopha croſs-legged, and ſometimes on a carpet on the floor. The back part of this tent is divided into ſmall apartments, where the officers attend who do not appear in his majeſty's preſence. There was nothing magnificent in this pavilion, the front of which was always open, even in the worſt weather; however, when it was extremely cold, ſeveral pots of lighted charcoal were placed in the middle.

At a conſiderable diſtance behind were the king's private tents, to ſome of which he retired at his meals; and, to render them warm, had Indian pannels, which were occaſionally ſet up, and formed the linings of two ſmall apartments. To theſe were only admitted his ſecret emiſſaries, when they had any remarkable intelligence to communicate.

Almoſt contiguous to theſe were the tents of his ladies, which differed from the others, in being divided by ſeveral curtains, that formed ſeparate apartments one within another. The boundaries of the king's quarter were occupied by eunuchs and female ſlaves, and almoſt this whole circuit, eſpecially towards the reſidence of the women, was encompaſſed by a ſtrong fence of net-work, round which the night-guard patrolled, and ſeverely puniſhed all intruders. As there were no lights, nor any tents near them, it frequently happened that people coming by night to the camp ignorantly ſtraggled thither; and, whenever this was the caſe, they were ſure to be uſed ill.

It has been obſerved, that none but the officers in immediate waiting were admitted into the royal pavilion; for the officers of ſtate and people of buſineſs ſtood in all weathers in the open air, forming a ſemi-circle at the front of the tent. If they were brought to anſwer for their conduct, they were held under the arm by proper officers, to prevent their eſcape. The ſame ceremony, with little difference, was alſo obſerved towards foreign ambaſſadors or great men.

The Perſians cover their cotton tents with a kind of glazing, to prevent their being penetrated by water. The tents of perſons of diſtinction are of various ſhapes, but generally oblong, and ſupported by three poles. The outſide is always of coarſe cotton cloth, and the inſide is either lined with the ſame, or with ſilk or woollen, according to the ſeaſons of the year and the circumſtances of the owner. The ground is ſpread with a thick cotton cloth or mat, over which is laid a carpet or woollen printed cloth of Britiſh manufacture. Beſides this covering the ſquare of the floor is encompaſſed with felts, which ſupply the place of bedſteads and feather-beds, though ſome have their beds raiſed a little above the damp earth. The top and ſides of the tents of ſome of the great officers were lined with pannels wrought with flowers, and a variety of figures. Large tents were often divided into two rooms by pannels or curtains. The back part was appropriated for the uſe of the women; but thoſe grandees who had ſeveral of them, placed their tents at a diſtance from their own, and ſurrounded them with cotton cloths to prevent their being ſeen.

The camp-market began at the end of the ſquare fronting the guard-rooms. It was about half a mile long, and conſiſted of tents on each ſide like a ſtreet, ſupplied with a variety of proviſions, apparel, horſe-furniture, and other neceſſaries brought thither for ſale. Many of the ſhop-keepers were little better than common ſutlers; but thoſe who carried on great buſineſs were under the protection of ſome of the principal courtiers, who were the grand dealers in flour and rice; and as they have many ſupernumerary ſervants, camels, and mules, they ſent them to the diſtant provinces for rice, which being brought to the camp, ſold to great advantage. But if the ſhop-keepers or other traders interfered with them in theſe branches of trade, they generally marked them out for deſtruction.

The two imperial ſtandards were placed on the right of the ſquare already mentioned: one of them was in

ſtripes of red, blue, and yellow; and the other of red, blue, and white, without any other ornament; and though the old ſtandards required twelve men to move them, Nadir lengthened their ſtaffs, and made them ſtill heavier, to prevent their being carried off by the enemy, except in an entire defeat. The regimental colours were a narrow ſlip of ſilk ſloped to a point, ſome red, ſome white, and others ſtriped.

Several hours before the moving of the camp, one of the ſtandards was taken down and carried to the place where the new camp was to be pitched, and with it went other tents belonging to the ſhah and the great men. The bulk of the army frequently marched an hour or two before the ſhah; for in removing from one camp to another he ſometimes galloped the whole way. He had about ſixty women, and near the ſame number of eunuchs, who commonly rode near his perſon. Before him were his running-footmen, preceded by his chanters, and before them the watch-guard, who were beſt acquainted with the track the ſhah was to take: theſe ſpread a mile or two before him, and terminating in a kind of angle, gave notice of his approach by crying Gerrie, or make way, which is ſometimes fatal to ſuch as cannot eſcape from them; for when they meet with people in the ſhah's route, rivers, precipices, and rocks, are no excuſe; they drive at them with their maces, and make all before them fly at their approach.

Whenever Nadir travelled with his women, the army kept at near a mile diſtance. Theſe women and others of diſtinction rode on white horſes, in the ſame manner as men; but when they were not in his company they were uſually carried on camels, and ſeated in machines reſembling a covered waggon, hung like paniers over a pack-ſaddle, being entirely concealed under a covering of crimſon cloth. Thus they rode one on each ſide, conducted with the uſual pomp. The ſick ladies and female ſervants of the court were always concealed in the ſame manner; but other women of no diſtinction rode on horſes or mules, and mixed among the crowd: they had a linen veil over their faces, and wore great coats reſembling thoſe of the men, but the poorer ſort wore a white veil which covered their whole body.

Mr. Hanway, who, at his deſire, was permitted to ſee the horſe-furniture belonging to the ſhah, ſays, that he had four complete ſets, one mounted with pearls, another with rubies, a third with emeralds, and the laſt with diamonds, moſt of which were of ſuch an amazing ſize, as hardly to merit belief; for many of them appeared as big as a pigeon's egg. He obſerves, that he was equally amazed at their immenſe value, and at the barbarous taſte in which they were ſet; for ſome of them did not appear to have any art beſtowed on them. That gentleman, on his afterwards viſiting one of the miniſters, took occaſion to mention his ſurprize at their prodigious value; which, he ſays, greatly exceeded any thing he had ever formed an idea of in that kind, though the jewels in Europe appear incomparably brighter and neater ſet; and obſerved, that if his majeſty would truſt him with one of thoſe bridles, he would procure a complete horſe-furniture to be made in Europe, that ſhould exceed any thing that had yet appeared in the world: but was informed, that the ſhah had not patience to wait till it could be finiſhed.

The pay given by Nadir to his ſoldiers was computed at a hundred crowns per annum, one with the other, beſides an allowance, which chiefly conſiſted of rice; but the expenſive manner of living in the camp rendered this large pay abſolutely neceſſary. They wear no uniform, but are obliged to buy all their cloaths of the king at an extravagant price, and to keep at their own expence yetims, or orphans, who are conſidered as their ſervants; and, when their maſters die or fall in battle, ſupply their place by ſerving as ſoldiers.

Eight or ten at a time of the ſoldiers amuſe themſelves by galloping before the army, and diſcharging their pieces at each other with powder. Mr. Hanway obſerves, that he was much ſurpriſed at their being permitted, even in the camp, to fire off their pieces, blow their trumpets, and beat their drums for their amuſement. They are ſeldom exerciſed, except in ſhooting with the bow, or with a ſingle ball at a mark, at which they are very expert. They are no leſs exact in loading their pieces; for, except it be in time of action, they weigh their powder as well as fit the ball to the bore. But the barrels of theſe pieces, ſome of which are match-locks, are ſo ill tempered, that they will not bear a quick fire. The greateſt part of their regular forces carry a muſquet and ſabre; but there are others in the army not ſo well provided; ſome having a ſpear or a battle-ax, and others a ſingle piſtol: but all of them wear ſabres, in the uſe of which they are very dexterous; but as to bayonets they have no notion of them.

Nadir, according to the cuſtom of the Perſian kings, ſays the above author, had the policy to oblige ſome, and to encourage all his army to uſe coſtly furniture: the officers, and even the ſoldiers, of rank had the bridles of their horſes mounted with ſilver, with a mane-piece of plate, and an ornamented chain. Their ſword, belts, and leathern accoutrements, were mounted with the ſame metal. The handles of their battle-axes were alſo for the moſt part ſtudded, or covered with thin ſilver plates, and in their ſaſhes about their waiſt they wore a knife, the handle and caſe of which were alſo covered with ſilver. Certain officers and perſons of diſtinction were obliged to wear their knives in gold caſes, and ſome of the great men had ſilver ſtirrups.

The armies of Perſia are never very large, conſidering the extent of the kingdom, and the diſcipline of the troops is as different as poſſible from that in Europe. As they are not troubled with much artillery, or baggage, they make ſwift marches, and frequently fall with incredible fury upon an enemy in his camp or quarters, when he leaſt expects ſuch a viſit. At other times they will cut off his proviſions, and turn the waters from their uſual courſe; and having harraſſed thoſe who invade them in a long march through a deſart country, will ſometimes fly till they have drawn them into a diſadvantageous ground, and then return to the charge. In their retreat they, like the ancient Parthians, diſcharge more arrows than when they advance.

When they are apprehenſive of an invaſion, they conſtantly withdraw all the people from the frontiers, and deſtroy the country in ſuch a manner, that the enemy can find no ſubſiſtence; for they are ſaid not to leave ſo much as a tree or a ſpire of graſs upon the ground: but they give the huſbandmen time to ſecure their grain, fruit, and forage, by burying them with moſt of their utenſils in deep pits, which they do in ſuch a manner, that it is almoſt impoſſible to diſcover them, and as the earth is very dry, they receive no damage. The army, having thus deſtroyed the country, incamp in ſeparate bodies, and, as they ſee occaſion, fall upon their enemies, and diſtreſs them in their march: ſometimes they attack a quarter of their camp in the night, and ſometimes another; and if they are unable by this means to put a ſtop to their march, they retire farther into the country, driving the people before them, and deſtroying every thing as before, and by theſe means they have defeated the greateſt armies ſent againſt them by the Turks. When the enemy are retired the people return to their lands, and rebuild their houſes with clay or ſuch materials as they find upon the ſpot.

SECT. XIV.

Of the Revenues of the Crown, and the Manner of collecting them.

WE ſhall next take a view of the revenues of the crown, and the manner of collecting them; and here it is neceſſary to obſerve, that all the lands of the kingdom are divided into four kinds: the firſt are thoſe of the ſtate; the ſecond the king's domain lands; the third are the lands of the church; and the fourth thoſe that belong to private perſons. Under theſe claſſes all the cultivated lands are included; but theſe make but a ſmall part of the kingdom, of which more than ten parts to one are deſart and uninhabited.

The lands of the ſtate contain the far greateſt part of what is cultivated. Theſe are in the poſſeſſion of the governors of the reſpective provinces, who out of them take

take their own revenue, and aſſign the reſt for the payment of their officers, and the troops they are obliged to maintain.

The domain lands are conſidered as the Shah's particular eſtate, out of which are paid the officers of the houſhold, the troops maintained by the king over and above thoſe ſupported at the charge of the reſpective provinces; and the remainder is depoſited in the treaſury.

The church-lands, if we may uſe the term, are the donations of their princes or private men, and being eſteemed ſacred, are never taxed or confiſcated for any crime whatever.

The lands which belong to private men are held of the crown for the term of ninety-nine years, on paying an inconſiderable annual rent; and at the expiration of that term they are allowed to renew their leaſe for the ſame number of years, on advancing only one year's income.

Any perſon, who deſires to build upon the uncultivated lands, or to convert any part of them into ploughed fields or gardens, may procure a grant of the king's officers for ninety-nine years, paying the uſual rent. Both the king's officers, and the private owners, let out their lands to huſbandmen, upon condition of receiving about a third part of the annual produce. The king and private owners have the ſame profit from the huſbandman's cattle, as they have from his corn; as for inſtance the third fleece, and the third part of the breed; and as there is leſs expence in cultivating fruit-trees, than in producing rice and grain, the king has ſtill a greater ſhare of the fruit.

The governors of provinces have the ſame advantages from the lands of the ſtate, to enable them to pay the officers and troops under their command. Beſides, every province frequently ſends large preſents to court of the beſt the country affords, whether cattle, ſilk, fruit, or grain; and theſe are ſent in ſuch quantities as are ſufficient for the ſupply of the king's houſhold.

The king has alſo the ſeventh fleece, and the ſeventh of the breed of the cattle in all the lands not appropriated to his uſe, which is a great addition to the revenue; for the ſhepherds of Perſia poſſeſs vaſt flocks and herds, on which they conſtantly attend, living in tents, and removing from place to place as they meet with paſture; for all men are at liberty to graze their cattle upon thoſe lands which are not the property of particular perſons, though they are deemed the king's; and this payment of the ſeventh beaſt ſeems to be an acknowledgment of his property in them. In every province is an officer named the chief of the ſhepherds, who takes the ſeventh of the ſheep, aſſes, mules, camels, and goats; but as to horſes, he is ſaid to have every third colt, and of ſilk and cotton, one third of all that is produced throughout the kingdom.

Minerals and precious ſtones belong ſolely to the king, and the money raiſed by the waters being let into every perſon's fields and gardens, is another conſiderable part of the revenue. All who are not of the religion of the country, whether natives or foreigners, pay the value of a ducat a head; every ſhop of the working trades pays ten pence, and the reſt of the ſhops twenty-pence each.

The cuſtoms and port-duties are very inconſiderable, there being no port of conſequence, except Gambroon. As for the merchandize carried into Perſia or out of it by land, they only pay a ſmall ſum for every camel's load, and in proportion for every mule and ox, without examining what are contained in the packs.

A very conſiderable part of the revenue ariſes from the confiſcated eſtates, and the preſents made by the great lords, the governors of provinces, and other perſons, particularly on New-Year's day, when, as hath been before obſerved, they make preſents to the king of every thing eſteemed rich and valuable, or that may contribute to the uſe, the ornament, and the pleaſures of life; but in the late reigns the principal revenues of the ſhah ſeem to have ariſen from the moſt cruel oppreſſions; the people in the greateſt part of the kingdom have been deprived of their whole ſubſtance by the tyranny of their princes, and the inſatiable avarice of their governors. Thoſe in high office make uſe of the moſt extraordinary and unaccountable methods of oppreſſion. Mr. Hanway gives a remarkable inſtance of this in Nadir's brother, who, when governor of Tauris, having a lame mule, aſked his groom what he might ſell it for? The groom ſuſpecting his deſign, and knowing his avarice, anſwered, "Two thouſand crowns," "Oh, "ſays he, a great deal more!" The price was at length fixed at ten thouſand, and the groom being armed with authority, demanded of every citizen and village a certain ſum for the mule, in ſuch terms as evidently ſhewed that a ſum was to be levied on them. Some, to avoid being beaten, paid him twenty, thirty, forty, or fifty crowns, till at length he came home with ten thouſand; and after all obliged a man to take the mule in good earneſt for one hundred and twenty crowns, which is the price of a ſmall one free from blemiſh. When ſuch amazing exactions as theſe are uſed, it is impoſſible to ſet bounds to the revenues of the prince or his governors; but by this means they not only have rendered the people poor and miſerable, but have forced many thouſands to fly with their families into India, and other of the neighbouring countries.

SECTV. XV.

Of the great Officers of State, the Beglerbegs and Khans, or Governors of Provinces.

THE Perſians, like the ancient Romans, prefer all men indifferently to poſts in the ſtate and army. Men of the law ſometimes command as generals and ſoldiers, and ſit as judges in the courts of juſtice: but the native Perſians are generally preferred to civil and eccleſiaſtical employments; and the inhabitants of Georgia, and other frontier countries, who are proud of being ſtiled the king's ſlaves, are frequently preferred in the army. There is ſeldom much regard paid to a perſon's birth or fortune in his promotion; but the king diſpoſes of places as he apprehends his ſubjects qualified for them. Theſe poſts they poſſeſs during life, and where they have behaved well, the children ſometimes enjoy them; and there are inſtances of a government being continued in a family ſeveral generations; but this ſeldom happens.

When the ſhah inveſts a great man with an office, his commiſſion is ſent him written on a roll of paper two or three feet long, in a large character, adorned with gold and painting, and put in a purſe of gold brocade, and with it is ſent a rich habit. When a man of the ſword is preferred, he receives, beſides the habit, a ſabre and poniard with rich hilts.

The firſt miniſter is the athemat doulet, or ſupport of the empire. No buſineſs of conſequence ought to be tranſacted without his direction; for the ſhah being uſually bred up in the women's apartment, in entire ignorance of affairs of ſtate, it is thought neceſſary for the ſafety of the people, and the preſervation of the government, that his orders ſhould be conſidered by ſome wiſe miniſter before they are put in execution.

The ſecond poſt in the government is that of the divan beghi, whoſe office has ſome reſemblance to that of our lord-chancellor. This great magiſtrate has the deciſion in the laſt reſort of all cauſes civil and criminal, except where the king in perſon ſits in judgment, which ſeldom happens, and he may command any cauſe to be removed to his tribunal from any court in the kingdom.

In the third rank are the generals; and firſt the generaliſſimo, which is an office that only ſubſiſts during a time of war. The next place is poſſeſſed by the kurchi baſhi, or general of the houſhold troops: and the kuller agaſi, or the general of the royal ſlaves.

The next poſt is that of ſecretary of ſtate, who regiſters the public acts, and has the care of the records. He has a deputy in every province, who tranſmits to him an account of all important affairs to be laid before the miniſtry.

The laſt great officer of ſtate is the mirab or lord of the water. Each province has its particular mirab, who

who takes care that the waters of the rivers and aqueducts are divided in ſuch proportions, that every part of the country may have an equal ſhare.

The officers of the houſhold are the nazir, who appears to be both lord-treaſurer and ſteward, and with him all ambaſſadors and foreigners tranſact their affairs; but there is a comptroller, and ſeveral other officers, that are a check upon him, and no ſums are paid out of the treaſury without the order paſſing under the ſeals of the prime miniſter, the nazir, and the divan beghi. The next great officer is the ichicagaſi baſhi, who commands all who attend in the outward palace, and when the king goes abroad, marches before him with a great ſtaff, covered with gold and precious ſtones. He does not ſit before the king as ſeveral other officers do of inferior quality, but always ſtands ready to obey his majeſty's orders, and ſee that they are executed.

The high chamberlain is always a white eunuch, and has great influence at court. He ſerves the king at table on his knees, taſtes his meat, dreſſes and undreſſes him, has the inſpection of the wardrobe, and the government of all the eunuchs in the palace. He carries a box covered with precious ſtones, in which are two or three fine handkerchiefs, opiums, perfumes, and cordials, with which he ſerves his majeſty when he calls for them.

The maſter of the horſe and the great huntſman are alſo conſiderable officers of the houſhold.

With reſpect to the government of the provinces, theſe are either under beglerbegs or khans. The former have the greateſt authority: their title ſignifies Lord of lords, and they have the power of life and death, as have the generals who are on the frontiers. In Nadir's time there were only three beglerbegs; but all of them were as cruel as they were powerful.

The governors of all the provinces have the title of khan, or cawn, as it is uſually pronounced: they live in great ſtate: they have all the ſplendor of ſovereign princes, and have under them the ſame officers as thoſe in the king's court. The governor alſo commands the militia of the province, and aſſigns them lands for their maintenance: he reviews them at certain times, and ſees that they are fit for ſervice.

When a governor, or any other great officer, returns from his command, which he muſt not do without expreſs orders, he always attends at the gate of the palace, where, having given notice of his arrival, and that he begs leave to throw himſelf at his majeſty's feet, he is uſually admitted; but if he has behaved ill in his poſt, inſtead of an anſwer, orders are given to take off his head.

The receivers of the king's revenues uſually oppreſs the people without mercy, under the pretence of the neceſſities of the ſtate. They generally obtain their places by making preſents to the eunuchs, or other favourites at court, and by engaging to increaſe the revenue of the province beyond what it had ever been; and in this they uſually keep their word. Indeed complaints are often carried to court againſt them, but, by the artifices of the miniſters who have obtained a ſhare in the ſpoils, they are frequently prevented getting acceſs to the king for a conſiderable time. Indeed the great men dare not openly oppoſe any perſon's petitioning the ſhah; but when the governors perceive that the country ſends commiſſioners to court to repreſent their grievances, they prevail on their friends to endeavour privately to divert them from it; and if they cannot prevail, their patrons at court are directed to make them large promiſes of redreſs, and if poſſible to ſend them back without ſeeing the king. If they find this impracticable, and the people ſtill inſiſt on demanding juſtice, the courtiers adviſe the king's receiver to proceed in a milder manner for the future; upon which the complaints againſt him are generally huſhed up.

When the complaint is from a large province, ſeveral hundreds of the perſons aggrieved uſually come up with it to the palace gate, where, with lamentable cries, rending their cloaths, and throwing duſt into the air, they demand juſtice. If they come to petition an abatement of their rents or taxes, on account of a drought or unſeaſonable weather, they come with branches of trees, or ſuch as have their leaves devoured by locuſts. The king ſends to be informed of the occaſion, and the people preſenting their petition in writing, it is referred to the examination of ſome great officer.

The receivers are ſeldom puniſhed with death, unleſs they have defrauded the king, in which caſe they infallibly loſe their heads.

SECT. XVI.

Of the Laws of Perſia, the Manner in which they are adminiſtered, and the Puniſhment of Criminals.

THE laws of the Perſians are blended with their religion, agreeably to the grand principle of the Mahometans, that the ſame perſon ought to bear the ſpiritual and temporal ſwords, and be both king and high-prieſt: that he ſhould command in war, and adminiſter juſtice, as well as explain the articles of faith and regulate their eccleſiaſtical diſcipline; and with this power both Mahomet and his ſucceſſors the caliphs were inveſted during the firſt five centuries. The Perſian doctors maintain, that the civil magiſtrate ought to have no farther concern in the adminiſtration of juſtice, than in executing the ſentences of the prieſt. But this is now far from being the caſe, the civil power having in a great meaſure ſwallowed up that which antiently belonged to the eccleſiaſtical.

In nadir's time the camp and court were the ſame, and the eccleſiaſtical as well as civil and military officers always attended. The chief adminiſtrators of the law were the mullah baſhi, and the naibſædar, who are judges both in eccleſiaſtical and civil concerns. The kaſræſkar is judge of the army. But in towns the higheſt eccleſiaſtic is judge, and tries civil cauſes under the governor, who generally refers the parties to him; and upon the receipt of his verdict the governor gives a final judgment. Military people, however, have ſeldom their cauſes tried by the latter. Theſe governors are often as deſpotic as ſovereign princes; and though they are accountable for all their actions, and have often their ears cut off, their noſes ſlit, and are ſeverely beaten on their back, baſtinadoed on their feet till their nails come off, and frequently ſtrangled by order of the ſhah, they ſeldom abſtain from acts of oppreſſion.

Their principal book of laws is the Koran; beſides which they have a few other religious works, which they have recourſe to in the deciſions made by the courts. There ſeems indeed but little occaſion to conſult them, where either the king or the governors of provinces ſit in judgment; for their determinations are entirely arbitrary, and they pay no regard either to the Koran or any other books. Were the Mahometan laws, with the interpretation put upon them by the Imams, ſtrictly obſerved, Chriſtians would be unable to live in Perſia, by their being daily plundered and abuſed, in purſuance of ſome precept or paſſage in the Koran; but both the prieſts and the people are become more moderate, and have leſs of a perſecuting ſpirit than formerly; and the temporal courts take care that theſe laws are ſeldom put in execution.

Though the ſpiritual and temporal courts differ ſo widely in their determinations, no diſputes ever ariſe between them; for the temporal courts having the government on their ſide, are never oppoſed by the ſpiritual, and indeed each of them have a diſtinct branch of buſineſs aſſigned them. The eccleſiaſtical courts meddle chiefly with marriages, divorces, deeds and contracts, the ſucceſſion of eſtates, and other litigious matters; while the temporal courts are either employed about criminal cauſes, or ſuch as are plain and obvious. As the former proceed in an arbitrary and ſummary way, they generally finiſh the cauſe at one hearing; but as the others proceed according to written laws, they are more tedious and expenſive.

When a perſon either cannot or will not pay his debts, he is delivered up to his creditor, who may impriſon him in his own houſe, ſet him to work, beat him, and treat him as he pleaſes, ſo he does not kill or maim him. He may alſo ſell the debtor's eſtate and goods, and

and even his perſon, wife, and children, towards the payment of the debt; but they ſeldom proceed to ſuch cruel extremities.

Facts are proved in the courts of Perſia by living witneſſes, and no title is given by preſcription. A man is allowed at any time to claim his right, and even the parties own deed is of no force, if he can ſhew that he was impoſed upon, or fraud was uſed in making him ſign it. Where there are no witneſſes, an oath is tendered to the perſon who denies the charge. Upon this occaſion the judge ſends for the Koran, which being brought him in a linen cloth, he himſelf and all the court riſe up, out of reſpect to the ſacred book. The judge then taking it in both his hands, kiſſes it; and touches it with his forehead; and having opened the book, offers it to the perſon who is to ſwear, who kiſſes it in the ſame reverend manner the judge had done, and putting his hand upon it open, ſwears to ſpeak the whole truth. When a perſon of a different religion is to take an oath, the judge ſends an officer with him to a prieſt of the ſame religion: a Chriſtian ſwears upon the Goſpels, and a Jew on the Old Teſtament. When they have been thus ſworn they return to the court, and offer what they have to ſay. The reaſon they do not ſwear an unbeliever on the Koran is, not only becauſe he does not regard it as a ſacred book, but leſt he ſhould prophane it, for ſuch are even forbidden to touch its cover.

When a perſon thinks himſelf aggrieved, he draws up a petition in ſuch terms as he thinks proper, and preſents it to the judge, who writes in the margin an order for bringing the perſon accuſed before him; and one of the judge's ſervants goes with it immediately to the defendant's houſe, and brings him with him. Being allowed time for producing the witneſſes, each party pleads his own cauſe before the judge, without the aſſiſtance of counſel, and frequently with much noiſe and clamour, ſo that the judge is ſometimes obliged to render them more orderly by cauſing them to be cudgelled. When the parties have offered what they had to ſay, and examined their witneſſes, the judge proceeds to give ſentence.

The women likewiſe plead for themſelves as well as the men, but with much more clamour; but as they are ſet in a part of the court by themſelves, and veiled, this doubtleſs gives them greater aſſurance. They have ſeldom any other buſineſs in a court of juſtice but to ſue for a divorce, and they uſually plead the impotence of the huſband, and make ſuch a crying and howling, that they in a manner deafen the judge, who muſt not order them to be beaten as he does the men when they grow too clamorous.

There are no public halls erected for trying cauſes; but every magiſtrate hears them in his own divan, or ſome convenient room in his garden, where he has no other aſſiſtant but his clerk, who underſtands the law; and as there are no pleadings in writing after the firſt petition, abundance of time is ſaved, and a ſentence ſoon obtained.

The temporal courts uſually conſiſt of three perſons: theſe are the preſident of the divan, the governor of the city, and the nazir, who decide all criminal caſes. As there are no public priſons, there are neither ſheriffs nor jailors, but every magiſtrate confines the criminal in ſome part of his own houſe 'till he is brought to his trial, which is generally within twenty-four hours after he is taken; and ſentence is no ſooner paſſed than it is executed, the judge's ſervants performing the offices both of jailors and executioners.

The proceedings in the criminal courts are nearly the ſame as in the civil. The party aggrieved preſents his petition to the magiſtrate, who ſends his ſervant to apprehend the offender and bring him before him; and when he has been examined ſome time the ſame day, or at fartheſt the next, he is ordered to prepare for his trial.

The condemnation of a malefactor in Perſia is conducted with very little ceremony, nor is the execution attended with any pomp. He is generally conducted to a field or open place near the reſidence of the judge, and the executioner cauſing him to kneel, the delinquent pronounces his creed, There is but one God, Mahomet is his prophet, and Ali his friend; and then, if he is to be beheaded, his head is taken off with the motion of a ſabre in a thruſting cut, which in drawing it back compleats the operation.

In caſes of rebellion the late princes of Perſia have been entire ſtrangers to humanity, and not ſatisfied with puniſhing the principals, moſt, if not all thoſe who were taken in arms, loſt their eyes or their heads; and it is impoſſible to read the accounts given by Mr. Hanway of the cruelties exerciſed over the people without being ſtruck with terror and compaſſion. As that gentleman was returning to Aſtrabad, where a rebellion had been ſuppreſſed, in which he was a ſufferer, he met ſeveral armed horſemen carrying home the wretched peaſants whoſe eyes had been cut out, the blood yet running down their faces. Near the entrance of the city ſtood two pyramids, one on each ſide, built of ſtone, and made full of niches, with a human head in each. Theſe pyramids were about ſixteen or twenty feet in diameter at the baſe, and roſe gradually near forty feet to a point, at the top of which was a ſingle head. This being towards the cloſe of the execution, the greateſt part of the niches were filled; ſeveral of the heads had beards, and being ſet a little projecting added to the horror of the view.

Criminals of ſtate are alſo ſentenced to wear for a determinate time a heavy wooden collar about their neck, to which one of their hands is ſometimes faſtened.

If a perſon has the misfortune to kill another, and the fact be proved before the judges, the offender is not puniſhed by the court, but delivered up to the relations of the deceaſed for them to put him to death in what manner they pleaſe. In this caſe all the relations and friends of the deceaſed aſſemble, and with loud cries demand the blood of him who has murdered their kinſman, which the magiſtrate ſeldom fails to promiſe them. But ſometimes the murderer, by his preſents to the judge, and to the relations of the deceaſed, procures his pardon. When the relations will be ſatisfied with nothing leſs than his life, the judge thus addreſſes them: "I deliver you the murderer according to law; make "yourſelves ſatisfaction with his blood for the blood "that he has ſpilt; but remember that God is merci-"ful." The judge's ſervants are then ordered to follow the directions of the proſecutors, and guard him to what place they deſire; and they follow the criminal, curſing, beating, and abuſing him all the way. When he comes to the place appointed, the miſerable wretch is delivered to the relations, who ſometimes inflict on him the moſt cruel tortures they can invent; and it is ſaid that the women, who ſcarce ever appear abroad on any other occaſion, will come and imbrue their hands in his blood.

Ordinary crimes, where the parties are men of ſubſtance, are uſually puniſhed with fines; but where they are poor they baſtinado them on the ſoles of their feet, giving them a certain number of blows, not under thirty, nor exceeding three hundred.

Pick-pockets and pilferers are marked with a hot iron in the forehead, and houſe-breakers have their right hand cut off. The ſame puniſhment is inflicted on thoſe who counterfeit the coin for the firſt offence; but for the ſecond their bellies are ripped open. This puniſhment is inflicted in the following manner: the criminal's feet are tied to a camel, with his head hanging down to the ground; his belly is then ripped open, and his bowels falling over his face, he is dragged through the principal ſtreets, an officer marching before him, and, with a loud voice, informing the people of the nature of his crime. Afterwards he is hung up by the heels upon ſome tree, and they ſay, that it is ſometimes ſeveral hours before he expires. They have ſome other puniſhments for capital crimes, as impaling, ſetting them up to the chin in the earth, precipitating a criminal from a high tower, cutting off the hands and feet, and leaving the poor wretch in that condition till he expires.

They ſometimes uſe tortures to extort a confeſſion, as by pinching off the fleſh with red hot pinchers; but the moſt uſual way of examining offenders is while they are beating the ſoles of their feet.

Bakers and victuallers have been ſometimes baked and roaſted alive, for cheating in their weights, and raiſing proviſions to an exorbitant price: but this is only in time of great ſcarcity; the uſual puniſhment in theſe caſes is a fine or the baſtinado.

Thus we have fully deſcribed the government of the once potent empire of Perſia, now ruined and laid waſte by tyranny and rebellion. In this account the reader, whoſe heart is ſenſible of the tender feelings of humanity, and whoſe boſom glows with a generous love of liberty, muſt have been frequently ſhocked and filled with pity and indignation; while his mind recurring back on his native iſle, the ſeat of liberty, he bleſſes Providence, and rejoices that he is born a Briton. Happy the land, and happy the king, whoſe hands are tied with the radiant bands of mercy! who, like the Univerſal Monarch, is guided by juſtice and clemency! who, as the brighteſt angel of heaven, is bound by laws ſacred and inviolable, and whoſe ſupreme delight conſiſts in the happineſs of his people! While the tyrants of the Eaſt boaſt of the baleful freedom of doing ill, of the power of imitating Satan, by being the tormentors of their ſubjects, and glory in being the ſovereigns of ſlaves; let the monarchs of Britain glory and rejoice in the ſuperior dignity of diſpenſing happineſs, and in the nobler titles of being the fathers of their people, the kings of freemen, the guardians of liberty, the protectors of the laws.

SECT. XVII.

Of the Iſle of Ormus, and the Settlement at Gambroon.

BEFORE we take leave of Perſia, it is proper to take notice of the iſle of Ormus, and of Gambroon, where the Engliſh have enjoyed conſiderable privileges, and which is the only place where we have any ſettlement on the coaſt of Perſia.

The city of Ormus was ſeated on an iſland of the ſame name, at the entrance of the Perſian Gulph, in twenty-ſeven degrees thirty minutes north latitude, about two leagues from the continent. It is near ſix leagues in circumference; yet has neither freſh water nor graſs upon it, and only a ſalt ſulphureous ſoil: but formerly its happy ſituation, and the goodneſs of its harbour, were conſidered as ſuch advantages, that the Arabians uſed to ſay, that if the world was a ring, Ormus ought to be conſidered as the diamond of it. A city had been built there by the Perſian kings, and it had for ſome ages carried on a conſiderable trade, when in 1507 it was taken and fortified by the Portugueſe, who obliged the king of Ormus to acknowledge the king of Portugal for his ſovereign, and to pay him tribute: after which they engroſſed all the commerce of thoſe parts to themſelves. At length Shah Abas, provoked at their inſolence, and particularly at their having given protection to Gabrieli, an Italian, who had fled from Perſia, engaged the Engliſh to join with him in reducing the place, which they attacked and carried in 1622; after which the Perſians demoliſhed the houſes, which amounted to four thouſand in number, and contained near forty thouſand inhabitants.

The Perſians ſome time after rebuilt the fort, and placed a garriſon in it; but they could never reſtore its trade. It is however ſtill the key to Perſia; but the heat of the iſland is frequently ſo exceſſive, that the inhabitants, 'tis ſaid, would be ſometimes ſtifled, did they not for hours together continue up to the neck in water. It is, however, at preſent almoſt deſerted, for it produces nothing but ſalt, which ſometimes lies two inches deep upon the ſurface of the earth.

Till the late civil wars, which have ſo dreadfully laid waſte the greateſt part of Perſia, the Engliſh Eaſt India company had two conſiderable factories in that kingdom, one at Iſpahan, and the other at Gambroon. The head of each factory was called their agent, and lived in as great ſtate as a nobleman. At the commencement of the civil wars the agent at Iſpahan had a retinue of no leſs than thirty or forty ſervants, and his houſe was an elegant building after the manner of the Perſian palaces, in the midſt of a fine garden. His horſes, ſervants, and equipage, when he went abroad, reſembled thoſe of a prince, and his furniture was covered with gold.

The agent at Gambroon had leſs grandeur, but equal advantages: the trade there has however ſuffered greatly by the misfortunes of Perſia. But the company ſtill maintain a noble factory, in which all their trade in the Perſian empire is carried on.

Gambroon, or Gombroon, is ſituated in the province of Farſiſtan, in twenty-ſeven degrees forty minutes north latitude, and is called by the natives Bander Abaſſi. It ſtands in a bay nine miles to the northward of the iſle of Ormus.

The Engliſh Eaſt India company began to ſettle here about the year 1613, and afterwards, as a reward for the ſervices performed by that company againſt the Portugueſe in the reduction of Ormus, Shah Abas granted them half the cuſtoms of Gambroon. This revenue was however reduced to a thouſand tomans a year, which in our money amounts to three thouſand three hundred and thirty-three pounds ſix ſhillings and eight-pence; but even this has been ill paid. The city is two or three miles in compaſs, and ſtands on a level ground cloſe to the ſea, the country on almoſt every ſide riſing inſenſibly for ſome miles without any conſiderable hill, except towards the north. Near it is the narroweſt part of the gulph of Perſia, and oppoſite to it lies the coaſt of Arabia at about ten leagues diſtance. Three leagues behind Gambroon are very high mountains covered with trees, and abounding with water. However, the territory belonging to this city is dry and barren, it conſiſting only of a moving ſand.

The town on the land-ſide is ſurrounded by a wall, and it has two ſmall fortreſſes. The houſes are computed at fourteen or fifteen hundred, one-third of which belong to Indian Gentoos, a few of them are inhabited by Jews, and the greateſt part are in the poſſeſſion of the Perſians; the reſt belong to the Engliſh, French, and Dutch companies. The governor of the province uſually reſides in this city, and not at Neris, the capital, which is ten days journey from thence: he has a pretty large and commodious palace at the end of the town, at the greateſt diſtance from the ſea, built with ſtone taken from the iſle of Ormus. The beſt houſes are built with bricks dried in the ſun, and ſtand cloſe to each other, being flat on the top, with a ſquare turret that has holes on each ſide for the free paſſage of the air into the houſes. Upon theſe roofs thoſe that ſtay in the town ſleep every night during the ſummer ſeaſon. The houſes belonging to the Engliſh and Dutch are as well built as any in the town, and are ſo near the ſea-ſide that at high-water the tide comes up to the very walls. Their merchandize is depoſited in the lower rooms, and the upper ſerve for lodgings, on account of their having the advantage of being more expoſed to the air. The common people have wretched huts made of the boughs of palm-trees, and covered with leaves. The ſtreets are narrow, irregular, and not kept very clean.

Gambroon has no port, but the road is as large and ſafe as any in the known world; yet it has one great inconvenience, which is, that the veſſels which ſtay there during the ſummer are frequently much damaged by the worms.

The water of Gambroon being very brackiſh is drank by none but the poor, and is taken out of pits dug three fathom deep in the ſand. People in eaſy circumſtances drink the water of Iſſeen, a large and fine village at the foot of the mountains; and the common people, who cannot be at the expence of having it brought ſo far, drink the waters of Mines, a village ſituated a league from the port.

The air of Gambroon is not only extremely diſagreeable, but unhealthful: the wind changes four times a day almoſt throughout the year. From midnight to break of day it blows from the north and is cold; from break of day till ten or eleven o'clock in the morning, it blows cold from the eaſt; but a hot ſouth wind riſes about three o'clock, which changes to the weſt at ſunſet, and blows hot till midnight. Theſe ſudden changes of the air, from cold to hot, produce many diſeaſes fatal to foreigners, particularly the dyſentery, the bloody flux, and malignant fevers. In ſhort, the weather is ſo

ſo exceeding hot and unhealthful, in the months of June, July, and Auguſt, that the Engliſh factory, during thoſe months, reſide at Iſſeen.

Gambroon is ſupplied with plenty of very good proviſions, particularly fiſh, which are brought aſhore morning and night; they ſometimes catch antelopes and partridges; but the natives live principally on milk and plants, of which there are a great variety.

As it ſeldom rains here, no graſs or herbs are to be ſeen about the city, except what is produced with incredible labour in the gardens, where they have cucumbers, onions, garlic, chibols, and radiſhes. The city is chiefly furniſhed with fruit and pulſe from the iſle of Kiſmiſh, which lies twelve miles to the ſouthward, and is forty-five miles long, and nine broad. In June and the reſt of the ſummer months this iſland produces oranges, lemons, grapes, peaches, damſcenes, quinces, pomegranates, and mangoes; and in October apples, pears, citrons, melons, almonds, piſtachios, and ſeveral other fruits in ſuch quantities, that they are as cheap at Gambroon, as perhaps in any other part of Perſia.

In Gambroon the people of ſuperior rank are dreſſed after the Perſian manner, but the poorer ſort of both ſexes go naked, except wearing a cloth to cover what decency requires them to hide. There are here people of ſeveral different nations, beſides the Perſians and Europeans, and the Banyans of India are ſo numerous, that they bribe the governor not to permit any cows to be killed in the city.

As the winter ſeaſon, when the heats are leſs violent, laſts from October to May, this is their chief time for trading, and the Perſians, Arabians, Banyans, Armenians, Turks and Tartars, come hither with the caravans, which ſet out from Aleppo, Bagdat, Iſpahan, Shiras, and Baſſora, under the convoy of guards. The Engliſh and Dutch come hither by ſea, and beſides ready money, bring cloth, and various other European and Indian commodities, which they exchange for Perſian tapeſtry, raw ſilk, goats wool, cotton, rhubarb, ſaffron, and roſe-water, which is made in vaſt quantities near Shiras, either by infuſion, which they call gullab, or by diſtillation; and this laſt they call arekakull, or the ſweat of roſes. As the Perſians have not a ſingle ſhip, all the navigation of that kingdom is carried on by foreigners.

All bargains at Gambroon are made for ſhahees, in which the company keep their accounts, reckoning each ſhahee at four-pence, though that coin is rarely met with; but inſtead of it the coz and mamooda are every where current. Ten coz, or pice, make one ſhahee; two ſhahees are one mamooda; two ſhahees and five coz are one laree; two mamoodas are one abaſſee; four mamoodas are of the value of one Surat rupee; fifty abaſſees or two hundred ſhahees make one toman; and thirty-one or thirty-two ſhahees are a chequeen.

As to the weights of Perſia, one maund tabres is ſix pound three quarters; one bazar maund tabres is ſix pound one quarter; one maund copara is ſeven pound three quarters in the Engliſh factory. One bazar maund copara is from ſeven pound and a quarter to ſeven pound and a half. One maund ſhaw is two maund tabres. One miſcall is two penny-weights, twenty-three grains, twenty-four decimals.

CHAP. XXV.

Of the CASPIAN SEA, and the ASIATIC TARTARS bordering upon it, and upon the North of PERSIA.

SECT. I.

Of the Caſpian Sea.

BEFORE we take notice of the different nations of Tartars ſituated near the Caſpian Sea, it will be proper to give ſome account of that vaſt collection of waters, which is improperly called a ſea, as it has no viſible connexion with the ocean; nor does it ebb and flow; but it muſt be acknowledged to be the greateſt lake in the known world. It is ſituated between thirty-ſix degrees forty minutes north latitude, and between forty-ſeven degrees fifty minutes eaſt longitude, and is about four hundred miles in length from north to ſouth, and three hundred in breadth from eaſt to weſt; but in many places it is much narrower. The water is ſalt, and ſome diſtance from the ſhore Mr. Hanway endeavoured in vain to find a bottom with a line of four hundred and fifty fathoms. The water has riſen within thirty years ſo conſiderably, that it has made great inroads on the Ruſſian ſide for ſeveral miles, both to the eaſt and weſt of the Volga, and has rendered the adjacent country extremely marſhy. Nor has it been more indulgent to the Perſians; for it is ſaid, that in the beginning of the preſent century, the land for about eight Engliſh miles on the ſide of Langarood river was dry and well inhabited, which is the more probable as the tops of ſome houſes riſe above the water. The ſame thing is reported of Aſtrabad, where the inhabitants affirm, that fifty years ago the bay was fordable by aſſes, though it has now two fathoms water.

The neighbouring inhabitants have a tradition, that the waters of the Caſpian ſea riſe during thirty years, and then for the ſame ſpace of time decreaſe. But it ſeems more probable, that the law of nature, which every where elſe produces a change in this element, by exhaling it in vapours, that form rain, hail, and ſnow, not only to refreſh and give fertility to the earth, but to ſupply the ſprings of rivers, muſt diſpoſe of theſe waters in the ſame manner. As this vaſt lake is the grand reſervoir that receives the vaſt rivers which flow from the mountains and tracts of land by which it is ſurrounded, it is alſo the reſervoir from which theſe tracts are watered, and from whence the many great rivers that fall into it are ſupplied. The great Dr. Halley has demonſtrated by very nice experiments and calculations, that the vapours ariſing from the Mediterranean ſea are more than ſufficient to ſupply all the rivers that fall into it. It is therefore highly probable, that the reaſon why the waters of the Caſpian are riſen higher than formerly, is from there having been more moderate ſummers, in which a ſmaller quantity of vapours has been exhaled.

SECT. II.

Of the CALMUC TARTARS.

Their Perſons and Dreſs, with the Manners, Cuſtoms, and Way of Life, of different Tribes of them.

THE country of the Calmucs, alſo called by different authors Khalmucks and Kalmucs, is bounded by Siberia on the north, by the country of the Mongols on the eaſt; by Tibet and Uſbec Tartary on the ſouth, and by the Caſpian ſea, and the kingdom of Aſtracan, which is ſubject to Ruſſia, on the weſt. Theſe people are not under any one ſovereign, but are divided into ſeveral tribes, ſome of which are ſo conſiderable as to appear formidable to the Ruſſians; but the greateſt part of them are at peace with that crown, and many of them are tributary to it.

The Calmucs are thick and low of ſtature, their countenances are far from being agreeable; for they have flat faces, ſmall eyes ſunk far into their heads, and ſuch ſhort noſes, that at a little diſtance they ſeem to have none at all. Their beards are thin and ſtraggling, and yet ſo ſtiff and long, that the hair ſeems like that of a horſe or goat, and it frequently grows in the middle of their cheeks, where other people have none.

The men wear ſhirts of a ſort of calicoe, their breeches are made of the ſame, and often of ſheep's ſkins, but they are extraordinary wide, and in the ſouthern provinces they wear no ſhirts in ſummer, contenting themſelves with a kind of ſheep's ſkin doublet without ſleeves, which they put on next their ſkin with the woolly ſide outward, tucking their ſkirts into their breeches, ſo that the whole arm is left bare up to the ſhoulders; but in the northern provinces they wear a ſhirt, and in winter a ſheep's-ſkin-coat over their doublets, which reaches to the calf of the leg, and to keep them the warmer turn the woolly ſide inwards. Theſe upper ſkins have ſleeves of ſuch a length, that when they are going about any work they are obliged to turn them up. They wear on their heads a little round bonnet, commonly edged with a border of fur, and adorned with a tuft of ſilk or hair of a bright red. Their boots are exceſſive wide. The women, in ſummer, wear no other cloathing than a calicoe ſhift, and in winter a long ſheep-ſkin gown, with a bonnet like that of their huſbands.

Red is the colour in higheſt eſteem among them; and how ill cloathed ſoever their princes may be, they never fail to have a ſcarlet robe for ſtate occaſions; nor do women of rank think themſelves well dreſſed if a ſcarlet gown be wanting. Indeed all over the north of Aſia a man will do more for a piece of red cloth than for four times its value in ſilver.

The Calmucs dwell either in tents or huts, made round with great poles of light wood joined together with leathern thongs. For the more eaſy ſetting up and removing them, they are covered on the outſide with a thick felt for a defence againſt the cold and rain. In the middle of the roof they leave an opening, which ſerves both for a window and a chimney, and there are places to ſleep on round the hut againſt the wall. Perſons of diſtinction have thoſe that are larger and more convenient. In ſummer they have alſo tents of calicoe, and in winter ſheds made of boards and covered with felt, which they can ſet up and take down in leſs than an hour's time.

The few fixed habitations of the Calmucs reſemble the huts, except the roof being in the form of a dome, the whole conſiſting of a ſingle room twelve feet high. In ſome places they have conveniencies for ſleeping upon, built two feet from the ground, and four feet broad, which run quite round the houſe, and ſerve at the ſame time for a chimney, for they have invented a way of making a fire without on one ſide of the door, and the ſmoke encircling the building by means of this chimney, which runs round it, has no paſſage out but at the other ſide of the door, which conveying a moderate heat to the place on which they ſleep, is very convenient in winter. All their habitations, whether fixt or moveable, have their doors facing the ſouth to avoid the north winds, which are very piercing. Their moveable habitations are carried on waggons.

Jonas Hanway, Eſq; gives a deſcription of a ſmall ſettlement of the Calmucs, in which the huts nearly agree with this deſcription, only the ſmoke iſſues out of a hole at the top. The people that gentleman deſcribes are miſerably poor, and inſtead of ſubſiſting on their herds and flocks, live on the fiſh they take on the Volga, and dry in the ſummer their winter's proviſions. Theſe prefer living on the banks, where the flags and ruſhes being grown to a great height, are ſome defence againſt the rigors of winter. There are ſeldom ſeen above ſeven or eight tents, which contain thirty or forty perſons, in a place.

The ſame worthy author deſcribes another ſettlement of theſe people in a valley near Zaritzen, in forty-ſeven degrees thirty minutes latitude, and obſerves, that theſe people continue in friendſhip with the Ruſſians no longer than they awe them by their power. Theſe are armed with bows and arrows, and feed on the fleſh of horſes, camels, dromedaries, and other animals; and eat the entrails, even when the beaſt dies of the fouleſt diſtempers. They throw their dead into the open fields, to be devoured by dogs, many of which run wild, and ſome are kept for that purpoſe; and if the body be devoured by a number exceeding ſix, they think honourably of the ſtate of the deceaſed, otherwiſe he is a diſgrace to his relations. They worſhip images, which generally conſiſt of a ſmall bit of wood about a palm in length: the upper part of it being rounded, is adorned with ſome rude marks in imitation of human features; and the figure, being thus prepared, is dreſſed up in rags. The many acts of violence committed by theſe barbarians have at length induced the Ruſſian government to compel them to take up their habitations on the banks of the Volga, below Aſtrachan, where they have a leſs field for robbery and murder.

Many tribes of theſe people move from place to place during the ſummer, and it is ſaid there are frequently no leſs than eight or ten thouſand of them in a body, driving large flocks and herds before them. They uſually begin their march in ſpring, and as they make eaſy journies leave ſcarce any herbage behind them in the country through which they paſs. In autumn, when there is a ſecond crop of graſs, they generally return the ſame way they came; and in the winter live in more ſubſtantial and warmer huts than they uſe in the ſummer; but the people and their cattle frequently live together in the ſame room.

Though the country through which they paſs is ſituated in as fine a climate as any in the world, they never cultivate the land, but live upon their cattle, which conſiſts of camels, horſes, cows, and ſheep. Their horſes are very good and mettleſome, and their oxen are ſaid to be the talleſt in the known world. Their ſheep are alſo very large, with very ſhort tails, buried in a caſe of fat, but the wool is very long and coarſe; they have a bunch upon the noſe, and hanging ears like thoſe of the hound.

Their principal food is horſe-fleſh and mutton; for they ſeldom eat beef, which they do not think near ſo good; and as for hog's fleſh and poultry they never eat any. Inſtead of cows-milk they uſe that of mares, which they think much better and richer; beſides the cows in the greateſt part of Grand Tartary will not be milked. As ſoon as they have ſuckled their calves they will ſuffer none to draw their teats, and upon being ſeparated from them immediately loſe their milk. From mares-milk they prepare a kind of brandy, which they diſtil from it after it is turned ſour; and, in imitation of the Indians, their neighbours, they give it the name of arrack.

The Tartars are in general fond of ſtrong liquors, and when they can get any continue drinking as long as they can ſtand. When they have a mind to be merry, each brings what liquor he can procure, and they drink night and day till all is ſpent. This love of tipling prevails among them in proportion as they dwell more to the north; and they are no leſs fond of tobacco.

They take as many wives as they chooſe, beſides concubines, whom they take from their ſlaves; and it is ſaid not to be unuſual for the father to marry his own daughter. They ceaſe lying with their wives when they are near forty years of age, and from thence-forward conſider them only as ſervants, to whom they give victuals for taking care of the family and attending the young wives who ſucceed in their places.

The children born of concubines are as legitimate as thoſe of the wife, and as capable of inheriting; but if the father has been khan or chief of ſome tribe, the iſſue of the wives ſucceed before thoſe born of concubines. However, the off-ſpring of common proſtitutes are looked upon with contempt, and ſeldom ſucceed their fathers, becauſe it is not eaſy to know whether the perſon to whom ſuch a woman lays a child be the real father.

Polygamy is attended with leſs inconvenience among them than the reſt of the Aſiatics, their wives being of great ſervice, and little expence to them; for the old manage the family, take care of the cattle, and provide for

for the ſubſiſtence of them all, while the huſband has little elſe to do but to ſleep and follow his diverſions.

Nothing can equal the reſpect which the children of all ages and conditions are accuſtomed to pay their fathers, whom they conſider as the kings of their families; but they ſet little value on their mothers, except they are under any particular obligations to them. They lament a father many days, denying themſelves all pleaſures, and the ſons muſt even abſtain for ſeveral months from the company of their wives. Nothing is ſpared to do honour to a father at his funeral, and at leaſt once a year they pay their devotions at his tomb, and call to mind the obligations they owe him.

Mr. Voltaire ſays, in his Hiſtory of Peter the Great, that in 1720 was found in this country a ſubterraneous houſe of ſtone, ſome urns, lamps, and ear-rings, an equeſtrian ſtatue of an oriental prince, with a diadem on his head, two women ſeated on thrones, and a roll of manuſcripts, which was ſent by Peter the Great to the Academy of Inſcriptions at Paris, and proved to be in the language of Tibet. "All theſe monuments plainly "ſhew, ſays the above author, that the liberal arts "formerly reſided in this barbarous country, and are "a laſting proof of the truth of what Peter the Great "ſaid more than once, that thoſe arts had made the tour "of the whole world."

In the reign of Peter the Great the Calmucs traded to Aſtrachan and to Tobolſki, the capital of Siberia, bringing with them great quantities of very fine ſalt, which their country afforded, receiving Ruſſia leather and iron-ware in exchange; but the Czar commanding one of his generals to march into the country of the Calmucs, to take poſſeſſion of their ſalt-works, and build a fort there; this was ſo highly reſented, that they forbore to go to the fair of Tobolſki, and even choaked up the mouth of the river Duria, whch falls into the Caſpian ſea, to which the Ruſſians uſed to go in ſearch of gold duſt. As this river was likely to prove of conſiderable advantage to the Ruſſians, both on account of the gold duſt, and in ſettling a trade with the Uſbec Tartars and India, the Czar built two forts at its mouth, without any diſturbance at firſt from the Tartars; but his forces marching farther into the country, where they diſperſed in ſearch of proviſions, they were all ſurrounded and cut to pieces, with prince Bekewitz, their general, who was a native of Circaſſia, and the two forts were afterwards ſurpriſed and demoliſhed.

SECT. III.

Of the Usbec, Crim, Kirgeese, *and* Lesgee Tartars. *Their Cuſtoms, Manners, and Way of Life.*

USBEC Tartary is bounded on the north by the country of the Calmucs, on the eaſt by Tibet, on the ſouth by India, and on the weſt by Perſia and the Caſpian Sea.

Theſe Tartars, like their neighbours, are at preſent divided into ſeveral tribes governed by their reſpective princes; when they were united under one ſovereign, they were the moſt powerful of all the Tartar nations, and are ſtill dreaded by Perſia and India, into which they frequently make incurſions; but their tribes not being very numerous, they ſatisfy themſelves with plundering and ravaging the country, without pretending to make conqueſts. The principal khans pride themſelves on being deſcended from Tamerlane.

With reſpect to the perſons of the Uſbecs, they are ſaid to have better complexions and more engaging features than the Calmucs. Their religion is Mahometiſm, and in general they differ very little from the people of the northern provinces of India; and from hence that country is furniſhed with the moſt ſerviceable horſes, camels, and other cattle.

The capital of the country is called Bokhara, and was once the metropolis of a kingdom of the ſame name. It is ſituated in latitude thirty-nine degrees fifteen minutes, thirteen miles from the antient city of Samarcand, the birth-place of Tamerlane. It is a large and populous place, ſeated on a riſing ground, and encompaſſed with a ſlender wall of earth and a dry ditch. The houſes are moſtly built of mud, though the caravanſeras and moſques, which are numerous, are all of brick. The bazars were once ſtately buildings, generally built of brick and ſtone; but the greateſt part of them are now in ruins; and here is alſo a handſome building for the education of the prieſts. A great number of Jews and Arabians frequent this place; but the khan ſeizes on their poſſeſſions at his pleaſure. The produce of the country is cattle, lambs fur, down, rice, and cotton, which they manufacture into calicoe.

The Crim Tartars receive their name from their originally coming from Crimea, the antient Taurica Cherſoneſus, a peninſula in the Black Sea. They rove from place to place in ſearch of paſtures, in houſes drawn on carts: but ſeveral miles round the city of Aſtrachan, where the ſoil will admit of cultivation, there are regular ſettlements of them tributary to the Ruſſians. Theſe are a very civil and induſtrious people. In the ſummer time they improve their land, the chief products of which are a ſeed called manna, oats, muſk, and water-melons: but their principal treaſure conſiſts in their ſheep, horſes and cows, and in their wives and children. When any of their daughters become marriageable, they erect a hut for her covered with white linen, and put a painted cloth on the top, which is uſually tied with red ſtrings; they alſo place a painted waggon on the ſide of the hut, and theſe are to be her marriage-portion. Thoſe who propoſe to marry obſerve this ſignal, and the girl is uſually given to him who offers the father the moſt valuable preſent. Though theſe people are Mahometans, they do not confine their women in the manner of the Turks and Perſians, and, contrary to the practice of the Calmucs, are extremely nice in their burying-places. They dig their graves very deep, and, after lining them with bricks dried in the ſun, and white-waſhing them on the inſide, erect a cover over them. They alſo raiſe thick mud walls round each tomb, on the top of which they fix one or more flags, according to the character of the deceaſed.

The Kirgeeſe Tartars poſſeſs a very extenſive tract of land, having the Baſhkeert Tartars to the north, the Black Calmucs with the city of Taſhcund to the eaſt, the Karakulpac Tartars and the Aral lake to the ſouth, and the river Yaeik to the weſt. They are divided into three tribes, under the government of a khan, and live in tents covered with felt of camels hair, which they remove with great eaſe whenever they change their quarters; and they never ſtay above two or three days in a place.

The Kirgeeſe Tartars live upon horſe-fleſh, mutton, and veniſon, and drink fermented mares milk to ſuch exceſs, that they are frequently intoxicated with it. They have no grain, nor any kind of bread. When they go upon any expedition, they take a ſmall quantity of a kind of cheeſe, which, being diſſolved in water, is their chief ſuſtenance. Money is hardly known among them; all their riches conſiſt in cattle and the fur of foxes and wolves, which they exchange with their neighbours for cloaths and other neceſſaries. They profeſs the Mahometan religion, and their language has a great affinity with that of the Turks. They are a ſtrong robuſt people, but rude, ignorant, and treacherous; yet are very civil to ſtrangers while they continue under their protection, for they eſteem the breach of hoſpitality a very great crime; but no ſooner is a ſtranger departed from under the roof of a Kirgeeſe Tartar, than his profeſſed friend and protector will ſometimes be the firſt perſon to rob him, and then he may think himſelf happy if he eſcapes being made a ſlave.

Theſe people think very favourably of many crimes prejudicial to ſociety, particularly of robbery; for their uſual puniſhment in this caſe is no more than making reſtitution, and murder is puniſhed by the loſs of the malefactor's goods: indeed, ſometimes the criminal and his whole family are delivered up as ſlaves to the relations of the deceaſed.

The Leſgee Tartars are a powerful and warlike nation, whoſe country extends about forty leagues from north to ſouth, and twenty-five from eaſt to weſt. They are under ſeveral different chiefs, named ſhamkalls, who, in

caſe of danger to their common liberty, unite their forces. A few of them have been occaſionally ſubject to the Perſians; but it does not appear that thoſe to the north and weſt of the Perſian dominions, ever ſubmitted to a foreign power. Indeed their ſituation is ſuch, with reſpect to the natural bulwarks of the mountains, that while they retain their bravery, they can hardly be enſlaved. Olearius mentions the very ſingular manner in which they chooſe a ſhemkall, which is done by a prieſt throwing a golden apple into a ring, round which the candidates are ſeated, when the perſon at whom it ſtops becomes their chief.

As to their perſons, they are well made, of a good ſtature, and extremely active. Their complexion is ſwarthy, their features regular, and their eyes black and full of life. They do not all wear their beards, ſome having only whiſkers. Their dreſs reſembles that of the Arabians, many of them wearing the ſame kind of drawers, which reach down to their ancles.

Theſe people are able to bring thirty or forty thouſand men into the field. They have had frequent wars with the Perſians, and in particular with Nadir Shah, who, with fifteen thouſand men, purſued a large body of them among their mountains; but, after ſuffering a very conſiderable loſs, was glad to make his retreat. Several Perſians, whom they then took priſoners, they cruelly deprived of their noſes, ears, or eyes, and ſent to Nadir with meſſages of defiance.

The Leſgees are frequently guilty of rapine, not only in the low-lands, and in-large bodies, but in flying parties, pillaging the Armenians and Georgians, whoſe trade brings them between Baku and Derbent. Yet if any ſtranger travelling into their country, or on its borders, ſeeks their protection, and chooſes a guide from among them, let him meet never ſo ſtrong a party, he is ſafe if his guide declares that the ſtranger is his gueſt: for they are in this caſe hardly ever known to violate the laws of hoſpitality.

Their manner of life reſembles that of the Perſians; they alſo profeſs the Mahometan religion, though they talk very lightly of the miracles of Mahomet, who they ſay was a very artful man; and whether he had any particular intereſt with the Almighty, will be beſt determined hereafter. They drink wine without reſerve, and are ſuppoſed to have once profeſſed the Chriſtian religion, and ſeveral books relating to Chriſtianity are ſaid to have been found amongſt them.

Their country is for the moſt part very pleaſant; their valleys are extremely fertile, and produce plenty of wheat, barley, and oats, and feed a multitude of ſheep. The people are ingenious in ſeveral manufactures of wool and camels hair; and none of the neighbouring nations equal them in making fire-arms, which they ſell to the Perſians. They trade with the Ruſſians, giving madder in exchange for ſhoes, boots, and cloathing of dreſſed ſheep-ſkins. The Armenians alſo bring them dyed callicoes, and other Perſian manufactures; alſo knives, rings, and ear-rings made in Europe; in return for which they receive madder, fire-arms, coarſe woollen manufactures, and falſe Perſian money: for as the coin of that empire is made ſmall and thick, it is exactly counterfeited with very little ſilver. The Armenians, it is ſaid, accept of this counterfeit coin for a quarter of its real value; however, it is certain there are great quantities of this money in Perſia, both in ſilver and gold.

SECT. IV.

Of Astrachan Tartary.

With a particular Deſcription of the City of Aſtrachan, now ſubject to Ruſſia; of its Gardens; of the Clouds of Locuſts with which the Country is ſometimes infeſted; and of the Trade of that City.

We ſhall now treat of Aſtrachan Tartary, which is under the dominion of Ruſſia. The kingdom of Aſtrachan is bounded by Siberia and Calmuc Tartary on the eaſt, by the Caſpian ſea on the ſouth, by Circaſſian Tartary on the weſt, and by Ruſſia on the north. That part of it which lies between the great river Volga, the river Jaika, and the Caſpian ſea, is uſually called Nagaia; as is alſo that part of the country which lies to the weſtward of Aſtrachan, and the natives are called Nagaian Tartars.

The city of Aſtrachan is ſituated within the limits of Aſia, in an iſland called Dolgoi, in forty-ſeven degrees latitude, ſixty Engliſh miles from the Caſpian ſea. It was for many ages ſubject to the Tartars, from whom it was taken by the Ruſſians. It contains about ſeventy thouſand inhabitants, among whom are many Armenians and Tartars of various denominations, with a few Perſians and Indians. The manners and cuſtoms of all thoſe different nations exhibit an epitome of Aſia.

Aſtrachan is about two miles and a half in circumference; but if we include the ſuburbs, it is near five miles round. It is encompaſſed by a brick wall in a ruinous condition, being about two hundred years old; it is alſo defended by a garriſon of ſix regiments of the beſt Ruſſian troops, and in the adjacent plains are many ſmall batteries, intended to prevent the approach of an enemy.

The houſes are of wood, and the greateſt part of them very mean; the higher parts afford a fine proſpect of the Volga, which here ſpreads itſelf near three miles, and contributes to the pleaſure and convenience of the inhabitants. The earth is ſo impregnated with ſalt, that it appears on its ſurface; and yet is extremely fertile, it bearing great quantities of fruit, which the common people eat to exceſs, and on that account are afflicted with many diſtempers. Their water-melons, which are much eſteemed in colour, flavour, and taſte, reſemble thoſe of Portugal. The city is ſurrounded by gardens and vineyards, which lie about two miles from it; theſe produce almoſt every kind of garden-ſtuff known in England, except artichokes, cauliflowers, and potatoes; and their orchards furniſh them with plenty of cherries, apples, pears, and other fruit; and their grapes are ſo admired at the court of Ruſſia, that a box of them is ſent thither from Aſtrachan every three days during the ſeaſon. It is carried by two horſes, and ſupported in the manner of a litter. The grapes are preſerved in ſand; but at beſt muſt be ill worth the expence of being thus conveyed twelve hundred Engliſh miles.

As their ſummers are generally dry, they water their gardens with large wheels, ſome of which are moved by horſes, and others by the wind. The wheels are of a ſufficient height to throw the water into the higheſt part of the gardens, from whence it runs in trenches to the root of every tree and plant. In this manner the gardens and vineyards are generally watered from the middle of May to the middle of September.

In the city is a little temple belonging to the Indian Gentoos, in which they have an idol of a very deformed and ugly appearance. Their Bramins here uſe beads, incenſe, proſtrations, and offerings; they have alſo ſmall bells, with other muſic, and raiſe their voices in ſinging with the utmoſt vehemence.

The Tartars at Aſtrachan being Mahometans, hold this image worſhip in the utmoſt abomination, and are ſo averſe to images, that they will not even carry money which has an impreſſion of man, bird, beaſt, or inſect, into their moſques. Their devotion is in ſilence and proſtrations, only the prieſt at certain times utters, in an awful tone, an invocation to the Lord of nature.

From the latter end of July to the beginning of October, the country about this city is frequently infeſted with locuſts, which fly in ſuch amazing numbers as to darken the air, and appear at a diſtance like a heavy cloud. When the cold weather comes on, they are ſeen in their flight from the north towards the ſouth, and wherever they fall, eat up every thing that is green. In this ſeaſon, therefore, their gardeners look out for them, and on their firſt appearance endeavour to keep them off by making as much noiſe and as great a ſmoak as poſſible; but, in ſpite of all their pains, after flying as long as they are able, they ſometimes fall in their gardens, in the ſtreets, and even into the fires kindled to diſperſe them. Captain Woodroofe obſerves, that once in ſailing up the Volga to Aſtrachan, he ſaw a prodigious cloud

cloud of them coming from the north-weſt, which is acroſs the river. The wind at that time blew very freſh, and nearly from the ſame point, when the locuſts falling, the water was covered with ſuch prodigious ſwarms of them, that in ſome places they greatly obſtructed the motion of the boat for ten or twelve fathoms together. He alſo ſays, that they live for ſome time under water, for mounting on each other's backs they formed cluſters near three feet in diameter, which rolled along by the force of the wind and the rapidity of the current. In this manner they were driven aſhore, where their wings being dried, they got upon the paſture; and very few being drowned, they lay ſo thick upon the plain for near three days, to the extent of as many miles, that it was impoſſible to walk without treading on them. On their beginning to fly, they diſappeared in leſs than half an hour, leaving not a ſingle blade of graſs on the plain.

The bodies of theſe inſects are very large, compared with the ſmallneſs of their wings. Their ſize is generally from two inches to two inches and a half long; they are about three quarters of an inch in diameter, and their ſhape is nearly the ſame as that of the larger ſort of green graſshoppers.

The revenue of Aſtrachan is computed from a hundred and forty to a hundred and ſixty thouſand rubles, or thirty-three thouſand five hundred pounds, of which the greateſt part ariſes from ſalt and fiſh. About ten miles below Aſtrachan is Boſmakoff, a ſmall iſland remarkable for its large ſtore-houſes of ſalt, which is made about twelve miles to the eaſtward of it, and being brought thither in boats, is conveyed in large flat-bottomed veſſels up the Volga. With this ſalt all the country is ſupplied as far as Moſcow. They annually dig ſome millions of poods, the excluſive property of which belongs to the crown of Ruſſia; for the common food of the ſoldiers and of the bulk of the people is bread and ſalt.

In this place are large fiſheries, to which the neighbourhood of the ſalt-works is of great advantage. Theſe fiſheries extend to the ſea, and alſo a prodigious way up the river, and from them all the country is ſupplied as far as Peterſburgh. The veſſels are ſent away in ſpring loaded with ſalt-fiſh; but as freſh-fiſh keeps good as long as it is frozen, the winter is no ſooner ſet in, than it is tranſported by land as far as Moſcow and Peterſburgh. The principal ſorts are ſturgeon, a large white fiſh called beluga, and the aſſotra, which reſemble ſturgeon.

The commerce of Aſtrachan is very conſiderable, tho' it has been greatly injured by the troubles in Perſia and the revolts of the Tartars. The foreign trade chiefly conſiſts in red leather, linnen and woollen cloth, and other European manufactures, which they export to Perſia, moſtly on account of the Armenians. In return they import from Perſia ſilk ſaſhes intermixed with gold, for the uſe of the Poles, wrought ſilks and ſtuffs mixed with cotton, raw ſilk, cotton, and a ſmall quantity of drugs.

The Nagay Tartars are all Mahometans, reſembling in countenance the Calmucs; but are more agreeable, their eyes not being ſo ſmall: theſe are driven off to the eaſtward, and now ſeldom make any inroads on the Ruſſian frontiers.

There are ſeveral other Tartarian nations bordering on the Volga; but theſe are the moſt known, and the moſt worthy of notice; we ſhall therefore proceed to the weſt, and give a particular account of the Circaſſian Tartars.

SECT. V.

Of CIRCASSIAN TARTARY.

The Bounds and Face of the Country; the Perſons, Dreſs, Food, Manners, and Cuſtoms of the Natives.

WE ſhall now give a deſcription of Circaſſian Tartary, which towards the eaſt is bounded by Aſtrachan and the Caſpian ſea, by Ruſſia on the north, by Georgia and Daghiſtan towards the ſouth, and by the river Don, the Palus Mæotis, and the Black ſea towards the weſt.

This is a very fine country, and nothing can appear more agreeable than the delightful proſpects formed by the variety of mountains, vallies, woods, ſprings, and rivers, with which it is every where diverſified. It produces plenty of barley, oats, and cummin, and great herds of cattle are fed here; but as the natives wander from place to place, they ſow no more corn than will juſt ſerve for the ſubſiſtence of their families; and if there happens to be a bad crop, they are reduced to great diſtreſs.

Both the men and women of Circaſſia are well proportioned; they are of a middle ſtature; but the men, like moſt of the other Tartars, have broad flat faces. The women have an eaſy ſhape, very agreeable features, according to our idea of beauty, and a very fine complexion. Their hair and eyes are generally black, and there is ſcarce a crooked perſon to be found amongſt them.

The men wear a veſt of coarſe grey cloth, and over it a ſheep-ſkin, which they turn to the ſide from which the wind blows. They wear boots of horſe-leather, clumſily made, and on their heads round bonnets of black cloth or coarſe felt.

The women wear nothing on their bodies in the ſummer but a ſhift open down to the navel; but in the winter they have furred gowns, like the Ruſſians. In the houſe their head-dreſs conſiſts of a ſilk or ſtuff cap, from which their hair hangs down in two or three treſſes; and they are very fond of necklaces, conſiſting of ſtrings of pearls or coloured glaſs. The men are not inclined to jealouſy, yet the women are veiled when they go abroad.

The Circaſſians generally feed on mutton, beef, poultry, wild fowl, and veniſon, of all which they have great plenty; but they prefer a piece of a young colt as a much greater dainty.

Their bread conſiſts of thin cakes, made either of barley-meal or millet, which they bake on the hearth. They are extremely hoſpitable, and will not permit a traveller to pay any thing for the entertainment of himſelf, his ſervants, and horſes, but will frequently contend who ſhall have the honour of treating him. When the natives travel, they take no proviſions with them, but behave with as much freedom in every houſe they come to as their own.

Their uſual drink, like that of the other Tartars, is water or mares milk; and both men and women, young and old, ſmoke tobacco. They ſit croſs-legged at their meals, and have a carpet, or a piece of Ruſſia leather, ſpread before them on little wooden tables.

The Tartars have no regular hours either for eating, drinking, or ſleeping, but are only guided by inclination and opportunity. When they are making excurſions, they are ſaid to paſs four or five days together without taking the refreſhments of food and ſleep; but they no ſooner return to their own country, than they indulge themſelves in both, and after ſuch a fatigue will ſleep two days together without waking. They ſeldom have any other beds than ſheep-ſkins, on which they lie, and throw others over them.

Their horſes are very ſwift, and finely proportioned. They have waggons for tranſporting their wives and children, tents and baggage, from place to place, which in ſome parts of the country are drawn by camels, and in others by oxen; for their horſes are only uſed for riding. The men are good horſemen, and many of them ſubſiſt principally by hunting and robbing.

The Circaſſians make no ſcruple of ſelling their children into Turky and Perſia, eſpecially their daughters, who leave their parents without reluctance, from the pleaſing tales they hear of thoſe who have arrived at the honour of being ſultana in the harrams of the Grand Signior and the king of Perſia; and their imaginations being taken up with fine cloaths, jewels, and a luxurious life, they leave their fathers houſe with joy; and even their mothers are no leſs pleaſed with the hopes of their daughters advancement.

As their beauty and innocence are the foundation of all theſe ambitious proſpects, particular care is taken to preſerve both: they inoculate their children at four or five years of age, after they have duly prepared them for

for it; they then receive the ſmall-pox without injury to their beauty. The merchants who buy them are generally as careful of preſerving their virginity as their mothers, on account of the great value the Mahometan chapmen ſet upon it.

As to the marriages of the Circaſſians, they are according to the rites of the religion they profeſs; thoſe near Turkey conſider it, like the Mahometans, only as a civil contract, and have a plurality of wives and concubines; but thoſe who live near Ruſſia, perform it after the manner of the Greek church. There are ſome Pagans among them who have generally ſome tincture of the religion of thoſe countries on which they border, intermixed with ſuperſtitions of their own.

There does not appear to be any conſiderable town in this country, except Terki, ſituated near the Caſpian ſea, three or four ſcore miles to the ſouthward of Aſtrachan. This town is chiefly inhabited by Ruſſians, for the whole nation of Circaſſians live in tents, or huts, according to the ſeaſon of the year, removing from one place to another; nor does the country produce any commodities ſo valuable as to induce foreigners to build or ſettle among them.

CHAP. XXVI.

Of ARABIA.

SECT. I.

Its Situation, Extent, Diviſions, Climate, and the Face of the Country in Arabia Felix; with an Account of its Vegetables, and a particular Deſcription of the Coffee-Plant. Of the Animals of Arabia.

ARABIA, including all the countries diſtinguiſhed by that name, is of very great extent, the moſt ſoutherly part lying in twelve degrees thirty minutes, and the moſt northerly in thirty degrees north latitude; and from eaſt to weſt it extends in the broadeſt part from thirty-five to ſixty degrees longitude from London. Hence it is computed to be thirteen hundred miles in length, and twelve hundred in breadth, where it is broadeſt; but in the moſt northern part it is very narrow. This extenſive country is a peninſula, bounded on the north-eaſt by the river Euphrates and the Perſian gulph; on the ſouth by the Indian and Æthiopic ocean; on the weſt by the Red Sea, the iſthmus of Suez, and part of Syria; and on the north-weſt by Syria and Diarbec, or Meſopotamia.

Arabia is divided into three grand diviſions; Arabia Felix, or Arabia the Happy, which is the moſt ſouthern, and the much largeſt part; Arabia Deſerta, or Arabia the Deſert, which is ſituated in the middle; and Arabia Petræa, which lies to the north.

In this country there are but few ſprings, and no conſiderable rivers, except the Euphrates, which waſhes its north-eaſt limits. As the tropic of Cancer extends through the middle of it, the air is exceſſive hot, and in many places unhealthful, particularly in that part which lies upon the coaſt. The winds are alſo hot and ſuffocating, and the ſands not only extremely troubleſome, but dangerous, they being ſometimes driven by the winds in ſuch prodigious clouds, that whole caravans have been buried and loſt by a ſingle ſtorm. The wind blows on the ſouthern coaſts from the ſouth-weſt, and varies to the weſt with hard guſts, and ſometimes rain, from the beginning of April to the middle or end of Auguſt, and then turns to the eaſtward, blowing gently from that quarter till the end of March. In ſome places it never rains more than twice or thrice in two or three years; but the great dews which fall in the night refreſh the ground, and ſupply the few plants which grow there with ſome moiſture.

Even that part of the country diſtinguiſhed by the name of the Happy, conſiſts, for the moſt part, of dry barren mountains, or ſandy deſarts; but ſome parts of ſouth Arabia being tolerably fruitful, and abounding in corn, herbage, and aromatic gums, it is eſteemed a happy land, when compared with the other parts of this deſolate country. As the hills for the moſt part conſiſt of a rocky ſoil, and are ſcarce capable of improvement, the natives never ſtrive to cultivate them; their vallies ſeem equally barren, where water is wanting, and bear ſcarce any herbage; but where they can bring water into them, they produce corn, all manner of garden-ſtuff, herbs, and flowers; and no country upon earth affords more agreeable proſpects. The inhabitants draw water in large ſkins out of their wells morning and evening with oxen, and convey it along little canals, by the ſides of which trees and plants are placed; they alſo cut channels through their corn-fields, into which they let the water run as occaſion requires.

By this means they have a great variety of excellent fruits, as peaches, apricots, oranges, lemons, and grapes; but this country is moſt famous for its coffee and its dates, which laſt are found ſcarce any where in ſuch perfection as in this country and in Perſia. With coffee a number of ſhips are annually loaded for Europe and India.

The coffee-ſhrub grows to the height of eight or ten feet; the twigs riſe by pairs oppoſite to each other, as do the leaves on the twigs, one pair being about two inches diſtant from another. The leaves are about four inches long, and two broad in the middle, from whence they decreaſe to both extremities, ending in a point. They are nearly of the form of a bay-leaf, and are ſmooth and without any inciſures on the edges. The ſhrub has a grey ſmooth bark; the wood is white, and has not much pith. The fruit hangs on the twigs by a foot-ſtalk, ſometimes one, two, or more in the ſame place. Theſe ſhrubs are watered by artificial channels like the other vegetables, and after three or four years bearing, the natives plant new ſhrubs, becauſe the old ones then begin to decline. The Arabians dry the berry in the ſun, and afterwards take off the outward huſk with hand-mills. In the hot ſeaſons the Arabians uſe theſe huſks roaſted in the room of coffee-berries, and eſteem the liquor impregnated with them more cooling.

Arabia alſo abounds in balm, frankincenſe, myrrh, manna, caſſia, incenſe, aloes, olibanum, and other valuable drugs; but they have very few trees fit for timber, and little wood of any kind in the country.

The moſt uſeful and excellent animals of Arabia are their camels and horſes; their camels are extremely proper for this ſandy country, and were doubtleſs formed by nature to enable the natives to traverſe the deſarts with which it abounds. Their breed of horſes are only fit for the ſaddle, and are never uſed for draught or burden. The fineſt horſes in the Perſian court are brought from hence, and are admired for their make, as much as for their ſwiftneſs and high mettle; they are indeed well known in Europe, and have contributed to improve the breed of thoſe in England. The uſual food for camels and horſes is barley or barley-meal made into dough. At Muſcat, which is ſituated near the entrance of the Perſian gulph, they feed their cattle with putrid fiſh; for digging in a pit, they throw a great quantity of fiſh into it, which lie till they are rotten, and turned to a kind of earth, after which this ſubſtance is taken up and boiled,

boiled, when having ſtood till it is cool, they give it their cattle, and it is ſaid to render them very fat.

They have oxen, buffaloes, goats, and veniſon; but their beef and buffalo's fleſh is very coarſe. As they are all Mahometans, they never breed any ſwine.

They have great plenty of fowl and fiſh on their coaſts, but the inland parts have few of either, there being neither wood nor water to be found in ſeveral days journey.

Lions, tygers, wolves, bears, jackalls, and other wild beaſts, are alſo found in ſome parts of Arabia; but there being no cover for them, they are much fewer than in ſome other places.

SECT. II.

Of the Face of the Country in Arabia Deſerta and Arabia Petræa, with a particular Deſcription of Mount Sinai, and of the Convent of St. Catherinè; the Rock of Meribah, and other Monuments of Antiquity.

ARABIA Deſerta has its name from the nature of its ſoil, which is a barren ſand. There are, however, large flocks of ſheep and herds of cattle near the Euphrates, where the land is good; there are alſo great numbers of oſtriches in the Deſart, and in ſeveral places a fine breed of camels. This country, in general, differs but little from Arabia Petræa, which is ſituated to the north of it, and is by far the ſmalleſt of the three diviſions of Arabia.

We ſhall now give a deſcription of Arabia Petræa, which has its name from Petræa, its ancient capital, now deſtroyed, and is famous for the children of Iſrael wandering there during forty years. People are not there, ſays the reverend Dr. Shaw, entertained with a view of paſtures covered with flocks, or vallies enriched with corn. There are no olive-yards or vineyards; but the whole is a deſolate, loneſome wilderneſs, only diverſified by ſandy plains, and mountains of naked rocks and craggy precipices. This deſolate country is never refreſhed with rain, except ſometimes at the equinoxes; and the few hardy vegetables ſeen in the clifts of the barren rocks, or wildly diſperſed on the ſandy plains, are ſhrunk by a perpetual drought; for the dews of the night are in a manner rendered inſufficient for the purpoſes of vegetation, by the ſcorching heat of the ſun during the day. The intenſe cold of the one and heat of the other, clearly account for the wiſe proviſion of Providence in ſpreading over the Iſraelites "a cloud to be a "covering by day, and fire to give light (and perhaps "heat) in the night-ſeaſon."

Though the land appears ſo deſolate, yet the ſurface of the Red-Sea, when calm, diſcovers in ſome places ſuch a diverſity of marine vegetables, that they reſemble a foreſt under water, and the traveller has the additional pleaſure of beholding a great variety of ſtars, urchins, and ſhells of the moſt uncommon and beautiful kinds.

The traveller, in traverſing theſe deſarts, is frequently offended by little ſwarms of locuſts and hornets; he is alſo in danger from the vipers; but the reptiles of the lizard kind, from the variety of their ſhapes and ſpotted ſkins, he views with more pleaſure and ſafety.

In travelling, ſays the above learned and judicious author, the heavens were every night our only covering, a carpet ſpread on the ſand was our bed, and a change of raiment made up into a bundle ſerved for a pillow. Our camels (for horſes and mules required too much water to be employed in theſe deſarts) lay round us in a circle with their faces looking from us, while their loads and ſaddles were placed by us behind them. In this ſituation they ſerved as guards and centinels; for they are watchful animals, and awake at the leaſt noiſe.

As in theſe long and dreary deſarts people have no proſpect of meeting with the leaſt hoſpitality, they are obliged to carry along with them every thing neceſſary for ſo tedious a journey: travellers, therefore, uſually provide a ſufficient number of goats ſkins, which they fill with water every four or five days, or as often as they find it. They provide balls made of the flour of beans or of barley for their camels, and wheat flour biſket, potted fleſh, honey, oil, vinegar, olives, and ſuch other things as will keep, for themſelves. They take with them alſo wooden diſhes, and a copper-pot for their kitchen-furniture. When they are obliged to boil or bake, they make uſe of camels dung, left by ſome preceding caravan, which, after its being expoſed a day or two in the ſun, catches fire like touch-wood, and burns as bright as charcoal. No ſooner is the food prepared, whether potted fleſh boiled with rice, lentil ſoup, or unleavened cakes ſerved up with oil or honey, than one of the Arabs placing himſelf on the higheſt ſtation he can find, calls out three times with a loud voice, to invite all his brethren, the ſons of the faithful, to come and partake of it, though none of them are perhaps within one hundred miles of him. This cuſtom the Arabs conſtantly maintain as a token of their benevolence.

In theſe deſarts the ſky is generally clear, the winds blow briſkly in the day, and ceaſe in the night. Where theſe deſarts are ſandy and level, they are as fit for aſtronomical obſervations as the ſea, which they nearly reſemble. It was ſurpriſing to obſerve, ſays the above learned divine, in what an extraordinary manner every object appeared to be magnified, for a ſhrub ſeemed as big as a tree, and a flock of achbobbas, birds nearly reſembling the ſtork, might be miſtaken for a caravan of camels. This ſeeming collection of waters always advances about a quarter of a mile before the travellers, while the intermediate ſpace appears of one continued glow, from the quivering undulating motion of that quick ſucceſſion of exhalations raiſed by the powerful influence of the ſun. The violent heat even draws up the moiſture from the carcaſes of the camels and other animals which lie expoſed in theſe deſarts, and prevents their putrefaction, whence they continue there a number of years without mouldering away. To the ſame cauſe, added to the coldneſs of the nights, may be attributed the plentiful dews that frequently wet the travellers to the ſkin; but the ſun no ſooner riſes, and the air becomes heated, than the miſts are diſperſed, and the moiſture of the ſands evaporated.

What is called the deſart of Sinai, is a beautiful plain, near nine miles long, and above three in breadth; it lies open to the north-eaſt, but to the ſouthward is cloſed by ſome of the lower eminences of mount Sinai; and other parts of that mountain make ſuch encroachments upon the plain, as to divide it in two, each ſo capacious as to be ſufficient to receive the whole camp of the Iſraelites. That which lies to the eaſtward of the mount is perhaps the deſart of Sinai, properly ſo called, where Moſes ſaw the angel of the Lord in the burning buſh. Over the place, where is ſaid to be this divine appearance, is erected the convent of St. Catherine, which belongs to the Greeks, and is three hundred feet ſquare, and above forty in height. On the ſpot which they ſuppoſe the burning buſh ſtood, is a little chapel, where the monks, in imitation of Moſes, put off their ſhoes whenever they enter it. This, with ſome other chapels dedicated to particular ſaints, is included within the church of the Tranſfiguration, a large beautiful ſtructure ſupported by two rows of marble columns, and the floor elegantly adorned with a variety of devices in Moſaic work, as are alſo the floor and walls of the preſbyterium. Upon the latter is repreſented the figure of the emperor Juſtinian, with the hiſtory of the tranſfiguration; and upon the partition that ſeparates the preſbyterium from the body of the church is a ſmall marble ſhrine, in which they pretend to have preſerved the ſkull and one of the hands of St. Catherine.

There is here a tower built by the empreſs Helena, probably for her own convenience when ſhe came here, as well as the monks: it is ſituated in the heart of the convent, where the archbiſhop's lodgings now are; it has three chapels, and is ſtill called St. Helena's tower. This convent is erected on a deſcent, but the deſign ſeems to have been to raiſe the lower part by a great number of arches, many of which remain, in order to build the firſt floor on a level, and erect more upon it. The walls and the arches, with the church, are the only ancient buildings; the latter is of a coarſe red granite. The walls of the convent are ſix feet thick, but ſome parts of them are ruined. There is, however, a walk all round on the top of them, and both at each

corner, and in the middle of each ſide, are little ſquare towers. The convent itſelf is very irregular, and ill built of unburnt brick.

The door of this convent is never opened but when the archbiſhop, who generally reſides at Cairo, comes thither to be inſtalled. Pilgrims are admitted by being drawn up near thirty feet high by a windlaſs, and then taken in at a window, where ſome of the lay brothers attend for that purpoſe. Theſe, with all the preſbyters, who are commonly called kalores, amount to about one hundred and fifty, and chiefly ſubſiſt upon the proviſion ſent them monthly from Cairo. They have mills, bake-houſes, and other offices neceſſary for people who muſt have every thing within themſelves. They live a very auſtere life, abſtaining not only from fleſh, but from butter, milk, and eggs. They chiefly ſubſiſt on bread, to which is added a portion meaſured out to each perſon of olives, oil, vinegar, ſallad, and pot-herbs; or of dates, almonds, figs, and parched pulſe.

St. Helena cauſed a ſtone ſtair-caſe to be carried up to the top of the mountain; but as moſt of the ſteps are either waſhed out of their places, removed, or defaced by time, the aſcent is very fatiguing, and is frequently impoſed upon the monks as a penance. However, at certain diſtances they have erected ſeveral little chapels, as breathing-places, dedicated to different ſaints, who are always invoked to lend their aſſiſtance upon theſe occaſions.

Though no kind of ſoil is to be found in this part of Arabia, theſe monks have in a long proceſs of time covered with dung and the ſweepings of their convent about four acres of theſe naked rocks, which now produce as good roots, cabbage, ſallads, and all ſorts of pot-herbs, as any climate or ſoil whatſoever. They have alſo raiſed a great number of apple, pear, plum, almond, and olive-trees of excellent kinds. The pears in particular are ſo eſteemed at Cairo, that every ſeaſon a preſent is ſent of them to perſons of the firſt quality in that city. Their grapes are alſo not inferior, either in ſize or flavour, to thoſe of any other country. This little garden is an evident proof of the great advantages that may be procured by indefatigable induſtry in improving nature.

The people ſhew on the ſummit of the mountain a print in the rock, where they pretend the body of St. Catherine lay; for they confidently affirm, that ſhe being tied to a wheel at Alexandria, under the reign of the emperor Maxentius, in order to be put to death, the wheel ſnapped to pieces on which ſhe was beheaded; when her body, in anſwer to her prayers that it might not fall into the hands of infidels, was carried by the angels to the top of the mountain, from whence the monks brought it to their convent ſoon after it was erected.

The ſummit of this mountain appears ſomewhat conical, and is not very ſpacious; Mahometans as well as the Chriſtians have a chapel there for public worſhip. Travellers are there ſhewn the place where Moſes received the law, where he hid himſelf from the face of God, and where his hand was ſupported by Aaron and Hur at the battle with Amalek, with ſeveral other places mentioned in the Holy Scriptures, and with which they ſeem as well acquainted as if they had been preſent when theſe great events were tranſacted.

In the plain of Rephidim, down the weſtern ſide of the mountain, is ſhewn a block of granite marble about ſix yards ſquare, ſaid to be the rock of Meribah; it lies tottering and looſe, and appears to have once belonged to Mount Sinai, which hangs over this plain in a variety of precipices. The pious and learned Dr. Shaw ſays, that the waters which guſhed out with the ſtream which flowed down it, have hollowed a channel, acroſs one corner of this rock, about twenty inches wide and two deep. Moſs grows in this channel, and all over it are a great number of holes, ſome four or five inches deep, and one or two in diameter, that appear incruſted over with fur, like the inſide of a tea-kettle. The learned Divine juſt mentioned makes no doubt of this being the very rock ſtruck by Moſes, out of which miraculouſly iſſued water to quench the thirſt of the Iſraelites; and imagines, that neither chance nor art could be concerned in forming this ſtone, which, he ſays, never fails to fill the mind of every beholder with a religious ſurprize; but the Rev. and learned Dr. Pococke, who alſo ſaw this ſtone, ſays, that in one of the roads from the convent of Suez there is exactly ſuch another, with the ſame ſort of openings all down, and the ſigns where the water ran; and Mr. Norden ſays in his Travels, that there is ſhewn in St. Mark's church, at Venice, a ſquare piece of granite marble that was brought from Mount Sinai, and which they pretend to be the very ſtone ſtruck by Moſes; and adds, that many of the like kind are found in Egypt; whence this ſtone is, perhaps, nothing more than a natural production.

Travellers are alſo ſhewn by the monks ſeveral other remarkable places about this mountain; they point out the very ſpot where Aaron's calf was molten; ſhew the place where the Iſraelites danced at its conſecration, and where Corah and his companions were ſwallowed up, and even the place where Elias concealed himſelf when he fled from Jezebel; but the hiſtory they give of theſe and other places is accompanied with the moſt idle and ridiculous tales.

Dr. Shaw obſerves, that part of this mountain, which lies to the weſtward of the plain of Rephidim, is compoſed of a hard reddiſh marble like porphyry, from which it is diſtinguiſhed by the repreſentations of little trees and buſhes on every part of it. Theſe impreſt figures reſemble the tamariſk, the moſt common and flouriſhing tree of theſe deſarts.

SECT. III.

A Deſcription of the noble Ruins of Palmyra, with a conciſe Hiſtory of that City.

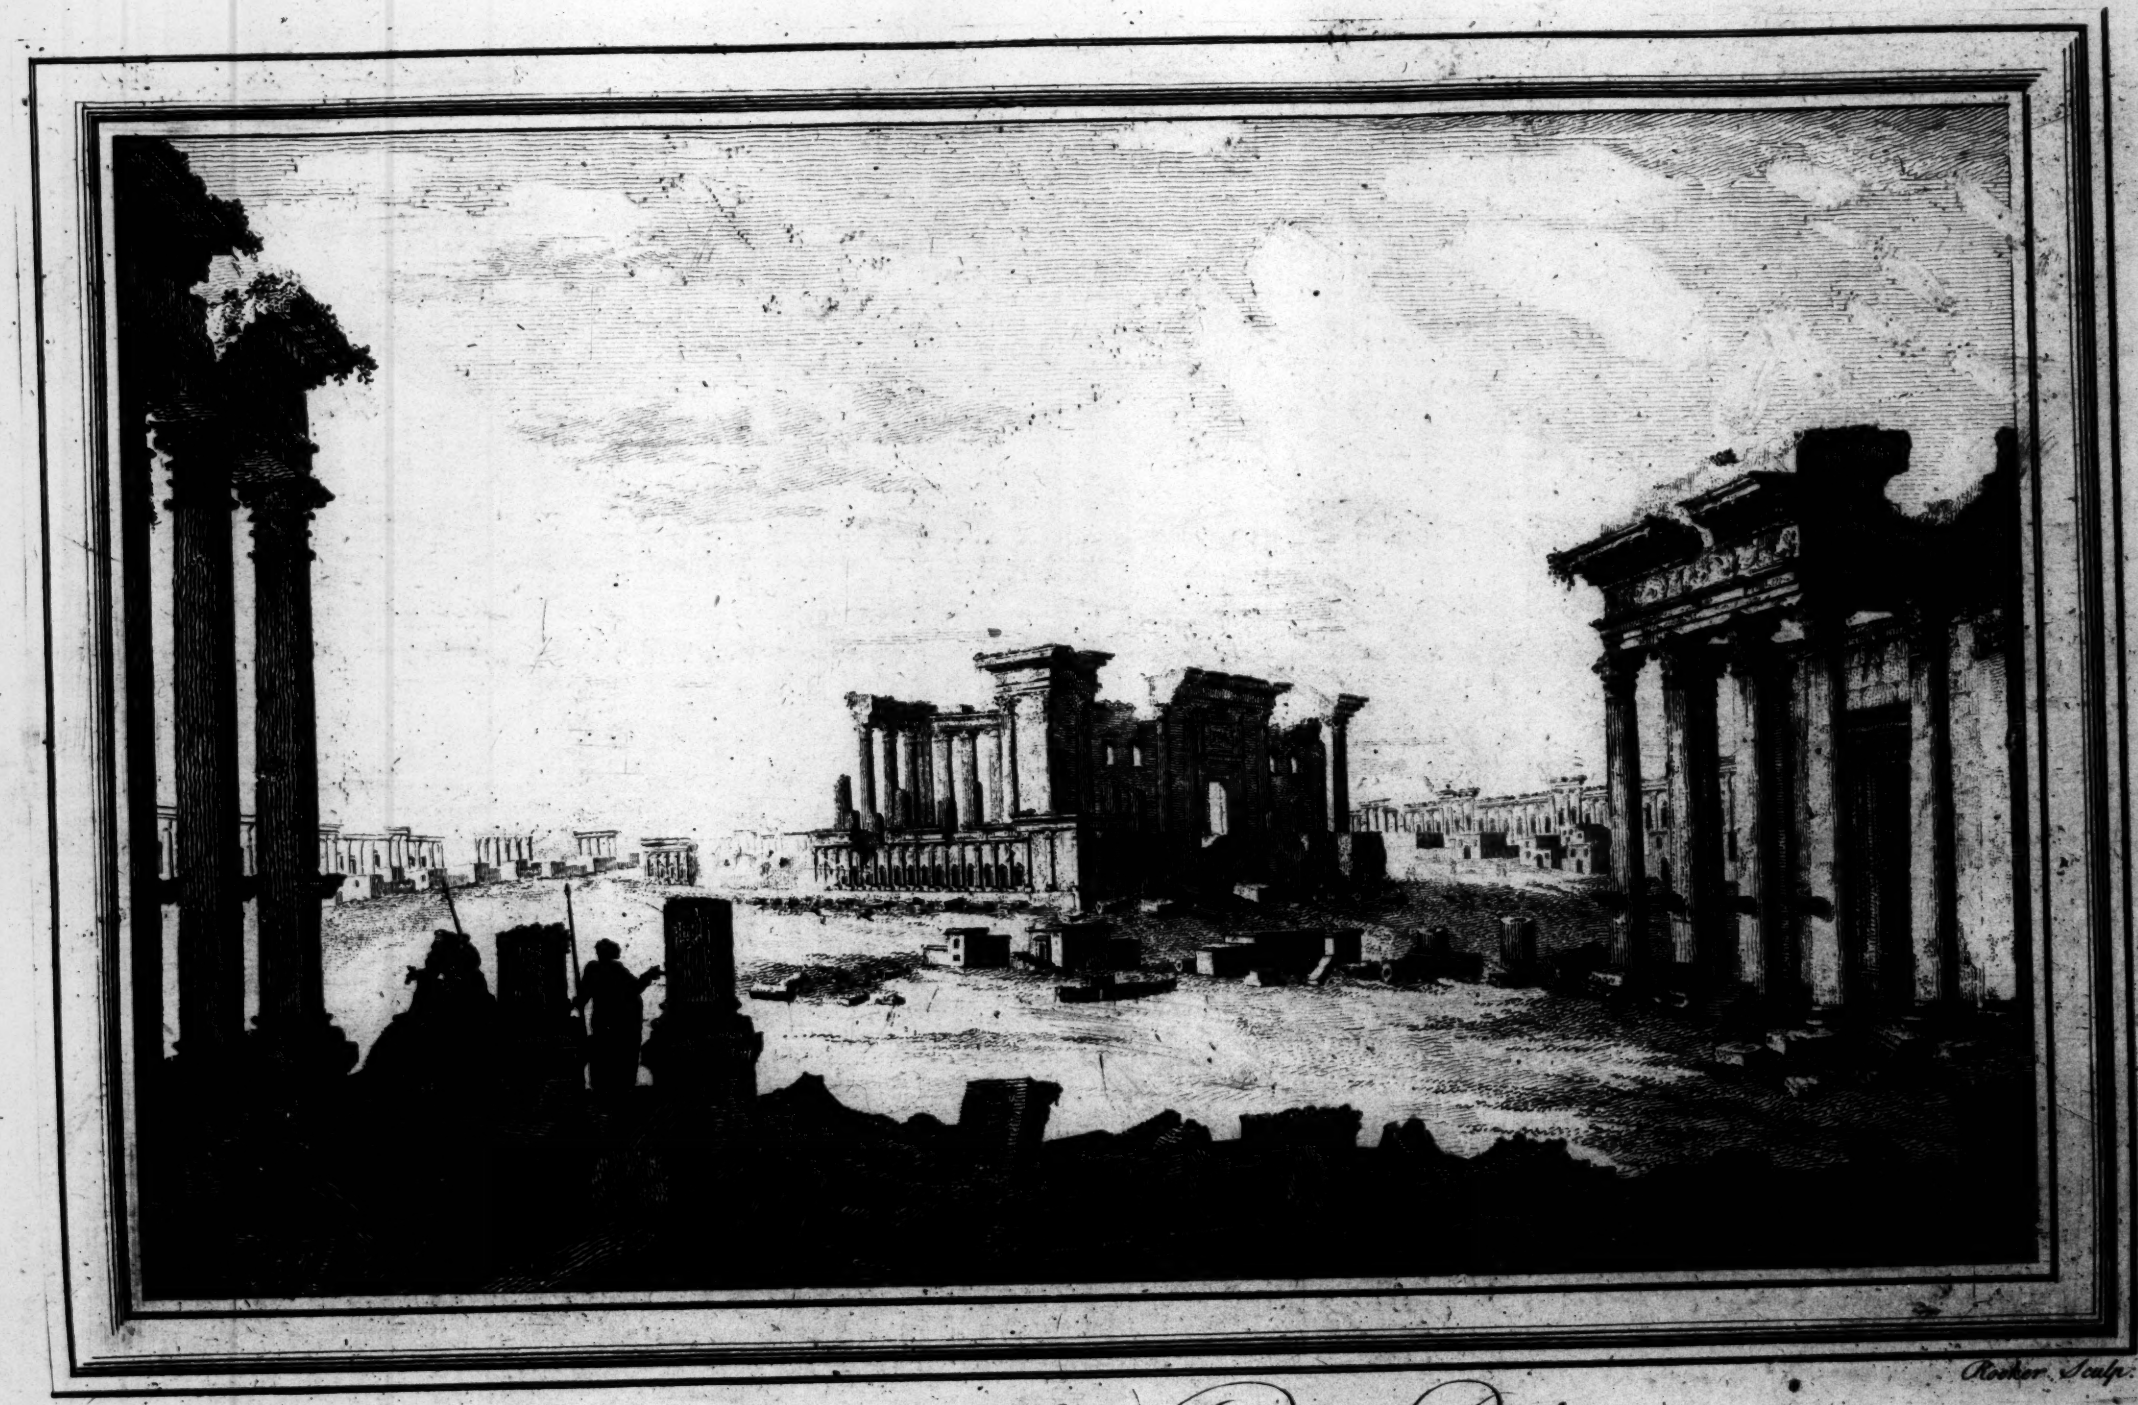
WE ſhall now take a view of the ruins of Tadmor, or Palmyra, formerly a magnificent city in Arabia, in a part of the deſarts of Arabia Petræa, uſually diſtinguiſhed by geographers by the name of the Deſart of Tadmore, or Palmyrene. It is ſituated in about thirty-three degrees north latitude, two hundred miles to the ſouth-eaſt of Aleppo. In deſcribing theſe noble ruins we ſhall follow the deſcription given of them by Mr. Wood, a learned and ingenious gentleman, who, with two others his companions, went thither, properly attended, to examine and take draughts of theſe curious antiquities, which have ſince been publiſhed in a very pompous manner, and are worthy a place in the libraries of the curious.

The ruins of Palmyra are approached by paſſing thro' a valley between two mountains, where are ſtill ſeen the ruins of an aqueduct that formerly conveyed water to that magnificent city; and on each ſide of this valley are many ſquare towers of a conſiderable height, which were the antient ſepulchres of the inhabitants of Palmyra. The traveller has ſcarcely paſſed theſe memorable monuments, when the valley opening on each ſide, he is ſuddenly aſtoniſhed with beholding a ſtupendous ſcene of the ruins of earthly grandeur, in the magnificent remains of the moſt noble ſtructures that every-where lie before him. No proſpect can be conceived more ſtriking and auguſt, and at the ſame time more romantic, than ſuch a multitude of Corinthian columns, all of white marble, riſing on every ſide with few intervening walls and ſolid ſtructures.

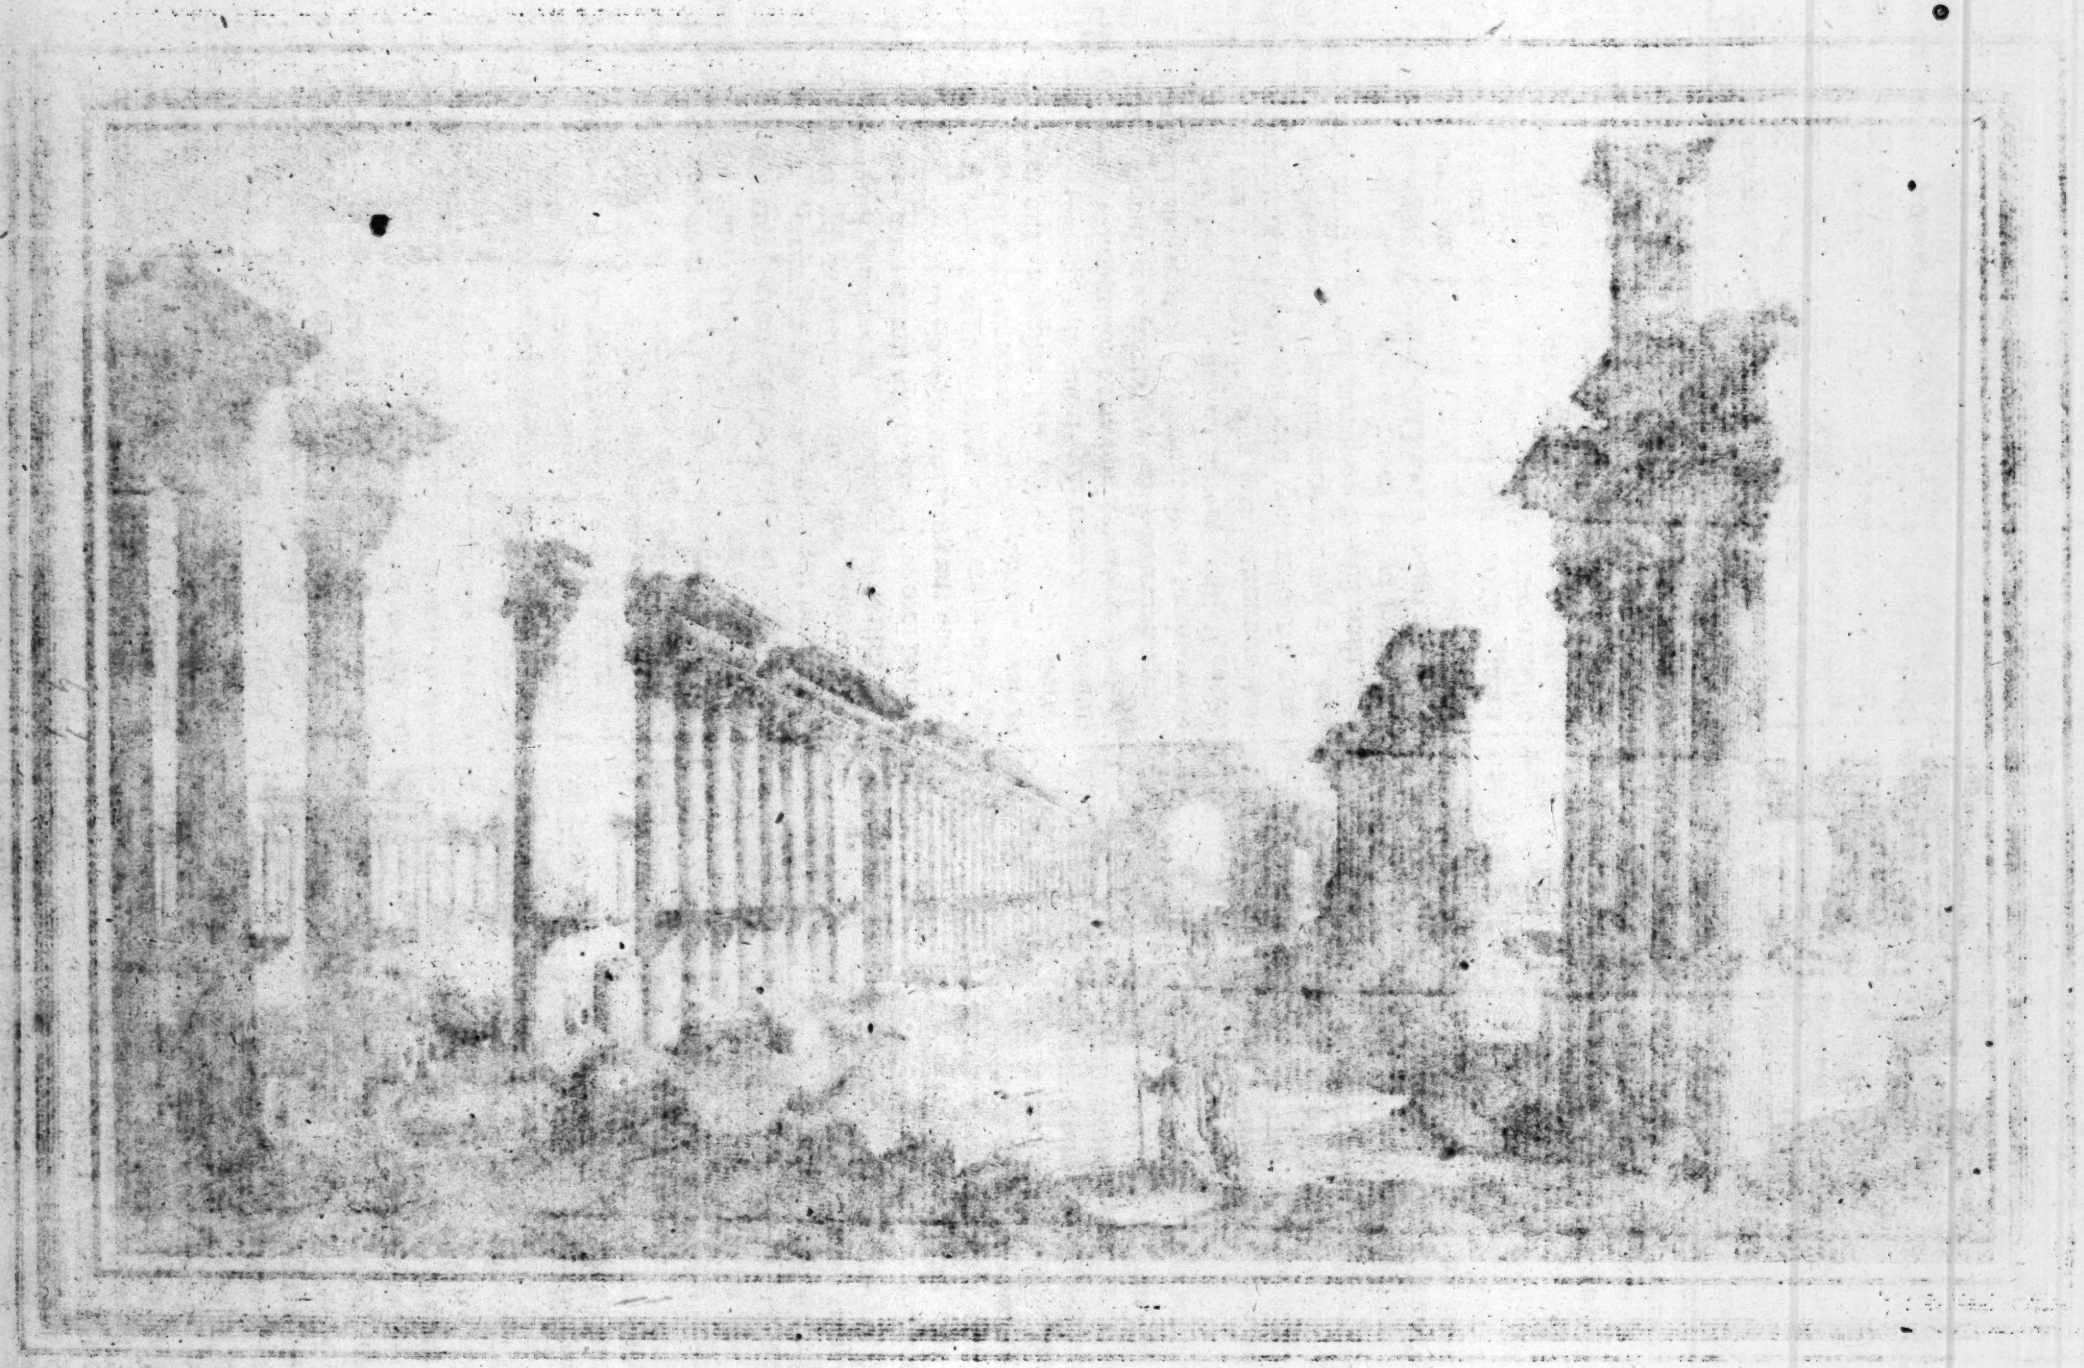
On the left hand appears a wall which once belonged to the Temple of the Sun; and though a part of it has fallen down, it is ſtill of a conſiderable length. A row of twelve noble windows ſtill ſtand together, and farther to the left are two others. Between each of them a pilaſter of the Corinthian order ſupports the entablature.

Through the ſpace broken down the view extends to diſtant rows of columns; and over the part of the wall ſtill ſtanding riſe the ruins of the temple itſelf. At the end where the portico ſtood is a ſquare ruinous tower, erected by the Turks, and before theſe remains of antient grandeur are incloſures of corn and olive-trees, which being planted by the Arabs, are ſeparated from each other by mud walls, while magnificent ruins are ſcattered all around.

A piece



A General View of Palmira.



Rocker Sculpt.

The Remains of the **Great Temple** *in* **Palmira** *from the West.*

A piece of a very large column ſtands on its baſe before the Turkiſh tower; but the greateſt part, with its capital and entablature, have fallen down. The ſtones around it ſhew that in this place was a grand edifice. This column is five feet and a half in diameter near the baſe.

A little to the right of the tower, but at a greater diſtance, are the ruins of a Turkiſh moſque, with its minoret; and before it a noble column, of the ſame dimenſions as that broken down, riſes to a great height. Somewhat farther to the right is a very magnificent arch, with a poſtern richly ornamented on each ſide, and from thence a colonade extends four thouſand feet in length, and is terminated by a ſuperb mauſoleum. Many of theſe columns are fallen, and open a view to other ruins, while in other parts the remains of magnificent ſtructures are ſeen through the intercolumniations. At ſome diſtance nearer, before this magnificent colonade, is a ſmall temple, adorned with a noble portico; and ſtill farther to the right is another temple, with its periſtyle ſeen through the intercolumniation. Farther ſtill to the right appears a range of columns, which ſeem to have belonged to a portico. At ſome diſtance nearer there ſeem to be the ruins of a Chriſtian church; and ſtill nearer, and farther to the right, are four lofty columns, with their ſuperb entablature, the only remains of a grand edifice. A little to the right of theſe, and at a greater diſtance, are many columns which ſupport a conſiderable part of their entablature, and are ſo diſpoſed, that they reſemble the periſtyle of a ſmall temple that has been entirely deſtroyed; and nearer, and more to the right, is a very elegant mauſoleum.

The plain is covered with a vaſt number of ſcattered columns, ſome with and ſome without their entablatures; and on all ſides lie rich entablatures, broken columns, capitals, and ſtones of a prodigious ſize. The diſtant proſpect is terminated by a range of diſtant mountains, on one of which is a caſtle, and on another are the ruins of a Turkiſh fortification.

All theſe noble ruins appear at one view in the diſtant proſpect; but, on a nearer approach, the admiration is ſtill kept up, by the ſize of the columns and the perfection of the workmanſhip beſtowed on the ornamental parts, particularly on the ornaments of the gate, and the beauty of the capitals and entablatures; but nothing can poſſibly form a more aſtoniſhing contraſt to all this magnificence, than the miſerable huts of the Arabs, of which there are about thirty in the court of the great temple.

Walls flanked with ſquare towers once ſurrounded theſe ruins, but in many parts they are entirely levelled. Theſe ſeem to have been three miles in compaſs: but the Arabs ſhew a tract of land raiſed above the level of the deſart, and about ten miles in circumference, which they ſay was the extent of the antient city, and that ruins are diſcovered there by digging. Indeed a circuit of three miles muſt be thought very little for Palmyra in its proſperity, when it is conſidered that the greateſt part of that ſpace was filled by public edifices, which, from their aſtoniſhing magnificence, and the many ſuperb ſepulchres, inconteſtibly prove its antient grandeur; and it is probable, that when Juſtinian fortified it, after its being deſtroyed, he contracted its bounds.

It ought not to be omitted, that three or four miles within the deſart, to the north of the ruins, is probably the valley of Salt, where David ſmote the Syrians, 2 Sam. viii. 13. This valley ſtill ſupplies Damaſcus and the neighbouring towns with great quantities of that commodity: for the earth is ſo impregnated with ſalt, that, on digging a place a little more than a foot deep, the water which lodges there raiſes a fine white ſalt, which, after the moiſture is exhaled by the ſun, is gathered and taken away.

The ſuperb remains of this city are ſo ſtriking, that it is impoſſible to avoid feeling our curioſity excited with reſpect to its antient condition; and we are naturally deſirous of knowing how a ſpot, thus divided from the reſt of the world by an inhoſpitable deſart, was choſen for the ſituation of ſo magnificent a city? who was its founder, and from whence it drew its riches? But hiſtory gives us little information, and moſt of the knowledge that can be obtained on theſe ſubjects, is only furniſhed by inſcriptions.

We learn from John of Antioch, that Palmyra was built by Solomon, on the very ſpot where David ſlew Goliath, in honour of that memorable action; but what the Arabian hiſtories relate on this ſubject, is ſo fabulous and extravagant as not to deſerve our notice: but there may be ſome truth mixed with fiction, for we learn from the Old Teſtament, that Solomon erected a city in the wilderneſs, and called it Tadmor; and Joſephus ſays, that the Greeks and Romans gave it the name of Palmyra, though the Syrians continued to call it by its antient name; and indeed the Arabs of the country ſtill call it Tadmor. They even pretend that theſe ruins were the works of Solomon. Among other things they ſhew his harram, and the tomb of his favourite concubines: "Solomon, the ſon of David, ſay they, per-"formed thoſe wonders by the aſſiſtance of ſpirits."

But there is no doubt that the buildings erected by Solomon were entirely demoliſhed by Nebuchadnezzar, who is ſaid to have deſtroyed that city before he laid ſiege to Jeruſalem. If this be true, it is not ſurpriſing that Xenophon ſhould take no notice of it in his celebrated retreat, though he is very exact in deſcribing the deſart; nor can we be ſurprized at its not being mentioned in the Hiſtory of Alexander the Great. No mention is made of it in the Roman Hiſtory before the time of Mark Antony, who would have plundered it, had not the inhabitants tranſported their moſt valuable effects beyond the Euphrates, and defended its paſſage by their archers. The inhabitants of Palmyra were then merchants, and ſold to the Romans the merchandizes of India and Arabia. We may therefore conclude them to be a rich and free people; but it is not known how long they had enjoyed theſe advantages. It is probable their trade and riches were of ſome ſtanding, ſince we find from inſcriptions that in leſs than forty years after their expences and their luxuries were exceſſive.

At length, when the Romans in the Eaſt were in a moſt diſtreſsful ſituation, Odenathus, king of Palmyra, entered into an alliance with the emperor Gallienus; and collecting the miſerable remains of the Roman army, by his valour and activity vanquiſhed Sapor, king of Perſia, in ſeveral engagements, and even advanced with his victorious troops as far as Cteſiphon, the capital of that empire. Returning from this expedition with the greateſt applauſe, and with conſiderable treaſures, Gallienus declared him Auguſtus, and his aſſociate in the government of the empire. Afterwards Odenathus defeated Baliſta, and at length drove out the Goths, who had committed the greateſt ravages: but he was ſoon after treacherouſly murdered by his kinſman Mæonius, and his ſon Herodes ſuffered the ſame fate. Mæonius was then ſaluted emperor, but in a ſhort time after was murdered by his own ſoldiers.

After the death of Odenathus Zenobia, his queen, by whom he had two ſons, aſſumed the reins of government, in the name of her children; and renouncing the alliance with Rome, attacked and defeated Heraclianus the Roman general, by which means ſhe obtained the poſſeſſion of Syria and Meſopotamia. She then conquered Egypt, and afterwards added to her dominions the greateſt part of Aſia Minor. How amazing are the viciſſitudes of fortune! Zenobia, ſurrounded by the barren ſands of Palmyra, includes Egypt within her dominions to the ſouth, and extends them to the north as far as the Black Sea and the Boſphorus; but this new-raiſed empire was of ſhort duration, for a few years after the emperor Aurelian recovered the eaſtern provinces, and obliged Zenobia to ſhut herſelf up within the walls of Palmyra. He then inveſted that city. The queen rejected all negotiations with contempt; and, after a brave defence, reſolving to ſolicit the aſſiſtance of the Perſians, ſhe ſet out on a dromedary; but juſt as ſhe was about to croſs the Euphrates, ſhe was taken priſoner by a party of horſe ſent after her by Aurelian. The inhabitants of Palmyra now ſurrendering, the emperor ſpared their lives, and leaving there a garriſon of ſix hundred archers, took a great part of the riches of the city, and marched with Zenobia to Emiſſa, where the queen ſtained her glory, and purchaſed a diſhonourable life, by meanly betraying her

her friends, and naming thoſe who had been her adviſers; on which the emperor had the cruelty to ſacrifice them to his reſentment, while ſhe was reſerved to adorn his triumph. Among thoſe who ſuffered was Longinus, who wrote the excellent Treatiſe on the Sublime, and had dictated a haughty letter the queen had ſent to the emperor; but the intrepid courage with which he ſubmitted to his fate, ſhews that his bravery was equal to his genius and learning.

But the misfortunes of Palmyra were not yet at an end. A brave and free people, who from the height of glory are ſuddenly reduced to the rank of ſlaves, uſually make ſome deſperate efforts to recover their liberty. Thus the Palmyrenes took up arms, and put the Roman garriſon to the ſword; but the news of this event no ſooner reached Aurelian, who was returning to Rome, than turning back, he took the city, deſtroyed it, and inhumanly cauſed moſt of the inhabitants to be maſſacred, without regard to age or ſex. But afterwards he gave orders for repairing the Temple of the Sun, and appropriated to that uſe three hundred pounds weight of gold found in Zenobia's coffers, her crown-jewels, and eighteen hundred pounds weight of ſilver, which he took from the people. Palmyra having thus loſt its liberty, continued ſubject to a Roman governor; and we find that Juſtinian repaired and ſupplied it with water, after it had been for ſome time almoſt deſerted. This is the laſt time that Palmyra is mentioned in the Roman Hiſtory.

None of the inſcriptions found there are more antient than the birth of Chriſt, nor any ſo late as the deſtruction of the city by Aurelian, except a Latin inſcription which mentions Dioclefian. Two of the mauſoleums have very legible inſcriptions; one of them informs us, that Jamblicus cauſed that monument to be erected as a ſepulchre for himſelf and his family in 314, which anſwers to the third year of the Chriſtian æra; and the other, that Elabelus Manaius cauſed it to be erected in 414, the hundred and third year after the birth of Chriſt. The ornaments of both theſe mauſoleums are much in the ſame taſte, though the laſt is the moſt elegant, and finiſhed with the greateſt care; and they are both ſo much in the taſte and manner of the other public ſtructures, that it is natural to conclude, that they are not the works of very different ages.

SECT. IV.

The Perſons, Dreſs, Food, Language, Manners, and Government of the Arabs.

THE Arabians are of a middle ſtature, thin, and of a ſwarthy complexion; and, like other people in the ſame climate, have black eyes and black hair. Their voices are rather effeminate than ſtrong; yet they are a brave people, very expert at the bow and lance, and, ſince they have been acquainted with fire-arms, are become pretty good markſmen.

The roving Arabs wear a kind of blue ſhirt faſtened about them with a white ſaſh, and ſome of them have over it a fur ſheep-ſkin veſt. They have a cap or turban on their heads; ſometimes they wear ſlippers, but never any ſtockings. Many of them go almoſt naked, but the women are generally ſo wrapped up, that nothing can be diſcovered but their eyes. The women Mr. Wood ſaw at Palmyra had good features; they were veiled, but were leſs ſcrupulous about ſhewing their faces than is uſual with the women of the Eaſt. They hang rings of gold or braſs in their ears and noſe; they colour their lips blue, and the tips of their fingers red. Both ſexes appear very healthy, and to be almoſt ſtrangers to diſeaſes.

Their food is beef, mutton, goats fleſh, veniſon, and the fleſh of camels, which they prefer to all the reſt, and eat with thin cakes made of flour and water; but many of them chooſe dried dates inſtead of bread. They alſo eat moſt ſorts of fiſh, except thoſe which have no ſcales; but on whatever animal they feed, they are very careful of draining out all the blood. The people about Muſcat not only abſtain from wine, but deny themſelves tea and coffee, and other innocent liquors; nor do they indulge themſelves in ſmoaking tobacco: water is their uſual drink, and ſometimes ſherbet, made of oranges, water, and ſugar.

The people of the Eaſt eſteem the Arabian tongue the richeſt and moſt copious of any in the world. It is every where conſidered by the orientals as a learned language; and even in Perſia and India the Koran is never read in any other tongue. But though the Arabs have in former ages been famous for their learning and ſkill in all the liberal arts, there is at preſent ſcarce any country where the people are ſo univerſally ignorant as in Arabia.

Though the Arabs are generally conſidered as only bands of robbers, yet in thoſe places where they are ſettled, and apply to the cultivation of the earth, to trade, and mechanic arts, they are diſtinguiſhed by their juſtice, temperance, and humanity. Captain Say obſerves, that the Arabians near Muſcat are courteous in their behaviour, extremely civil to ſtrangers, to whom they offer no violence or affront, and though they have the higheſt veneration for their religion, they never ſtrive to force it upon others: that a man may travel ſeveral hundred miles without ſo much as meeting with abuſive language; and if he has a charge of money, he needs no arms to defend it, but may ſafely ſleep with it in his hand by the way-ſide; and that though he lived ſeveral years in the country, during which he ſpent much of his time in travelling, he never heard of a ſingle robbery among them. Indeed it is not ſurpriſing, that in a country of ſo great extent, the manners and cuſtoms of the people ſhould be very different. It is true, ſeveral Arabian princes extort money from the caravans; but as the country is theirs, they might refuſe to let any caravans paſs through it, and poſſibly what they impoſe upon caravans may be by way of toll; which is the more probable, as the ſums they demand are not ſo large as to diſcourage the caravans from paſſing through their dominions. But after all, there is no doubt but ſome tribes of the wandering Arabs live chiefly by robbery and plunder. We find that Mr. Wood and his companions, in travelling to Palmyra and Balbec, had an Arabian eſcort to defend them from a prince of the Bedouins, or wandering Arabs; and that, on their arrival at Palmyra, they ſlept in ſafety in the huts of poor but honeſt Arabian peaſants.

The Arabs who live in towns are very inconſiderable in point of number, compared with thoſe who live in tents, and are called Bedouins. Theſe people have no fixed habitation, but being poſſeſſed of large flocks of ſheep, and herds of camels and goats, rove from one part of the country to another, where they can find paſture and water for their cattle; and when they have deſtroyed all the forage, load their goods and baggage, with their wives and children on their camels, and march on in ſearch of freſh paſture. When they encamp, their tents make a very indifferent appearance, they being uſually covered with a coarſe ſtuff made of black, or dark-coloured goats hair. Theſe are the people dangerous to travellers.

The Arabians of the inland country are divided into tribes, and the tribes into families; every tribe has its ſheik el kebir, or great prince; and every family its ſheik or governor. The office of ſheik is hereditary; but when the ſheik of a family dies without iſſue, the family chooſe another, with the leave of the ſheik el kebir, or ſovereign; and if the ſovereign himſelf dies without iſſue, the whole tribe aſſemble to chooſe another. The ſheiks, or emirs, near Turky, are ſaid to be tributary to the Turks; but, inſtead of this, they generally receive gratuities for permitting the pilgrims to paſs through their country; and the Grand Signior is always glad to maintain a good underſtanding with them, as it is in their power to attack the pilgrims in their way to Mecca, as well as to injure his ſubjects by their excurſions and robberies; while it is very difficult for him to puniſh them for it.

In Arabia are ſovereign ſtates whoſe monarchs are ſtiled xerifs, and others are named imams, both of them including

including the offices of king and prieſt, in the ſame manner as the caliphs of the Saracens, the ſucceſſors of Mahomet. Theſe monarchs appear to be abſolute, both in ſpirituals and temporals; the ſucceſſion is hereditary, and they have no other laws than thoſe found in the Koran and the comments upon it.

The uſual arms of the Arabs are a lance, or half-pike, a ſabre, a dagger, and a bow and arrows; and of late fire-arms have been introduced among them. The Arabs, like the Perſians, are excellent horſemen, and harraſs an enemy by their ſudden attack, and even defeat them when purſued. They are not very fond of fighting upon equal terms with the ſcymitar, but truſt much more to the fleetneſs of their horſes, and their ſkill in throwing the lance, firing, and diſcharging their arrows at thoſe who purſue them.

Theſe monarchs do not appear to have any ſtanding army, or even a regular militia; but they command both the perſons and purſes of their ſubjects. Thoſe ſituated near the coaſt have rendered themſelves formidable at ſea, particularly the king of Muſcat, whoſe veſſels not only attacked thoſe of the Aſiatics, but even the Europeans themſelves: they are generally at war with the Danes and Portugueſe; and if an Engliſh veſſel, that is not a ſhip of force, comes in their way, they will not ſcruple making a prize of her. Mr. Lockhart ſays, that when he was at Muſcat there were fourteen men of war at that city, beſides twenty merchantmen; that one of theſe ſhips of war carried ſeventy guns, and none of them leſs than twenty: at the ſame time there were fifteen or ſixteen ſail of their men of war cruiſing abroad. Their colours are red, which they diſplay in ſtreamers and pendants at the maſt-head, and other parts of the ſhip, which gives their fleets a gay appearance.

As they have ſcarce any timber of their own growth fit for ſhipping, ſome of them are ſaid to be built in the mouth of the river Indus, and many of them are prizes taken from other nations.

SECT. V.

Of Pilgrimages to Mecca, the Ceremonies with which they are attended, and a Deſcription of Mecca and Medina.

THE Mahometans of all countries conſider it as a duty to go in pilgrimage to Mecca. Thoſe who reſide in Africa commonly embark on board veſſels, which wait for that purpoſe at the port of Suez, a ſmall town ſituated at the moſt northern extremity of the weſt gulph of the Red Sea, whence they proceed to Rabbock, about four days ſail from Mecca, where ſtripping off their cloaths, and covering their bodies with only two wrappers, with their heads bare and ſandals on their feet, they go on ſhore, and travel by land to Mecca. The ſcorching heat of the ſun ſometimes burns the ſkin off their backs and arms, and greatly ſwells their heads; but when their lives are in danger from theſe auſterities, they may put on their cloaths, on condition that on their arrival at Mecca each ſhall kill a ſheep, and give it to the poor. But while dreſſed in this mortifying habit, it is held unlawful even to cut their nails, or to kill the vermin that bites them. They are likewiſe to be free from all enmity, to keep a guard over their tempers and paſſions, to preſerve a ſtrict government over the tongue, and to make continual uſe of a preſcribed form of devout expreſſions. Theſe auſterities are continued ſeven days.

At about the diſtance of a day's journey from Mecca they are met by perſons who come to inſtruct them in the ceremonies to be uſed in their worſhip, who, on their arrival at that city, conduct them into a great ſtreet in the midſt of the town, which leads to the temple; go with them to the fountains where they are to perform their ablutions, and then take them to the temple, where the pilgrims leaving their ſandals with one who attends to receive them, they enter at the door of the court which ſurrounds it, called the gate of peace, and having proceeded a few paces, their guide holds up his hands towards the ſacred edifice, which ſtands in the centre, and utters ſeveral words, which the pilgrims repeat after him, burſting into tears at the ſight of the building. Being led ſeven times round it, they are conducted back into the ſtreet, where they ſometimes run, and ſometimes walk very quick, the pilgrims imitating their guide with the utmoſt awe and trembling, performing theſe ſuperſtitions with great ſeeming devotion; and theſe being ended, they return and ſeek out for lodgings.

All the pilgrims eſteem it their indiſpenſable duty to improve their time while at Mecca, not only by performing the accuſtomed duties within the court of the temple, but in ſpending all their leiſure-time there, and, as far as they are able, in continuing to walk round the temple itſelf, at one corner of which is faſtened a black ſtone framed in with ſilver, and every time they come to that corner they kiſs the ſtone; and having gone round ſeven times, they perform two prayers. The people there have a tradition that this ſtone was formerly white, but that it is rendered black by the ſins of the people who kiſs it.

Mecca is ſituated in the latitude of twenty-one degrees twenty-five minutes, in a valley amidſt many little hills, and about a day's journey from the Red Sea. It is a place of no ſtrength, it having neither walls nor gates, and the buildings are extremely mean. The hills which encompaſs the town conſiſt of a blackiſh rock, and on the top of one of them is a cave, where they pretend Mahomet uſually retired to perform his devotions, and ſay, that the greateſt part of the Koran was brought to him here, chapter by chapter, by the angel Gabriel.

This city is rendered famous by the reſort of many thouſand pilgrims, who annually viſit the temple of Mecca, which is a ſmall, plain, ſquare building in the midſt of a ſpacious area, encompaſſed by a ſtructure which has piazzas on the inſide reſembling thoſe of the Royal Exchange, in London; but the ſquare is near ten times bigger, and over the piazzas is a range of domes, one on each ſide, which cover little rooms or cells, inhabited by people who give themſelves up to reading and a devout life; and at each corner is a minoret, or ſteeple, from which the cryers call the people to prayers. In this outer-building are forty-two doors, which open into the ſquare. The area on the inſide of the incloſure is covered with gravel, except the paths that lead to the temple, and a ſmall place around it, which are paved with ſhort ſtones.

The Holy Houſe, or temple, which is in the center of the area, is a ſquare ſtructure, each ſide of which is about twenty-four paces long, and about twenty feet high, formed of large ſtones perfectly ſmooth and plain, without the leaſt carved-work; but is covered all over from top to bottom with a thick kind of ſilk, and above the middle is embroidered with letters of gold two feet in length. The door is covered with ſilver plates, and has a curtain before it thick with gold embroidery. This temple is the principal object of the pilgrims devotion, and is opened only two days in the ſpace of ſix weeks; that is, one day for the men, and the next for the women. On the inſide are only two wooden pillars, which ſtand near the middle to ſupport the roof, with a bar of iron faſtened to them, on which hang three or four ſilver lamps. The walls on the inſide are marble, and covered with ſilk, except when the pilgrims enter. Thoſe who are admitted into this ſtructure ſcarcely ſtay ten minutes, becauſe others wait for the ſame privilege; and while ſome are going out, others are entering in. All who pleaſe have the liberty of thus paſſing through the temple. The top of the ſtructure is flat and covered with lime and ſand; and as it has a long ſpout to carry off the rain whenever that falls, the people crowd to get under it, that the water which comes from the holy houſe may fall upon them, which they eſteem a ſingular happineſs; and if they can catch ſome of it to drink, their joy is extreme.

Round the temple is a marble pavement fifty feet broad, on the edge of which are braſs pillars twenty feet diſtance from each other, and near fifteen feet high. Above the middle part of theſe pillars an iron bar extends from one to the other, with glaſs lamps hanging to each by braſs wires, to give light in the night as in the day.

At the diſtance of about twelve paces from the temple is a building called the ſepulchre of Abraham, who they imagine built the temple, in obedience to a divine command. This ſepulchre is incloſed with iron gates, and adorned with an embroidered covering. Near it on the left hand is the well Zemzem, the water of which is eſteemed holy, on which account the pilgrims, when they firſt arrive at Mecca, drink of it unreaſonably, by which means it purges them, and makes their fleſh break out in pimples. This they term purging of their ſpiritual corruptions. Many of them carry ſome of this water home to their reſpective countries, in ſmall tin pots, and preſent perhaps half a ſpoonful of it to each of their friends, who, with abundance of thanks, receive it in the hollow of their hands, and ſipping a little of it, rub the reſt on their faces and naked heads.

Oppoſite to each ſide of the temple is a ſmall edifice raiſed on pillars, where the Imam and the Mezzins perform their devotions in the ſight of all the people. Theſe four ſtructures belong to ſo many different ſects of Mahometans.

The covering of this temple is annually renewed, and ſent from Cairo by order of the Grand Signior, when the caravan proceeds with the pilgrims to Mecca. The new covering is carried upon two camels, which are exempted from work for the ſpace of a year after. This covering is received with extraordinary joy by the people, and is put up by the xerif of Mecca himſelf; and after he has cauſed the old covering to be cut in pieces, ſells them at a high price to the Hadgees.

There are ſeveral thouſand blue pigeons at Mecca, which none will affright, much leſs kill them, whence they are ſo very tame, that they will pick corn out of the people's hands. They are called the pigeons of the prophet, and come in flocks to the court of the temple, where they are fed by the Hadgees.

Before the pilgrims receive the title of Hadgee, they reſume their mortified habit, and proceed to a hill called Gibbel el Orphet, or the mount of knowledge, where ſeventy thouſand perſons are ſaid to aſſemble every year, two months and nine days after the feaſt of Ramadan. Nothing can be more affecting, than to ſee ſo many thouſand people cloathed in their garments of humility, with their heads bare, and their cheeks wet with tears, while with bitter ſighs they earneſtly beg, in a form of penitential expreſſions, the remiſſion of their ſins, and promiſe to reform their lives. This is continued for the ſpace of four or five hours, after which they all at once receive the title of Hadgee from the Imam, which they enjoy as long as they live.

They no ſooner receive this name, than trumpets being ſounded, they leave the hill in order to return to Mecca; but, having proceeded two or three miles, reſt for that night. After their devotions, each perſon gathers forty-nine ſmall ſtones, and the next morning they proceed to a place called Mina, where they pretend that Abraham went to offer up his ſon, and having all pitched their tents, every Hadgee throws ſeven of the ſtones he had gathered at a ſmall pillar, crying, "Stone the devil and them that pleaſe him."

The country people then bring in great flocks of ſheep: every one who is able buys one, and having ſlain it, gives ſome of the fleſh to his friends and the poor: then all of them pulling off their penitential habits, ſpend three days in feſtivity and rejoicing. It muſt be obſerved, that there are two other pillars, and that on the ſecond day they throw at each of the three ſeven ſtones, and the ſame number the day after.

At the expiration of the three days they all return to Mecca, where they muſt not ſtay above ten or twelve days longer, and during that time is held a great fair, in which all ſorts of India goods are ſold. Moſt of the people here buy a ſhrowd of fine linen to be wrapped in at their death, on account of the advantage of having it dipt in the holy water. In the evening before they leave Mecca, they all take a ſolemn leave of the holy houſe, and retiring backwards, hold up their hands, and offer up their petitions with their eyes fixed on the building, till having loſt ſight of it, they burſt into tears, and proceed on their journey.

It is worthy of remark, that this holy houſe, which the vulgar ſay was built by Abraham, had long been an idol-temple, but was dedicated by Mahomet to the Unity of God; and that their pilgrimages thither are intended to ſhew their deteſtation of all idolatry. As to Mahomet himſelf, there is ſaid to be now only a faint reverence kept up for his name, even in Arabia his native country; and a judicious author obſerves, "that the furious zeal of which the firſt Saracen conquerors made ſuch a parade, and ſo ſucceſsfully availed themſelves, had not ſo much a veneration for Mahomet for its object, as the Unity of the Supreme Being, in the invocation of which, if they joined the commemoration of his name, it was purely out of gratitude, for being the miſſionary of that Unity, and for his deſtroying the idol-worſhip, to which Arabia had continued ſo long under bondage. For the reſt they looked upon him as a mere man, ſubject to all the failings and paſſions of one, and are ſo far from addreſſing him as a ſaint, that in their moſques and private oriſons, they do not pray to him, but for him." Indeed, there are no pilgrimages to his tomb that is at Medina, and is viſited by the Mahometans purely out of curioſity, and reverence to his memory, and many of the pilgrims return without ſeeing it at all.

It is a very great miſtake that thoſe who have been at Mecca, may commit crimes with impunity, and muſt not be put to death; ſince their being Hadgees does not entitle them to any privilege of that nature: for even on the road to and from Mecca, the pilgrims who commit crimes are puniſhed as in other places; there being a baſha and a cady in the caravan to try them, and numbers are annually executed both on the road thither, and in returning from thence.

Medina, the place where Mahomet lies entombed, to which he fled when driven from Mecca, and where he was firſt inveſted with regal power, is ſituated in twenty-four degrees thirty minutes north latitude, about eighty miles to the eaſtward of the Red Sea, and two hundred miles to the north of Mecca. It contains about a thouſand houſes built of brick and ſtone, which cannot be very lofty, as they are raiſed but one ſtory from the ground.

In this city are ſeveral noble moſques, the principal of which is named Mos a Kibu, or the moſt holy. It ſtands in the middle of the town, and is a ſquare building one hundred paces in length, and eighty in breadth, ſupported by many columns. It is ſaid to have no leſs than three thouſand lamps; but Mr. Pitts, who was there, maintains, that there are not above one hundred. Mahomet's tomb ſtands in this temple, covered with a dome, and encompaſſed with iron rails: the tomb itſelf is ſurrounded by a ſilver grate, and encloſed like a bed by curtains of rich ſilk. None are permitted to enter within the grate; for this is only allowed to thoſe who go in to light the lamps, which burn by night.

Some pretend, that Mahomet's coffin is ſuſpended by the attractive virtue of a load-ſtone fixed to the roof, but there is not the leaſt foundation for this opinion; for the curtains that cover the tomb are not half ſo high as the dome; it is therefore impoſſible that the coffin ſhould hang there, and the Mahometans never pretended that it did.

SECT. VI.

A conciſe Deſcription of Mocha, with an account of the Trade of that City, and of the Coins, Weights, and Meaſures in uſe there.

WE ſhall now give a conciſe deſcription of Mocha, the principal trading town of Arabia Felix, ſituated on the Red Sea, in thirteen degrees north latitude, and in the forty-fifth degree of eaſt longitude from London. The neighbouring country is under the government of an Arab prince, who reſides at a place two hundred miles to the eaſt of Mocha. Aden was formerly the ſea-port of his dominions; but that being very inconvenient, he removed it fifteen leagues farther to Mocha,

cha, which was then only a fiſhing town; but trade has rendered it a conſiderable city. It ſtands cloſe to the ſea in a large dry and ſandy plain, that affords neither fruits nor water, except what is brackiſh, and ſo unwholeſome, that it is ſaid long worms breed in the legs and feet of thoſe who drink it. The inhabitants have, however, very good and wholeſome water from Moſa, which lying at the diſtance of twenty miles, and the water coming by land-carriage, is as dear to the inhabitants as ſmall beer in England. But notwithſtanding this inconvenience, Mocha is large, pretty well fortified, and makes a fine appearance from the ſea. The buildings are lofty, and their markets well furniſhed with proviſions, as the fleſh of camels and antelopes, beef, mutton, goats-fleſh, lamb, and kid: their common fowls are Guinea hens, partridges, and pigeons. The ſea alſo affords variety of fiſh, but they are not well taſted, which proceeds from the extreme ſaltneſs of the ſea-water, and the nature of the aliment. All the year round the town is well ſupplied with good fruit, as peaches, apricots, grapes, and quinces, of which they make marmalade, both for their own uſe and for exportation; though near the town there is not a tree or ſhrub to be ſeen, except a few date-trees. They have ſeldom more than two or three ſhowers in a year, and ſometimes no rain for two or three years together; but among the mountains, at about twenty miles diſtance, there is generally a moderate ſhower every morning, which render the vallies between them very fertile, particularly in fruit, wheat, and barley.

Since Mocha was made a free port, it is become a place of great trade. It has a factory belonging to the Engliſh Eaſt India company, another belonging to the Dutch, and a conſiderable commerce is carried on by veſſels from Baſſorah, Perſia, and Muſcat in Arabia Petræa. The country itſelf produces few valuable commodities, except coffee, and ſome drugs, as myrrh, olibanum, or frankincenſe, from Coſſin; aloes ſocotrina from Soccotra; liquid ſtorax, white and yellow arſenic, gum arabic, with ſome balm of Gilead that comes down the Red Sea. The coffee trade brings in a continual ſupply of gold and ſilver from Europe; for though other goods and merchandize may be bought and ſold on credit for a certain time, coffee is always bought for ready money. The ſhips from Europe are ſaid to take in annually at Mocha about twenty thouſand tons, and from other countries about as much more. The Dutch obtain here great advantages over other nations by their poſſeſſing the monopoly of ſpices, which being conſumed here in great quantities, enables them to purchaſe coffee at eaſier rates than their neighbours; yet their trade at Mocha is continually ſinking, from the vaſt quantities of coffee cultivated in their own colonies at Batavia, Amboyna, and the Cape of Good Hope, though the Dutch themſelves acknowledge that there is no compariſon between the flavour of the coffee raiſed in their own plantations and that brought from Mocha.

The coins current at Mocha are dollars of all kinds, which with them ought to weigh ſeventeen drams, fourteen grains; for all their coins are taken by weight, and valued according to their fineneſs. The gold coins current there are ducats of Germany, Venice, Turky, and Egypt. The comaſſees are a ſmall coin taken at the price the government ſets upon them; but they keep their accounts in cabeers, an imaginary coin, eight of which make a dollar.

The weights uſed at Mocha are the bahor, which amounts to four hundred and twenty pounds Engliſh: the fraſſel, or twenty-eight pounds, fifteen of which make a bahor: the maun, ten of which go to a fraſſel: the fakea, forty of which make a maun; and the coſſila, ten of which make a fakea.

Their dry meaſures are the medeeda, which contains three Engliſh pints; and cloth and ſilk are meaſured by their cubit of twenty-four inches.

CHAP. XXVII.

Of TURKY in ASIA.

SECT. I.

Of its Situation, Extent and Diviſions.

TURKY in Aſia, which once formed a great part of the Eaſtern empire, and was moſt of it enlightened by the knowledge of Chriſtianity, extends from the twenty-eighth degree of north latitude to the forty-fifth, and from the twenty-ſeventh degree of eaſt longitude from London to the forty-ſixth. It is about a thouſand miles in length from eaſt to weſt, and about eight hundred in breadth from north to ſouth. This extenſive country is bounded on the north by the Black Sea and Circaſſia; on the eaſt by Perſia; on the ſouth by Arabia and the Levant, or ſouth-eaſt part of the Mediterranean Sea; and by the Archipelago, the Helleſpont, and Propontis, which ſeparate it from Europe, on the weſt.

As to the grand diviſions of this part of the Turkiſh empire, theſe conſiſt of the following provinces: on the eaſt are Eyraca Arabic, or Chaldea; Diarbec, or Meſopotamia; a part of Curdiſtan, or Aſſyria; Turcomania, the antient Armenia Major; part of Georgia, including Mingrelia, Imaretta, and part of Circaſſia; Syria, and Paleſtine. The weſtern diviſion conſiſts of Natolia, the antient Aſia Minor, which is divided into Natolia Proper, Amaſia, Aladulia, and Carmania.

As ſeveral of theſe provinces have been ſeparate kingdoms, and ſtill enjoy advantages and diſadvantages of ſoil and climate peculiar to themſelves, we ſhall conſider them ſeparately, and not attempt to give a general deſcription of the whole, that can only be true in part, and muſt be liable to many exceptions.

The Turks, who poſſeſs the country, are indeed every where the ſame, and therefore by deſcribing them here, we ſhall avoid many repetitions that would appear irkſome and tedious to the reader; and, by ſeeing whatever is worthy of notice in relation to their perſons, dreſs, manners, and cuſtoms placed before him in one view, he will be better able to form a juſt idea of that people, than he could obtain from our mixing them with the particularities and cuſtoms of the original inhabitants of different provinces.

SECT. II.

Of the Perſons and Dreſs of the Turks.

THE Turks in general are pretty well made: thoſe in the cities have a tolerably fair complexion; but the peaſants, and ſuch as are obliged to be much in the ſun, are ſwarthy. Their hair is commonly black, or of a dark cheſnut, and they have commonly black eyes. The men are tolerably handſome when young, but tho' the women are very beautiful they arrive very early at maturity, and ſoon fade; and, in general, they look old by the time they reach thirty.

So[illegible]

Some of the old men dye their beards, and the old women their hair of a red colour with henna, which gives them a very whimſical appearance; and many of the men ſtrive to conceal their age by dying their beards black.

Few of the Turkiſh ladies paint, for this is almoſt peculiar to the common proſtitutes; but they uſually black their eye-brows, or rather make artificial ones, with a compoſition which they call hattat. From a principle of ſtrengthening the ſight, as well as an ornament, it is a general practice among the women to black the inſide of their eye-lids, by applying a powder called iſmed; this is a mineral ſubſtance that reſembles a rich lead-ore, and is prepared by roaſting it in a quince, apple, or truffle; it is then levigated with the oil of ſweet almonds on a piece of marble, and if intended to ſtrengthen the ſight they frequently add flowers of olibanum, or amber. They perform this operation with a cylindrical piece of ſilver, ſteel, or ivory, about two inches long, and of the ſize of a common probe. This they wet with water, in order that the powder may ſtick to it, and applying the middle-part horizontally to the eye, ſhut the eye-lids upon it, and drawing it through between them, it blackens the inſide, leaving a narrow black rim round the edge. This is ſometimes practiſed by the men, but is then eſteemed foppiſh. Singular as this cuſtom may appear, it has been practiſed throughout the Eaſt for many ages; and it was a cuſtom not unknown to the beauties of antient Greece and Rome.

The women have another ſingular method of adorning themſelves, which is, by ſtaining their feet and hands with henna, which is brought in great quantities from Egypt chiefly for that purpoſe. The common way is to dye only the tips of the fingers and toes, and ſome few ſpots upon the hands and feet, and leave them of a dirty yellow, the natural tincture of the henna, which has a very diſagreeable appearance to an European; but it is more polite to have the greateſt part of the hands and feet ſtained in the form of roſes, and various figures, with a dye that is of a very dark green. But after ſome days this begins to change, and at laſt looks as diſagreeable as the other.

The women in ſome of the villages, and all the Arabs, wear a large gold or ſilver ring through the external cartilage of their right noſtril; and ſome of theſe rings are at leaſt an inch and a half in diameter. It is likewiſe uſual for theſe people to mark their under lip, and ſometimes their breaſts and arms, with a blue colour, by pricking the part with a needle, and then rubbing it with a certain powder which leaves an indelible mark.

As a ſlender waiſt is far from being admired by the Turks, and is rather conſidered as a deformity in the ladies, they uſe all their endeavours to render themſelves plump. The Turkiſh habit appears very graceful: next the ſkin the men wear a pair of drawers, and over them a ſhirt and a doliman of ſattin, taffety, or other neat ſtuff, which reaches to their heels, like a cloſe-bodied caſſock. In winter this is quilted, and this they gird very tight round the waiſt with a ſaſh, in which they frequently wear two daggers, the handles and ſheaths of which are ſometimes adorned with gold and ſilver. Perſons of diſtinguiſhed rank have them oramented with precious ſtones. In this girdle they alſo carry their money and their pouch for tobacco. Over the doliman they wear a kind of night-gown, which thoſe who are able line with furs in the winter. Their ſtockings are of cloth, footed with red or yellow leather; and their ſhoes are of the ſame colour. On their head they wear a crimſon velvet cap, round which they wrap a red or white turban, which is a ſcarf of linen or ſilk many ells long.

Upon particular occaſions the Janizaries wear a ſercola or cap of ceremony, which hangs down behind, and has a pipe of gilt leather half a foot long that reaches to the middle of the forehead; but they uſually wear a turban of white, red, or other ſilk. The Turks ſhave their heads, and ſay, "The devil neſtles in long "hair;" but they are fond of a venerable beard.

In deſcribing the dreſs, the manners, and cuſtoms of the Turkiſh ladies, we ſhall follow the account given of them by a lady, who was of a rank ſufficient to gain her admittance into the harrams of the great; and was herſelf diſtinguiſhed by uncommon learning, and thoſe great qualifications which add dignity to the higheſt ſtations. This truth requires, for little credit ought to be given to the account travellers have given of ladies whom they were never permitted to ſee, and to their deſcription of cuſtoms which they cannot know. The only objection that can be made, is, that her obſervations were made at Conſtantinople, and that we are deſcribing the cuſtoms of the Turks in Aſia; but as the manners of theſe people are every where the ſame, this can produce no other alteration, except, perhaps, ſome abatement in point of ſplendor.

"The firſt part of my dreſs, ſays the lady Wortley "Montague, when ambaſſadreſs at Conſtantinople, is a "pair of drawers, very full, that reach to my ſhoes, "and conceal the legs more modeſtly than your petti-"coats. They are a thin roſe-coloured damaſk, bro-"caded with ſilver flowers. My ſhoes are of white kid "leather embroidered with gold. Over this hangs my "ſmock of a fine white ſilk gauſe, edged with embroi-"dery. This ſmock has wide ſleeves, hanging half "way down the arm, and is cloſed at the neck with a "diamond button; but the ſhape and colour of the "boſom is very well to be diſtinguiſhed through it. "The antery is a waiſtcoat, made cloſe to the ſhape, "of white and gold damaſk, with very long ſleeves fall-"ing back, and fringed with deep gold fringe, and "ſhould have diamond or pearl buttons. My caftan, "of the ſame ſtuff with my drawers, is a robe exactly "fitted to my ſhape, and reaching to my feet, with "very long, ſtrait, falling ſleeves. Over this is the "girdle, of about four fingers broad, which all that "can afford it have entirely of diamonds or other pre-"cious ſtones; thoſe who will not be at that expence, "have it of exquiſite embroidery on ſattin; but it muſt "be faſtened before with a claſp of diamonds. The "curdee is a looſe robe they throw off or put on, ac-"cording to the weather, being of a rich brocade, (mine "is green and gold) either lined with ermine or ſables; "the ſleeves reach very little below the ſhoulders. The "head-dreſs is compoſed of a cap, called talpoc, which "is in winter of fine velvet embroidered with pearl or "diamonds; and in ſummer of a light ſhining ſilver "ſtuff. This is fixed on one ſide of the head, hang-"ing a little way down, with a gold taſſel, and bound "on either with a circle of diamonds, (as I have ſeen "ſeveral) or a rich embroidered handkerchief. On the "other ſide of the head the hair is laid flat; and here "the ladies are at liberty to ſhew their fancies; ſome "putting flowers, others a plume of herons feathers, "and, in ſhort, what they pleaſe; but the moſt general "faſhion is, a large bouquet of jewels, made like natu-"ral flowers, that is, the buds of pearls, the roſes of "different coloured rubies, the jeſſamines of diamonds, "the jonquils of topazes, &c. ſo well ſet and enamelled "'tis hard to imagine any thing of that kind ſo beauti-"ful. The hair hangs at its full length behind, divid-"ed into treſſes braided with pearl or ribbon, which is "always in great quantity."

The ſame admirable writer obſerves, that the Turkiſh ladies do not commit one ſin the leſs for not being Chriſtians, and that they are far from wanting the liberty ours enjoy. No woman, let her rank be what it will, is permitted to go into the ſtreets without two murlins, one that hides the whole dreſs of her head, and hangs half way down her back, and another that covers her face all but her eyes. Their ſhapes are alſo entirely concealed by a ferigee, which no woman of any ſort appears without; this has long ſleeves that reach to their fingers ends, and wraps round them like a riding-hood. This in ſummer is of plain ſilk, or ſtuff, and in winter of cloth. By this means they are ſo diſguiſed that the greateſt lady cannot be diſtinguiſhed from her ſlave, and it is impoſſible for the moſt jealous huſband to know his wife when he meets her, and no man dare touch or follow a woman in the ſtreet.

Their thus appearing in maſquerade affords them the liberty of following their inclinations without danger of diſcovery. Their moſt uſual method of intrigue is ſend-

ing

ing an appointment for the lover to meet them at a Jew's ſhop, where the moſt valuable goods are to be purchaſed. The great ladies ſeldom let their gallants know who they are; and it is ſo difficult to diſcover them, that they can ſeldom gueſs the lady's name with whom they have correſponded above half a year together. Hence the number of faithful wives is perhaps ſmall, ſince they have nothing to fear from the indiſcretion of a lover.

The Turkiſh women, the above ingenious lady obſerves, notwithſtanding all that has been ſaid to the contrary, are perhaps more free than any other in the univerſe, and are the only women in the world that lead a life of uninterrupted pleaſure, exempt from cares; their whole time is ſpent in viſiting, bathing, or the agreeable amuſement of ſpending money, and inventing new methods of adorning their perſons. A huſband would be thought mad that exacted any degree of œconomy from his wife, whoſe expences are only limited by her fancy. 'Tis his buſineſs to get money, and hers to ſpend it; and this prerogative extends to the meaneſt of the ſex. Indeed theſe have no places of reſort but the bagnios, and there can only be ſeen by their own ſex; however, they are fond of dreſs, and take great pleaſure in frequenting the baths.

Thoſe Turks who are not afraid of ſhewing that they are rich live well, and are far from being ſo abſtemious as many people imagine. As ſoon as they riſe in the morning they breakfaſt on fried eggs, honey, cheeſe, leban, &c. At about eleven o'clock in the forenoon in winter, and rather earlier in ſummer, they dine. They have a round table, which, as well as their diſhes, is made either of copper tinned, or, for perſons of high rank, of ſilver. This is placed upon a ſtool about twelve or fourteen inches high, and a round piece of cloth is ſpread under the table, upon a carpet, to prevent its being ſoiled. A long piece of ſilk is laid round to cover the knees of thoſe who ſit at the table, which has no covering but the victuals. Sallads, pickles, ſmall baſons of leban, bread, and ſpoons, are placed in order round the edge, and the middle of the table is for the diſhes, which, among the great, are brought in one by one: and, after each has ate a little, they are changed. Their fingers, as in other parts of the Eaſt, ſerve for knives and forks; but for liquids they make uſe of ſpoons made of wood, horn, or tortoiſe-ſhell; for gold or ſilver they are not permitted to uſe by their religion.

Their uſual bread is of wheat-flour not well fermented, made into thin flat cakes ill baked, and for the moſt part ate ſoon after it comes out of the oven; beſides theſe there are a variety of ruſks and biſcuits, moſt of them ſtrewed over the top with the ſeeds of ſeſamum, or fennel-flour. The firſt diſh is generally a kind of broth, or ſoup, and the laſt pillaw. The intermediate diſhes, which are frequently numerous, conſiſt of mutton cut into ſmall pieces, roaſted or ſtewed with herbs, ſtewed fowls, pigeons, or other birds, which are commonly ſtuffed with rice and ſpices. A whole lamb ſtuffed with rice, almonds, raiſins, piſtachos, &c. and ſtewed, is a favourite diſh. Paſtry, both with meat and of the ſweet or fruit kind, they would make very well, if the badneſs of their butter did not in moſt places ſpoil it. A large pillaw, with a diſh of ſweet ſtarch, which they ſometimes eat with it, comes laſt, except a very thin ſyrup, with dried apricots, raiſins, piſtachos, ſlices of apples, pears, or the like, ſwimming in it; of this each perſon takes a large ſpoonful, with ſpoons brought in with it on purpoſe; and thus finiſhes the repaſt.

Water is their liquor at table, and after dinner they drink coffee. Moſt of their diſhes are greaſy either with fat or butter, and pretty high-ſeaſoned with ſalt and ſpices; many of them are made ſour with verjuice, pomegranate, or lemon-juice; and onions and garlic frequently complete the ſeaſoning.

The lady Wortley Montague ſays, that, for the firſt week, their cookery pleaſed her extremely: but then growing weary of their table, ſhe deſired her cook might add a diſh or two after our manner; but, at the ſame time, acknowledges, that this might be owing to cuſtom, and that ſhe was ready to believe that an Indian, who had never taſted of either, would prefer their cookery to ours.

The Turks ſup at about five o'clock in the winter, and ſix in the ſummer, in much the ſame manner as they dine; and in winter they frequently viſit each other and ſit up late, when they have a collation of ſeveral ſweet diſhes. Beſides dinner and ſupper, they frequently eat, within the compaſs of the day, ſeveral ſorts of fruit, according to the ſeaſon.

The common people have not this variety. Bread, dibbs, leban, butter, rice, and a very little mutton, are their principal food in the winter; as rice-bread, cheeſe, and fruits, are in the ſummer. Their principal meal is in the evening, when they return home from performing the buſineſs of the day.

Though wine and ſpirits are ſuppoſed to be only drank by the irreligious and licentious, yet their number is more than one would imagine from their appearance; for as theſe liquors are prohibited by their religion, they are commonly drank in ſecret at their gardens, or privately in the night; and whenever they can come at liquor, if they once begin, they generally drink to great exceſs. There are, however, others who drink wine with moderation, and ſay in excuſe, that all the creatures of God are good and deſigned for the uſe of man; however, that the prohibition of wine was an act of wiſdom, and deſigned for the common people, among whom it would be the ſource of infinite diſorders: but that the prophet never intended to reſtrain thoſe that knew how to uſe it with diſcretion; nevertheleſs, ſcandal ought to be avoided, and therefore they never drink it in public. This indeed is the general way of thinking among the ſenſible part of the people, very few of whom make any ſcruple of drinking wine that are able to afford it.

Coffee made very ſtrong, without milk or ſugar, is a refreſhment highly eſteemed by every body; and a diſh of it, preceded by a little wet ſweet-meat, which frequently conſiſts of conſerve of red roſes, ſharpened with lemon-juice, and a pipe of tobacco, is the uſual entertainment at a viſit; but if they chooſe to uſe leſs ceremony, they omit the ſweet-meat. When the Turks would ſhew an extraordinary degree of reſpect, they alſo preſent ſherbet; ſprinkle roſe or other ſweet-ſcented water; and perfume their viſitor with the ſmoke of the wood of aloes, which is brought in a cenſer, and generally ſerves for an intimation that it is time for the ſtranger to take his leave.

This is thought an entertainment ſufficient for any perſon, let his rank be ever ſo great; and if it be a viſit of ceremony from a baſha, or other perſon in power, a fine horſe, ſometimes with furniture, or ſome other valuable preſent, is made him at his departure.

After mentioning the entertainments of the Turks, it cannot be amiſs to obſerve, that though we are apt to eſteem theſe people as no better than barbarians, yet politeneſs and hoſpitality are their diſtinguiſhing characteriſtic. On a traveller's addreſſing the governor of a province for his protection, and making him, according to the cuſtom of the Eaſt, a handſome preſent, a pipe, coffee, ſweet-meats, and perfume, are ſucceſſively preſented; and he will tell him, that the land he commands, and all that is in it, are at his ſervice. "In "no inſtances, ſays the ingenious Mr. Wood, do the "oriental manners ſhew theſe people in ſo amiable a "light, as in their diſcharge of the duties of hoſpita-"lity: the ſeverities of Eaſtern deſpotiſm have indeed "been always ſoftened by this virtue, which ſo happily "flouriſhes moſt where it is moſt wanted. The great "forget the influence of power to the ſtranger under "their roof, and only preſerve a dignity ſo tempered by "humanity, that it ſolely commands that grateful re-"ſpect which is otherwiſe ſcarce known in a country "where inferiors are oftener taught to fear than to love. "But avarice, he adds, is as much an Eaſtern vice as "hoſpitality is an Eaſtern virtue. The moſt ſordid in-"ſtances among the former we found among the great, "and thoſe in public employments, while we expe-"rienced extraordinary inſtances of generoſity in private "life. We would therefore be cautious of charging "to the character of a people, what this government

" ſeems to require: for amidſt the uninterrupted ſeries " of ſhameleſs venality, which regulates the diſcharge " of every private duty, from the prime vizier down- " wards, and which, in the true ſpirit of deſpotiſm, " ſtops only at the wretch who is too low to make re- " priſals; every ſubaltern in power muſt ſubmit to that " portion of the common proſtitution which belongs to " his rank, and which therefore ſeems rather the vice " of the office than of the man."

But, notwithſtanding the general character of politeneſs, courteſy, and hoſpitality, by which the great are peculiarly diſtinguiſhed, the Mahometans, in private life, aſſume a ſuperiority over all who are of a different faith, which is beſt perceived by thoſe who dwell for a conſiderable time among them. This generally increaſes among the people in proportion to their vicinity to Mecca: thus the inhabitants of Aleppo have a much greater ſhare of it than Conſtantinople, Smyrna, and other places at a farther diſtance, though it greatly declines; and, even in Syria, ſeveral baſhas have conferred many public honours on the Europeans, that would formerly have cauſed great popular diſcontent. Among the common people an affected gravity, with ſome ſhare of diſſimulation, is too much their characteriſtic. And though they are much addicted to quarrelling and abuſive language, none are leſs guilty of fighting. However, though they are ſo prone to anger on the moſt trifling occaſions, no people upon earth can be more calm when it is for their intereſt: yet there are people who deſerve a much better character, for ſome of them are poſſeſſed of the utmoſt honour and integrity.

SECT. III.

Of the Amuſements and Diverſions of the Turks; particularly their Smoaking, their taking Opium, their Riding, Sleeping, and Games. Their Dancing, Wreſtling, and Muſic.

THE men ſmoak tobacco to great exceſs, as do many of the women; and the labourers, or handicraft tradeſmen, have generally a pipe in their mouths, if they are able to be at the expence. Theſe pipes are made of the twig of the cherry-tree or roſe-buſh, bored for that purpoſe; and thoſe of ſuperior rank are five or ſix feet long, and adorned with ſilver. The bowl is of clay, and often changed, though the pipes themſelves laſt for years. Many in affluent circumſtances adopt the Perſian manner of ſmoaking with the caalean already deſcribed. They uſe the Perſian tobacco, which has an agreeable flavour, with this inſtrument; and what is ſmoked this way, is ſaid to be attended with this advantage, that neither the taſte nor ſmell of it remain after waſhing the mouth.

The practice of taking opium is not ſo general in Turky as is commonly imagined, few uſing themſelves to it. By the debauchee, it is taken in various electuaries, or confections, in which it is mixed with aromatics; and ſome uſe it pure. The conſequences that reſult from this ill habit are the perſon's looking old and beſotted, like thoſe who in Europe have ruined their conſtitutions by hard drinking. And though they are ſeldom carried off by dropſies, or thoſe other diſeaſes that are the uſual conſequences of an habit of drunkenneſs, they ſeldom live to old age: but, having firſt loſt their memory, and moſt of their intellectual faculties, decline like thoſe who ſink under the weight of years.

The Turks have no notion of the benefit of exerciſe, either for the preſervation of health, or curing of diſeaſes; and laugh at the Franks or European Chriſtians for taking a walk, eſteeming it ridiculous to walk merely for the ſake of amuſement. Indeed, it is with reluctance that they uſe much exerciſe, either for buſineſs or pleaſure. To walk or ride to their gardens, where they are ſituated at a ſmall diſtance, once or twice a week at the proper ſeaſons, is as much as moſt of them care to do.

We muſt, however, except people of rank, who, though they are not fond of walking, are very active on horſeback, and in throwing the jareed, a ſhort ſtaff, which they dart very dexterouſly on horſeback; and a mock-fight with this weapon is a common entertainment. It is ſurpriſing to ſee with what dexterity they manage their horſes upon theſe occaſions, ſo as to avoid running againſt each other when numbers are galloping ſeemingly in the greateſt diſorder. This, however, is but ſeldom practiſed, the greateſt part of their time being ſpent in the indolent indulgence of lolling on their divans.

As the Turks in moſt parts of their Aſiatic dominions have no coaches, perſons of rank ride on horſeback, and in the cities have a number of ſervants walking before them, according to their rank, which, though it may be leſs convenient in bad weather, has a more manly, if not a grander appearance, than our ſedans and coaches. The ladies of the greateſt diſtinction are obliged to walk on foot, if they go only a moderate diſtance; but in journies, the women of rank are carried by mules in a litter cloſe covered up, and thoſe of inferior circumſtances are generally ſtowed one on each ſide of a mule in a kind of covered cradle.

Moſt of the natives go early to-bed, and riſe betimes in the morning. They ſleep in their drawers, and at leaſt in one or two waiſtcoats; and ſome of them in winter in their furs. Their beds only conſiſt of a matraſs laid on the floor and over it a ſheet, and in winter a carpet or ſome other woollen covering, the other ſheet being ſewed to the quilt, which is thrown over them. A divan-cuſhion often ſerves them for a pillow and bolſter; but ſome have a bolſter and pillow like ours. When the time of repoſe approaches they ſeat themſelves on this matraſs, and ſmoke till they find themſelves ſleepy, then lying down they leave their ſervants to cover them when aſleep; and many of the people of rank are lulled to reſt by ſoft muſic, or ſtories told out of the Arabian Nights Entertainment, or ſome other book of the ſame kind. If they happen to awake in the night they ſit up, fill their pipe, have a diſh of coffee made, and ſometimes in the long winter-nights eat ſome of their ſweet paſtry, and thus ſit till they drop aſleep again. In the ſouthern provinces their beds are made in ſummer in their court-yard, or on the houſe-top; and in the winter they chooſe for their bed-chamber the ſmalleſt room on the ground-floor. They have always a lamp burning, and when the weather is cold have frequently one or two pans of charcoal, which is ſometimes of ill conſequence even to them, and would ſuffocate ſuch as had never been accuſtomed to it.

Their principal amuſements within doors are playing at cheſs, at which they are very expert, and a kind of back-gammon, both borrowed from the Perſians: their other diverſions are playing at draughts, mankala, tabuduc, and the play of the ring, as they term it, with which the great frequently amuſe themſelves in the winter evenings. This diverſion conſiſts in gueſſing under what coffee-cup a ring is hid, out of a number of cups placed on a large ſalver. Several engage in this play on each ſide, and thoſe who win have the privilege of blacking the faces of thoſe who loſe, or of putting fools caps on their heads, and obliging them to ſtand before them, while they ſing extempore ſongs in their own praiſe, and in deriſion of the loſers. But they treat none in this manner but their ſervants, or their inferiors, ſome of whom, eſpecially if they have any turn for buffoonery, are always of the party. Theſe games are only uſed by the Turks for amuſement; for they never play for money, though they will ſometimes go ſo far as to play for an entertainment.

Dancing is far from being reckoned an accompliſhment among people of faſhion, and is ſcarce ever practiſed among any of the vulgar, except ſuch as make a trade of it. Their dexterity conſiſts leſs in their agility, than in the motion of their arms and body; putting themſelves in different attitudes, and uſing geſtures which, particularly among the female dancers, are none of the moſt decent.

Wreſtling is alſo ſometimes a part of their entertainment at their feſtivals. The wreſtlers anoint their naked bodies, and have nothing on but a pair of breeches. At their entrance they ſtrut and boaſt ſo much that people might expect great matters from them; but they greatly fail in the performance. Among their amuſements they have likewiſe buffoons, who conſtantly attend all merry-makings, in order to keep up the mirth of the company.

The

The muſic of this country conſiſts of two ſorts, one for the field and the other for the chamber. The firſt is performed before the baſhas and the other great military officers, and is alſo uſed in their garriſons. It conſiſts of trumpets, cymbals, hautboys, ſhorter but ſhriller than ours, and large drums, the upper head of which is beat upon with a heavy drum-ſtick, and the lower with a ſmall ſwitch. Beſides theſe they have ſmall drums, which are beat after the manner of our kettle-drums; this muſic has a pretty good effect at a diſtance.

Their chamber muſic conſiſts of a guittar, an Arab fiddle, a dulcimer, the derviſes flute, which is blown in a very particular manner, a couple of ſmall drums, and the diff. This laſt inſtrument chiefly ſerves to beat time to the voice, which is frequently the worſt of all their muſic; for many of them bellow ſo hideouſly, as to ſpoil what would be otherwiſe harmonious. This diff is a hoop, over which a piece of parchment is extended, and ſometimes pieces of braſs are fixed in it to make a jingling. It is beat with the fingers, and is the true tympanum of the antients, as is evident from its figure in ſeveral relievos repreſenting the rites of Cybele and the orgies of Bacchus. They have likewiſe a kind of flute, which reſembles the antient ſyrinx; but as few can play upon it, it is not much uſed. Beſides theſe inſtruments they have a kind of bagpipe, which many idle fellows play upon in the ſtreets of Aleppo, in order to obtain money from the paſſengers.

The Turks are acquainted with the different meaſures uſed in muſic, and have names for them; but, being unacquainted with the method of writing muſic by notes, they are obliged to learn entirely by the ear; however, when ſeveral perſons play together, they keep exact time, all playing the ſame, for they have neither baſs nor any other parts in muſic.

Some authors have ſaid, that the Turks have no muſic but what is ſhocking to the ear; but they probably never heard any but what is played in the ſtreets, and, as an ingenious lady whom we have already quoted obſerves, their account is juſt as reaſonable as if a foreigner ſhould take his ideas of Engliſh muſic from the bladder and ſtring, or the marrow-bones and cleavers. Their muſic is indeed extremely pathetic, and many of the women have fine voices.

SECT. IV.

Of the Bagnios; the Manner in which the Men are waſhed; with an Account how the Women ſpend their Time there: of the Introduction of a Bride, and the Manner in which a Woman is treated after her Lying-in. Of Coffee-Houſes, and the Dwelling-Houſes of the Turks in general.

IN all the great towns are a number of public bagnios, frequented by people of all ſects and conditions, except thoſe of a very diſtinguiſhed rank, who have generally baths in their own houſes. On entering a bagnio you come into a large lofty room, in the midſt of which is uſually a fountain with a baſon. This apartment is ſurrounded with ſophas, and here the people dreſs and undreſs; the air not being influenced by the heat of the bath, except juſt at the door, which opens into a ſmall room that is pretty warm, and from thence into a larger that is very hot. About the ſides of theſe two rooms are uſually placed round ſtone-baſons, about two feet and a half in diameter, with two cocks, one of hot and the other of cold water, ſo that it may be tempered at pleaſure; and there are copper-bowls for pouring it upon the body. In the corners of the inner room are ſmall retiring places, in one of which is frequently a ciſtern of warm water, about four feet deep, and large enough for bathing the whole body. All theſe rooms are covered with domes, and the inner receive their light from ſmall openings in the dome covered with glaſs. A few bagnios are ſolely for the uſe of the men; others are appointed for the women only: yet moſt of them admit both ſexes, that is, the men in the morning, and the women in the afternoon.

When a man enters the hot room he firſt applies the dewa, a medicine for taking off the hair from the pubis and arm-pits; this remains till the hair is quite looſe; and then is waſhed clean away with great care. After this one of the ſervants of the bagnio begins with chafing or kneading violently, firſt the tops of the ſhoulders, and then by degrees the whole body. On his coming to the hands he pulls the joints of the fingers ſo as to make each crack ſeparately; then laying the perſon on his back, with his arms acroſs his breaſt, he raiſes him forcibly by the back part of the neck, making the greateſt part of the vertebræ crack. Then having chafed the back a little more, he throws a quantity of warm water over the whole body, and rubs him hard with a bag of coarſe cloth drawn over his hand. He is next rubbed over with a ſoap lather, and this being waſhed clean off, the perſon puts one towel round his middle, another round his head, and a third perhaps over his ſhoulders; then returning to the great room, he generally ſmokes a pipe, drinks coffee, and perhaps eats ſome fruit before he dreſſes.

The reader cannot fail of being highly pleaſed at ſeeing here an account of the manner in which the ladies ſpend their time at the bagnios, extracted from the only author capable of giving him information. The right honourable lady, from whoſe letters we have already borrowed ſome curious particulars, entered one of the public baths at the city of Sophia, in her way to Adrianople: ſhe was then in her travelling habit, which was a riding-dreſs: and though this muſt appear very extraordinary to the Turkiſh ladies, none of them ſhewed the leaſt ſurprize, but received her with all the obliging civility poſſible: and the noble writer obſerves, that ſhe is acquainted with no European court where the ladies would have behaved in ſo polite a manner to ſuch a ſtranger. There were about two hundred women, and yet none of thoſe diſdainful ſmiles and ſatyrical whiſpers that never fail in our aſſemblies, when any body appears that is not exactly dreſſed in the faſhion. They only repeated over and over, *Uzelle, pek uzelle*, "Charming, very charming." Round the room were two rows of ſophas covered with cuſhions and rich carpets, on which ſat the ladies, and on the ſecond their ſlaves behind them, all in the ſtate of nature, without any beauty or defect concealed; yet there did not appear the leaſt wanton ſmile, or immodeſt geſture. They walked and moved with the majeſtic grace with which Milton deſcribes our general mother. Many among them were as finely proportioned as ever any goddeſs was drawn by the pencil of a Guido or Titian, and moſt of their ſkins of a ſhining white, only adorned by their beautiful hair, divided into many treſſes, hanging on their ſhoulders, braided either with pearl or ribbon, perfectly reſembling the figures of the Graces.

This illuſtrious lady obſerves, that ſhe was here convinced of the truth of a reflection that ſhe had often made, "That were it the faſhion to go naked, the "face would hardly be obſerved;" for the ladies who had the moſt delicate ſkins, and fineſt ſhapes, had the greateſt ſhare of her admiration, though their faces were ſometimes leſs beautiful than thoſe of their companions. They were in different poſtures, ſome in converſation, ſome drinking coffee or ſherbet, others working, and many negligently lying on their cuſhions; while their ſlaves, who were moſtly agreeable young women of about ſeventeen or eighteen, were employed in braiding their hair in ſeveral pretty fancies.

This, in ſhort, is the womens coffee-houſe, where all the news of the town is told. They uſually take this diverſion once a week, and ſtay there at leaſt four or five hours; but it is ſurpriſing they do not get cold by immediately coming out of the hot-bath into the cool room. It muſt not be omitted, that it is death for any man to get admiſſion to thoſe bagnios when the ladies are there.

We ſhall now give the reader a deſcription of the reception of a Turkiſh bride, from another of the letters of the ſame noble and learned lady. The ceremonies obſerved on that occaſion, ſhe ſays, made her recollect the epithalamium of Helen by Theocritus. All the female friends, relations, and acquaintance of the two families newly allied meet at the bagnio, and others going out of curioſity, there were near two hundred women

men preſent. Thoſe that were or had been married placed themſelves round the rooms, on the marble ſophas; but the virgins haſtily threw off their cloaths, and appeared without other ornament or covering than their own long hair, braided with pearl or ribbon. Two of them met the bride at the door, conducted by her mother and another grave relation. She was a beautiful maid of about ſeventeen, very richly dreſſed and ſhining with jewels, but was preſently reduced to the ſtate of nature. Two others filled ſilver gilt cenſers with perfume, and began the proceſſion, the reſt following in pairs to the number of thirty. The leaders ſung an epithalamium, anſwered by the others in chorus, and the two laſt led the fair bride, her eyes fixed on the ground, with a charming affectation of modeſty. In this order they marched round the three large rooms of the bagnio. 'Tis not eaſy, ſays our author, to repreſent the beauty of this ſight, moſt of them being well proportioned and white ſkinned; all of them perfectly ſmooth, and poliſhed by the frequent uſe of bathing.

The bride was then led to every matron round the rooms, and by each was ſaluted with a compliment and a preſent, ſome of jewels, others of pieces of ſtuff, handkerchiefs, or little gallantries of that nature, which ſhe thanked them for by kiſſing their hands.

Dr. Ruſſel, who for a long time practiſed phyſic at Aleppo, obſerves, that the firſt time a woman of the country, whether Chriſtian, Turk, or Jew, goes to the bagnio after child-bearing, ſhe is ſeated in one of the waſhing-places of the inner room, and the midwife rubs her over with a compoſition of ginger, pepper, nutmegs, and other ſpices made into a kind of electuary with honey. In this manner ſhe ſits for ſome time, while the other women expreſs their joy by ſinging. The lady is afterwards waſhed clean, and this finiſhes the ceremony. This they imagine is very ſtrengthening, and prevents many diſorders which would otherwiſe enſue after delivery; and they likewiſe uſe it after recovering from any ſevere fit of illneſs.

In the great towns are coffee-houſes for the men; but they are generally frequented by none but the vulgar. The maſter uſually provides for the entertainment of his cuſtomers a concert of muſic, a ſtory-teller, and particularly at the feaſt of Ramadan an obſcene kind of puppet-ſhew; and ſometimes tumblers and jugglers.

The Turkiſh houſes are, in general, compoſed of apartments on each of the ſides of a ſquare court all of ſtone, where it can be conveniently had; but in many places they are only built of wood. Theſe ſtructures conſiſt of a ground floor, which is generally arched, and an upper ſtory flat on the top, and either terraced with hard plaſter, or paved with ſtone. The ceilings are of wood neatly painted, and ſometimes gilded, as are likewiſe the pannels of ſome of their rooms, the cupboard doors, of which they have a great number, and the window ſhutters, which taken together have a very agreeable effect. Over the door and windows within the houſes of the Turks are inſcribed moral paſſages out of the Coran, or verſes either of their own compoſing, or taken from ſome of their moſt celebrated poets.

The court formed by the four ſides of the houſe is neatly paved, and has generally a baſon with a fountain in the middle, and on one or both ſides is a ſmall ſpot left unpaved for a kind of garden, which frequently does not exceed two or three yards ſquare. The verdure here produced, with the addition of flowers in pots, and the fountain playing, would be a very agreeable ſight to the paſſenger, were there openings to the ſtreet through which theſe might be ſeen; but they are entirely ſhut up with double doors, ſo contrived, as that when opened, none can look into the inner court, and there are no windows to the ſtreet, except a few in the upper rooms, ſo that nothing is perceived but dead walls, which give the ſtreets in all the Turkiſh towns a very diſagreeable appearance to the Europeans. Moſt of the houſes of people of diſtinguiſhed rank have an arched alcove within this court, open to the north and oppoſite to the fountain. This alcove has its pavement raiſed about a foot and a half above that of the yard to ſerve for a divan. Between it and the fountain the pavement is generally formed of Moſaic work of various coloured marble, as is alſo the floor of a large hall, which has a cupola roof, and frequently a fountain in the middle, or at one end.

SECT. V.

Of the Learning of the Turks, and their little Skill in the Sciences.

THE Turks are extremely ignorant with reſpect to all kinds of literature: many baſhas, farmers of the cuſtoms, and conſiderable merchants, can neither read nor write; their youth are, however, now better taught than formerly, though their education ſeldom extends farther than reading the Turkiſh language, and a little of the Koran, and writing a common letter, except thoſe who are bred to divinity and the law, which are here cloſely allied; and the profeſſors of both generally pretend to have likewiſe ſome ſkill in phyſic. A few of the Turks underſtand aſtronomy, ſo far as to be able to calculate the time of an eclipſe; but the number of theſe being very ſmall, they are looked upon as extraordinary perſons. However, there are great numbers who pretend to underſtand judicial aſtrology, in which the Turks have great faith.

They have a conſiderable number of colleges, but little is taught in them; for as they are frequently erected by the founders, partly as an atonement for the acts of oppreſſion by which they obtained their wealth, and partly to ſecure ſome of it to their deſcendants, whom they appoint curators of theſe endowments, theſe frequently apply to their own private uſe what ſeemed intended for the benefit of the public, and the ſchool ſoon runs to decay. Several of theſe have a library; and a few private men among the learned have ſome books, but they ſeldom make much uſe of them.

The Turks believe in predeſtination, and yet are perſuaded that as God has afflicted mankind with diſeaſes, he has alſo ſent them remedies proper for their recovery, and therefore thoſe who practiſe phyſic are very numerous, and well eſteemed.

The doctrine of predeſtination has, however, ſuch an effect, that during the plague, which ſometimes rages very violently, the markets are all open, and there is as great a plenty of proviſions as at any other time. The ſtreets, though not quite ſo much crowded, are pretty full of people; and the generality of the Turks viſit the ſick, and attend their funerals as at other times.

Their phyſicians are native Chriſtians, and a few Jews; for the Turks ſeldom make this their profeſſion. However, moſt of the phyſicians of this country are egregiouſly ignorant; for they have no colleges, in which any branch of phyſic is taught; and as the diſſection of human bodies is not allowed, and that of brutes is never thought of, they have a very imperfect idea of the ſituation of the parts, or their diſtinct offices. They are alſo totally ignorant of the uſe of chemiſtry in medicine.

They have the works of ſome of the Arabian writers, particularly Ebenſina, whoſe authority is indiſputable with them. They have alſo ſome tranſlations of Hippocrates, Galen, Dioſcorides, and a few other Greek witers; but their copies are generally very incorrect. Hence the ſtate of phyſic in this country, as well as every other ſcience, is at a very low ebb, and far from being in a way of improvement.

SECT. II.

Of their Marriages and Funerals.

THE tender paſſion of love can here have very little ſhare in promoting matrimony. Moſt of the women are married from the age of fourteen to eighteen, and often ſooner; but the young folks never ſee one another till the ceremony is performed.

The marriages of the Turks, as among other eaſtern nations, are uſually brought about by the ladies. The mothers

mothers, in order to find a proper wife for their ſons, take all opportunities of introducing themſelves into company where they expect to ſee young women who are diſengaged, and when they meet with one they think will be agreeable, make the propoſal to her mother. Upon this the girl's family enquire into the character and circumſtances of the young man, and if affairs are likely to be adjuſted, his father makes a formal demand of her, the price is fixed that the man is to pay for her, and a licence is procured from the cady for their marriage. Each of the young folks then appoint a proxy, who meet the imaum and ſeveral of the male relations, and after examining witneſſes, to prove that thoſe proxies are regularly appointed, he aſks the one if he be willing to purchaſe the bride for ſuch a ſum of money, and the other if he be ſatisfied with the ſum; when, being anſwered in the affirmative, he joins their hands, and the money being paid, the bargain is concluded with a prayer out of the Koran.

After this, the bridegroom may take home his bride whenever he thinks proper, and the day being fixed, he ſends to let her family know it. The money he paid for her is laid out in furniture for one chamber, with cloaths, jewels, and other ornaments for the bride, whoſe father makes ſome addition, according to his circumſtances, and all are ſent with great pomp to the bridegroom's houſe three days before the wedding. He at the ſame time invites all his friends and acquaintance, and if a man in power, many others; for all who are invited ſend preſents whether they go or not: and a kind of open houſe is kept for ſeveral days preceding the wedding. On the day appointed, the women go from the bridegroom's houſe, and bring home the bride, accompanied by her mother, and other female relations, when each ſex makes merry in ſeparate apartments till night. The men, having dreſſed the bridegroom, introduce him to the door of the women's apartment, where his own female relations meet him, and proceed ſinging and dancing before him to the ſtairs foot of the bride's apartment, when ſhe is brought half way down ſtairs to receive him, veiled with a piece of red gauze, and he having conducted her up ſtairs, they are left to themſelves.

Any woman that dies unmarried is thought to die in a ſtate of reprobation. To confirm this belief, they ſay, that the end of the creation of woman is to encreaſe and multiply; and that ſhe is only properly employed in the works of her calling, when ſhe is bringing forth children, or taking care of them, which are all the virtues that God expects from her: and indeed their way of life, which excludes them from all public commerce, does not permit them any other. Hence many of thoſe who are moſt ſuperſtitious, are no ſooner widows than they marry again as ſoon as they can, for fear of dying in the wicked ſtate of an uſeleſs creature. But thoſe that like their liberty, and are not ſlaves to their religion, content themſelves with marrying when they are afraid of dying. This, ſays our author, is a piece of theology, very different from that which teaches nothing to be more acceptable to God than a vow of perpetual virginity.

Among the Turks it is a greater diſgrace to be married and not fruitful, than it is with us for a woman to be fruitful before marriage. They have a notion that whenever a woman leaves off bringing forth children, ſhe is too old for it, whatever her face ſays to the contrary. This opinion, ſays the ingenious lady whoſe letters we have ſo often quoted, makes the women ſo ready to make proofs of their youth, that not contenting themſelves with uſing the natural means, they fly to all ſorts of quackeries to avoid the ſcandal of being paſt childbearing, and often kill themſelves by them. They are reſpected according to the number they produce, and therefore when they are with child, it is common for them to ſay, they hope God will be ſo merciful as to ſend them two this time; and when I, the above lady adds, have aſked them ſometimes, how they expected to provide for ſuch a flock as they deſire; they anſwer, that the plague will certainly kill half of them; which, indeed, generally happens, without much concern to the parents, who are ſatisfied with the vanity of having brought them forth. What appears moſt wonderful, is the exemption they ſeem to enjoy from the curſe entailed on the reſt of the ſex: for the ladies ſee company on the day of their delivery, and at the fortnight's end return viſits, decked out in their jewels and new cloaths.

The Turks keep their wives at home as much as they can; but the huſband, let him be ever ſo jealous, is obliged to ſuffer them to go frequently to the bagnio; and Mondays and Tueſdays are a kind of licenſed days for their viſiting the tombs of their deceaſed relations, which affords them an opportunity of walking abroad in the gardens or fields.

Upon the death of a Turk, the women immediately burſt forth into ſhrieks, which they continue till the body is interred, which is done as ſoon as poſſible. They firſt waſh the corpſe upon a large table, and having ſtopped all the natural paſſages with cotton, to prevent any moiſture oozing out, which would render the body unclean, they wrap it in cotton cloth, and lay it in a kind of coffin nearly in the form uſed by us, only the lid riſes with a ledge in the middle, and at the head ſtands up a wooden battoon about a foot long, on which the proper head-dreſs of the deceaſed is placed if it be a man; but if it be a woman a head-dreſs is placed upon it flat on the top like a trencher, and over it is thrown a handkerchief. The middle part of the pall has a ſmall piece of the old covering of the Holy-houſe at Mecca; but the reſt is of no particular ſtuff or colour. Upon the pall are laid ſome of the beſt cloaths which belong to the deceaſed.

In carrying the corpſe to the grave a number of ſheicks with tattered banners walk firſt, then come the male friends, and after them the corpſe, carried with the head foremoſt upon mens ſhoulders. The bearers are often relieved, for on ſuch ſolemn occaſions every paſſenger thinks it meritorious to lend a helping hand. The neareſt male relations follow the body, and the women cloſe the proceſſion with dreadful ſhrieks, while the men are all the way employed in ſinging prayers out of the Koran. In this order they proceed to a moſque, where the bier is ſet down in the court-yard, and a ſervice is ſaid by the imaum; after which the corpſe is carried in the ſame order to the burying-place, which is generally in the fields.

The graves, which lie eaſt and weſt, are lined with ſtone, and the corpſe being taken from the bier is put in a poſture between ſitting and lying on the right ſide, with the head to the weſtward, and the face towards Mecca. Some earth being placed behind the body to keep it ſteady, the grave is covered with long ſtones, which go acroſs and prevent the earth they throw over them from falling in upon the corpſe. The imaum throws on the firſt handful of earth, ſaying at the ſame time the following words: "O man, from the earth "thou wert at firſt created, and to the earth thou doſt "now return. This grave being the firſt ſtep in thy "progreſs to the manſions of the other world, if in "thy actions thou haſt been benevolent, thou art abſolved by God: but if, on the contrary, thou haſt "not been ſo, the mercy of God is greater than all "things. But remember, what thou didſt believe in "this world, That God is thy Lord, Mahomet thy "prophet, and in all the prophets and apoſtles, "and pardon is extenſive." Every one preſent then throws on a handful of earth, ſaying, "God be mer-"ciful to the deceaſed." At each end of the grave is ſet up a ſtone, upon which is commonly wrote ſome prayer, and it is uſual to place a pillar with a carved turban at the top of it at the head of the grave; and as their turbans, by their different ſhapes, ſhow the quality or profeſſion of the wearer, it is in a manner putting up the arms of the deceaſed. Theſe ſtones continue a long time; for on no occaſion are they ever removed. The ſepulchres of particular families are railed in, and the burying-places take up a conſiderable ſpace round the cities.

The neareſt relations pray at the grave on the third, ſeventh, and fortieth days after the interment; and alſo that day twelvemonth after the perſon's deceaſe, and on each of thoſe days a quantity of proviſions is dreſſed and given to the poor. Every Monday or Tueſday the women dreſs the tomb with flowers, or green leaves, and

with the appearance of the deepeſt grief frequently expoſtulate with the deceaſed on his unkindneſs in leaving them, when they did all in their power to render his life agreeable. This, however, is much cenſured by the men, who generally acquieſce with the greateſt patience in the loſs of their neareſt relations, and under every other misfortune behave with a firm and ſteady fortitude.

The men wear no mourning; but the women dreſs in their graveſt coloured cloaths, and wear a head-dreſs of a dark brick-duſt colour. Their jewels and all other ornaments are laid aſide for the ſpace of twelve months when they mourn for a huſband; and ſix months if it be for their father. Theſe periods are not, however, very ſtrictly obſerved upon all occaſions; but before the widow can marry again, ſhe muſt mourn for forty days, without leaving the houſe or ſpeaking to any perſon more than is abſolutely neceſſary; and this prohibition extends even to her neareſt relations.

SECT. VII.

Of the Religion of the Turks.

WE ſhall not here enter into a particular deſcription of the doctrines of Mahometiſm, of which we have already given a pretty long account in treating of Perſia; and have there alſo ſhewn in what the difference between the religion of the Perſians and the Turks principally conſiſts. Mahometiſm is ſaid to be divided into as many ſects as Chriſtianity, and the firſt inſtitution appears to be as much neglected and obſcured by interpretations. A fondneſs for myſteries, and a love of novelties, as well as the different formation of the human mind, and the various lights in which ſubjects appear to the underſtanding, have been there, as well as among us, the ſource of the wideſt differences in religion; and the Turks behave with as much zeal in the ſupport of their opinions as the Chriſtians in Europe, though it has not been attended with all the dreadful effects which has been produced among the Chriſtians by a perſecuting ſpirit. The moſt prevailing opinion among the Turks at preſent is ſaid to be that of plain deiſm; but there are none there who ſet up for wit, either by declaring that they believe there is no God, or by blaſpheming him, and treating with familiar contempt his ſacred name.

Charity is enjoined in the ſtrongeſt terms in the Koran, and the Turks are remarkable for acts of benevolence to the poor and the diſtreſſed, and are even careful to prevent the unfortunate being reduced to neceſſities. They repair highways, erect ciſterns of water for the convenience of travellers, build kanns or caravanſeras for their reception, and ſome devout people, it is ſaid, erect ſheds by the way-ſide, that the weary traveller may ſit under the ſhade and take his refreſhment. In chap. iv. of the Koran are the following injunctions: "Shew "kindneſs to thy parents, to thy relations, to orphans, "to the poor; to thy neighbour who is related to thee, "and to thy neighbour who is a ſtranger; to thy fa- "miliar companion, to the traveller, and to the cap- "tive whom thy right hand has taken: for God loveth "not the proud, the vain-glorious, the covetous, or "thoſe who beſtow their wealth in order to be ſeen of "men."

They name their children as ſoon as they are born, when the father putting ſome grains of ſalt into their mouths, and lifting them on high, as dedicating them to God, he cries out, "God grant, my ſon Solyman, "that his holy name may be as ſavoury in thy mouth "as this ſalt, and that he may preſerve thee from being "too much in love with the world." As to the infants who die young before they are circumciſed, they believe they are ſaved by the circumciſion of their father.

Their children are not circumciſed like thoſe of the Jews at eight days old, but at eleven or twelve, and ſometimes at fourteen or fifteen years of age, when they are able to make a profeſſion of their faith. On the day fixed for this ceremony, the boy is ſet on horſeback, and conducted, with muſic, about the town; and on his return is circumciſed in his father's houſe.

The imaum or prieſt makes a ſhort exhortation, and cauſes him to make his profeſſion of faith, by ſaying, "There is no God but God, and Mahomet is his pro- "phet," then orders the ſurgeon to place him upon a ſopha, and perform the operation. Two ſervants hold a cloth ſpread out before the child's face, and the ſurgeon having drawn the fore-ſkin as low as he can without prejudice, holds it with his pincers while he cuts it with a razor; and ſhewing it to the aſſiſtants, cries, "God is great." The child cries out with pain; but every one comes to congratulate him on his being admitted into the rank of a muſſulman, or believer; and on this occaſion a feaſt is made for all the relations and friends, who are very merry, and ſpend their time in dancing and ſinging; and the next day thoſe who are invited make preſents to the child. Some are admitted to circumciſion at ſeven or eight years old; but this is only upon extraordinary occaſions. In caſe of poverty, it is uſual to ſtay till they are fourteen or fifteen; and then if the parents are unable to defray the expence, they wait till the ſon of ſome rich perſon is circumciſed, on which occaſion the rich make preſents to the youths that are circumciſed with their ſons, and give liberal alms to their poor neighbours, that by their prayers the divine grace may deſcend upon their child and his family. When any renegado Chriſtian is circumciſed, two baſons are uſually carried after him, to gather the alms which the ſpectators freely give. Thoſe who are uncircumciſed, whether Turkiſh children or Chriſtians, are not allowed to be preſent at their public prayers; and if they are taken in their moſques, they are liable to be impaled or burnt.

We have already given an account of the faſt of Ramadam, which the Turks obſerve exactly in the ſame manner as the Perſians, and ſhall here deſcribe the feaſt of Bairam, which begins with the next new moon after that feaſt, and is publiſhed by firing of guns, bonfires, and other rejoicings. At this feaſt the houſes and ſhops are adorned with their fineſt hangings, tapeſtries, and ſophas. In the ſtreets are ſwings ornamented with feſtoons, in which the people ſit and are toſſed in the air, while they are at the ſame time entertained with vocal and inſtrumental muſic performed by perſons hired by the maſters of the ſwings. They have alſo fire-works; and during the three days of this feſtival many women, who are in a manner confined the reſt of the year, have liberty to walk abroad. At this time they forgive their enemies, and become reconciled to them; for they think they have made a bad Bairam, if they harbour the leaſt malice in their hearts againſt any perſon whatſoever. This is termed the Great Bairam, to diſtinguiſh it from the Little Bairam, which they keep ſeventy days after. They have alſo ſeveral other feſtivals, on all which the ſteeples of the moſques are adorned with lamps placed in various figures.

They regularly pray five times a day, and are obliged to waſh before their prayers and every time they eaſe nature. As they eat chiefly with their fingers, they are likewiſe under the neceſſity of waſhing after every meal, and the more cleanly alſo do it before meals. Beſides, every time they cohabit with their women, they muſt go to the bagnio before they can ſay their prayers; thus they are almoſt all day long dabbling in water.

By the Mahometan law a man may divorce his wife twice, and if he afterwards repents, he may lawfully take her again; but Mahomet, to prevent his followers from divorcing their wives upon every ſlight occaſion, or merely from an inconſtant humour, ordained, that if any man divorces his wife a third time, it is not lawful for him to take her again, till ſhe has been married and bedded by another, and divorced from that huſband. This precaution has ſuch an effect, that the Turks ſeldom divorce their wives; and ſcarce any who have the leaſt ſenſe of honour will take a wife again on this laſt condition.

There are a few monaſteries of derviſes, whoſe devotions and religious acts are performed in a very whimſical manner. Theſe fellows are permitted to marry, but

but have an odd habit, which only conſiſts of a piece of coarſe white cloth, or a looſe frock, wrapped about them, with their legs and arms naked. Their order has few rules beſides performing their fantaſtic rites every Tueſday and Friday, when meeting together in a large hall, they all ſtand with their eyes fixed on the ground, and their arms acroſs, while the imaum, or preacher, reads part of the Koran from a pulpit placed in the midſt; and when he has ended, eight or ten of them make a melancholy concert with their pipes, which are no unmuſical inſtruments. He then reads again, and makes a ſhort expoſition on what he has read; after which they ſing and play till their ſuperior, who alone is dreſſed in green, riſes, and begins a ſort of ſolemn dance. They all ſtand about him in a regular figure, and while ſome play, the others tie their robe, which is very wide, faſt round their waiſt, and begin to turn round with an amazing ſwiftneſs; and yet, with great regard to the muſic, moving ſlower or faſter as the tune is played. This laſts above an hour, without their ſhewing the leaſt appearance of giddineſs, which is not to be wondered at, as they are uſed to it from their infancy, moſt of them being devoted to this way of life from their birth. There are amongſt them ſome little derviſes of ſix or ſeven years old, who whirl round too, and ſeem no more diſordered by that exerciſe than the others. At the end of the ceremony they cry out, "There is no other "God but God, and Mahomet is his prophet;" and then kiſſing the ſuperior's hand retire. The whole is performed with the moſt ſolemn gravity: for nothing can be more auſtere than the appearance of theſe people, who never raiſe their eyes, and ſeem devoted to contemplation.

We ſhall defer giving an account of the Turkiſh government, which is in the higheſt degree tyrannical, till we treat of Turky in Europe; and ſhall therefore now proceed to the ſeveral provinces belonging to the Turks in Aſia.

SECT. VIII.

Of Chaldea, *called by the Turks* Eyraca Arabic. *Its Situation and Fertility; with a Deſcription of the Cities of Bagdat and Boſſora.*

HAVING given an account of the Turks in general, we ſhall proceed to deſcribe the provinces of that great empire, and ſhall begin with Chaldea, or Eyraca Arabic, which is ſituated between the rivers Tigris and Euphrates, and is bounded by Diarbec, or Meſopotamia, on the north, by part of Perſia towards the eaſt, by the gulph of Perſia and part of Arabia Deſerta on the ſouth, and by another part of Arabia Deſerta on the weſt.

The hot ſulphurous winds already mentioned in treating of Perſia ſeem more fatal in this country than in any other. Theſe blow from the ſouth-eaſt, and it is ſaid thoſe who breathe the fiery blaſts inſtantly fall down dead.

In this country once ſtood the city of Babylon, the metropolis of the Babylonian empire, which is repreſented by all the antient authors as the largeſt, the moſt magnificent, and the moſt populous city that ever was erected; but the prophecies mentioned in the Old Teſtament relating to this city, once the wonder of the whole earth, are literally fulfilled: "Babylon is fallen, and "become the den of wild beaſts;" nor is there any remains either of its antient grandeur, or of its ruins, to ſhew the exact ſpot on which it ſtood.

The capital city of this province is Bagdat, or Bagdad, which is ſituated upon the river Tigris, in thirty-three degrees fifteen minutes north latitude, and forty-three degrees eaſt longitude from the meridian of London. It is about fifteen hundred paces in length, and half as many in breadth, including only that part of the city which ſtands on the eaſtern ſide of the Tigris; but the ſuburbs on the weſtern ſide of that river are very conſiderable. On the north-weſt corner of the city ſtands the caſtle, which is of white ſtone; and the place is alſo encompaſſed by brick walls, ſtrengthened by large towers, and a wide and deep ditch. It has only four gates, one towards the river, and the other three towards the land, and is uſually defended by a garriſon of three or four thouſand horſe and foot. Below the caſtle, by the water-ſide, is the palace of the viceroy, and there are ſeveral ſummer-houſes on the river, which make a fine appearance. The houſes of the city are generally ill built; but their bazars, in which the tradeſmen have their ſhops, are tolerably handſome. Theſe were erected by the Perſians when they were in poſſeſſion of the place, as were their bagnios and every thing worthy the notice of a traveller. In the city are five moſques, two of which are well built, and have handſome domes covered with varniſhed tiles of ſeveral colours.

The cady has here an authority almoſt equal to that of the mufti at Conſtantinople. There is alſo a treaſurer who collects the revenues, and a reis effendi, who ſigns all acts of ſtate, and is ſometimes called ſecretary and ſometimes chancellor. In the hands of theſe officers is lodged the civil government of the province, and they alſo are of the viceroy's council.

This was the capital of the Saracen empire, till it was taken by the Turks in the thirteenth century; ſince which time it has been taken ſeveral times by the Perſians and Turks, and laſt by the Turks in 1638, who have been in poſſeſſion of it ever ſince, Nadir Shah having laid ſiege to it in vain.

This city has a conſiderable trade, it being ſupplied with all the merchandize of the Eaſt by the way of Boſſora, which is ſituated towards the mouth of the united ſtreams of the Tigris and Euphrates, and is annually viſited by the caravans from Smyrna, Aleppo, and the weſtern part of the Turkiſh empire, by which means it is furniſhed with the produce of thoſe countries.

The next conſiderable city of Chaldea is Boſſora, or Buſſarah, which is ſituated in thirty degrees twenty minutes north latitude, about forty miles north-weſt of the gulph of Perſia, between the river Euphrates and the Deſart. The eaſt end ſtands by the ſide of the river, and a canal, which runs from it, and extends from one end of the city to the other, divides the city into two parts, and over it is a bridge of boats to keep up a communication between them. The town is encompaſſed with a wall of earth upwards of twelve miles in circumference, but within this ſpace are included many void ſpaces, and others filled with date-trees. The houſes are generally two ſtories high, flat on the top, and built with bricks dried in the ſun; but the buildings in general are very mean. Its ſituation is pleaſant and very advantageous on account of trade, and the ground about it is extremely fertile. The port is ſafe and commodious, ſo that large veſſels may come up to the end of the canal without danger. The trade of this city was once very conſiderable; but in 1691 it was viſited by the plague, which deſtroyed eighty thouſand of the inhabitants, and the reſt deſerted the place; but it was afterwards repeopled by the Arabs, who were ſoon after brought under the ſubjection of the Turks. It is at preſent governed by a baſha, and has a garriſon of three thouſand Janiſaries.

Canals are cut through all the country between Bagdat and Boſſora, that are about two hundred and fifty miles aſunder, which give it the reſemblance of Holland. This country is one of the richeſt under the dominions of the Grand Seignior; no finer meadows and paſture-grounds can any where be ſeen, and theſe are covered with flocks and herds, and more particularly with buffaloes. Hither the Grand Seignior annually ſends a treaſurer with a body of horſe to collect his duties, who make the people pay a piaſter and a quarter for every ox or buffaloe, two piaſters for every horſe or mare, and ten pence for every ſheep, which would amount to an immenſe ſum, did not the ruſtics keep back a part, and ſometimes refuſe to pay any, which occaſions a petty war between them and the treaſurer's guards; but the government rather chuſes to wink at ſome frauds, than to provoke them to revolt by too rigorous exactions.

SECT.

SECT. IX.

Assyria, *called by the Turks* Curdistan.

Its Situation, Soil, and Produce; the Manners of the wandering Curds, and a Deſcription of their Tents. No other Remains of Nineveh but Heaps of Ruins. Of the Town Cheraſoul, Amadia, and Betlis.

We ſhall now take a view of Turkiſh Curdiſtan, for the moſt eaſterly part of that country is ſubject to the Perſians. This province is bounded on the north by Armenia or Turcomania, on the eaſt by Perſian Curdiſtan; by Chaldea on the ſouth, and by Diarbec or Meſopotamia on the weſt.

This country, which comprehends great part of ancient Aſſyria, enjoys a fruitful ſoil agreeably diverſified with hills and valleys, the former covered with fruit-trees, the fineſt oaks, and a variety of other timber; while the valleys being well watered, wherever they are cultivated, bear excellent grain: but being under the dominion of the indolent Turks, or rather a frontier country between Turky and Perſia, a very ſmall part of the land is improved by agriculture. However, the paſtures ſupport vaſt flocks and herds, whoſe owners live in tents like the wandering Arabs.

The governing part of the country are Mahometans; but the common people are ſaid to be a kind of Chriſtians, and yet are repreſented by travellers, as being no leſs guilty of plundering the caravans than the wandering Arabs: but this is the leſs ſurpriſing, as they are ſituated upon the frontiers of two great kingdoms that are in perpetual enmity.

Their tents are large and of an oblong ſquare, about the height of a man. They are encompaſſed with cane lattices, covered with thick brown coarſe cloth, and lined with good mats. When they march they fold up theſe moveable tenements, and place them with their wives and children upon oxen and buffaloes, and thus wander from mountain to mountain, ſtaying wherever they find good paſtures. The men are all well mounted on horſeback, and are armed with lances.

The principal produce of the ſoil is ſaid to be galls and tobacco; though it ſeems capable of producing any other vegetables. There are few towns and villages; but the houſes, where they are to be found, are diſperſed at the diſtance of a muſquet-ſhot from each other; and though the people make no wine, there is ſcarce a houſe which has not a vineyard; but they dry their grapes.

In this country once ſtood the famous city of Nineveh, the capital of the Aſſyrian empire, which was ſituated on the eaſtern bank of the river Tigris, oppoſite the place where Mouſſul now ſtands: but at preſent there is only to be ſeen heaps of ruins, which extend about three miles along that river. At the diſtance of a mile and a half from the Tigris is a little hill, on the top of which ſtands a moſque over the place, where, according to tradition, Jonas was buried.

The preſent capital of Curdiſtan is Cheraſoul, which ſtands to the eaſtward of Nineveh, in the thirty-ſixth degree of north latitude. It is a large place formed after a ſingular manner, the houſes being hewn out of a rock on the ſide of a hill for near a mile together, and up to them is an aſcent of fifteen or twenty ſteps, and ſometimes more. In this city reſides the beglerbeg or viceroy of the province, who has ſeveral ſangiackſhips or governments under him.

The other towns of Curdiſtan are Amadia, which is ſeated to the northward of Nineveh in thirty-ſeven degrees north latitude on the top of a mountain, ſo high that it takes up an hour in aſcending to the town. It is, however, a place of pretty good trade, and in the middle of it is a bazar, where the merchants keep their ſhops.

To the eaſtward of Cheraſoul is Arbela, and near that town is a plain fifteen leagues in extent, where Darius was defeated by Alexander. In the midſt of this plain is a little hill about half a league in circumference, covered with fine oaks, and at the top of it are the ruins of a caſtle, in which, according to tradition, Darius ſtood to ſee the ſucceſs of that celebrated battle.

Near the lake Van in the north part of this province is the city of Betlis, ſituated in thirty-ſeven degrees ſome odd minutes north latitude. The bey or prince of this place is ſaid to have ſtill preſerved his independency, and to be ſubject neither to the Turks nor the Perſians. As his country is very mountainous, and almoſt inacceſſible, he is able to interrupt the trade between Aleppo and Tauris whenever he pleaſes; whence it is the intereſt of both the Turks and Perſians to keep fair with him. On approaching Betlis the traveller is obliged to proceed a whole day among high ſteep mountains, from whence, in the rainy ſeaſon, there fall prodigious torrents. The way up to the city is cut through a rock, and is ſo narrow that there is but juſt room for a camel to paſs. It is built round the hill, which is in the form of a ſugar-loaf, and there is no method of aſcending up to it, but by winding round the mountain. On the top is a plain, on which is erected the caſtle, and there the bey has alſo his palace. He is ſaid to be able to raiſe twenty-five thouſand horſe, and a conſiderable body of foot out of the ſhepherds of his country.

SECT. X.

Of Mesopotamia, *called by the Turks* Diarbec.

Its Situation, Produce, and Face of the Country. With a Deſcription of the Cities of Beer, and Orfa; and an Account of the Well of the Handkerchief. Of the Cities of Mouſſul and Diarbec, or Diarbekar.

Diarbec, or Diarbekar, is ſituated between the rivers Tigris and Euphrates, which bound it on the eaſt and weſt; it is alſo bounded by Turcomania or Armenia Major on the north, and by Chaldea on the ſouth.

The north part of this province appears as fertile as any part of the Turkiſh empire, and affords plenty of corn, wine, cattle, wild fowl, and all manner of proviſions; but the ſouthern part of it is much leſs fruitful. The country is diverſified with a pleaſing variety of hills and vallies, and beſides the rivers juſt mentioned, by which it is almoſt encloſed, it is watered by ſeveral other ſtreams.

The principal towns are Bir, Orfa, Mouſſul, and Diarbec.

Bir, or Beer, as it is pronounced, is ſituated on the eaſtern bank of the river Euphrates, in a little more than thirty-ſeven degrees north latitude, and is the great paſs into Meſopotamia. It is built on the ſide of a hill, at the top of which ſtands a caſtle erected upon a rock, where the governor reſides, and from thence is a way cut under ground to the river. In the caſtle Mr. Maundrell was ſhewn a room filled with old arms, as croſs-bows of a prodigious ſize, and beams which ſeemed deſigned for battering rams, alſo Roman ſaddles, and large head-pieces. Two fine ſtreams run along the top of the hill, and flow down into the town, and in the ſide of the hill is a cave cut in the rock, the roof of which is ſupported by fifteen large pillars. The city has a good wall; but the houſes are very indifferently built. The inhabitants have, however, a deſirable climate, plenty of proviſions, and good water. The garriſon is compoſed of ſix or ſeven hundred men, commanded by an aga. The city is within the territories of the baſha of Orfa.

To the eaſtward of Beer is the city of Orfa, ſuppoſed to be ſituated in the place where anciently ſtood the city of Edeſſa. Orfa, the capital city of Meſopotamia, ſtands in the thirty-ſixth degree north latitude, and, according to tradition, is ſeated in the place where Abraham dwelt. There is here a large fountain, the ſprings of which are under the foundations of the principal moſque in the city. The Chriſtians there pretend that this was the place where Abraham prayed before he went to ſacrifice his ſon Iſaac, and ſay, that two ſprings of water roſe from the ſpot on which he kneeled, and feed the above fountain: ſo ſacred is this place eſteemed, that no perſon is ſuffered to enter the grotto where they riſe, without pulling off his ſhoes. Many of the inhabitants

inhabitants are Armenian Chriſtians, and are permitted the free exerciſe of their religion. Here are alſo ſhewn ſeveral antient tombs of the Chriſtians in grottos of the neighbouring mountains.

The walls of this city are of free-ſtone with towers at proper diſtances; but the town is meanly built, and has ſeveral void and uninhabited places. It is governed by a baſha, and has a garriſon of ſix or ſeven hundred ſpahies or horſemen, and about two hundred janizaries; the horſe being of great ſervice in oppoſing the incurſions of the Arabs, who frequently croſs the Euphrates in hopes of plunder. Near the walls are ſeveral pleaſant gardens watered by artificial channels, and the ſoil produces good wine; but Orfa is principally famous for its manufacture of yellow Turky leather.

The caſtle, which ſtands on the ſouth ſide of the city, is defended by a broad deep ditch cut in the rock, and on the top of the caſtle is a ſmall ſquare turret, where they ſay Elias formerly dwelt. They alſo ſhew a well on the ſouth ſide of the town, which they call the well of the handkerchief, and ſay that Abgarus, king of Orfa, ſent meſſengers to our Saviour, beſeeching him to come and heal him, and with the meſſenger ſent a painter to draw the picture of Chriſt: that our Lord anſwered the meſſengers he could not go with them becauſe his paſſion drew nigh; but obſerving the painter taking his picture, he threw a handkerchief over his face, which immediately receiving the impreſſion of his countenance, he gave it them to carry to their prince. But as they were returning they were attacked by robbers near the city of Orfa, when the perſon who had the handkerchief dropt it into a well, in order to conceal it, and eſcaping to the town related the accident. Upon which the king went the next day, accompanied by all his people in proceſſion to the well, where finding the water riſen to the brim, and the handkerchief floating upon it, the king took it in his hands, and was inſtantly cured of his leproſy; upon which the king and his ſubjects became Chriſtians. They add, that they kept this miraculous picture many years; but at length it being ſtolen by ſome Franks, or European Chriſtians, they carried it to Rome. Hence they ſuppoſe that the water of this well has the property of curing lepers.

On the weſtern bank of the river Tigris, oppoſite the place where Nineveh is ſuppoſed to have ſtood, is the city of Mouſſul, in thirty-five degrees thirty minutes north latitude. It is a large place ſurrounded with high walls; but the houſes are ill built, and in ſeveral places are gone to ruins; however, it has a ſtrong caſtle and a citadel. It has a good trade, from its being ſeated on the road from Aleppo to Perſia, and its having a communication with Bagdat and the Perſian gulph, by means of the Tigris. It is chiefly inhabited by Armenians, Neſtorians, Greeks, and Maronite Chriſtians; but the eſtabliſhed religion is that of the Mahometans. The garriſon uſually conſiſts of three or four thouſand horſe or foot. A great trade is carried on for galls, produced in the neighbouring country.

The city of Diarbec is ſituated about ſix days journey to the north-eaſt of Orfa, in thirty-eight degrees north latitude, and ſtands on a riſing ground, where the Tigris forms a half moon. It is encompaſſed with a double wall, in the outermoſt of which are ſixty-two towers, and three gates, on each of which is an antient Greek inſcription, not now intelligible, though the name of Conſtantine is ſeveral times repeated. In the town are two or three handſome bazars, and a magnificent moſque, which was formerly a Greek church. About a league from the city is a canal cut from the Tigris, which ſupplies the town with water, and in this water all the red Turky leather made at Diarbec is waſhed. This leather is remarkable for excelling all others in the beauty of its colour; and in this manufacture, at leaſt one fourth of the natives are employed. The city is ſo populous, that it is ſaid there are about twenty thouſand Chriſtians there, two thirds of which are Armenians, and the reſt Neſtorians and Jacobites. The baſha is beglerbeg or viceroy, and has ſeveral governments under him, in which it is ſaid he can raiſe twenty thouſand horſe, who hold of the crown by military tenures.

SECT. XI.

Of ARMENIA MAJOR, *called by the Turks,* TURCOMANIA.

Its Situation and Climate, with a Deſcription of the Plain and City of Erzerom; of the Cities of Van and Cars. The Religion of the Armenian Chriſtians, their Marriages, and Funerals.

THE province of Turcomania is bounded by Georgia and Natolia towards the north; by Aderbeitzen, or Media, a province of Perſia, towards the eaſt; by Diarbec and Curdiſtan to the ſouth; and by another part of Natolia towards the weſt.

The climate of this country is pretty cold, from its having a chain of mountains frequently covered with ſnow in the middle of June. At the foot of theſe mountains is ſituated the city of Erzerom or Arzerom, in forty degrees latitude, about five days journey to the ſouthward of the Black Sea, at the end of a fine plain, which is fruitful in all manner of grain; but their harveſt is very backward, it being ſeldom before September. The ſudden alteration of the weather from exceſſive cold to extraordinary heat, with the ſcarcity of wood and other fuel, are great diſadvantages with reſpect to the city of Erzerom; for they have no wood nearer to it than within two or three days journey, and in all the neighbouring country there is not ſo much as a tree or buſh to be ſeen: hence their ordinary fires are made of cow-dung, with ſome other diſagreeable mixture, which cauſe an offenſive ſmell, and give a taſte to the milk, as well as to the meat they dreſs with it, which is otherwiſe very good; and the country abounds with cattle. The beſt fruit to be met with there is brought from the neighbouring country of Georgia, where they have earlier ſummers.

From the hills near Erzerom fall very ſmall rivulets, which ſerve the town, and water the adjoining fields; but their wine and ſpirits are the worſt in all Turky, and yet the moſt difficult to be procured, there being no place where the Turks ſee the prohibition againſt drinking them more ſtrictly obſerved.

The city is encloſed with double walls ſtrengthened by towers; but the ditches are neither deep nor well kept, and are about two miles in circumference. The viceroy of the province reſides in an ill-built palace, and the aga of the janizaries, who is independent on him, lives in a caſtle, which ſtands rather above the town. There are computed to be in Erzerom about eighteen thouſand Mahometans, and ſix thouſand Armenians, and in the province there are ſaid to be ſixty thouſand of the latter, and ten thouſand Greeks. Moſt of the Turks in the city paſs under the name of janizaries, who are very numerous in the other parts of the province; but are moſtly tradeſmen, who are ſo far from receiving the pay of janizaries, that the principal part of them give the aga money to purchaſe the privilege of being deemed of that body, and to obtain the power of inſulting the reſt of their people; and thoſe in ſuperior circumſtances are forced to inliſt themſelves, to prevent their being expoſed to the violence of their neighbours; for the janizaries inſult the reſt of their fellow-ſubjects with impunity.

Near Erzerom are ſaid to be mines both of ſilver and copper, and among the latter are found ſome lapis lazuli; but in ſmall quantities.

The other cities of Turcomania are Van and Cars. Van is a large city ſeated by a lake, to which it gives its name, in thirty-eight degrees thirty minutes north latitude, and has a ſtrong caſtle erected on a mountain, in which is always kept a numerous garriſon. The town is populous, and is under the government of a beglerbeg, who has nine ſangiacs or leſſer governments under him. The lake of Van abounds with excellent fiſh, with which the neighbouring countries are ſupplied, and is repreſented by ſome travellers as eight days journey in circumference, while others ſay it is only four; it, however, receives ſeveral rivers, and has no diſcharge.

The city of Cars or Kars is ſituated on a river of the ſame name, in forty-one degrees thirty minutes north latitude. It is of an oblong figure, and is encompaſſed

by a double wall about two miles in compaſs; but is very thinly inhabited. The caſtle ſtands on an almoſt inacceſſible rock next the river, and has a numerous garriſon commanded by an aga. The Turkiſh officers in this city are ſaid to make intolerable exactions on travellers, and eſpecially on the Franks, who find great difficulty in paſſing through this town into Perſia.

Before we leave Armenia we ſhall give a particular account of the Armenian Chriſtians, who not only inhabit this country, but are diſperſed over the Turkiſh and Perſian empires, and even into India, where the Armenian merchants are the greateſt traders in the world. The Armenians were, they ſay, converted to the Chriſtian religion by St. Gregory, and differ both from the Latin and Greek churches. They have two patriarchs, who have under them many archbiſhops and biſhops, prieſts, and an order of recluſes called the monks of St. Baſil, who are the only part of their clergy that are prohibited marriage. A prieſt, however, is not ſuffered to perform divine ſervice for the firſt ſeven days after his marriage; and if after the death of his firſt wife he marries again, he can never after perform that office. Their clergy are frequently ordained at eighteen years of age. But both the clergy and laity obſerve ſo many faſts, that ſeven months of the year is ſpent in abſtinence from all manner of fleſh and fiſh, and at thoſe times they eat nothing till the evening. Theſe faſts are not to be diſpenſed with on the moſt urgent neceſſity. No occaſion whatever can excuſe them, if they touch any thing more than mere herbs or roots, without oil and plain bread; which on theſe occaſions is their conſtant diet. One of the interpreters of the Engliſh ambaſſador at Conſtantinople, was brought ſo low by the ſeverity of his faſts, that his life was deſpaired of: yet neither his maſter's commands, nor the entreaties of the doctors, who declared that nothing elſe could ſave his life, were powerful enough to prevail on him to take two or three ſpoonfuls of broth.

Gemelli informs us, that he went to hear divine ſervice in a great Armenian church, in which he ſays there was but one altar; that the choir was raiſed ſeveral ſteps above the body of the church, and the floor of both of them covered with rich carpets; for the Armenians put off their ſhoes when they enter into the church. The ſervice was ſaid by the archbiſhop, aſſiſted by two biſhops, and during the ſervice a great number of lighted candles ſtood on the right ſide of the altar. After reading the Goſpel, ſome little bells were rung, and the whole congregation, clergy and laity, ſung to the muſic.

They do not believe in tranſubſtantiation; but give the bread dipped in wine to all the congregation, and even to infants; nor do they mix water with their wine, becauſe, as they alledge, our Saviour himſelf drank it pure and unmixed when he inſtituted this ſacrament. The bread is without leaven, and made in little round cakes.

With reſpect to baptiſm, their firſt care, 'tis ſaid, is to provide a godfather, after which ſome woman carries the child to church, and puts it into the hands of the prieſt, who plunges it three times naked into a veſſel of water, pronouncing much the ſame words as are uſed among us. He then anoints the infant with holy oil on the head, the mouth, the ſtomach, neck, hands, and feet. This oil is made of ſeveral ſweet flowers and aromatic drugs, by their patriarchs; and as no baptiſm can be duly performed without it, it is ſold at an high price to ſuch biſhops and prieſts as are ſubordinate to them. When the child is thus anointed, it is wrapped in its cloaths and carried to the altar, where the ſacrament is put into its mouth. The godfather then takes the child in his arms, covering it with a kind of mantle, which he preſents it on this occaſion; and then returns with the child to its father's houſe, preceded by ſeveral prieſts carrying the croſs and lighted tapers in their hands, ſinging the Goſpel to the ſound of certain muſical inſtruments, and having delivered the child to the mother, the reſt of the day is ſpent in eating, drinking, and making merry with their relations.

The Armenian church rejects the doctrine of purgatory; but the people believe that after death the ſouls of the juſt remain in a ſtate where they ſhall know neither joy nor ſorrow till the reſurrection, except that which proceeds from a reflection on their paſt lives; but they are ſaid to believe, that the wicked are ſent immediately to hell. They give great faith to ſome fabulous traditions, and ſay that the holy Virgin, being with child, was accuſed by her ſiſter Salome of incontinency, when the Virgin bidding her lay her hand upon her belly, a fire iſſued from it, which conſumed half of Salome's arm; but the Virgin bidding her lay the remainder of her arm upon it again, it was reſtored whole as at firſt. They alſo relate, that Judas, deſpairing of pardon for having ſold his Lord, reſolved to hang himſelf, becauſe he knew he would deſcend into hell and deliver all the ſouls he found there; but that the devil, being informed of this contrivance, held Judas by the feet till our Saviour was gone, and then let him fall in. The Armenians have no idea of what is called the hypoſtatic union; but believe that the divine and human nature of Chriſt are united in his ſacred perſon, as the ſoul and body are in man.

What appears moſt ſingular, is their great feſtival of the Baptiſm of the Croſs, in remembrance of our Saviour's Baptiſm. The Armenian biſhops and clergy go in proceſſion on this occaſion to ſome river, or other great water, with a croſs carried before them; and having read prayers ſuitable to the occaſion, and ſung ſeveral anthems to the ſound of the country muſic, the biſhop plunges the croſs ſeveral times into the water; after which happy is the perſon who is ſprinkled by it. This ceremony begins before day-break, at about four in the morning, when there are ſcaffolds erected on the river or ſome large pond for that purpoſe. This is eſteemed the beſt opportunity of baptiſing their children, who are plunged three times into the conſecrated water.

The children of the Armenians are uſually married in their infancy, to prevent their being carried into the harrams of the great men: but though they are frequently contracted at four or five years of age, the marriage is ſeldom celebrated till they are eight or ten; and in the mean time the bridegroom ſends the bride every Eaſter a veſt ſuitable to her quality. Every thing relating to marriages is under the direction of the parents, and the young people are never aſked for their conſent till they are brought to church.

On the day appointed for this ceremony the bridegroom, richly dreſſed, mounts his horſe, and, in company with his neareſt relations, rides to the houſe of the bride's father, where ſhe alſo mounts dreſſed in the fineſt ſilks, and, attended by her friends, proceeds with her face covered with a veil to the church; their friends and relations holding lighted torches in their hands. When the bridegroom and bride have diſmounted, they walk up to the altar, where ſtanding pretty cloſe together, face to face, the biſhop reſts his book upon their heads, while he reads the ſervice, and having received their conſent gives them his bleſſing; upon which the drums and trumpets ſound, and the ſofter muſic plays, while they return in the ſame order to the bridegroom's houſe; except they ſtay to attend divine ſervice and receive the ſacrament, as they frequently do. The gueſts upon theſe occaſions are ſplendidly entertained; but the men and women neither eat nor drink in the ſame room. In the evening the new-married couple are conducted to the bridal chamber, and the company retire, after a thouſand wiſhes for the happineſs of the new-married pair.

A few days after the wedding the portion given with the bride is ſent to the huſband's houſe. It conſiſts of fine cloaths, jewels, gold, and ſilver, according to the rank of the parties, to which they uſually add ſome fruit and ſweet-meats, all which are carried in fine cabinets and boxes, attended by muſic; but this is ſometimes deferred till the birth of the firſt child, when a rich cradle is provided, and all neceſſaries proper for the new-born infant.

At the death of an Armenian, a perſon whoſe office it is, waſhes the body with conſecrated water, and puts upon

upon it a new white ſhirt and other linen; then ſewing the corpſe up in a linnen bag, it is carried to church on a bier, without a coffin, attended by the prieſts and relations, holding lighted tapers in their hands; and having placed it before the altar, a prieſt reads the ſervice appointed, and then the body is left in the church all night, with candles burning about it. In the morning, after divine ſervice, it is carried to the gate of the archbiſhop, or biſhop, who ſays a prayer for the repoſe of the ſoul of the deceaſed; it is then taken to the burying-place, the biſhop and prieſts ſinging their prayers till it is laid in the grave. The biſhop then takes up a handful of earth, and throwing it upon the corpſe, ſays three times, "From earth thou didſt come, and to earth "ſhalt thou return; remain there till the coming of "our Lord." They then fill up the grave, and the relations and friends return to the houſe of the deceaſed, where they find a dinner provided; and, if the relations are people of ſubſtance, are ſplendidly entertained for ſeveral days ſucceſſively.

SECT. XII.

Of GEORGIA, *or* GURGISTAN.

Its Situation, Climate, and Produce; the Perſons, Dreſs, Manners, and Religion of the Inhabitants; with a Deſcription of Teflis, the Capital.

GEORGIA is a conſiderable province of Aſia, part of which belongs to Perſia, and part to the Turks. It is bounded on the north by Circaſſia, on the eaſt by Shervan and the Tartars of Daghiſtan, on the ſouth by Turcomania, and on the weſt by the Black Sea. It is ſaid the Greeks gave the people the name of Georgoi, which in their language ſignifies Huſbandmen; others derive the name from Kurgia, which they ſay the country received from the river Kur. It has many woods and mountains that incloſe large and beautiful plains; but the middle part, which is watered by the river Kur, the antient Cyrus, is the moſt fertile.

The air of Georgia, which is very dry, is hot in ſummer and cold in winter; but though the fine weather does not begin till the month of May, it laſts till the end of November. Hence the inhabitants are obliged to water the earth, by which means it is rendered ſo fertile as to produce all ſorts of grain and fruit in the greateſt profuſion. The bread is ſaid to be as good as any in the world, and the fruits excellent; no part of Europe produces better apples and pears, nor any part of Aſia more excellent pomegranates.

The cattle of this country are not only extremely numerous but very good, particularly the wild boars The common people live almoſt entirely upon pork, ſwine being ſeen all over the country, and their fleſh is ſaid to be not only extremely palatable, but very wholeſome; beſides, the river Cyrus, which runs through Georgia, affords the inhabitants great plenty of freſh-water fiſh.

The vines of this country grow about the trees, and produce moſt excellent wine, of which the inhabitants drink great quantities, and alſo ſend it into Armenia, Media, and Perſia; it being ſo cheap that a horſe-load of the very beſt ſort, which is three hundred weight, ſells in the country for about the value of eight ſhillings. Georgia alſo produces a great deal of ſilk, which is exported to Turky and the neighbouring countries.

The Georgians are ſaid to be the handſomeſt people, not only in the Eaſt, but in the whole world. Sir John Chardin ſays, he never ſaw an ordinary perſon of either ſex in this country, and he has obſerved ſome that have been quite angelical, nature having given moſt of the women ſuch graces, that it is impoſſible to behold without loving them. They are tall, eaſy, and genteel, but injure their beauty with paint, which they uſe as an ornament, juſt as among us are worn rich cloaths and jewels.

The habit of the Georgians nearly reſembles that of the Poles: they wear the ſame ſort of bonnets. Their veſts are open at the breaſt, and faſtened with buttons and loops. Their covering for the legs and feet reſembles that of the Perſians, and the habit of the women is entirely Perſian.

The natives have naturally much wit, and, had they a proper education, might be diſtinguiſhed by their learning and their ſkill in the arts and ſciences; but the want of inſtruction and the force of ill example render them ignorant, diſhoneſt, and lewd. With the greateſt effrontery they will deny what they have ſaid and done, and aſſert the moſt notorious falſhoods. They are indeed not eaſily diſpleaſed, and are never exaſperated without juſt cauſe of anger; but then they are irreconcileable in their hatred, and never forgive. They are addicted to drunkenneſs and luxury, which are not eſteemed crimes; the churchmen get drunk as well as the laity, and keep beautiful ſlaves for concubines, which is ſo general a cuſtom, that it gives no offence. The above author obſerves, that the catholicos, or patriarch, of Georgia uſed to ſay, that he who did not get drunk at the great feaſts of Chriſtmas and Eaſter ought not to be eſteemed a Chriſtian, and deſerved to be excommunicated.

The women are equally vicious with the men, their deſires are warm, and they are at leaſt as blameable as the other ſex for the torrent of impurity that overflows the country.

The Georgians are, however, in many reſpects civil, friendly, and have the appearance of great gravity. Their manners and cuſtoms are a mixture of thoſe of moſt of the nations by which they are ſurrounded, which is probably owing to the commerce they carry on with many different countries, and from the liberty every one enjoys in Georgia of living according to his own religion and cuſtoms, and of freely defending them. Here are Perſians, Turks, Muſcovites, Indians, Tartars, Greeks, and Armenians. The latter are even more numerous than the Georgians themſelves; they are alſo richer, and fill moſt of the inferior poſts in the ſtate: but the Georgians are more powerful, vain, and oſtentatious, and the difference between their diſpoſitions, manners, and belief, has produced a reciprocal hatred.

All the public edifices and the houſes of the great are erected on the ſame models as thoſe in Perſia. They build cheap, for they have ſtone, lime, and wood in abundance. They alſo imitate the Perſians in their manner of ſitting, eating, and lying.

The nobility exert the moſt tyrannical power over their vaſſals, whom they oblige to work for them as often as they pleaſe, and even whole months together, without allowing them either money or food for their labour. They think they have a right to their ſubſtance, liberty, and lives: they ſeize their children and ſell them, or keep them as ſlaves; but ſeldom diſpoſe of any of the fair ſex who are above twenty years of age. Hence the Georgians marry their daughters as ſoon as poſſible, and even in their infancy.

Moſt of the Georgian lords make an outward profeſſion of the Mahometan religion, ſome to gain poſts or penſions from the court, and others to obtain the honour of introducing their daughters into the ſervice of the Grand Seignior or the king of Perſia.

The Georgians are extremely ignorant of the principles of religion, and the prince, though a Mahometan, commonly fills the vacant ſees, and generally gives the biſhopricks to his own relations. The churches in the towns are kept in decent order, but in the country they are very dirty. Theſe people have a ſtrange cuſtom of building their churches on the tops of mountains, in diſtant and almoſt inacceſſible places. They ſee and ſalute them, at three or four leagues diſtance; but ſeldom go near them. They build them, and then abandon them to the injuries of the weather, and to the birds. As to the religious opinions and ceremonies uſed by the Georgians, we have no particular account of them.

Teflis, the capital of the province, is ſituated at the foot of a mountain by the ſide of the river Kur, in the forty-third degree of north latitude. This city is ſurrounded by ſtrong walls, except on the ſide of the river, and has a large fortreſs on the declivity of the mountain, which is a place of refuge for criminals and debtors, and the garriſon conſiſts of native Perſians. Teflis has fourteen churches, ſix of which belong to the Georgians, and the

the reſt to the Armenians. The cathedral, which is called Sion, is an ancient ſtone building ſituated on the bank of the river. It has four naves and a large dome in the middle, ſupported by four maſſy pillars, and the inſide is filled with Greek paintings ſo wretchedly executed, that it is difficult to diſcover what they are intended to repreſent. The Mahometans have no moſques here, for fear of offending the people; for the Georgians being naturally brave, mutinous, and fickle, and being ſituated near the Turks and Perſians, their maſters are unwilling to come to extremities with them, and therefore allow them the free enjoyment of their religion: hence they uſe bells in their churches, ſell pork in the market, and wine at the corners of the ſtreets.

The public buildings of this city are of ſtone, and make a handſome appearance, particularly the bazars and caravanſeras. The prince's palace is one of the principal ornaments of the city. It has grand ſaloons, which open upon the river, and face very extenſive gardens. It has alſo aviaries filled with a great number of birds of different kinds, and a very noble falconry. Before the palace is a ſquare, in which may be drawn up a thouſand horſe; it is encompaſſed with ſhops, and oppoſite the gate of the palace is the grand bazar, from the end of which the ſquare and the front of the palace appear in a beautiful perſpective. The inhabitants, who are chiefly Chriſtians, amount to about twenty thouſand, and are Georgians, Armenians, Papiſts, and a few Mahometans. In the neighbourhood of the city are many pleaſant houſes and fine gardens.

SECT. XIII.

Of the ancient Colchis, *now called* Mingrelia.

Its Boundaries and Extent, Climate, Produce. The Perſons, Dreſs, Food, Manners, Cuſtoms, and Religion of the Natives; with a conciſe Account of the Principality of Guriel, and the little Kingdom of Imeretta.

COLCHIS or Mingrelia is bounded on the eaſt by mount Caucaſus, and the little kingdom of Imeretta; on the ſouth by part of Georgia; on the weſt by the Black Sea; and on the north by Circaſſia: it is about one hundred and ten miles in length, and ſixty in breadth; but the ancient Colchis was of much larger extent, it reaching on one ſide to the Palus Mæotis, ſometimes called the ſea of Aſoph, and to Iberia on the other. Its principal rivers are the Corax and Phaſis, now called the Codaurs and Rione; and its capital, named Colchos, was anciently ſituated at the mouth of the Phaſis.

This country is very uneven, it being full of hills and mountains, vallies and little plains. It is covered with woods, except the manured lands, which are but few, and abounds with rivers, which deſcend from mount Caucaſus, and fall into the Black Sea.

The air of Mingrelia is temperate with reſpect to heat and cold; but as it rains almoſt continually, the moiſture and warmth of the climate breed in the ſummer peſtilential diſeaſes. The ſoil is, in general, bad, and produces little corn, and the fruits, which grow there, are taſteleſs and unwholeſome; their vines, however, thrive well, and produce moſt excellent wine. The vines encompaſs the trunks of the trees, and riſe to their very tops. In ſeed-time they ſow their wheat and barley without plowing; and alledge, that were they to break up the earth, it would become ſo ſoft as to be unable to ſupport the ſtalk. They plow their land for their other corn, with wooden plough-ſhares, which, in this moiſt ſoil, make as good furrows as iron.

Their common grain is gomm, which reſembles millet; and of this they make a paſte, which they uſe for bread, and is both wholeſome, agreeable to the palate, cooling, and laxative. They have alſo great plenty of millet, and ſome rice; but wheat and barley being very ſcarce, people of quality eat wheaten bread as a rarity; but it is never taſted by the poor.

Mount Caucaſus produces a multitude of beaſts, as lions, tigers, leopards, jackalls, and wolves; which laſt enter into Mingrelia, and make great havock among the cattle, frequently diſturbing the inhabitants in their houſes with their dreadful howlings. The people have great numbers of very good horſes, almoſt every man keeping ſeveral of them; for they coſt little or nothing, as they neither ſhoe them, nor feed them with corn.

The men are well ſhaped, and the women are extremely handſome, and yet paint their faces, and particularly their eyebrows.

All the men, except the eccleſiaſtics, permit but little of their beard to grow. They ſhave the crown of the head, and leave only a little hair over the forehead and down to their ears, and even that is clipped ſhort. They wear a bonnet of fine felt, which in winter they line with fur; but they are generally ſo poor, that when it rains they put it in their pocket, to prevent its being ſpoiled, and go bareheaded. Thoſe in mean circumſtances are almoſt naked, and uſually wear only a covering of ſtrong felt of a triangular form, at one end of which is a hole, through which they put the head; and this covering they turn to the ſide on which blows the wind or rain. Under this they have a ſhirt, which tucks into a ſtraight pair of breeches: but it is uſual for them to have only one ſhirt and one pair of breeches, which laſt them a year, during which they ſeldom waſh the ſhirt above three times: however, they commonly ſhake it once or twice a week over the fire. Their ſandals are made of the raw ſkin of a buffalo untanned, tied round the foot, and faſtened with thongs of the ſame ſkin: but when the earth is covered thick with ſnow, they wear a kind of ſnow-ſhoes, which ſpreading much farther than the feet prevent their ſinking into it.

The women dreſs themſelves in as ornamental a manner as they can, wearing a Perſian habit and curling their hair.

The ordinary food of the inhabitants is beef and pork. Of the laſt they have great plenty, and it is eſteemed the beſt in the world. Their veniſon is the hart and fallow-deer. They have likewiſe wild boars and hares, all which are excellent food; but their goats-fleſh is lean and ill-taſted. They have a great number of pheaſants, partridges, and quails; with ſome river-fowl and wild pigeons, which are very good, and as large as crammed chickens. They take a great number of thoſe pigeons during the ſummer in nets.

The whole family, both males and females, without diſtinction, eat together: the king with all his train to the very grooms, and the queen with her maids and ſervants. In fair weather they dine in the open court, and if it be cold make a large fire, for wood is ſo plentiful that it coſts nothing. Upon working-days the ſervants have nothing but gomm, and the maſters pulſe, dried fiſh, or fleſh; but on holidays, or when they make entertainments, if they have no veniſon, they kill a cow, an ox, or a hog. Both the men and women drink to exceſs, and at their feaſts are ſollicitous to make all their friends drink as much as poſſible. Their wine is drank unmixed, and beginning with pints they proceed to greater quantities. At theſe merry-meetings the men diſcourſe on their wars and robberies, and the women tell of their amours.

As to the character of people of both ſexes, the women are witty, civil, and full of compliments; but are, at the ſame time, proud, cruel, deceitful, and libidinous. The men have qualities equally prejudicial to ſociety, but the vice they moſt practiſe is theft and robbery, in which they even glory. They vindicate the lawfulneſs of having many wives, by ſaying they bring them many children, which they can ſell for ready money, or exchange for neceſſary conveniences: yet when they have more than they can ſupport, they think it a piece of charity to deſtroy their new-born infants, and to put a period to the lives of ſuch perſons as are ſick, and, in their opinion, paſt recovery, becauſe by this means they free them from miſery. In Mingrelia adultery and inceſt are ſcarce conſidered as crimes; and when a man ſurpriſes another embracing his wife, he may oblige him to pay a hog: he ſeldom takes any other method of revenge, and all three commonly ſit down to feaſt upon it.

Their nobility ſpend their whole time in the field in hawking, and they take particular delight in flying the falcon

falcon at the heron, which they catch only for the ſake of the tuft upon his crown, in order to put it upon their bonnet; and when they have cut it off, they let him go again, that it may grow afreſh.

The houſes of the Mingrelians are built with timber, of which they have great plenty; but the poorer ſort never raiſe them above one ſtory, nor the rich above two. The lower room is always furniſhed with beds and couches to lie down or ſit upon: but theſe buildings are inconvenient, from their having neither windows nor chimnies; and as they have frequently only one room for a whole family, they all lie together, and at night have alſo their cattle with them.

They have no cities nor towns, except two by the ſea-ſide; but their houſes are ſo ſcattered over the country, that you can hardly travel a mile without ſeeing three or four of them. There are nine or ten caſtles in the country, the chief of which is that where the prince keeps his court. This caſtle has a ſtone wall, but is ſo ſmall and ill built, that it might be battered down with the ſmalleſt piece of artillery. It has, however, ſome cannon, which the other caſtles have not.

Theſe caſtles are built in the following manner: in the midſt of a thick wood the people erect a ſtone tower, thirty or forty feet high, capable of containing fifty or ſixty perſons. This is the place of ſtrength where all the riches of the lord, and of thoſe who put themſelves under his protection, are ſhut up. Near this tower are five or ſix others of wood, which ſerve as magazines for proviſions, and as places of retreat for the wives and children of the people in caſe of an attack. There are alſo ſeveral huts made of wood, others of branches of trees, and others of canes and reeds. The area in which they are incloſed is encompaſſed by a cloſe hedge, and by a wood ſo thick that it is impoſſible to find theſe retreats but by the way cut to them, which is ſtopped up by trees whenever there is reaſon to apprehend the approach of an enemy.

The gentlemen have full power over the lives and eſtates of the tenants, and even ſell or diſpoſe of their wives and children in what manner they pleaſe. Beſides, every huſbandman is obliged to furniſh his lord with as many cattle, and as much corn, wine, and other proviſions as is in his power. Thus the riches of the great conſiſt in the number of their vaſſals. They are the judges of all the diſputes that ariſe between them; but when they themſelves are at variance, they determine their quarrels by force of arms, and therefore all of them go armed with a ſword, a lance, and bow. Mingrelia is but thinly peopled, which is owing to their wars and the vaſt numbers ſold by the nobility to the Turks and Perſians.

All their trade is carried on by way of barter, for their money has no ſettled value. The current ſpecie are ſaid to be piaſters, Dutch crowns, and abaſſis, which are coined in Georgia, and bear the Perſian ſtamp. The revenues of the prince of Mingrelia do not exceed twenty thouſand crowns a year, which are raiſed by cuſtoms and goods exported and imported, by ſelling of ſlaves, and by fines and impoſitions. But for this he has little uſe; for his ſlaves ſerve him without pay, and his vaſſals furniſh his court with more proviſions than he can ſpend. He is not able to raiſe more than four thouſand men fit to bear arms, and thoſe are chiefly cavalry. The ſoldiers are not diſtributed either into regiments or companies; but each lord and gentleman leads his men to battle without order, and they follow him as well in flying as in charging the enemy. Upon ſolemn feſtivals the prince's court conſiſts of two hundred gentlemen, but upon other days it does not amount to above a hundred and twenty. The prince of Mingrelia pays a tribute to the Grand Signior of ſixty thouſand ells of linen cloth made in that country.

The religion of the Colchians was antiently the ſame with that of the Greeks and Romans; but, according to eccleſiaſtical hiſtorians, they were converted to Chriſtianity by a ſlave, in the reign of Conſtantine the Great. The Mingrelians however aſſert, that St. Andrew preached among them at a place called Pigaitas, where a church now ſtands, to which the catholicos, or archbiſhop, goes once in his life to make the holy oil uſed in baptiſm. However, theſe people are utterly unworthy of the name of Chriſtians; for they have fallen into ſuch an abyſs of ignorance, that, according to Sir John Chardin, they look upon every thing moſt eſſential in Chriſtianity as mere fables, and yet practiſe ſome outward forms and ceremonies of religion. Their clergy perform ſcarcely any duties belonging to their office; for few of them can read, and they have in a manner loſt the method of performing divine ſervice. They make a public profeſſion of foretelling future events, and as ſoon as a Mingrelian is ſick the prieſt is ſent for; not to pray with him, but to look in his book to ſee whether he will die of that diſeaſe. The prieſt opens the book, which he takes care to bring with him, and having with great gravity turned over the leaves, pronounces, with the voice of an oracle, that the Cati, for thus they call their images, being offended, has inflicted upon him that diſeaſe, and if a good preſent be not made him the patient will die. This preſent uſually conſiſts of a cow, a hog, a goat, or the like, which the poor wretch, terrified at the apprehenſions of death, immediately gives the prieſt to be offered to the image.

The catholicos of Mingrelia has a great revenue; for he has four hundred vaſſals who furniſh his houſe with all the neceſſaries, and many of the ſuperfluities of life. He ſells the children of theſe people to the Turks, and when he viſits the places in his dioceſe, it is not to reform the clergy, or inſtruct the people, but to enrich himſelf. It is ſaid he will not conſecrate a biſhop for leſs than ſix hundred crowns, nor ſay maſs under a hundred. His ſanctity conſiſts in abſtinence from fleſh and wine in Lent; and he is generally ſo ignorant, that he can hardly read his Breviary and Miſſal. He has ſix biſhops under him, who pay little regard to the ſouls of the people, and never viſit their churches and dioceſes; but ſuffer the prieſts to live in ignorance, and the people to commit the greateſt crimes. They are chiefly employed in feaſting and getting drunk. Their principal revenues ariſe from the oppreſſion of their vaſſals, and ſelling their wives and children. However, like the Greek biſhops, they abſtain from fleſh, and ſeem to think that this is almoſt the only duty they are obliged to perform. Their cathedrals are adorned with images, which they embelliſh with gold and jewels, and by this means fancy they ſatisfy the divine juſtice and atone for their ſins. They are cloathed in ſcarlet and velvet, and differ from the ſeculars in wearing long beards, and bonnets that are black, high, and round.

The common prieſts are numerous, and miſerably poor. They cultivate their own grounds and thoſe of their lords, and are as great ſlaves as the ſeculars; nor have they any reſpect ſhewn them, except when they bleſs the food at meals or ſay maſs. As their pariſh churches have no bells, they call the people together by knocking with a great ſtick upon a board. Their churches are commonly kept as naſty as ſtables; and though the images are foul, broken, and covered with duſt, the worſhip paid them is in the higheſt degree idolatrous. They indeed worſhip thoſe moſt that are fineſt adorned, or moſt famed for their cruelty; and when they ſwear by one of theſe, they never break their oath. One of their moſt formidable images is named St. Giobas, whom they dare not approach nearer than to the place where they can juſt ſee him, and there they leave their preſents, for they imagine he kills all who venture to approach him.

For none of the Romiſh ſaints have they any value, except for St. George, to whom both they and the Georgians pay the higheſt reverence. Their maſs reſembles that of the Greeks. Their chalice is a wooden goblet, and their patten a wooden diſh. They never ſay maſs in Lent but on Saturdays and Sundays, becauſe they think the communion ſpoils their faſting. They conſecrate either leavened or unleavened bread, without any difference, and mix no water with the wine, except it be very ſtrong.

Sir John Chardin ſays, that while he was in Mingrelia he was invited to two chriſtenings, which were performed in the following manner: the prieſt being ſent for at about ten in the morning, went into the buttery, where they kept the wine, and ſitting on a bench began to read an half torn octavo volume, running on very faſt, in a

low voice, and in the moſt careleſs manner. In about a quarter of an hour the father and godfather brought in a boy about five years old, when the godfather fixed up a ſmall candle againſt the cabin door, and ſcattered a few grains of incenſe upon ſome hot embers. The prieſt ſtill continued reading with the ſame inattention, breaking off to ſpeak to every body that came in; while the father and godfather were all the time walking in and out, and the little boy did nothing but eat. In about an hour's time a bucket full of warm water was got ready, and the prieſt having put into it about a ſpoonful of the oil of walnuts, bid the godfather undreſs the child, which he had no ſooner done than he was ſet on his feet in the water, and the godfather waſhed his whole body very well. The prieſt then taking a ſmall quantity of the oil of unction out of a leather purſe that hung at his girdle, gave it to the godfather who anointed the child on the crown of the head, the forehead, the ears, the noſe, the cheeks, the chin, the ſhoulders, the elbows, the back, the belly, the knees, and feet: while the prieſt continued reading, till the godfather had dreſſed the child; when the father bringing in boiled pork and wine, they ſat down to table with the family, and ſoon got drunk.

The ſame author ſays, that every other religious act is celebrated by the Mingrelians with the ſame indecent irreverence; and informs us, that one day as he was paſſing by a church, the prieſt, who was ſaying maſs, heard him aſk the way of ſome people who were ſtanding at the door, and cried out from the altar, "Stay, "and I'll ſhew you." A moment after he came to the door, muttering the maſs as he walked; and having aſked whence he came, and whither he was going, he very civilly ſhewed him the way, and then returned to the altar.

They obſerve nearly the ſame faſts as the Greeks, for they keep the four great Lents, the firſt before Eaſter, which is forty-eight days; that before Chriſtmas, which is forty days; St. Peter's faſt, which laſts near a month; and the faſt obſerved by the Eaſtern Chriſtians in honour of the Virgin Mary, which continues fifteen days. Their prayers are all addreſſed to their idols for temporal benefits, as for their own proſperity and the ruin of their enemies. They abſtain from work only at the feſtivals of Chriſtmas and Eaſter, which they celebrate only by eating and drinking in their houſes to exceſs; but their greateſt feſtivals are when the image of a ſaint is carried through their country; upon which occaſion they dreſs in their beſt cloaths, make a great feaſt, and offer their preſents to the idol.

Theſe people have certain monks, of the order of St. Baſil, who wear black bonnets, eat no fleſh, and ſuffer their hair to grow; but pay no regard to religion, except obſerving their faſts, with great exactneſs. They have alſo nuns of the ſame order, who obſerve their faſts, and wear a black veil; but they have no nunneries, nor are under any vows, but quit the order whenever they pleaſe.

In their marriages the parents of the girl agree upon the price with the perſon who deſires her; and here they pay leſs for a woman who has been divorced, more is demanded for a widow, and ſtill more for a maid. When the agreement is made, the young man may keep company with her till the money is paid, and it is no ſcandal if ſhe prove with child by him.

In mourning for the dead the women rend their garments, tear their hair, and fleſh, beat their breaſts, and make terrible lamentations. The men tear their cloaths, and ſhave their heads and faces. The mourning laſts forty days; on the ten firſt of which it is accompanied with the moſt extravagant ſigns of grief, which then gradually diminiſhes till the fortieth, when they inter the body. A feaſt is then made for all who come to weep, and the biſhop, after having ſaid maſs, lays claim to every thing which belonged to the deceaſed, his horſes, arms, cloaths, money, and every thing of the like kind; for, among the Mingrelians, death is the ruin of families; but when a biſhop dies, the prince ſays the maſs for the dead on the fortieth day of mourning, and takes all his moveable goods.

On the confines of Mingrelia lie the little principalities of Guriel and the kingdom of Imeretta. The former borders upon Imeretta on the north, upon Mount Caucaſus on the eaſt, upon the Black Sea on the ſouth, and upon Mingrelia on the weſt. The inhabitants are of the ſame diſpoſition, and have the ſame irregularity of manners as the Mingrelians, being addicted to robbery, murder, and lewdneſs.

Imeretta, which is ſomething larger than the country of Guriel, is encompaſſed by mount Caucaſus, Mingrelia, the Black Sea, the principality of Guriel, and part of Georgia. Like Mingrelia it is covered with woods and mountains, but the vallies are more pleaſant and more fertile; they producing cattle, corn, pulſe, and a variety of herbs. There are ſome iron mines, and ſome money current among the people; and this is coined in the kingdom. They have likewiſe ſeveral towns; but their cuſtoms differ but little from thoſe of the Mingrelians. All theſe nations were once ſubject to the emperor of Conſtantinople; but, after they had freed themſelves, became involved in continual wars, till calling in the aſſiſtance of the Turks, they were made tributary to them.

SECT. XIV.

Of SYRIA, *called by the Turks* SURISTAN.

The Face of the Country, Climate, and Seaſons; their Vegetables, and method of Huſbandry; their Beaſts, Birds, Reptiles, and Inſects.

HAVING taken a view of the Turkiſh empire in Aſia, from Arabia to its moſt northern extremity, we ſhall lay before the reader an account of the countries ſituated to the eaſt of Arabia; and, beginning with Syria, Phœnicia, and Paleſtine, ſhall proceed to Natolia, or Aſia Minor, and the Aſiatic iſlands ſubject to the Turks.

Syria is bounded on the north by Diarbec and Natolia; on the eaſt by Diarbec and the Deſarts of Arabia; which alſo, together with Judea, bound it on the ſouth; and on the eaſt by the Mediterranean Sea.

The coaſt is in general bordered by very high mountains, except near Seleucia, and from Mount Pieria to Mount Caſſius, which is ten or fifteen miles, where it is level, and opens a paſſage for the river Orontes to diſcharge itſelf in the Mediterranean. Theſe mountains are covered with trees, ſhrubs, and a number of plants, which do not, like thoſe in the plains, loſe their verdure during the heat of ſummer. As they abound with ſprings, theſe form ſmall rivulets, which, in ſome places on the ſide next the ſea, unite into rivers, and refreſh the plains between them and the ſea-ſhore. Behind them on the land-ſide are generally extenſive plains, that alſo receive great benefit from the ſtreams that deſcend from the mountains, near which they are covered with myrtle, oleander, and other ſhrubs. But the oppoſite boundaries of thoſe plains are chiefly low, rocky, barren hills; but behind them are other large plains, which, though only watered by the rains that fall in winter, are exceeding fertile. This intermixture of rocky eminences and plains extends about ſixty or ſeventy miles within land.

The Orontes is the only river of any note in Syria. It riſes on the land-ſide of the above high mountains, and from thence winding round falls into the ſea: the reſt of the rivers, which are few and inconſiderable, are abſorbed by the thirſty plains through which they paſs. Even the Orontes, though ſwelled by a number of brooks from the lofty mountains behind which it runs, and alſo from the lake of Antioch, ſeems as conſiderable many miles above that city, as where it diſcharges itſelf into the Mediterranean.

The ſeaſons are here extremely regular, and the air ſo pure and free from damps, that, from the end of May to the middle of September, all the inhabitants, of whatever rank, ſup and ſleep expoſed to the air in their court-yards, or upon the houſe-tops. The natives reckon that the ſeverity of winter laſts only forty days, beginning from the twelfth of December, and ending at the twentieth

twentieth of January. During this time the air at Aleppo is very piercing, even to ſtrangers who have juſt come from a cold climate: yet, during the thirteen years Dr. Ruſſel reſided there, the ice was not above three times of ſufficient ſtrength to bear a man, and that too with caution, and only in a ſituation ſheltered from the beams of the ſun. In ten years of that time the ſnow never lay on the ground above a day: even in the depth of winter, when the ſun ſhines and there is no wind, the weather is warm, and ſometimes almoſt hot. Hence narciſſuſes are in flower during all this ſeaſon, and violets, at the lateſt, appear before it is quite over. As February advances, the fields, which were before partly green, become entirely covered with an agreeable verdure, by the ſpringing up of the latter grain; and though the trees continue in their leafleſs ſtate till about the beginning of March, yet the almond, when lateſt, is in bloſſom before the middle of February, and being quickly ſucceeded by the apricot, peach, &c. the gardens aſſume an agreeable appearance.

The ſpring is extremely pleaſant, but is of ſhort duration; for as March brings it on with rapidity, ſo April with equal haſte advances towards ſummer; and the agreeable livery worn by the fields during theſe two months, and indeed through moſt of the winter, fades before the middle of May; and, ere that month is cloſed, the whole country has ſo parched and barren an aſpect, that one would ſcarce think it capable of producing any thing beſides the few hardy plants that are ſtill able to reſiſt the extreme heats. From this time no refreſhing ſhower falls, and ſcarce a friendly cloud appears to ſhelter the inhabitants from the exceſſive heat of the ſun, till about the middle of September, when a little rain generally falls, and greatly refreſhes the air. There is an interval of between twenty and thirty days from theſe firſt rains till the ſecond, during which the weather is ſerene, temperate, and extremely delightful, and if the rains have been plentiful, though but of a few hours duration, the country ſpeedily aſſumes a new face. After the ſecond rains the weather becomes variable, and winter approaches; but by ſuch ſlow degrees, that the greateſt part of the trees preſerve their leaves till the middle of November, and people of the moſt delicate conſtitutions never have fires till about the end of that month.

The country about Aleppo has ſeldom any hard gales of wind; the coldeſt in winter blow between the eaſt and north-weſt; and the nearer they approach to the former point, the colder they are during that ſeaſon and part of the ſpring; but from the beginning of May to the cloſe of September, the winds blowing from the very ſame point, reſemble the air iſſuing from the mouth of a hot oven. The only remedy againſt them is to ſhut all the doors and windows; for though they are not fatal in Syria, as in other countries, they are extremely troubleſome, affecting moſt people with a painful languor and a difficult reſpiration. However, many ſummers paſs without them; and, during Dr. Ruſſel's ſtay in the country, in no ſummer were there more than four or five days of them; for though the northerly and eaſterly winds reign moſt in the winter, yet Providence has wiſely ordained the weſterly winds to be moſt frequent in the ſummer, without which the intenſe heat of the rays of the ſun, with their reflection from a bare rocky tract of ground, would render the country ſcarce habitable.

With reſpect to the vegetables of this country, they ſow in the fields Turky wheat, barley, beans, a green kind of kidney-beans, Turky millet, lentils, hemp, cotton, muſk-melons, water-melons, a ſmall cucumber, baſtard ſaffron, and ſeveral others. Near Aleppo tobacco is planted in the gardens; but in the villages, at about ten or fifteen miles diſtance, a large quantity is planted in the fields, and all the hills from Shogre to Latachia produce ſuch plenty of it, that this vegetable makes no inconſiderable branch of trade, particularly with Egypt.

The harveſt begins with cutting the barley about the beginning of May, and both that and the wheat are generally got in by the twentieth of the ſame month. As ſoon as it is cut down, or plucked up, (which is the more uſual method) it is carried to a neighbouring ſpot of hard even ground, where it is ſeparated from the huſk by a machine like a ſledge, that runs upon two or three rollers, drawn by horſes, oxen, or aſſes. In theſe rollers are fixed low iron wheels, notched like the teeth of a ſaw, which being pretty ſharp, at once cut the ſtraw and ſeparate the grain. Their granaries are ſubterraneous caverns, entered by a ſmall hole like a well, frequently in the high way; and as they are commonly left open when empty, they render riding in the night not a little dangerous near the villages.

The olives produced about Aleppo are little more than ſufficient to ſerve the inhabitants for pickling; but at Edlib, about thirty miles to the ſouth-weſt, and in the neighbouring villages, there are large plantations, which afford abundance of oil, with which, and the aſhes brought by the Arabs from the Deſart, a conſiderable quantity of ſope is annually made. The vineyards round Aleppo produce pretty good grapes; but the wine made by the Chriſtians and Jews is preſſed from grapes brought from ſome diſtance. Their white wines are palatable, but thin and poor, and ſeldom keep ſound above a year. The red wine is deep-coloured, ſtrong, and heady, but without any flavour; and, inſtead of producing mirth, and elevating the ſpirits, bring on ſleep or ſtupidity.

From raiſins, uſually mixed with a few aniſeeds, they draw a ſtrong ſpirit, which they call arrack, of which the Chriſtians and Jews drink pretty freely.

Among the fruits of this country there are only two or three ſorts of apples, and thoſe very indifferent. They have apricots, peaches, indifferent good pears, quinces, pomegranates of three ſorts, black and white mulberries, oranges, and lemons; figs of four ſorts, walnuts, hazle nuts, piſtachio nuts, &c. All theſe trees are ſtandards, planted promiſcuouſly and but little improved by culture. There are alſo ſeveral kinds of foreſt trees, as the white poplar, the plane, the hornbeam, the aſh, the turpentine-tree, a few oaks, the tamariſk, and many others: there are likewiſe a great variety of garden plants and flowers.

As to the beaſts of Syria, there are a few black cattle, which are chiefly uſed for the plough and in drawing water for the gardens. Moſt of thoſe employed for that purpoſe are very large, with remarkable long legs and great bellies. In ſome parts of Syria are abundance of buffaloes; but near Aleppo there are very few, and thoſe chiefly kept for their milk.

They have two ſorts of ſheep, the one reſembling the larger kinds in Britain, only their tails are rather bigger and thicker; the others are the moſt numerous, and have tails that are very broad and of an extraordinary ſize, terminating in a ſmall appendage that turns back, and is of a ſubſtance between fat and marrow; it is not eaten ſeparately, but mixed with lean meat in many of their diſhes, and is alſo often uſed inſtead of butter. Theſe tails uſually weigh upwards of fifteen pounds; but thoſe which belong to ſheep of the largeſt breed, and that have been fattened, ſometimes weigh fifty pounds. Thoſe in Aleppo being kept up in yards, are in no danger of injuring their tails; but in other places, where theſe ſheep feed in the fields, the ſhepherds are obliged to fix a piece of thin board to the under part of the tail to prevent its being torn by the buſhes, thiſtles, and rocks, it not being covered underneath like the upper part with thick wool; ſome have alſo wheels to facilitate the dragging of this board after them, whence they have been repreſented by travellers as having carts to carry their tails.

They have two kinds of goats, one that reſembles thoſe in Britain, and the other remarkable for the length of their ears. Theſe are only a little larger than ours, and yet their ears are frequently a foot long, and broad in proportion: they are chiefly kept for their milk, which is ſweet and well taſted. In the beginning of April they are brought to Aleppo, and great numbers are driven through the ſtreets every morning, and their milk ſold as they paſs till September.

Syria abounds with two ſorts of antelopes, of which that of the mountains is the moſt beautiful. Its back and neck are of a dark brown, and the antelope of the plain is neither ſo ſwift, nor ſo well made; yet both ſorts are ſo extremely fleet, that the grey-hounds, though very good ones can ſeldom come up with them, without the aſſiſtance of a falcon, unleſs in ſoft deep ground.

There are plenty of hares, but none of the natives, except the Arabs, are fond of them. The method of dreſſing them is very extraordinary. They dig a hole in the earth, which they fill with light bruſhwood, and ſet it on fire; when thoroughly lighted, the hare, with the ſkin and entrails, juſt as it was taken, is thrown into it, and after the flame has ceaſed, they cover up the hole with the looſe earth taken out of it, which at firſt had been laid round the edge to grow hot. Thus it is left till they imagine it is ſufficiently roaſted; when taking it out, they throw a handful of ſalt over it, and eat it without any other dreſſing.

Of the beaſts of burthen here are three ſorts of camels, theſe are the Turcoman camel, the Arab camel, and the dromedary.

The Turcoman camel is much larger, ſtronger, more hairy, and of a darker colour than any of the others. Their common load is eight hundred pounds; but they ſometimes carry much more. Theſe cannot bear heat, and therefore they are never worked in the months of June, July, and Auguſt.

The Arab camel is much ſmaller, leſs hairy, of a lighter colour, and ſeldom carries more than ſix hundred pounds weight; but can bear heat and thirſt much better than the Turcoman. There is no need of theſe camels being fed with barley flour, or chopped ſtraw; for the very thiſtles and other plants, which grow in the deſart, are almoſt all the food they require. Dr. Ruſſel ſays, that he remembers an inſtance, where, in a caravan from Baſſora, the camels, which were of this ſort, travelled without water for fifteen days; but the quantity they drank, as ſoon as they came at it, proved fatal to many of them.

The dromedary appears to be only a high breed of the Arab camel, from which they are only diſtinguiſhed by their being of a lighter and handſomer make, and inſtead of the ſolemn walk to which the others are accuſtomed, they pace, and are generally ſaid to go as far in one day as the others in three.

The other beaſts of burthen are horſes, which are here well broke, and taught to ſet off in full ſpeed, and ſuddenly to ſtop. There are two ſorts of aſſes, one very large with remarkable long ears, and the other ſmall, and reſembling thoſe in England; there are likewiſe ſome mules.

Among the rocky hills, and in the mountains, are hyænas. Some authors have pretended, that this animal will imitate the human voice, and even learn the names of the ſhepherds, in order to call them out and devour them; but this is far from being true, for they are fonder of the flocks than of the ſhepherds, and never attack men but in their own defence, or through exceſs of hunger; yet they will rob the graves whenever they can come at them.

Foxes and wolves are found in the plains, but they are ſmaller than thoſe in Europe, and the jackalls are ſo numerous, that every evening they paſs in full cry, like a pack of hounds, through the gardens of Aleppo, and not only give great diſturbance by their noiſe, but make free with the poultry.

The country affords the turky, gooſe, and duck, the dunghill-cock and hen, the Bagdat fowl, which is of a large breed, the rumkin, or cock and hen without rumps. Among the game are wild geeſe, plenty of wild ducks and mallards, ſeveral kinds of widgeon, ſpoon-bills, and various ſorts of teal, water-hens, and water-rails. In autumn the becca-figos and wit-walls are both in ſeaſon, and the former are eſteemed great delicacies. Here are alſo the buſtard of two kinds; the red legged partridge, the frankolin, the fleſh of which is delicious; the common ſky-lark, the wood-lark, the creſted lark, and ſeveral others, particularly ſeveral ſpecies of pigeons, among which is the carrier formerly uſed by the Europeans, for conveying expeditiouſly the news of a ſhip's arrival at Scanderoon: but this has been diſuſed for many years.

The pigeon employed on theſe occaſions was one that had young at Aleppo. Dr. Ruſſel enquiring into the method of training them was informed they were ſent to Scanderoon in an open cage, and as ſoon as let go, would fly back to Aleppo; but others ſaid, they were brought to this by letting them return from ſhorter diſtances on the Scanderoon road. All agree, that if the pigeon had been a fortnight at Scanderoon, it was not afterwards to be truſted to fly back, leſt forgetting its young, it ſhould not be ſo eager to get home. A ſmall piece of paper, with the ſhip's name, the day of its arrival, and the moſt material circumſtances, contained in a narrow compaſs, was fixed under the wing, to prevent its being deſtroyed by wet. They alſo bathed the pigeon's feet in vinegar, in order to keep them cool, that it might not ſettle to waſh itſelf, which would deſtroy the paper. An Engliſh gentleman, who remembered this practice, ſaid he had known one of them arrive in two hours and a half, tho' the diſtance is no leſs than ſeventy miles.

Beſides the birds uſed for food and ſport, the country produces the black vulture, the cormorant, the ſtork, a few pelicans, the owl, a kind of jay, with feathers beautifully variegated with blue, green, and brown; two ſorts of the crane, one a fine bird, which the natives often keep tame in their houſes; the heron, the flamingo, and the black-cap, a kind of gull, of which there are a great number in Aleppo, during the winter, ſo tame, that the women call them from the houſe-tops, throwing up pieces of bread, which they catch in the air.

Among the reptiles are ſerpents of various kinds, and many of them extremely venomous; but as they all fly from man, and from the barren fields in ſummer, when alone they are abroad, there is but little danger of accidentally treading upon them. However, large white ſnakes are often found in the houſes; but it does not appear that they do any miſchief. The ſcorpion and ſcolopendra indeed often ſting the natives in their houſes, which cauſes great pain for ſeveral hours, but is attended with no other ill conſequence. In the gardens are tree frogs, and over the whole country are various kinds of lizards.

Of the uſeful inſects, there are only ſilk-worms, which produce a conſiderable quantity of ſilk; and bees, which make excellent honey. Among thoſe which are prejudicial are the locuſts, which ſometimes appear in ſuch incredible numbers, as to deſtroy all the verdure wherever they paſs: but this ſeldom happens.

SECT. XV.

A Deſcription of the City of Aleppo and the neighbouring Country; of the Inhabitants, and particularly of the Cuſtoms of the Chriſtians, with an Account of the Marriages of the Maronites, and of the Europeans in that City. The Manner in which they ſpend their Time, and the epidemic Diſeaſes which prevail at Aleppo.

THE city of Aleppo, the preſent metropolis of Syria, called by the Turks Haleb, is ſituated ſixty miles from the ſea, in thirty-ſix degrees twelve minutes north latitude, and in thirty-ſeven degrees forty minutes eaſt longitude from the meridian of London, and with reſpect to its buildings is inferior to no city in this part of the Turkiſh empire.

This city with its ſuburbs is built on eight ſmall hills, none of which is of a conſiderable height, except one in the middle of the city, upon which the caſtle is erected. This is of a conic form, and ſeems in a great meaſure artificial, and raiſed with the earth thrown out of a broad deep ditch with which it is ſurrounded. The city is encompaſſed by a wall now much decayed, and a broad ditch, in moſt places converted into gardens. It is about three miles and a half round; but including the ſuburbs, which lie chiefly to the north-eaſt, the whole is about ſeven miles in compaſs.

The houſes are built of ſtone; but as the ſtreets are generally narrow, and the houſes have no windows that look into them, except a few in the upper rooms, nothing is to be ſeen but dead walls, which give them a diſagreeable appearance. The ſtreets are, however, well paved, and kept remarkably clean.

The moſques are numerous, and ſome of them magnificent. Before them is a ſquare area, in the middle of which is a fountain for the appointed ablutions before prayers; and behind ſome of the larger moſques is a ſmall garden.

There are alſo many large caravanſeras, each conſiſting of a ſpacious ſquare court, on all ſides of which are erected on the ground-floor, a number of rooms occaſionally uſed for ſtables, chambers, or ware-houſes. Above ſtairs is a colonade on each of the four ſides, to which open ſeveral ſmall rooms, wherein the merchants, as well natives as ſtrangers, tranſact moſt of their buſineſs.

In the city are alſo a number of public bagnios, which are frequented by people of all religions, and of all ranks, except thoſe in high ſtations, who generally have them in their houſes.

The bazars, or market-places, are here, as in other parts of the eaſt, long, narrow, covered ſtreets, with ſhops on each ſide, juſt ſufficient to hold the tradeſman, and perhaps one or two more, with all his commodities about him, the buyer being obliged to ſtand without. A particular bazar is allotted for each trade, and theſe and the ſtreets are locked up an hour and a half after ſunſet, and many of them earlier. It is remarkable that though their doors are moſtly caſed with iron, yet their locks are of wood.

The natives in their common buildings make uſe of a white gritty ſtone, that is every where in plenty about the city: it is eaſily cut, but grows hard by being expoſed to the air. But in the gates, pillars, and pavements of their nobleſt ſtructures, they employ a yellow marble, capable of a tolerable poliſh. This is alſo the produce of the country, and is often intermixed, by way of ornament, with red, white, and coarſe black marble, brought from other places: but when they are in want of the red, they give their own yellow marble that colour, by rubbing it over with oil, and then putting it into a moderately hot oven, in which it continues for ſeveral hours.

At about the diſtance of five miles are ſeveral ſprings that ſupply the city with good water, by means of an aqueduct, which is ſaid to have been built by the empreſs Helena. This water is ſufficient for the neceſſary purpoſes of drinking and cookery. Almoſt every houſe has alſo a well; but that water being brackiſh, is only employed for waſhing their yards, and filling the reſervoirs for the ſupply of the fountains. Indeed the river Caic, the ancient Singas, which is no more than ſix or eight yards broad, runs by the weſtern part of the city, within a few yards of the walls; but it barely ſerves to water a narrow ſlip of gardens on its banks, that extend from about five miles north, to about three miles ſouth of the town. Beſides theſe gardens, there are a few more near Bab Allah, a village about two miles to the north-weſt, which are ſupplied by the aqueduct. The riſing grounds above the gardens, to which the water cannot be conveyed, are in ſome places laid out in vineyards, interſperſed with olive, fig, and piſtachio trees, as are alſo many ſpots to the eaſtward, where there are no gardens. But inconſiderable as this river and theſe gardens may appear, they contain almoſt the only water, and all the trees to be met with for twenty or thirty miles round; for the villages have no trees, and moſt of them are only ſupplied with the water the inhabitants ſave in their ciſterns.

The fuel uſed in the houſes of Aleppo is wood and charcoal; but for heating their bagnios they burn the dung of animals, the parings of fruit, and the leaves of plants, all which people are employed to gather and dry for that purpoſe.

The ground, at leaſt four or five miles round Aleppo, is very ſtony and uneven, with a number of ſmall eminences, moſt of which are as high as any part of the city; and from the weſt-ſouth-weſt to the north-weſt by weſt, this uneven country extends at leaſt twenty miles; but is, however, interſperſed with many ſmall fertile plains.

Plenty of lime-ſtone is found near the city, that affords good mortar for their buildings, which they carry on with great eaſe and dexterity; and at a few hours diſtance is found the gypſum, in ſmall quantities, of which plaſter of Paris is made. This is chiefly uſed in cementing the earthen pipes, uſed in conveying water, and for a few other purpoſes about their beſt buildings.

At the diſtance of about eighteen miles ſouth-eaſt of Aleppo is a large plain called the valley of ſalt, bounded by low rocky hills, which form a kind of natural baſon, that retains the rain deſcending from the rocks, together with the water that riſes from a few ſprings in the neighbourhood, and cauſe the whole to be overflowed in the winter. The extent and unevenneſs of the ſurface prevents this water from being of any great depth; ſo that it is ſoon evaporated by the ſun, when it leaves a cake of ſalt in ſome places half an inch thick; and with this the whole encloſed plain is covered. The ſoil of this plain is a ſtiff clay ſtrongly impregnated with ſalt. In the month of April a number of people are employed in gathering this ſalt, which is not only very good, but ſufficient to ſupply all this part of the country.

The inhabitants of the city and ſuburbs of Aleppo are computed at about two hundred and thirty five thouſand, of whom two hundred thouſand are Turks, thirty thouſand are Chriſtians, and the remaining five thouſand Jews. But though they are of ſuch different religions, they ſeem to be nearly the ſame people, nor are the Chriſtians much ſuperior to their neighbours in virtue. The greateſt number of them are Greeks, the moſt numerous next to them are Armenians, next to them the Syrians, and then the Maronites; each of whom have a church in a part of the ſuburbs, where moſt of them reſide.

The vulgar language is Arabic; but the Turks of rank uſe the Turkiſh: moſt of the Armenians can ſpeak Armenian; many of the Jews underſtand Hebrew; but few Syrians can ſpeak Syriac; and ſcarce one of the Greeks underſtand a word of either ancient or modern Greek.

There are alſo a people named Chinganas, who, like the Arabs, wear a large ſilver or gold ring through the external cartilage of their right noſtril. Theſe people are eſteemed the plague of Aleppo; they reſemble the Arabs, and, like ſome tribes of them, live in tents; but are not acknowledged by them. As they are extremely poor, a few of them, who are conſtantly encamped round the ſkirts of the city, hire themſelves for labourers, and other menial offices; but the greateſt number come thither from all parts in the ſpring, to aſſiſt in reaping the corn.

We have already given a ſufficient deſcription of the manners of the Turks of this city, in deſcribing thoſe of Aſia in general, and ſhall here therefore only take a view of the cuſtoms and manners of the Chriſtians who compoſe ſo conſiderable a part of the city.

When the Chriſtian women go abroad, they are as cloſely veiled as thoſe of the Turks; but they are ſeldom allowed to go any where but to church, to their phyſicians, to the bagnio, or now and then to viſit a relation. A few women are permitted by their huſbands to go two or three times a year to their gardens; but others, though they are not a mile from their houſes, never ſaw a garden in their lives.

The women in general have ſuch eaſy labours, that thoſe of the moſt delicate conſtitutions are ſeldom confined above ten or twelve days, and thoſe of the villages are commonly able to go the next day about their uſual employments. Women of all ranks ſuckle their own children, and ſeldom wean them till either the mother is again with child, or they are three or four years of age.

As to the marriages of the Chriſtians they are generally contracted when children, by their parents, and as there is no material difference between the nuptial ceremonies of the different ſects, a deſcription of thoſe of the Maronites may ſerve as a ſpecimen of all the reſt.

The bride having been demanded, the bridegroom's relations are invited by the bride's father to partake of an entertainment, in order to fix the wedding-day; for the young folks themſelves have no vote in theſe affairs, in which they are ſo nearly concerned. On the afternoon of the day appointed, they again go to the bride's houſe, and after ſupper is over, return to that of the bridegroom, who has not yet appeared; for he is obliged by cuſtom to hide himſelf, and is not to be found, till they have made a ſeemingly ſtrict ſearch for him. He is brought out dreſſed in his worſt clothes, when great

noiſe and rejoicings are made on their finding him, and he and the brideman, after being led ſeveral times round the court in a noiſy proceſſion, are conducted into a room where their wedding clothes are laid out in form. A prieſt then ſays a long prayer over them, and being dreſſed, they are led back into the court with the ſame ceremony as before. At midnight, or a few hours after, the relations, accompanied by all of both ſexes who have been invited to the wedding, return in proceſſion to the houſe where the bride lives, with muſic playing before them, and each holding a candle. On their coming to the door, it is ſhut againſt them, and when they knock and demand the bride, they are refuſed admittance. Upon this a mock fight enſues; but the bridegroom's party are always conquerors. The women then conduct the bride out of her chamber covered all over with a veil, and ſhe is carried in proceſſion to the bridegroom's, accompanied only by one or two of her ſiſters, or neareſt female relations, and being ſeated at the upper end of the room, among the women, continues veiled with red gauze, and muſt neither ſpeak nor move, except riſing to every perſon who comes into the room, of which ſhe is informed by one of the women, who conſtantly ſits by her; for ſhe muſt not open her eyes. Few retire to reſt, and the remainder of the night is ſpent in mirth by each ſex in their ſeparate apartments, there being no want of wine, arrack, fruit, and ſweetmeats.

At about nine the next morning, the biſhop or a prieſt comes to perform the ceremony. At his entrance all the women are veiled, and the bride ſtands entirely covered, ſupported by two women. The bridegroom dreſſed in a gaudy robe, entering with the biſhop, is placed on the bride's left hand with his brideman by him, and a ſhort ſervice being performed, the biſhop puts a crown firſt on the bridegroom's head, and then on the heads of the bride, the brideman, and bridemaid. Afterwards joining the hands of the bridegroom and bride, he continues the ſervice, and at length puts a ring on the bridegroom's finger, and delivers another to the bridemaid to be put on that of the bride. Near the concluſion of the ſervice he ties a piece of tape or ribbon round the bridegroom's neck, and in the afternoon a prieſt comes to take it off.

The ceremony being concluded, the bridegroom and all the men return to their own apartment, where they drink coffee and ſit very gravely while the biſhop ſtays, which is not long, for dinner being immediately ſerved up for him and a few others, he dines and takes his leave, on which they inſtantly reſume their mirth. Great quantities of proviſions being dreſſed, ſeveral tables are covered both for dinner and ſupper, and there is generally plenty of arrack, wine, coffee, and tobacco.

About midnight the bridegroom is led in proceſſion to the bride's chamber, when preſenting her a glaſs of wine, ſhe drinks to him, and he having returned the compliment, is conducted back with the ſame ceremony. The muſic, during the whole time, continues playing, buffoons and other of their diverſions are going forwards, and the houſe is uſually full of company till the next day in the afternoon, when all take their leave, except a few intimate friends, who ſup with the bridegroom, and about midnight leave him heartily fatigued, to retire to the bride's chamber.

All who are invited to the wedding ſend preſents, and for ſeveral days after the marriage is conſummated, flowers are ſent to the bride by all her female acquaintance. On that day ſeven-night the bride's relations come to viſit her, and an entertainment is provided for them. But it is not thought decent for a bride to ſpeak to any perſon for at leaſt a month, except a few words to her huſband, and this the Armenians are ſo unreaſonable as to extend to a year. The old women generally give them a ſtrict charge about this, and particularly enjoin them not to talk too ſoon even to the huſband.

Few women are allowed to ſit at table with their huſbands, but wait upon them as ſervants, and though they have no guards about their apartments, yet the people of faſhion are never permitted to appear unveiled before men, except they are their near relations, their ſervants, prieſts, or phyſicians. The Maronites are the leaſt ſtrict in this reſpect, for ſome of them will appear before particular ſtrangers, and are permitted to ſit at table with their huſbands. Their confinement, however, proceeds leſs from jealouſy of their conduct, than from the fear of the bad conſequences that might attend their being ſeen by a Turk, ſhould he take a liking to them.

The Europeans, or Franks, who reſide at Aleppo, are chiefly Engliſh and French. Of the former there were in the year 1753 the conſul, the chancellor, the chaplain, the phyſician, ten merchants, and an officer who walks before the conſul with a ſtaff tipped with ſilver; he is alſo employed as a meſſenger, and takes care of letters.

The French have a conſul, and the other officers, with the druggermen, or interpreters, and double the number of merchants and clerks. The French have likewiſe under their protection three convents in the city, and a college of Jeſuits. The Dutch have a conſul; but no other perſon of their country reſides there. There are likewiſe a few Venetian merchants and Italian Jews. The greateſt part of the European merchants live in caravanſeras in the principal quarter of the city, in which the ground-floor ſerves for their warehouſes, and the upper ſtory is fitted up for their dwellings by buildings between the pillars of the colonade, forming a long corridore; opening on which are a number of rooms, ſo that they nearly reſemble cloiſters; and as theſe merchants are unmarried, and their communication with the people of the country is almoſt ſolely on account of trade, their way of life nearly reſembles that of the monaſtic. They formerly wore the Turkiſh habit, retaining only the hat and wig, by way of diſtinction; but of late years moſt of them continue in their proper dreſs.

The Europeans have their proviſions dreſſed after their own manner, and the evening being the chief time of entertaining their friends, they eat more animal food for ſupper than is cuſtomary in England. At table they commonly drink a dry white wine and red wine brought from Provence. The Engliſh in ſummer generally drink before dinner and ſupper a draught of weak punch, which is found ſo very refreſhing, that now moſt of the other Europeans, ſeveral of the Eaſtern Chriſtians, and ſome Turks, follow their example.

All the Engliſh keep horſes, and three or four times a week ride out for an hour or two in the afternoon. On Saturdays, and frequently on Wedneſdays, they dine abroad under a tent, in ſpring, autumn, and during the fine weather in winter. In the month of April, and part of May, they generally live at the gardens near Baballah; and in the heat of ſummer they dine at the gardens. Thoſe who love hunting and hawking uſually go abroad twice a week after the ſecond rains, till the weather grows too warm; beſides, in the evening they uſually take a walk on the houſe-top. The reſt of the time is ſpent in the compting-houſe.

The Europeans at Aleppo have no reaſon to complain of the behaviour of the Turks. Their capitulations with the Porte prevent their being ſubject to the oppreſſions of the government; and the baſhas and people of diſtinction uſually treating the conſuls with civility and reſpect, others follow their example; ſo that they live in great ſecurity in the city, and can even travel abroad unmoleſted by the Arabs and Curds, where the natives dare not venture. This is partly owing to a ſmall preſent annually ſent to the prince of the Arabs, and the civil treatment the Curds ſometimes meet with at Scanderoon; and partly to their travelling with no more money than is abſolutely neceſſary to defray their expences, ſo that they would get but little by robbing them. And, beſides, an inſult of this nature would be made a pretence by the Turkiſh government for chaſtiſing them ſeverely.

The epidemical diſtempers which prevail moſt in Aleppo are fevers of ſeveral kinds, dyſenteries, quinſies, rheumatiſms, pleuriſies, and peripneumonies; to which may be added the plague: they have alſo a cutaneous diſeaſe, by ſome thought peculiar to this place, whence it is called the Aleppo evil.

SECT.

SECT. XVI.

Of the Cities of Alexandretta, or Scanderoon; Antioch, now called Anthakia; Laodicea, now called Latakia; with a Description of the Catacombs, and other Antiquities near that City: and also of the Cities of Jebilee, antiently called Gabala, and of Arka.

ALEXANDRETTA, or Little Alexandria, is said to have been repaired and embellished, if not built, by Alexander the Great, after a victory he obtained over Darius; and it received its name to distinguish it from Alexandria in Egypt. This city, which is now called Scanderoon, is situated at the extremity of the Mediterranean Sea, in thirty-six degrees thirty-five minutes north latitude, and is the sea-port town of Aleppo. It stands on a marshy ground, in so unhealthy a situation, that it is now only a confused heap of wretched houses, most of them built of wood, and others of boughs of trees interwoven, and plastered over with clay; and is inhabited chiefly by Greeks, who entertain all the sailors and ordinary travellers that come thither; while the merchants and persons of rank generally lodge with the consuls of their own nation, where they meet with better accommodations; for these have handsome houses a mile or two from the town, where the place resembles a little city. During the excessive heats, when Scanderoon is most unhealthful, many of the inhabitants retire to the neighbouring villages, particularly to Balain, which is situated at ten miles distance among very high mountains, where there is excellent water and also delicious fruit.

Scanderoon has an old castle, defended by a small garrison, under the command of the governor. The people used formerly to send pigeons with letters to inform the merchants of Aleppo of the arrival of any ship; but we have already observed, that this custom is now laid aside.

About twenty-two miles to the south of Scanderoon are the remains of the antient and celebrated city of Antioch, now called Anthakia, once the capital of Syria; but now a ruinous place, the channel where vessels used to ride being choaked up. It is situated on the river Orontes, now called Affi, and has been in the possession of the Turks ever since the year 1188. It was formerly called by the Greeks Epidaphne, from the grove and oracle of Apollo adjoining to it; and there the disciples of our Lord were first called Christians.

A little farther to the south is Laodicea, now called Latakia. This city is situated in thirty-five degrees thirty minutes north latitude, and was originally built by Seleucus Nicanor, who gave it the name of Laodicea in honour of his mother. It was antiently a place of great magnificence, but was afterwards reduced to a low condition; but being rebuilt, is now become one of the most flourishing towns on the coast.

Among the ruins of this antient city are still standing several rows of columns formed of porphyry and granite, with part of an aqueduct, the same, perhaps, which Josephus says was built by Herod; this last is a massy structure, without arches. The principal monument of the antient grandeur and magnificence of this city is a large triumphal arch, supported by pillars of the Corinthian order. The architrave is adorned with trophies, shields, battle axes, and other military weapons, while the rest of the entablature is extremely bold and noble. This structure now forms part of a mosque. A furlong to the westward of the city are the ruins of a beautiful cothon, in the form of an amphitheatre, and so capacious as to be able to contain the whole British navy. Its mouth, which is about forty feet wide, is defended by a small castle; but it is at present so choaked up with sand and pebbles, that half a dozen small vessels are all that can be conveniently admitted at one time.

About two furlongs to the northward of the city, near the shore, are the antient catacombs, in which are several stone coffins, some of which have preserved their covers, and are adorned with beautiful decorations of shells and foliage; or the busts of men and women, satyrs, and the heads of oxen; others are pannelled, and have their covers supported by pilasters of the Ionic and Corinthian orders.

The catacombs in which these coffins are found are formed in the rocky ground, and consist of a number of sepulchral vaults, from ten to thirty feet square, and upon the front and side-walls of each stair-case are curious designs in basso relievo, answering to those of the coffins. Along the sides of these vaults are narrow cells, wide enough to receive one of these coffins, and long enough for two or three. One of these vaults is held by the Greeks in great veneration. It is called St. Teckla, in commemoration of some acts of penance and mortification said to have been performed there by the first virgin martyr. In the middle of it is a spring supposed to produce extraordinary cures and miraculous visions; and here they bring those afflicted with the jaundice and other distempers; and, after several ceremonies, they return with a steady faith in their cure. Here also the aged and decrepid pretend to receive warnings of their approaching death; while the young foresee a long train of events which, they imagine, are to happen within the future course of their lives.

Farther to the south is Jebilee, antiently called Gabala, which stands close to the sea, in a fruitful plain. It now makes but an indifferent appearance, though it was once a bishop's see. Among the ruins of the antient city are many pillars of granite, with capitals of white marble highly finished: but the greatest monument of its antient splendor is the remains of a noble theatre, by the north gate of the city. The walls are not above twenty feet high, and part of them have been blown up by the Turks, who have taken from thence a great quantity of marble, to adorn the mosque and bagnio of this city. All that is now standing is the semi-circle, which is a hundred yards in diameter. In this part is a range of seventeen round windows, just above the ground, and between these were raised large massive pillars, standing on high pedestals; but these are broken to pieces. On the west side the seats of the spectators remain entire. The outward wall is three yards and three quarters thick, and built with very large and firm stones.

Still farther to the south, near a rivulet called the Serpent Fountain, are several remarkable antiquities, particularly a large bank, with the sides sloping, and stairs formed out of the rock from the top to the bottom. This bank extends above a furlong, with stairs running in right lines all along the sides. Beyond it is a court fifty yards square, cut in the rock, the sides of which rise about three yards high, supplying the place of three walls, for it lies open to the northward. In the center of the area a part of the rock rises three yards high, and is five yards and a half square. This serves for a pedestal to a kind of throne erected upon it, composed of four large stones, two at the sides, one at the back, and another over the top, in the manner of a canopy, with a handsome cornice round it. This structure is about twenty feet high, and was perhaps an idol temple, and the pile in the middle the throne of the idol.

About a mile farther to the southward are two towers, under which are several sepulchres hewn out of the solid rock.

About five miles to the southward are other sepulchres covered with pointed cylindrical buildings, where the situation of the country has something in it so romantic and peculiar to itself, that it never fails to fill the mind with an agreeable mixture of melancholy and delight. The uncommon contrast of woods and sepulchres, rocks and grottos; the medley of sounds and echoes from the beasts, birds, cascades, and water-falls; the distant roaring of the sea, and the composed solemnity of the place, says Dr. Shaw, naturally remind us of the beautiful groves and retreats of the rural deities described by the poets.

Opposite the northern extremity of Mount Libanus are still to be seen the remains of the antient Arka, the city of the Arkites, in a most agreeable situation, having a prospect to the northward of an extensive plain, diversified by a variety of castles and villages, ponds and rivers: to the eastward the sun is seen rising over a long and distant chain of mountains, and to the westward setting in the sea. Here beautiful Thebaic columns and rich

entablatures

entablatures atteſt the antient ſplendor of this city. Arka was erected on the ſummit of a mount, and by its ſituation muſt have been in a manner impregnable. This mount is in the form of a cone, and ſeems to be the work of art. In a deep valley below the city is a ſwift ſtream, more than ſufficient to ſupply the place; yet it was thought moſt proper to bring the water from Mount Libanus, which was effected by an aqueduct, whoſe principal arch could not be leſs than a hundred feet in diameter.

SECT. XVII.

Of thoſe Cities of Syria in the Part antiently called Phœnicia, particularly Tripoly, Balbec the ancient Heliopolis, Damaſcus, Tyre, and Sidon.

THE antient Phœnicia, now included under the general name of Syria, was bounded on the north by Syria Proper, already deſcribed, on the eaſt by Arabia Deſerta, on the ſouth by Paleſtine, and on the weſt by the Mediterranean Sea; and is comprehended partly under the beglerbeglic of Damaſcus, and partly under that of Syria. Though this is but a ſmall territory, it has made a conſiderable figure in hiſtory, on account of the ingenuity of its inhabitants, to whom are generally attributed the invention of letters, the art of navigation, the making of glaſs and many other uſeful diſcoveries. In navigation they particularly excelled, and by their commerce not only became a wealthy people, but eſtabliſhed colonies in Europe, Aſia, and Africa. It is remarkable, that the name of Phœnicia is not to be found in the Hebrew text of the holy ſcriptures, though it is in the Greek verſion, it being always called in the ſacred books, Canaan, and the inhabitants Canaanites.

The principal places in this diſtrict are Tripoly, Balbec, Damaſcus, Tyre and Sidon.

Tripoly, called Tripolis of Syria, to diſtinguiſh it from Tripoly in Barbary, received its name from its being antiently formed of three cities at a ſmall diſtance from each other, one of which belonged to the Aradians, or antient kingdom of Arad, the ſecond to the Sidonians, and the third to the Tyrians, perhaps as a common mart to thoſe maritime powers. The preſent town of Tripoly is built at the diſtance of a mile and a half from the other, upon the declivity of a hill facing the ſea, in thirty-four degrees fifteen minutes north latitude, and in thirty-ſix degrees fifteen minutes eaſt longitude from London. It is ſurrounded with walls, fortified with ſeven high ſtrong towers, and a caſtle, all of Gothic architecture; but the ſtreets are narrow, and the houſes low. The moſt extraordinary building in the place is an aqueduct, with its reſervoirs, ſome of which are twenty or thirty feet high, and being placed at proper diſtances in the town, ſupply moſt of the houſes to the ſecond or third ſtories with water. A ſmall river alſo runs through the town, and ſerves to water the gardens, few of which are without a fountain or caſcade; it likewiſe turns ſeveral mills, and over it is a ſtone bridge. Here is a large and handſome moſque, which was formerly a Chriſtian church: the Chriſtians have ſome monaſteries and neat chapels, among which is that of the capuchins, who are chaplains to the French, and the jeſuits have likewiſe a handſome college. In the ſea oppoſite the town is a ſand bank, which encreaſes ſo much, that it is thought it will in time choke up the harbour, which is two miles weſt of the town, and formed by a round piece of land united to the continent by an iſthmus. On each ſide is a bulwark, in which are an hundred janizaries, and ſome great guns to defend the entrance.

The city contains about eight thouſand houſes, and near ſixty thouſand inhabitants, conſiſting of Turks, Chriſtians, and Jews. The baſha, who reſides in the caſtle, where there is a garriſon of two hundred janizaries, governs the adjacent territory, in which there is plenty of fruit, and a great number of mulberry-trees, which enable the inhabitants to carry on a ſilk manufacture, from which they draw conſiderable profit.

We ſhall now proceed to the ſouth-eaſt, and view the remains of antient magnificence, viſible in the ruins of Balbec; which, like thoſe of Palmyra already deſcribed, both aſtoniſh and humble the ſpectator, and ſhew, that, with reſpect to architecture, we are far from rivalling the antients.

In deſcribing the ruins of Balbec, we ſhall follow the ingenious and learned Mr. Wood. The valley of Bocat, in which Balbec is ſituated, that author obſerves, might be rendered one of the richeſt and moſt beautiful ſpots in Syria, it being more fertile than the celebrated vale of Damaſcus, and better watered than the rich plains of Rama and Eſdraelon. It at preſent produces corn and ſome good grapes; but though ſhade is an eſſential article of oriental luxury, there are few plantations of trees.

This valley extends in length from Balbec almoſt to the ſea, and its breadth from Libanus to Anti-Libanus appears in few places leſs than ſix miles, or more than twelve. It is watered by the rivers Litane and Bardouni; the firſt riſes from Anti-Libanus, a little to the north of Balbec, and is greatly increaſed by a fine ſpring cloſe by the city walls. The Bardouni riſes from the foot of Libanus, and joins the Litane in the plain. Theſe ſtreams, which are encreaſed by ſeveral conſtant rills from the melting ſnow of Libanus, might be improved to all the purpoſes either of agriculture or pleaſure. Theſe rivers being joined, form the Caſimiah, under which name they enter the ſea near Tyre.

Balbec is agreeably ſituated upon a riſing ground near the north-eaſt extremity of this plain, between Tripoly of Syria and Damaſcus, in thirty-five degrees twenty-five minutes north latitude, and there is not the leaſt doubt of its being the Heliopolis of Cœloſyria, ſometimes called the Heliopolis of Phœnicia. It now contains about five thouſand inhabitants, a few of which are Greek and Maronite Chriſtians, and ſome Jews; but the people are poor, and without trade and manufactures.

When we compare the ruins of Balbec, ſays the above author, with thoſe of many ancient cities we have viſited in Greece, Egypt, and Aſia, we cannot help thinking them the remains of the boldeſt plan that appears to have been ever attempted in architecture.

The traveller, on taking a view of this city from the ſouth, ſees the preſent town encompaſſed with its wall, and at the eaſt end the moſt conſiderable ruins of the ancient Heliopolis, particularly the remains of its magnificent temple. The portico which formed the grand front of that ſtructure is ſo noble, that no ornaments ſeem wanting to render it complete; but it is diſfigured by two Turkiſh towers erected on its ruins. Behind it an hexagonal court, into which the portico leads, is adorned with the moſt magnificent buildings now in ruins; but enough ſtill remains to give an idea of their ancient grandeur. The walls are adorned with pilaſters of the Corinthian order with niches for ſtatues; the doors are finely ornamented, and the entablature, which ſurrounds the building above the pilaſters, is richly adorned with feſtoons; but the colonade, which ſurrounded theſe edifices, has ſcarce any thing remaining but the pedeſtals, and the whole court is covered with broken columns, capitals, and other parts of the buildings.

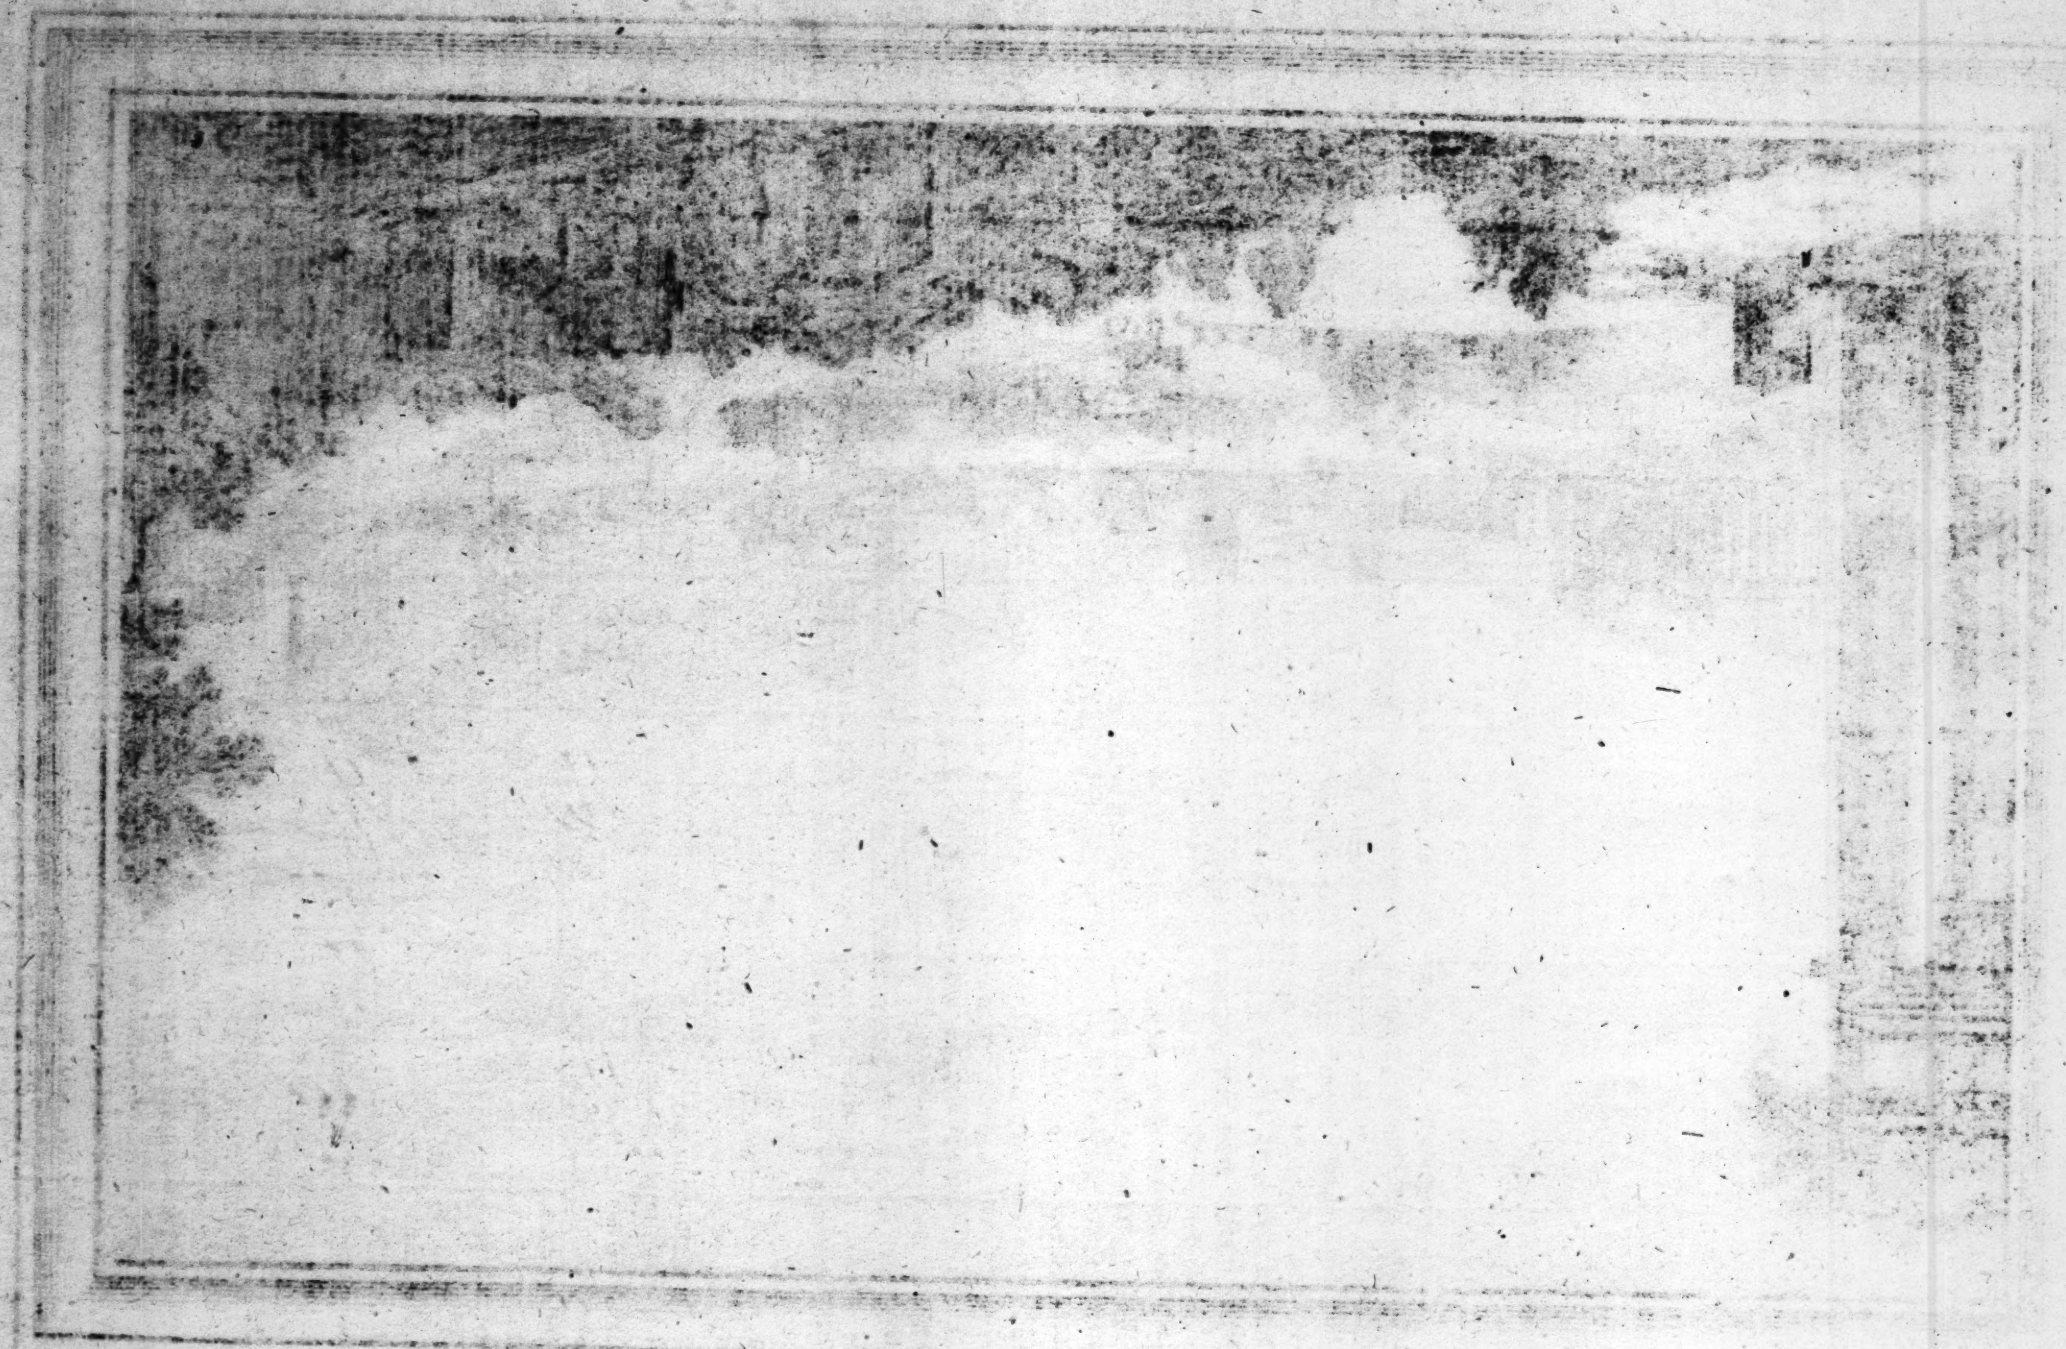
This opens into a quadrangular court, in which are alſo the remains of magnificent buildings much in the ſame taſte. The portico was crowned with an Attic courſe, which was carried through the two courts, and ſeems to have been adorned with ſtatues.

On paſſing through the portico and the two courts, the traveller comes to the great temple. Little more of this ſtructure remains than nine lofty columns, which ſupport their entablature. It is very remarkable, that the ſhafts of theſe columns conſiſt of three pieces, exactly joined without cement, which is uſed in no part of theſe buildings; they being only ſtrengthened with iron pins, received into a ſocket cut in each ſtone. Moſt of the baſes have two ſuch ſockets, one ſquare and the other circular, correſponding to two others of the ſame ſhape and dimenſions in the under part of the ſhaft. On meaſuring ſome of the largeſt of thoſe that were circular it was found, that the iron pin which they received muſt have been a foot long, and above a foot in diameter; and by the ſockets in all the fallen fragments of this temple, it appears, that each ſtone was faſtened in the ſame manner. How greatly this contributed to the ſtrength of the build-

ing

Rooker Sculp.

A General View of Balbec.



ing is ſeen in another temple, which is more entire, where a column has fallen againſt the wall with ſuch violence, as to beat in the ſtone it fell againſt, and break part of the ſhaft, while the joinings in the ſame ſhaft have not been in the leaſt opened by the ſhock.

The moſt entire temple is placed irregularly with reſpect to the former, and is erected upon a much lower horizontal plan. It has ſtill a periſtyle of eight columns in front, and fifteen in flank, which continue to ſupport their entablature, though the Turks have made ſeveral attempts to deſtroy them, in order to get the iron uſed in ſtrengthening this noble building. The arch of the portico is divided into compartments by the richeſt carved work and mouldings cut in the ſolid ſtone. Theſe compartments are in an alternate ſucceſſion of one hexagon, and four rhombs encloſing figures and heads in alto relievo. The rhomboid pannels contain heads of gods, heroes, and emperors; the hexagons likewiſe contain the heads of the ſame ſubjects, and ſometimes entire figures relating to the antient mythology, as a half length of Diana, Leda and the Swan, Ganymede riding on the back of an eagle, &c. On the inſide of the temple a row of fluted Corinthian columns riſe to the top of the building, and ſupport a rich entablature. Between each column is a niche finely ornamented, and above each niche a tabernacle or opening anſwering to it, ſupported by ſmall columns. The roof is fallen in, and many ſhrubs grow out of the ruins of the entablature.

To the weſt of theſe noble remains of antiquity is a magnificent circular temple. This ſtructure is on the outſide of the Corinthian order; within of both the Corinthian and Ionic; and the ſhafts of all the columns are of one piece. The front of this temple is diſfigured by Turkiſh houſes and modern additions erected againſt it, and on the inſide, the lower, or the Ionic ſtory, is converted into a Greek church, and for that purpoſe is ſeparated from the Corinthian ſtory above.

At the ſouth-weſt end of the city, where a ſmall part of the foot of Anti-Libanus is encloſed by the walls, is a ſingle Doric column of conſiderable height; but nothing in its ſize, proportion, or workmanſhip appears ſo remarkable, as its having on the top of its capital a little baſon, which has a communication with a ſemicircular channel cut five or ſix inches deep down the ſide of the ſhaft. It is ſaid that water was formerly conveyed down from the baſon by this channel; but how the baſon itſelf was ſupplied is at preſent unknown.

The ſmall part of the city now inhabited is near the circular temple, and to the ſouth and ſouth-weſt of it; and within this compaſs are ſeveral moſques with their minorets. The city walls ſeem like the confuſed patchwork of different ages. The broken entablatures, pieces of capitals, and reverſed Greek inſcriptions, which appear in going round them, ſhew that they were repaired after the decline of taſte, with ſuch materials as lay neareſt at hand.

At a ſmall diſtance from the walls of the city is a quarry of free-ſtone, from which probably the immenſe ſtones employed in the body of the great temple were taken, while the more ornamented parts of thoſe buildings were ſupplied by a quarry of coarſe white marble at a greater diſtance to the weſt of the city. There are ſtill remaining in the firſt quarry ſome vaſt ſtones cut and ſhaped for uſe. One of thoſe ſtones thus ſhaped, but not entirely detached from the quarry at the bottom, is ſeventy feet long, fourteen broad, and fourteen feet five inches deep, and conſequently contains fourteen thouſand one hundred and twenty-eight cubic feet, and, were it Portland ſtone, would weigh about two million two hundred and ſeventy thouſand pounds averdupois, or about eleven hundred and thirty-five tons.

All the inhabitants of this country, both Chriſtians, Jews, and Mahometans, confidently maintain, that both Balbec and Palmyra were built by Solomon. Indeed the ruins of both, ſays our ingenious author, anſwer our ideas of his riches and power, and it is not difficult to diſcover his love of pleaſure in the former, and his wiſdom in the latter. It is probable that his character as a wiſe and yet voluptuous prince, may have given riſe to an opinion, which, with reſpect to Balbec at leaſt, ſeems to have ſcarce any other foundation; for no where could an eaſtern monarch enjoy a more luxurious retirement than amidſt the ſtreams and ſhades of Balbec. The natives tell many ſtories of the manner in which he ſpent his hours of dalliance in this retreat: a ſubject on which the warm imagination of the Arabs is apt to be too particular.

It may be more reaſonably enquired, whether the Phœnicians did not erect theſe temples in the neighbourhood of their capital; for it is pretty certain that the ſun was worſhipped here in the flouriſhing times of that people, when this plain was probably a part of their territory. According to Macrobius, the city obtained both its name and worſhip from Heliopolis, in Egypt; and he obſerves, that the ſtatue of Heliopolitan Jove was brought from thence to this city. "This divinity, ſays "he, was both Jupiter and the Sun, which appears both "by the rites of the worſhip, and by the attributes of "the ſtatue, which is of gold, repreſenting a perſon "without a beard, who holds in his right hand a whip, "like a charioteer, and a thunderbolt with ears of corn "in his left, all which point out the united powers of "Jupiter and Apollo; and the temple excels in divi-"nation."

But, inſtead of conſulting the Jewiſh and Phœnician hiſtory for buildings of the Corinthian and Ionic order, it may be thought more proper to ſearch for them during the time when this country was in the poſſeſſion of the Greeks: but we do not find them mentioned from the period when it was conquered by Alexander, to that when it was ſubdued by Pompey. Hence it is reaſonable to conclude, that they were works of a later date; and indeed John of Antioch, ſurnamed Malala, obſerves, that Antonius Pius erected a temple to Jupiter at Heliopolis, near Libanus, in Phœnicia, that was one of the wonders of the world. This is the only hiſtorian who takes notice of the building of a temple in this place.

We ſhall now proceed to Damaſcus, at preſent called Sham, at a ſmall diſtance from which the river Barrady, which ſupplies that city and its gardens with water, pours down in a ſtream near twenty yards broad from the mountains, which are cleft aſunder to give it admiſſion into the plain below. From a precipice on theſe mountains the traveller has a moſt perfect view of Damaſcus, and no proſpect in the world can appear more delightful. It ſtands in a level plain of ſuch extent, that the mountains which encompaſs it on the farther ſide can ſcarcely be diſcerned, and is only two miles diſtant from the place where the river Barrady breaks out from between the mountains, to which its gardens almoſt extend. The city is about two miles in length; it is thick ſet with moſques, and the gardens, by which it is on all ſides encompaſſed, are ſaid to be no leſs than thirty miles in compaſs: whence it reſembles a noble city ſeated in the midſt of a vaſt wood. Theſe gardens are filled with fruit trees, kept freſh and verdant by the waters of the Barrady; and from amidſt the trees riſe many minorets, obeliſks, ſummer-houſes, and turrets.

A conſiderable part of the beauty of this proſpect ariſes from the river; which, on its iſſuing from between the clefts of the mountain, ſeparates into three ſtreams: the middlemoſt and largeſt runs through the city, where it ſupplies all the ciſterns and fountains; while the two others encircle it, one to the right, and the other to the left, diſperſing a multitude of little currents through the gardens, where they are improved into fountains and other water-works, which are peculiarly charming in a country where the heat of the climate renders a profuſion of water one of the greateſt luxuries.

On a nearer approach, the garden-walls appear of a ſingular ſtructure, they being built of bricks dried in the ſun, of an extraordinary ſize, and being two yards long, one broad, and half a yard thick. Two rows of them placed edge-ways, one upon another, form in this dry country a durable wall expeditiouſly built at a ſmall expence.

Damaſcus is ſituated in thirty-three degrees north latitude. The ſtreets, as in other hot countries, are narrow, and all the houſes built of no better materials than either ſun-burnt brick, or Flemiſh wall coarſely daubed over; whence, upon any violent ſhowers, the whole city is rendered by the waſhing of the houſes an

entire quagmire; yet the gates and doors of thoſe ſtructures are adorned with marble, carved and inlaid with great beauty and variety, and nothing can appear more ſurpriſing than to ſee ſuch a mixture of mud and marble, meanneſs and grandeur. On the inſide there is generally a large court, encompaſſed by ſplendid apartments, beautified with marble fountains, and floored with variegated marble in Moſaic work. The cielings are, after the Turkiſh manner, richly painted and gilt, and the carpets and cuſhions are extremely beautiful.

In this city is the church of St. John Baptiſt, which the Turks have converted into a moſque. This is a very noble ſtructure; the gates, which are extremely large, are covered with braſs, and before it is a ſpacious court about a hundred and fifty yards long, and eighty or a hundred broad, paved all over. On the three ſides of this court is a double cloiſter, ſupported by two rows of granite columns of the Corinthian order, which are exceeding beautiful and lofty. In this moſque the Turks pretend to have the head of St. John, and ſome other relics; and they here maintain, that at the day of judgment Chriſt will deſcend into this moſque, as Mahomet will into that of Jeruſalem.

The caſtle is a good ruſtic building, three hundred and forty paces in length, and ſomewhat leſs in breadth. In it is depoſited a great quantity of armour and arms taken from the Chriſtians.

In this city is a large coffee-houſe, capable of entertaining four or five hundred people under the ſhade of trees. It has two quarters for the reception of gueſts, one fit for the ſummer, and the other for the winter. That deſigned for the ſummer is a ſmall iſland, waſhed by a large ſwift ſtream, and ſhaded over head with trees and mats. Here a multitude of Turks reſort, there being nothing which they behold with ſuch delight as the ſhade of green trees and water; to which, if a beautiful face be added, they ſay, that all three will baniſh the moſt obſtinate melancholy.

They ſhew here a ſmall grotto, in which is a Chriſtian altar, and a Turkiſh oratory, near each other: this grotto, according to their tradition, was the houſe where Ananias reſtored St. Paul to his ſight.

The Turks will not ſuffer a Frank to ride on horſeback when he goes to ſee the gardens or other curioſities without the city; but he muſt either walk on foot, or ride upon an aſs, there being always aſſes ſtanding ready in the ſtreets equipt and ready for mounting. The rider has no occaſion for either whip or ſpur, for the maſter of the aſs, or his ſervant, follows him wherever he goes, and forces him along with a goad.

At two or three hours diſtance from Damaſcus is a high hill, which, according to tradition, is the place on which Cain and Abel offered ſacrifice, and where Cain ſlew his brother.

Damaſcus is a place of great trade. One of the principal manufactures carried on there is the making of ſword-blades, knives, and other utenſils of iron and ſteel; the water here being eſteemed excellent for tempering their metal. The making of damaſks is another manufacture in which they excel. They alſo make great quantities of ſope. The principal merchandizes brought from hence, beſides the above, are roſe-water, made of the damaſk-roſes, which grow plentifully here, raw and wrought ſilks of ſeveral kinds, wine, and prunes.

Sidon, called by the Turks Sayd, is ſituated upon the coaſt to the ſouthward of Tripoly, in thirty-three degrees thirty-three minutes north latitude. It was anciently a place of great ſtrength, and had a very extenſive trade; but though it is ſtill populous, it has fallen from its antient grandeur, as the many beautiful columns found in the gardens without the preſent walls ſufficiently prove. It is ſtill a place of ſome trade, and has a pretty well frequented harbour. The city is defended by an old caſtle, and near it is an ancient unfurniſhed palace, where the baſha reſides.

About twenty miles to the ſouth of Sidon ſtands the antient Tyre, called by the Turks Sur. This city is ſituated in thirty-three degrees north latitude, and was once famous for a ſhell-fiſh which produced a moſt beautiful purple, thence called the Tyrian-dye. This place is now nothing but a heap of venerable ruins. It has two harbours; that on the north ſide is extremely good, and the other is choaked up by the ruins of the antient city. The preſent inhabitants are only a few poor fiſhermen, who live in vaults and caves. The adjacent country is naturally fertile, being watered by a number of ſprings, but is now neglected.

SECT. XVIII.

Of JUDEA, *or* PALESTINE.

Its Situation, Names, Extent, and Climate. A remarkable Ignis Fatuus ſeen there by Dr. Shaw. Of the rocks of Judea, and the natural Productions given to Travellers as Petrefactions and ſacred Relics. Of the River Jordan and the Dead Sea; an Account of the bituminous Matter which riſes in that Lake; and of an extraordinary Kind of Pebbles found on the Shore. Several ſuperſtitious Opinions refuted. The antient Fertility of Paleſtine proved even from its preſent State; with an Account of its Vegetables and Animals.

PALESTINE is bounded on the north by Mount Libanus, which ſeparates it from that part of Syria antiently called Phœnicia; on the eaſt by Mount Hermon, which ſeparates it from Arabia Deſerta; on the ſouth by Arabia Petræa; and on the weſt by the Mediterranean. This country received the name of Paleſtine from the Philiſtines, who dwelled on the ſea coaſt; it was called Judea from Judah, and is termed the Holy Land from its being the ſpot where the antient prophets firſt reſided, where our Saviour himſelf received his birth, preached his holy doctrines, confirmed them by miracles, and laid down his life for mankind. This country is only about a hundred and fifty miles in length, and generally eighty in breadth, though in ſome places it is wider, and in others narrower; it is ſituated in the fourth and fifth climate, between thirty-one and thirty three degrees thirty minutes north latitude, and the longeſt day is about fourteen hours and a quarter.

The climate of Paleſtine differs but little from that of Barbary, except in its being hotter. The eaſterly winds are uſually dry, though they are ſometimes tempeſtuous; and thoſe which are weſterly are attended with rain. Though the heat from the ſituation of the country with reſpect to the equator might be expected to be exceſſive, yet Mount Libanus, from its uncommon height, is covered all the winter with ſnow. The Rev. Dr. Shaw obſerves, that in travelling by night through the vallies of Mount Ephraim, he and his company were attended for above an hour by an ignis fatuus that aſſumed a variety of extraordinary appearances; it was ſometimes globular, then reſembled the flame of a candle; but inſtantly it would ſpread itſelf, and involve the whole company in its pale inoffenſive light; then contracting itſelf, it would inſtantly diſappear; but in leſs than a minute would again become viſible as before; or, moving from one place to another, would expand itſelf, at particular intervals, over two or three acres of the adjacent mountains. It is remarkable that in the preceding evening the atmoſphere had been uncommonly thick and hazy, and the dew unuſually unctuous and clammy.

The firſt rains, as they are called, generally fall about the beginning of November; and the latter rains ſometimes in the middle, and ſometimes towards the end of April. In the country round Jeruſalem, if a moderate quantity of ſnow falls in the beginning of February, and the brooks ſoon after overflow their banks, it is thought to promiſe a fruitful year; and the inhabitants make rejoicings upon this occaſion, like the Egyptians upon the cutting of the Nile: but this country is ſeldom refreſhed with rain during the ſummer ſeaſon.

The ſame learned author obſerves, that in Judea he ſaw the barley in full ear in the beginning of April, and in the middle it began to turn yellow in the ſouthern diſtricts. He found it as forward near Jericho at the end of March, as in the plains of Acra a fortnight after; but in either of thoſe places there was little wheat in the ear, and the ſtalk was ſcarcely above a foot high in the fields near Jeruſalem and Bethlehem.

The

The rocks of Judea are in many places covered with a ſoft chalky ſubſtance, in which is incloſed a great variety of ſhells and corals. The greateſt part of the mountains of Carmel, and thoſe of Jeruſalem and Bethlehem, are alſo covered with a white chalky ſtratum. In the former are gathered many ſtones, which, being in the form, as it is pretended, of olives, melons, peaches, and other fruit, are impoſed upon pilgrims not only as thoſe fruits petrefied, but as antidotes againſt ſeveral diſeaſes. Indeed the olives, which are the *lapides judaici* of the ſhops, have been an approved medicine againſt the ſtone and gravel; however, little can be ſaid in favour of their peaches and melons, which are only round flint ſtones of different ſizes, beautified on the inſide with ſparry knobs, that are made to paſs for ſeeds and kernels. The waters of Jordan and Siloam; the roſes of Jericho; beads made of the olive ſtones of Gethſemane; the chalk-ſtone of the grotto near Bethlehem, called the Virgin's milk; the little round calculi, called her peaſe; and other curioſities of the like nature, are preſents which the pilgrims uſually receive in return for their charity.

With reſpect to the rivers of this country, the Jordan is not only the moſt conſiderable, but, next to the Nile, is by far the largeſt to be found either in the Levant or in Barbary. Dr. Shaw ſays, that though he could not compute it to be more than thirty yards broad, it is ſo deep, that even at the brink he found it to be nine feet. If we take this, ſays he, during the whole year, for the mean depth of the ſtream, which runs about two miles an hour, then Jordan will daily diſcharge into the Dead Sea about ſix millions ninety thouſand tons of water. So great a quantity of water daily received, without increaſing the limits of that ſea, or lake, has made ſome conjecture, that it is carried off by ſubterraneous cavities, or abſorbed by the burning ſands; but if the Dead Sea is, according to the general computation, ſeventy-two miles long, and eighteen broad, by allowing, according to the obſervation of the great Mr. Halley, ſix thouſand nine hundred and fourteen tons of vapour for every ſquare mile, there will be daily drawn up in clouds, to refreſh the earth with rain or dews, eight millions nine hundred and ſixty thouſand tons, which is almoſt one-third more than it receives from this river. With reſpect to the bitumen, for which this lake has been always remarkable, it is ſaid to riſe at certain times from the bottom in large hemiſpheres, which, on their touching the ſurface of the water, and being acted upon by the external air, burſt with a great noiſe and ſmoke, and diſperſe themſelves in a thouſand pieces. This is ſaid, however, only to happen near the ſhores; for in greater depths the irruptions are ſuppoſed only to diſcover themſelves by the columns of ſmoke which ariſe from the lake. This bitumen is probably accompanied on its riſing with ſulphur, as both are found promiſcuouſly on the ſhore. The latter exactly reſembles native ſulphur, and the former is brittle, and yields a fetid ſmell upon friction, or on its being ſet on fire; it is alſo as black as jet, which it exactly reſembles in its ſhining appearance.

The Rev. Mr. Maundrel found on the ſhore a black ſort of pebbles, that burn on being held to the flame of a candle, yielding a moſt offenſive ſmell; but though they loſe their weight in burning, they do not decreaſe in bulk. Theſe ſtones are common on the neighbouring hills, and are capable of being carved and poliſhed to as great a perfection as marble.

It has been commonly reported, that all the birds that attempt to fly over this lake drop down dead into it, and that neither fiſh nor any other animal can live within theſe deadly waters; but this is ſo far from being true, that birds fly over the lake without any viſible injury, and on the ſhore are the ſhells of fiſh reſembling thoſe of oyſters caſt up by the waves. The water is very limpid, and not only ſalt, but very bitter and nauſeous; and the laſt mentioned reverend gentleman being deſirous of trying its ſtrength, went into it, and found that it bore him up in ſwimming with uncommon force. As to the apples of Sodom, mentioned by ſeveral authors, theſe are alſo a fiction, for nothing of that kind is either ſeen or mentioned near this lake; nor is there any tree from which ſuch kind of fruit might be expected.

Our modern unbelievers have dwelt much on the rocks of Paleſtine, the barrenneſs of the country, and the diſagreeableneſs of the climate, in order to invalidate the accounts given in Scripture of the fertility of that land of Promiſe, which is repreſented there as flowing with milk and honey; but the Rev. Dr. Shaw, who ſeems to have examined the country with an uncommon degree of accuracy, and was qualified by the ſoundeſt philoſophy to make the moſt juſt obſervations, ſays, that was the Holy Land as well cultivated as in former times it would be more fertile than the very beſt parts of Syria and Phœnicia, becauſe the ſoil is generally much richer, and, every thing conſidered, yields larger crops. Thus the cotton gathered in the plains of Zabulon, Eſdraelon, and Ramah, is more eſteemed than that produced near Tripoly and Sidon; and it is impoſſible for pulſe, wheat, or any other grain, to exceed what is commonly ſold at Jeruſalem. Therefore, the barrenneſs, ſays he, of which ſome authors complain, does not proceed from the natural unfruitfulneſs of the country, but from the want of inhabitants, the indolence which prevails among the few who poſſeſs it, and the perpetual diſcords and depredations of the petty princes who ſhare this fine country.

Indeed the inhabitants can have but little inclination to cultivate the earth. "In Paleſtine, ſays Mr. Wood, "we have often ſeen the huſbandman ſowing, accom-"panied by an armed friend to prevent his being rob-"bed of the ſeed;" and, after all, whoever ſows is uncertain whether he ſhall ever reap the harveſt. As the parts about Jeruſalem in particular have been deſcribed as rocky and mountainous, it has thence been raſhly concluded, that it is barren; but this is ſo far from being the caſe at preſent, that, notwithſtanding the want there has been for many ages of a proper culture, the plains and vallies, though as fertile as ever, are almoſt entirely neglected, while every little hill is crowded with inhabitants. It cannot here be urged, that the inhabitants enjoy more ſafety than in the plains; for they have no walls or any fortifications to ſecure either their villages or encampments; and as there are few places of difficult acceſs, both lie equally expoſed to the ravages of an enemy: but they find ſufficient conveniences for themſelves, and much greater for their cattle, which feed upon a richer herbage; and both are refreſhed by ſprings of excellent water.

Corn, wine, and oil, with milk and honey, were both the food and the principal dainties of the early ages. Theſe were once the produce of this country, as they might be ſtill in the greateſt plenty, only by uſing proper care. The plenty of wine alone is at preſent wanting; yet, from the goodneſs of the little ſtill made at Jeruſalem and Hebron, we find that theſe rocks, barren as they are improperly called, might yield a much greater quantity, did but the Turk and Arab encourage the cultivation of the vine. The wild-honey, once part of the food of St. John Baptiſt, ſhews there was plenty of it in the deſarts of Judea; and by taking the hint from nature, and enticing the bees into hives, the quantity might be vaſtly increaſed. As in ſome places the mountains abound with roſemary, thyme, ſage, and ſuch aromatic plants as are chiefly ſought by the bees; ſo others are as well ſtocked with ſhrubs, and a delicate ſhort graſs, of both which the cattle are more fond than of the plants common to meadows and fallow ground. The milk of the cattle thus fed is not only far richer, but their fleſh is more ſweet and nouriſhing.

Theſe mountainous diſtricts have been alſo valuable on other accounts; they ſeem to have been formerly well planted with olive-trees, one acre of which, if properly improved, is more valuable than twice the extent of arable ground; and ſeveral parts of Paleſtine, no leſs than Idumea, which lies contiguous to it, are repreſented by the antients as abounding in date-trees.

In the beginning of March the plains between Jaffa and Ramah, and other places in the road to Jeruſalem, are particularly diſtinguiſhed by beds of tulips, frutillaries, and other plants of the ſame claſs. The balſam-tree, however, is no longer found in this country,

and

and the dudaim, or mandrakes, mentioned in the Scriptures, are equally wanting. What the Chriſtian inhabitants of Jeruſalem take for that fruit are the pods of the jelathon, a leguminous plant peculiar to corn-fields. The boccora, or early-fig, is not ripe before the middle or latter end of June; but no ſooner does it draw near to perfection, than the kermez, or ſummer-fig, ſold by the grocers, begins to be formed, and is ſeldom ripe before Auguſt, when it frequently puts forth another crop, uſually of a much larger ſhape, and of a darker colour, that hangs ripening on the tree even after the leaves are ſhed, and if the winter proves mild, is gathered as a delicious morſel in the ſpring; and as the fruit of this plant always precedes the leaves, when our Saviour ſaw one of them in full vigour having leaves, he might, according to the common courſe of things, juſtly "look "for fruit, and haply find ſome," of the former or latter kind.

Every part of the country abounds with plenty of game, as antelopes, hares, and rabbits; and of the winged kind, woodcocks, partridges, teal, ſnipes, and ſeveral others, which are all caught by hawking and the chace. The hawks are uſually of the nature and ſize of our goſs-hawks, and ſo ſtrong as to bring down a buſtard and ſtop an antelope in full career. Among the uncommon animals is the daman Iſrael, which ſignifies Iſrael's lamb; this is the ſaphan of the Scriptures, and is common both in Mount Libanus and in other places of this country. It is of the ſize of a rabbit, but is of a browner colour, with ſmaller eyes, and a more pointed head. The fore-feet are ſhort, and thoſe behind very long in proportion to them. Theſe animals uſually ſhelter themſelves in holes and clefts of the rocks, but ſometimes burrow in the ground.

SECT. XIX.

Of the principal Places of Paleſtine, with a particular Deſcription of Jeruſalem, and of the Ceremonies performed in the Church of the Holy Sepulchre and in that City: with the moſt remarkable Places in the neighbouring Country uſually viſited by Pilgrims.

ACRA, antiently called Accho, ſituated in thirty-two degrees forty minutes north latitude, is one of the places from which the Iſraelites could not expel the antient Canaanites. In after times it being enlarged by Ptolemy I. he, from his own name, called it Ptolemais; but it has ſince reſumed ſome reſemblance of its antient name. This city was the ſcene of many obſtinate diſputes between the Croiſaders and the Saracens. In the year 1191 it was taken by Richard I. king of England and Philip of France, and given to the knights of St. John of Jeruſalem, who kept poſſeſſion of it an hundred years; when the Turks, after a long ſiege, took and razed it to the ground, in order to prevent ſuch ſlaughter for the future. Its ſituation is as advantageous as poſſible; on the north and eaſt it is encompaſſed by a ſpacious fertile plain, on the weſt it is waſhed by the Mediterranean, and on the ſouth by a large bay which extends from the city as far as Mount Carmel; it, however, contains little more than a few cottages, and prodigious heaps of ruins, that only ſerve to ſhew its former ſtrength.

The remains of the following ſtructures diſtinguiſh themſelves from the general heap by evident marks of magnificence and ſtrength: the cathedral of St. Andrew, which riſes higher and is more conſpicuous than the reſt; the church of St. John; the convent of the knights hoſpitallers; the palace of the grand maſter of that order, and ſome remains of a large church, that once belonged to a convent, of which the Chriſtians there tell the following remarkable ſtory: the Turks, after a long ſiege, took the city by ſtorm in the year 1291, when the abbeſs of the convent dreading leſt ſhe and her nuns ſhould be treated, as is uſual in ſuch caſes, aſſembled them, and exhorting them to mangle their faces, as the only means of preſerving their virginity, inſtantly, with an heroic courage, ſet them the example, which the nuns boldly followed, by cutting off their noſes, and diſfiguring their faces in ſuch a manner rendered them more adapted to excite horror than lu Hence the ſoldiers ſoon after breaking into the conve were ſo diſappointed at ſeeing, inſtead of a number blooming beauties, ſuch diſmal objects, that they cruel put them to the ſword.

The city appears to have been formerly encompaſſ by a double wall defended with towers: and without t walls are ditches, ramparts, and a kind of baſtions fac with ſtone.

To the ſouth of Acra is Sebaſta, the ancient Samari the capital of the ten tribes after their revolt from t houſe of David; and it being rendered by Herod a ve magnificent city, he gave it the name of Sebaſta in h nour of Auguſtus Cæſar. It is ſeated on a long moun of an oval figure, which riſes in a fruitful valley, ſur rounded by a range of hills, and is now entirely con verted into gardens, having no other remains of its bein once a famous city, but a large ſquare encompaſſed wit columns, and the ruins of a great church ſaid to b erected over the place where John the Baptiſt was impri ſoned and beheaded. In the body of the church is a ſtair caſe into the dungeon, where they ſay his blood was ſhed There are here a few poor families of the Turks, who hav a great veneration for this priſon.

A little farther to the ſouth is Naploſa, the ancient Sy chem, which ſtands in a narrow valley between mount Ebal on the north, and Gerizim on the ſouth. The Samaritans, whoſe chief reſidence is at Sychem, have a ſmall temple upon mount Gerizim, to which they ſtill repair at certain ſeaſons, for religious worſhip, and it is ſaid aſſemble once a year to offer ſacrifices there. Upon one of theſe mountains God commanded the children of Iſrael to ſet up great ſtones plaſtered over, inſcribed with the body of the law, and to erect an altar and offer ſacrifices, feaſting and rejoicing before the Lord, Deut. xxvii. 4. But whether Ebal or Gerizim was the place appointed for this ſolemnity, is not eaſily determined; as the Hebrew Pentateuch, and ours from it, aſſert, that mount Ebal was appointed for that uſe, while the Samaritan ſays that it is Gerizim.

Mr. Maundrell, who viſited the chief prieſt of the Samaritans, diſcourſed with him about this and other difficulties, when the chief prieſt aſſerted, that the Jews, out of hatred to the Samaritans, had altered the text, putting Ebal for Gerizim, becauſe the Samaritans worſhipped in the latter mountain, which, for that reaſon, they would not have to be the true place appointed by God for his worſhip; to confirm which he alledged, that Ebal was the mountain of curſing and naturally unpleaſant, while Gerizim was pleaſant and fertile, and the mountain of bleſſing appointed for religious feſtivals. However, he acknowledged that none of the great ſtones, which Joſhua was directed to ſet up, were to be found on Gerizim.

At a ſmall diſtance from Naploſa is Jacob's well, moſt famous for our Saviour's conference with the woman of Samaria. Over this well there once ſtood a large church built by St. Helena, of which none but the foundation now remains. The well is at preſent covered with an old ſtone vault, into which pilgrims are let down thro' a ſtreight hole, when removing a broad flat ſtone, they diſcover the mouth of the well, which is dug in the firm rock; it is about three yards in diameter, and thirty-five in depth, about five of which are filled with water. This, ſays Mr. Maundrel, proves the falſhood of the ſtory told by travellers, that it is dry all the year round, except on the anniverſary of the day when Chriſt ſat upon its ſide, at which time they pretend that it bubbles up plenty of water.

Jeruſalem is encompaſſed with hills, ſo that the city ſeems as if ſituated in an amphitheatre; but no place affords a diſtant view of it: that from the mount of Olives, which is the beſt, and perhaps the fartheſt, is ſo near, that when our Saviour was there, Dr. Shaw obſerves, he might be ſaid almoſt in a literal ſenſe, to weep *over* it. There are, however, few remains either of that city as it appeared in our Saviour's time, or as it was afterwards built by Adrian, its very ſituation being changed; for mount Sion, the higheſt part of the ancient Jeruſalem, is now almoſt entirely excluded; while the places adjoining

joining to mount Calvary; where Chriſt ſuffered without the gate, are at preſent almoſt in the center.

This city, which is about three miles in circumference, is ſituated in the thirty-firſt degree, fifty minutes of north latitude, and in the thirty-ſixth degree of eaſt longitude from London, on a rocky mountain, on all ſides of which are ſteep aſcents, except towards the north; and is ſurrounded by a deep valley, which is again encompaſſed with hills. The walls are not ſtrong, nor have any baſtions; but towers are erected upon them, after the old method of fortification, and on one ſide only it is defended by an inconſiderable ditch. The city has ſix gates; theſe are that of Bethlehem, mount Sion, Sterquilina, or the dunghill gate, St. Stephen's, Herod's, and that of Damaſcus, beſides the golden gate, which is ſhut up.

The private buildings are mean, the ſtreets are narrow, and this ancient city but thinly inhabited. The reſort of pilgrims thither, and accommodating them with neceſſaries, ſeems the principal buſineſs of the inhabitants. A Turkiſh baſha reſides there in order to preſerve good order, and collect the grand ſeignior's tribute from the pilgrims and the prieſts who live there, and alſo to protect them from the Arabs, when they viſit the holy places in the adjacent country.

No French or European Chriſtian is allowed to enter the city till the governor is informed of his arrival, and he has paid the duties required, nor are any permitted to enter on horſeback or with arms, except they come with ſome public miniſter or conſul. The Europeans, whether papiſts or proteſtants, always go to the Latin or Popiſh convent, where they are entertained by the guardian and friars for their money, though ſome diſtinction is made between thoſe who travel thither out of devotion, and thoſe who only come out of curioſity.

The pilgrims are indeed treated with peculiar marks of reſpect. The druggerman, or interpreter, with ſome others deputed by the convent, uſually meet the pilgrims without the gate of the city, where they pay the duties, and bring them to the cloiſter, where they are handſomely entertained, and an apartment is aſſigned them, where their feet are waſhed. Some time after they are conducted to the chapel, to which the father guardian comes with all his monks, and having made the pilgrims ſit on a couch of crimſon velvet, waſhes their feet in veſſels of water mixed with roſes, and kiſſes them; and after the guardian has done, the ſame ceremony is performed by all the monks, who in the mean while ſing hymns and anthems. At the concluſion of this ceremony, each of the pilgrims receives a wax taper, and they all make a proceſſion about the cloiſter, ſinging Te Deum for bringing them in ſafety to the holy city, and this they perform at three altars, that is, the high altar, dedicated to the Holy Ghoſt; at the altar of our Lord's laſt ſupper; and at the altar of Chriſt's appearing to St. Thomas after his reſurrection.

One of the principal places viſited by the pilgrims, is the church of the holy ſepulchre upon mount Calvary, which is about one hundred paces long, and ſixty wide. In order to lay the foundation of this church, the founders were obliged to reduce the top of the mount to a plain area, by cutting down ſeveral parts of the rock, and raiſing others; but they ſay that care was taken that no parts of the hill more immediately concerned in our Saviour's paſſion ſhould be altered, and therefore that part of the mount, where Chriſt was faſtened to the croſs, is left entire, and at preſent ſtands ſo high above the common floor of the church, that there are twenty-one ſteps to go up to the top; and the holy ſepulchre, in which our Lord's body was laid, which was originally a cave hewed in the rock, is now a grotto above ground, the rock being cut away from it.

This church, with many others throughout Paleſtine, is ſaid to have been founded by the empreſs Helena, the mother of Conſtantine the Great. At the weſt end of it is a ſquare tower or ſteeple, which appears ſomewhat ruinous; but the edifice in general is kept in good repair, and has a ſumptuous appearance. The body of the church is round, and has two circular galleries above each other, ſupported by large ſquare pillars, formerly faced with white marble; and here are ſeveral moſaic pictures in niches, repreſenting prophets, apoſtles, and among the reſt, Conſtantine, the firſt Chriſtian emperor, and his mother Helena. This part of the church is covered with a dome of a prodigious ſize, ſupported by rafters of cedar, with an opening at the top, through which it receives ſufficient light. Exactly underneath this aperture is the holy ſepulchre, which riſes conſiderably above the pavement: and the rock on the outſide is hewn into the form of a chapel, adorned on the outſide with ten beautiful columns of white marble, adjoining to the wall, and ſupporting a cornice. People are obliged to ſtoop very low in entering the door, which does not exceed a yard in height; but within it is about eight feet ſquare, and as much high, all cut out of the ſolid rock, and lined with white marble. The tomb in which they ſay our Lord was laid is raiſed in the form of an altar, almoſt three feet from the floor, extending the whole length, and half the breadth of this little chapel, ſo that there is not room for more than three perſons to kneel without great inconvenience. The multitude of lamps here kept continually burning, render the place extremely hot, the ſmoke of which eſcapes through vent-holes cut through the roof, over which is a ſmall canopy covered with lead, ſupported by ſix double Corinthian columns.

The choir has ſome reſemblance to that of our cathedrals; and is ſeparated from the body of the church by a wall, which has a door oppoſite to that of the holy ſepulchre; terminating to the eaſt in a ſemicircle, where the high altar ſtands, which is richly gilt, and hung round with the pictures of ſeveral ſaints, painted full-faced, after the manner of the Greeks, to whom the choir belongs.

Though the church of the ſepulchre is leſs than one hundred paces in length, and not more than ſixty in breadth, it is ſuppoſed to contain twelve or thirteen places conſecrated by ſome action relating to our Saviour's death and reſurrection. As the place where the ſoldiers derided him; where they divided his garment; where he was confined while they dug the hole in which they erected the croſs; where he was nailed to it; where the croſs was erected; where the ſoldiers ſtood who pierced his ſide; where his body was anointed in order for burial; where it was depoſited in the ſepulchre; where the angels appeared to the women after his reſurrection; where Chriſt himſelf appeared to Mary Magdalen; all which, and many others, are ſuppoſed to be contained within the narrow limits of this church, and are all adorned with ſo many altars.

Anciently every Chriſtian nation had a ſmall ſociety of monks, who reſided in the galleries about the church, and the little buildings annexed to it; but the greateſt part of them have forſaken theſe apartments on account of the heavy rents impoſed upon them by the Turks, and none remain but the Latins, Greeks, Armenians, and Coptics. Every fraternity had alſo their altars and a ſanctuary for their ſeparate uſe, from whence other nations were excluded. The ſeveral ſects have contended to have the holy ſepulchre as their own property, and in particular the Greeks and Latins have ſo warmly diſputed the privilege of ſaying maſs there, that they have ſometimes come to blows, and wounded each other at the very door of the ſepulchre: however, by the interpoſition of the French king, it was put into the hands of the Latins, who have the ſole privilege of ſaying maſs in it, though the Chriſtians of all nations may enter it, and perform their private devotions there.

Ten or twelve Latins, with a preſident over them, always reſide in the church, and are daily employed in trimming the lamps; and every day they alſo make a ſolemn proceſſion, in which they carry tapers and crucifixes to the ſeveral ſanctuaries, ſinging at each a little hymn, relating to the ſubject of the place. But in the holy week before Eaſter, when the pilgrims uſually flock to Jeruſalem, this is performed with greater ſolemnity than at other times. On the evening of Good-Friday, as ſoon as it begins to grow dark, all the friars and pilgrims aſſemble in the chapel of the Apparition, a ſmall oratory on the north ſide of the holy grave, in order to go in proceſſion round the church; but before this begins one of the friars preaches a ſermon in Italian, on the darkneſs at the crucifixion, and he has no ſooner

begun, then all the candles are put out, to give a more lively image of that darkneſs; and thus they continue without light, till the preacher having concluded his diſcourſe, every perſon preſent has a large lighted taper put into his hands, and the crucifixes and other utenſils are put in order for the proceſſion. Among the reſt is a large crucifix, which bears the image of our Lord, as big as the life, faſtened on with great nails. This image, which is well painted, and crowned with thorns, is carried at the head of the proceſſion, firſt to the pillar of Flagellation, a large piece of which they pretend to have in a little cell juſt by the chapel of the Apparition. They there ſing an hymn, and preach in Spaniſh on the ſcourging of our Lord. From hence they proceed to the priſon, where, they ſay, Chriſt was ſecured, while the ſoldiers prepared for his crucifixion: here alſo they ſing an hymn, and a third friar preaches in French. They next proceed to the altar of the diviſion of Chriſt's garments, where they only ſing an hymn. From thence they go to the chapel of Deriſion, where they ſing an hymn, and have another ſermon in French. From this place they go to Calvary, leaving their ſhoes at the foot of the ſtairs. Here are two altars, one where Chriſt was nailed to the croſs, at which they lay down the great crucifix, and act the part of the Jews in nailing our Saviour to it; and after the hymn, one of the friars preaches another ſermon upon the crucifixion. At the other altar is a hole in the rock, in which they pretend the foot of the croſs ſtood, and here they ſet up their croſs with the bloody image upon it, and leaving it, ſing an hymn, after which the father-guardian, ſeating himſelf before it in a chair, preaches a paſſion ſermon, in Italian. In this manner Mr. Maundrell ſaw it performed.

About four feet from the hole in which they fix the foot of the croſs, is a cleft in the rock, ſaid to be made by the earthquake, which rent the rocks at the death of Chriſt. It has the appearance of a natural breach about a ſpan wide at its upper part, and the ſides of it anſwer each other, running in ſuch intricate windings as ſeem above the power of art to imitate. The chaſm is about two ſpans deep, after which it cloſes; but again opens below, as may be ſeen in another chapel by the ſide of mount Calvary, where it runs down to an unknown depth.

After this ſermon, two friars repreſenting Joſeph of Arimathea and Nicodemus, go with a grave and ſolemn air to the croſs, draw out the nails, and take down the pretended body, which is ſo contrived that the joints are flexible as if it was really fleſh and bone, and the ſtranger is ſurpriſed to ſee them bend down the arms, which were before extended, and lay them upon the body, which is received in a large winding-ſheet, and carried down from mount Calvary, while all the company attend it to the ſtone of unction, which, they ſay, is the place where Chriſt was anointed and prepared for burial; and here they caſt over the fictitious corpſe ſweet powders and ſpices, and in the mean while ſing an hymn, after which a friar preaches a funeral ſermon in Arabic. The pretended body is then carried away, and laid in the ſepulchre, where it is ſhut up till Eaſter Monday.

There is another ceremony obſerved in this church, which is too ſingular to be omitted. This is a pious fraud performed by the Greek prieſts, who pretend that upon every Eaſter-eve a miraculous flame deſcends into the holy ſepulchre, and kindles all the lamps and candles there. The Eaſter of the Greeks happening a week after that of the Latins, when Mr. Maundrell was at Jeruſalem, he went on the evening before their Eaſter Sunday to this church, which he found crowded with a diſtracted mob, making a hideous clamour, and with difficulty preſſing through them, got into the gallery next the Latin convent, where he had a view of all that paſt. The people ran with all their might round the holy ſepulchre, crying, "Huia, huia;" "this is he, this "is he." And having at length, by their running round and their vociferation, almoſt turned their brains, they acted the moſt antic tricks imaginable, ſometimes dragging one another along the floor, and carrying others upon their ſhoulders round the ſepulchre: ſometimes they carried men with their heels upwards, with ſuch indecency, as to expoſe their nudities; and ſometimes they tumbled round the ſepulchre, like tumblers on a ſtage; and, in ſhort, nothing can be more rude and extravagant than their behaviour upon this occaſion. This frantic tumult laſted from twelve to four in the afternoon; and then the Greeks ſet out in a proceſſion round the ſepulchre, followed by the Armenians, encompaſſing it three times, dreſſed in their embroidered habits, and carrying crucifixes, ſtandards, and ſtreamers. Towards the end of the proceſſion a pigeon came fluttering into the cupola over the ſepulchre, at which the people redoubled their ſhouts and clamour. The Latins obſerved to the Engliſh gentlemen, that this bird was let fly by the Greeks to deceive the people into the belief that this was a viſible deſcent of the Holy Ghoſt. After the proceſſion the ſuffragan of the Greek patriarch, and the principal Armenian biſhop, approached the door of the ſepulchre, cut the ſtring with which it was faſtened, and breaking the ſeal, entered in, ſhutting the door after them, all the candles and lamps within having been before extinguiſhed in the preſence of the Turks. As the accompliſhment of the miracle drew nearer, the exclamations were redoubled, and the people preſſed with ſuch violence towards the door, that it was not in the power of the janizaries who ſtood to guard it to keep them off with the ſevereſt blows. This crowding was occaſioned by their deſire to light their candles at the holy flame, as ſoon as it was brought out of the ſepulchre.

The two biſhops had not been above a minute in the ſepulchre, before a glimmering of the holy fire was ſeen through ſome chinks of the door, at which the mob behaved with the moſt extravagant kind of phrenzy. Soon after the two biſhops came out with blazing torches in their hands, which they held up at the door, while the people thronged about them to light their tapers at the divine flame, though the Turks endeavoured to keep them off with their clubs, and laid on without mercy. Thoſe who got the fire inſtantly applied it to their faces and boſoms, pretending that it would not burn like an earthly flame; but none of them would try the experiment long enough to make good this pretenſion. However, ſuch numbers of tapers were preſently lighted, that the whole church ſeemed in a blaze, and this illumination concluded the ceremony.

The Latins take great pains to expoſe this ceremony as a ſhameful impoſition and ſcandal to the Chriſtian religion. Mr. Thevenot obſerves, a flint and ſteel would ſoon produce fire were there none in the ſepulchre before; and, according to him, the Turks have diſcovered the cheat, and would have puniſhed them for it; but the patriarch repreſented, he could not pay them the money required of him if they took from him the profit of the holy fire: they are therefore ſuffered to continue the juggle, and the prieſts have acted the cheat ſo long, that they are now in a manner compelled to ſtand to it, for fear of endangering the apoſtacy of the people.

The zealous among theſe bigots ſmear pieces of linen with the melted wax which drops from theſe tapers, and lay them up for winding-ſheets for themſelves and their friends, imagining, ſays the Rev. Mr. Maundrell, that nothing can be a better ſecurity againſt their ſuffering by the flames of hell.

The Armenians have a ſpacious convent on a pleaſant ſpot of ground, which, with the gardens, covers all that part of Mount Sion which is at preſent within the city walls; and they aſſert, that their church is built over the place where St. James, the brother of John, was beheaded. In this ſtructure are two altars richly adorned, and in the middle of the church ſtands the pulpit covered with tortoiſe-ſhell and mother of pearl, with a beautiful cupola over it of the ſame fabric; and, it is ſaid, that the tortoiſe-ſhell and mother of pearl are ſo exquiſitely mingled and inlaid, that the workmanſhip greatly exceeds the value of the materials.

The Armenians have a chapel in the convent where they ſay the houſe of Annas ſtood, and on the inſide they ſhow a hole in the wall to point out the place where one of the officers of the high prieſt ſmote our Saviour. In the court before the chapel is an olive-tree, to which they pretend that Chriſt was chained by order of Annas, to prevent his eſcape. They have alſo another ſmall chapel on the ſpot where the houſe of Caiaphas ſtood, and

and under the altar they pretend is the ſtone that lay at the door of our Saviour's ſepulchre, which they ſay the Armenians ſtole from the church of the ſepulchre and brought thither, though it is two yards and a quarter long, one yard broad, and a yard thick. It is plaſtered over; only about five or ſix places are left bare to receive the kiſſes of the pilgrims. In this chapel is alſo ſhewn a ſmall cell, ſaid to be our Lord's priſon, till the morning when he was carried before Pilate.

Juſt without Sion-gate is the church of the Cœnaculum, where they ſay Chriſt inſtituted his laſt ſupper; but this being converted into a moſque, the Chriſtians are not permitted to enter it. Near it are the ruins of a houſe in which the Virgin is ſuppoſed to have died; and at ſome diſtance from it is a place where they ſay a Jew arreſted her body as they were conveying it to the grave; but the hand with which he ſeized the bier was withered.

At the bottom of Mount Sion, without the city, is ſhewn Bathſheba's pool, where ſhe was waſhing herſelf when David ſaw her from the terrace of his palace. At a ſmall diſtance from thence is the Potters-Field, afterwards called The Field of Blood, but now named *Campo Santo*: this piece of ground is only about thirty yards long and fifteen broad, one-half of which is taken up by a ſquare building erected for a charnel houſe. It is twelve yards high, and bodies are let down into it from the top, where five holes are left open for that purpoſe, through which they may be ſeen under different degrees of putrefaction. A little below the Campo Santo is a cave, conſiſting of ſeveral rooms one within another, where the diſciples are ſaid to have hid themſelves when they forſook their maſter.

On Mount Olivet they ſhew ſeveral caves cut with intricate windings, called the ſepulchres of the prophets, and twelve arched vaults, where it is pretended the apoſtles compiled their Creed; and at the top of the Mount they ſhew the place of our Saviour's aſcenſion, where there was antiently a large church, but all that remains of it is an octagonal cupola about eight yards in diameter, which is ſaid to be over the place where our Lord ſet his laſt footſteps on earth; and upon a hard ſtone under a cupola is ſhewn the print of one of his feet. This chapel of the Aſcenſion is in the cuſtody of the Turks, who uſe it for a moſque.

On another ſide of the mountain they ſhew the place where Chriſt beheld the city and wept over it, and near the bottom is a great ſtone, upon which the bleſſed Virgin dropt her girdle after her aſſumption, in order to convince St. Thomas; and there is ſtill to be ſeen a ſmall winding channel upon the ſtone, which they ſay is the impreſſion of the girdle when it fell. A little lower is ſhewn Gethſemane, an even piece of ground between the foot of mount Olivet and the brook Cedron. It does not exceed fifty-ſeven yards ſquare, but is well planted with olive-trees, which the people are ſo credulous as to believe are the ſame which grew there in our Saviour's time; and the olives, ſtones, and oil produced from them are purchaſed at a high price by the Spaniards: and yet Joſephus obſerves, that Titus cut down all the trees within a hundred furlongs of Jeruſalem.

At the upper part of this garden is a flat ledge of naked rocks, ſaid to be the place on which Peter, James, and John fell aſleep during our Saviour's agony; and by it is a cave, in which, it is ſaid, he underwent that bitter part of his paſſion. Near it is a narrow piece of ground, twelve yards long and one broad, ſaid to be the path on which Judas walked up to Chriſt, and ſaying, "Hail "maſter," kiſſed him. This narrow path is diſtinguiſhed by a wall on each ſide, as a *terra damnata*, which was done by the Turks, who, as well as the Chriſtians, deteſt the ground on which that infamous piece of treachery was acted. They alſo ſhew the place where the palace of Pilate ſtood; but upon this ſpot is now only an ordinary Turkiſh houſe, from the terrace of which people have a full view of the ſpot on which the temple ſtood; and, it is ſaid, that a fitter place for an auguſt building could not be found on the whole earth; but no Chriſtian is permitted to enter within the borders of that ground. In the middle of the area ſtands a moſque of an octagonal figure, ſaid to be erected on the ſpot where formerly ſtood the Holy of holies. In the above pretended houſe of Pilate they ſhew the room where Chriſt was mocked with enſigns of royalty, and buffeted by the ſoldiers. On the other ſide of the ſtreet is a room, which belongs to a weaver's ſhop, where it is ſaid our Saviour was ſcourged. In what is called the dolorous way, they ſhew the place where Pilate brought out our Lord to the people, ſaying, "Behold the man;" where Chriſt fainted twice under the croſs; where the Virgin Mary ſwooned at this tragical ſight; where St. Veronica preſented him a handkerchief to wipe his bleeding brows; and where the ſoldiers compelled Simon to bear his croſs.

They ſhew many other places in the city of Jeruſalem, and its neighbourhood, diſtinguiſhed by ſome action of our Saviour or his apoſtles; ſo that there is not the leaſt circumſtance relating to his behaviour either recorded in the Holy Scriptures, or believed as traditions, but they can point out the very ſpot where it was performed, with much greater exactneſs than thoſe who lived when thoſe events were performed. We ſhall now lead our reader to a few of thoſe places at a diſtance from Jeruſalem, celebrated on account of the events performed there.

We ſhall begin with Bethlehem, which is famous for being the birth-place of our Saviour. It is ſeated two miles to the ſouth of Jeruſalem, on the ridge of a hill, in thirty-one degrees thirty minutes north latitude; but at preſent is only an inconſiderable place, though it is much viſited by the pilgrims. It has, however, a church erected by Helena, which is yet entire, and in the form of a croſs. The roof is of cedar, ſupported by four rows of columns, ten in each row, made of one entire block of white marble, in many places beautifully ſpeckled. The walls are covered with large ſquares of white marble almoſt to the top, and the reſt is adorned with Moſaic painting. Over the midſt of the chancel is a handſome cupola, covered with lead and adorned with figures in moſaic work. Under the church, in a cave hewn out of the rock, is the chapel of the nativity, in which they pretend to ſhew the manner in which Chriſt was laid, alſo cut out of the rock, and now encruſted with marble. An altar, with the repreſentation of the nativity, is erected here, and lamps kept burning before it. Here is alſo the chapel of St. Joſeph, the ſuppoſed father of our Lord, and of the Holy Innocents. The place is chiefly inhabited by a few poor Greeks, and at a ſmall diſtance is a monaſtery of Franciſcan friars.

Near Bethlehem they ſhew the place where the ſhepherds were watching their flocks when they received the glad tidings of Chriſt's birth, and at a ſmall diſtance is the village where they dwelt.

The Wilderneſs of St. John, though very rocky, is well cultivated, and produces plenty of corn, vines, and olive-trees. In this wilderneſs they ſhew a cave and fountain, where they ſay the Baptiſt uſed to exerciſe his auſterities. Between this wilderneſs and Jeruſalem is the convent of St. John, which is a large, ſquare, and neat modern ſtructure; and its church is particularly beautiful. It conſiſts of three iſles, and at the upper end of that to the north is a deſcent of ſeven marble ſteps to a ſplendid altar, erected on the place where the Baptiſt is ſaid to have been born. This church has a handſome cupola in the middle, under which is a pavement of moſaic work that is ſaid to equal, if not exceed, the fineſt works of the kind among the antients.

Nearer to Jeruſalem is a neat convent of the Greeks, that takes its name from the holy croſs. It ſtands in a delightful ſituation; but what is moſt extraordinary, is the reaſon they here give for its name and foundation; for they ridiculouſly pretend, that here is the earth which nouriſhed the root that bore the tree of which the croſs was made. Under the high altar they ſhew a hole in the ground, where the ſtump of the tree ſtood, and many pilgrims are ſo blindly ſuperſtitious as to fall down and worſhip it. Here the father guardian waſhes the feet of all the pilgrims who come thither, while the whole ſociety ſtand round ſinging hymns; and when the guardian has finiſhed his office, the pilgrims feet are kiſſed by every friar.

Nazareth

Nazareth is now a ſmall village, ſituated in a kind of round concave valley on the top of a high hill, in thirty-two degrees thirty minutes north latitude. The church of Nazareth is partly formed by a cave, where it is ſaid the Virgin Mary received the meſſage from the angel, "Hail, thou that art highly favoured, &c." This ſtructure is in the form of a croſs, and is fourteen paces long and ſix over, running directly into the cave, having no other arch over it but that of the natural rock. The tranſverſe part, which is erected acroſs the mouth of the cave, is nine paces long and four broad; and where theſe join are two granite pillars, one ſuppoſed to ſtand where the angel, and the other where the Virgin ſtood, at the time of the annunciation. The pillar of the Virgin has been broken, and eighteen inches in length taken away between the pillar and its pedeſtal, and yet it touches the roof, to which it probably hangs, though the friars maintain that it is ſupported by a miracle. In this village they ſhew the houſe of St. Joſeph, where Chriſt lived near thirty years in ſubjection to his ſuppoſed father. Near it they point out the place where ſtood the ſynagogue, in which Jeſus preached the ſermon by which his countrymen were ſo exaſperated. At each of theſe laſt places are the ruins of a handſome church erected by Helena.

The next place we ſhall mention is Mount Tabor, a high, round, and beautiful mountain near Jeruſalem, thought to be that on which our Saviour was transfigured. People are near an hour in aſcending to the top, where they find a moſt fruitful and delicious plain of an oval form, about two furlongs in length, and one in breadth. It is every where ſurrounded with trees, except towards the ſouth, and was antiently encompaſſed with walls, trenches, and other fortifications, many remains of which are ſtill viſible. In ſeveral places are ciſterns of good water, and near the plain are three caves, formed to repreſent the tabernacles Peter propoſed to erect; when, beholding the glory of the transfiguration, he cried out, "Lord, it is good for us to be here, let us make "three tabernacles, &c." The top of this mountain has a moſt delightful proſpect. The north-weſt affords a view of the Mediterranean, and all round are the fine plains of Galilee and Eſdraelon. To the eaſtward is Mount Hermon, and at the foot is ſeated Nain, famous for our Lord's reſtoring the widow's ſon to life. Due eaſt is the ſea, or rather lake of Tiberias; and cloſe to it a ſteep mountain, down which the ſwine ran and periſhed in the water. Towards the north is what they call the Mount of the Beatitudes, a ſmall riſing from which Chriſt delivered his ſermon; and near this little hill is the city of Saphet, ſtanding upon a high mountain, which, being then in view, our Saviour may be ſuppoſed to allude to it when he ſays, "A city ſet on a hill cannot be hid;" and to the ſouthward is a view of the mountains of Gilboa, fatal to Saul.

Mr. Maundrell obſerves, that it is pretty extraordinary that almoſt every thing repreſented to be done in the Goſpel is ſaid by the people who ſhew the places to be done in caves, even where the circumſtances of the actions themſelves ſeem to require very different places: thus thoſe of the birth of the Virgin Mary, of the annunciation, of Mary's ſalutation of Elizabeth, of the nativity of Chriſt and John the Baptiſt, of the transfiguration, and of St. Peter's repentance, are repreſented as being done under ground.

SECT. XX.

Of Natolia, *or* Asia Minor.

Its Names, Situation, Extent, Climate, Soil, and Rivers; with a particular Deſcription of the Euxine or Black Sea. The Diviſions of the Country; with a conciſe Account of Caramania, Aladulia, and Amaſia; which contain the antient Provinces of Lydia, Pamphylia, Piſidia, Lycaonia, Cilicia, Cappadocia, Pontus Cappadocius, Pontus Polemoniac, and Pontus Galaticus.

NATOLIA, or Anatolia, formerly called Aſia Minor, is the moſt weſterly part of Turky in Aſia: it received its name of Anatolia, or Natolia, from its eaſtern ſituation with reſpect to Europe, and on ſame account is called the Levant. This country very large peninſula, that extends from the Euphrates as far as the Archipelago; which, with ſea of Marmora, the ſtreights of Galipoli, and of C ſtantinople, ſeparate it from Europe on the weſt; it is bounded on the north by the Euxine or Black S and by the Mediterranean and Syria on the ſouth, tending from thirty-ſeven to forty-one degrees th minutes north latitude, and from twenty-ſeven to ſo degrees eaſt longitude. Its utmoſt length from eaſt weſt is computed to be about ſix hundred miles, and breadth from north to ſouth about three hundred a twenty. This country is uſually divided into ſ parts, Caramania, Aladulia, Amaſia, and Nato Proper.

The air is healthy, and the whole country has a ri and fertile ſoil, though the tyranny of the Turkiſh g vernment has almoſt reduced it to a deſart; for, notwit ſtanding the fields are naturally rich and well watere they lie for the moſt part uncultivated, and are over-r with brambles and weeds. The few plains improved agriculture yield excellent corn of ſeveral ſorts, and variety of fruits, as exquiſite grapes, olives, citron oranges, lemons, figs, and ſeveral others; beſides plen of coffee, rhubarb, galls, balſam, opium, and oth valuable gums and drugs.

This country is watered by a conſiderable number rivers, the principal of which are the Porteni, Zaga or Sangarius, the Aitoeſu, Ali, Hali, or Otmigiut, a the Iris, or Caſalmach, which diſcharge themſelves the Euxine Sea; the Jechel-Irma, or Green River, th falls into the Kara, or Black River, which diſcharg itſelf into the Euphrates; the Satalia, the Cydnus, Caraſu, and the Xanthus, or Sirbis, which runs into t Mediterranean; the Madre, antiently the Mæander, t Granicus, the Cayſter, or Caraſou, the Samander, Scamandra, and the Hermus, now Sarabat, which r ceives the Pactolus, and the Caicus, the Caſtri, or Gi maſti, and falls into the Archipelago.

As the Black or Euxine Sea waſhes the northern co of Natolia, it is proper here to give a particular deſcri tion of it. It lies between Europe and Aſia, and bounded on the north by Tartary; on the eaſt by Mi grelia, Circaſſia, and Georgia; on the ſouth by Nato lia; and on the weſt by Romania, Bulgaria, and Beſſ rabia, extending from the forty-ſecond to the forty-fix degree of north latitude, and from the twenty-ninth t the forty-fourth degree of longitude, its form being g nerally compared to that of a bended bow. It is entirel ſurrounded by the Turkiſh dominions, who have the ſo navigation of it. The Ruſſians have indeed attempted trade upon this ſea; but by late treaties, they have bee obliged to give up all their fortreſſes on its coaſt, and con ſequently to abandon its navigation.

This ſea has been denominated black, not from th colour of its water, or of its ſand, but from the furiou tempeſts ſaid to rage here; though it has not more fre quent nor more violent ſtorms than other ſeas. But pro bably ſome particular perſons being loſt there, whe navigation was much leſs underſtood than it is at pre ſent, the people are taught to entertain terrible appre henſions of it; which being improved by Ovid, and othe poets, it is no wonder that it was at length called Black or Terrible.

We ſhall begin with Caramania, which lies contiguou to the province of Syria, and is under the government a beglerbeg. This province contains the antient Lycia Pamphylia, Piſidia, Lycaonia, and Cilicia.

Lycias, at preſent called Mentiſeli, is bounded on th north and eaſt by Phrygia Major and Pamphylia; o the ſouth by the Mediterranean, and on the weſt b Caria. The mountains which branch out of Tauru ſurround it on three ſides, as does the ſea on the fourth The river Xanthus divides it into two, and ſeveral leſſe ſtreams run acroſs it; which once rendered it very rich and fertile; but at preſent it is entirely neglected. It has a remarkable mountain named Chimæra, about fi miles from the ſea; which has been celebrated by Vir gil for its volcano, near which the Lycians built a city called Hepheſtiæ, and dedicated it to Vulcan. From it having

having lions at the top, goats about the middle, and snakes at the bottom, it is said the poets feigned the monster Chimæra, which they represent as having the head, body, and hind parts of those animals.

This country had anciently several considerable cities, but the face of things is entirely changed, and it does not appear that any considerable remains are left to proclaim their former grandeur.

Pamphylia is bounded on the north by Pisidia; on the east by Cilicia; on the south by the Mediterranean; and on the west by Lycia. The inland country is extremely mountainous, and abounds with large flocks of goats, and the natives make excellent camblets of their hair; but towards the sea-coast the country is naturally fertile. The principal town is Attalia, now called Sattalia, which has a pretty good harbour, but the entrance is difficult, and it is defended by a castle, which is considered in that part of the world as a fortification of considerable strength. There is also the city of Perga, which was anciently famous for its temple dedicated to Diana.

Pisidia, another division of Caramania, lies to the north of Pamphylia, and consists of a fruitful plain entirely surrounded by mountains, which affords some minerals, pasture, and great quantities of wood. Antioch, called Antiochia Pisidiæ, to distinguish it from the city of the same name in Syria, was the capital of this province when it was under the Roman government, and was likewise called Cæsarea; but like the other places of Asia, it is now reduced to a very mean town.

Lycaonia, or Isauria, is situated to the eastward of Pisidia, and is a fine champain country. Its principal town is Iconium, now Cogni, which is the capital city, not only of Lycaonia, but of all Caramania, where the beglerbeg himself resides. It is situated about an hundred miles north of the sea-coast, near a fresh water-lake. The other towns are Lystra, where the people attempted to offer sacrifices to St. Paul and Barnabas; Derbe, which is towards the south part of the country; and Isauria, which once gave name to the province, but is now entirely destroyed.

Cilicia extends near two hundred and fifty miles along the coast of the Mediterranean, having Syria on the east, and Pamphylia on the west; but does not exceed fifty miles in breadth from north to south. On the north and east the country is rocky and mountainous, and the passes between the mountains exceeding narrow; but the plain country is very fruitful. The principal towns are Issus, now called Lajazzo, or Aiazzo, which is situated on a bay to which it gives its name, and is remarkable for the victory obtained by Alexander over Darius among the mountains in its neighbourhood. Tarsus, the capital of the province, at present called Therassa; Sole, or Pompeopolis; Philadelphia, Seleucia, Trachea, and Silenus.

The next grand sub-division of Natolia, called Aladulia, extends eastward to the river Euphrates, and contains all the ancient Cappadocia. This is a country of very great extent, which formerly abounded in corn, wine, and fruits, of which it is not destitute at present; but as the Turks cultivate no more land than they want for their own private use, and export nothing from hence, it is impossible that the face of the country should appear so delightful, or that it should enjoy such plenty as formerly. A large ridge of hills runs across the country, and these contain mines of silver, copper, and allum; there is here also a good breed of horses, and plenty of oxen, buffaloes, sheep, deer, and wild fowl.

The principal towns are Cæsarea, now Caisar, which was the capital of Cappadocia when it was under the dominion of the Romans. It is situated on a rock at a small distance from the river Melus, and is a pretty handsome city well peopled. Marosch, antiently called Melita, is seated near the banks of the Euphrates, and is a large town in which the beglerbeg resides.

The next division of Natolia is Amasia, which contains Pontus Cappadocius, Pontus Polemoniac, and Pontus Galaticus.

Pontus Cappadocius is bounded by Georgia on the east, by the Euxine or Black-Sea on the north, by Armenia Minor on the south, and by Pontus Polemoniac on the west. The principal town is Trebisond, which is situated on the Black Sea, in forty degrees forty-five minutes north latitude, at the foot of a little steep hill by the sea-side. The walls, which are very lofty, are supposed to stand upon the ancient foundations, because the town is still an oblong square: they have high battlements, and are evidently built out of the ruins of ancient buildings, as appears from inscriptions found on pieces of marble in several parts of them. The town is large, but not very populous; for it has more groves and gardens than houses, and these are only one story high. The castle is large and situated on a flat rock, in which the ditches are cut. The port is at the east end of the town, and was formerly so commodious, that it occasioned a very great trade; but it is now almost destroyed, and cannot be entered by vessels larger than the Turkish saiques. The suburbs, which are much bigger than the city, are chiefly inhabited by Greeks and Armenians, who are allowed the free exercise of their religion. Neither the hills nor the vallies about the town are so fertile as in other parts of Natolia, on which account provisions are neither so cheap, nor so good as in other places: they have flesh in their markets but few months in the year, and fish is still scarcer. The country produces excellent oil, but their wine is not extraordinary.

The Greek and Roman emperors were masters of this city by turns. In 1209 the emperor Alexis Commines, surnamed the Great, usurped the sovereignty of it with the title of duke; and John Commines, his successor, is said to be the first who permitted the Greeks to stile him emperor of Trebisond; a title which its princes enjoyed till 1460, when Mahomet II. carried David Commines prisoner to Constantinople, where he was some time after put to death, and this place has ever since been under the dominion of the Turks.

Pontus Polemoniac is situated to the westward of Pontus Cappadocius. Its principal town is Neocesarea, now Tocat, which is the capital of the province, and the seat of the beglerbeg. This is a handsome city built at the foot of a very high mountain, and encompasses a round rock, which rises in the midst of the town, and has a castle at the top of it. The streets are narrow, but the houses pretty well built, and one of the mosques is very magnificent. The city is inhabited by Mahometans, Greeks, Armenians, and Jews, and for fourteen or fifteen leagues round Tocat the country is chiefly inhabited by Armenian Christians, who work in several mechanic branches of trade, particularly in copper, all manner of vessels of that metal being made here, and exported to Constantinople and Egypt. They have also a great manufactory of Turky leather. The wine is excellent, and they have almost all sorts of fruit in great plenty; and as this is one of the greatest thoroughfare towns of the east, they have better accommodations for merchants and travellers than in most other places. Here the caravans lodge which come from Constantinople, Smyrna, Persia, Diarbec, and Bagdat. About a mile from the city is a river over which is a beautiful stone bridge. This river waters a very large and fertile plain, that produces great quantities of saffron, which is extremely profitable, it being sent to the Indies, where it is purchased at a high price, and used by the natives in their food.

SECT. XXI.

Of Natolia Proper, its Extent and Divisions; particularly Pontus, Paphlagonia, Galatia, Phrygia Major, Lydia, Doris, Caria, Ionia, Æolis, Mysia, Phrygia, Bithynia; with the Cities in each, and a particular Description of Smyrna, and of the Cameleons near that City.

NATOLIA Proper extends from the Archipelago, that is, from twenty-six degrees thirty minutes east longitude to almost the thirty-fifth, where it is bounded by the beglerbeglics of Amasia and Aladulia, and extends from the coast of the Black Sea on the north, to the government of Caramania on the south; that is, from thirty-seven to forty-one degrees twenty minutes north latitude, and is by far the largest division of Natolia. It

contains many fine provinces; theſe are, Pontus, Paphlagonia, Galatia, Phrygia Major, Lydia, Doris, Caria, Ionia, Æolis, Myſia, Phrygia, and Bithynia.

Pontus and Paphlagonia are uſually joined together, and have the Euxine Sea on the north, Cappadocia on the eaſt, Galatia on the ſouth, and Bithynia on the weſt. The name of Pontus was formerly given to the whole coaſt of the Euxine Sea, which from thence was called Mare Ponticum; but what we now treat of, is only a ſmall part of it. The chief towns are,

Amaſtris, now Semaſtre, a ſea-port at the mouth of the river Parthenius.

Heraclea Ponti, now Penderachi, a ſea-port in the north-weſt part of the country.

Claudiopolis, now Caſtromena, an inland town.

The principal city in that part of this diviſion named Paphlagonia is, Cinope, which is ſituated upon the iſthmus of a peninſula about ſix miles in circumference. This city Mithridates, king of Pontus, made the capital of his dominions, and Lucullus added it to the Roman conqueſts. The whole peninſula conſiſts of pleaſant fields and gardens, and the city has a double wall, with triangular and pentagonal towers; but the caſtle is run to ruin, and has only a ſmall garriſon. The city is inhabited only by the Turks; for the Greeks and Jews are forced to live in the ſuburbs. There are ſome little remains of the ancient grandeur of this city to be ſeen in the modern buildings, particularly pieces of marble columns are interſperſed among the other ſtones in the walls; and in the Turkiſh burying-place are a prodigious number of pedeſtals, baſes, and capitals, which the Turks have carried thither to erect and adorn their tombs. The adjacent country produces good corn, wine, and oil.

Galatia is bounded by Cappadocia on the eaſt, by Pamphylia on the ſouth, by Phrygia on the weſt, and by Paphlagonia on the north.

The principal city of Galatia is Ancyra, now called Angouri, which is ſituated on the river Melus, and is one of the beſt cities of Natolia. The ſtreets abound with old marble columns, among which ſome are of a kind of reddiſh porphyry, veined with white; and there are found ſome pieces of white and red jaſper. Though the houſes of the city are moſtly built with clay, there are frequently fine pieces of marble uſed to adorn them; and though the city walls are low, they are compoſed of pieces of the ſhafts of columns, baſes, capitals, and entablatures: but theſe are moſt frequently found in the gates and towers. The caſtle has a triple wall compoſed of large pieces of white marble, and of ſtones reſembling porphyry, on which are ſeveral inſcriptions; but at preſent moſt of theſe are not legible.

The inhabitants of this city are ſaid to amount to about forty thouſand Mahometans, four or five thouſand Armenians, and a thouſand Greeks. The Armenians have ſeven churches here, and the Greeks two.

In the adjacent country are ſaid to be the fineſt breed of goats in the world; they are perfectly white, and their hair, which is as fine as ſilk, is curled, and eight or nine inches long. Of this hair they make fine ſtuffs, which are the chief manufactures of the country, and in which the inhabitants carry on a great trade. Theſe goats are only to be found within four or five days journey from the city; for the breed degenerates if they are carried farther.

The next province we ſhall mention is Phrygia Major, now called Germian, formerly a fruitful and pleaſant country, but now in a great meaſure uncultivated. It is bounded on the north by Bithynia, on the eaſt by Galatia, on the ſouth by Pamphylia, and on the weſt by Myſia. The rivers Meander, Sangarius, Hemus, and Marcius, have all their ſources in this diſtrict. The principal towns are,

Cotæum, now Chintaia, a conſiderable town, the ſeat of the beglerbeg, and once of the Turkiſh emperors, before the taking of Conſtantinople.

Gordium, where Gordius king of Phrygia is ſaid to have tied the famous knot in Apollo's temple, of which it was foretold, that the perſon who untied it ſhould be emperor of the world; but Alexander finding great difficulty in accompliſhing it, cut it with his ſword, and by that means performed the taſk.

Coloſs, now Chonoſs, is ſeated on the ſouth ſide of the Mæander. To the inhabitants of this city St. Paul wrote his epiſtle to the Coloſſians.

Apamia, is ſituated near the conflux of the Mæander with the Marcius, and was formerly a place of good trade. Hieropolis, now Bamboukale, ſeated in the frontiers of Lydia, and at preſent famous only for its noble ruins and hot ſpring.

Lydia, or Mæonia, is a fruitful country watered by ſome conſiderable rivers, particularly the Pactolus, Caicus, Hemus, and Caiſtratus, and is bounded by Phrygia Major on the eaſt, by Caria on the ſouth, and by Æolis and Myſia on the weſt. The wealthy Croeſus was formerly king of this country. The principal towns are,

Sardis, which was once its capital, but is now a poor village on the river Pactolus, about ſeventy miles to the eaſtward of Smyrna. This was one of the ſeven churches of Aſia, but was deſtroyed by an earthquake; there are however, ſtill ſome noble ruins, which afford a proof of its ancient grandeur.

Laodicea, or Eſkihiſar, was ſituated on the eaſtern boundaries of Lydia; it was alſo one of the ſeven churches, and was a large city, as appears from its ruins among which are three theatres of white marble almoſt entire, and a noble circus; but it is now uninhabited.

Philadelphia, or Alachſheyer, another of the ſeven churches, is ſituated in a fruitful plain, but is fallen much from its primitive grandeur; however, according to ſome travellers, it has ſtill two thouſand Chriſtian inhabitants who have four churches.

Thyatira, another of the ſeven churches, now called Akhiſar, ſtands about thirty miles to the north-weſt of Philadelphia, near the ſouth bank of the river Hemus, where are ſeen the ruins of ſeveral ancient marble ſtructures, though the modern houſes are only built with clay. It, however, carries on ſome trade for corn and cotton.

Magneſia, now Guſethiſar, ſituated on the river Mæander, was anciently a conſiderable city, as appears from its ruins, and is ſtill a pretty large walled town, which trades to Smyrna in cotton and yarn.

Doris and Caria are uſually joined together under the name of Adinelli, and are bounded by the river Mæander on the north, and by the ſea on the ſouth and weſt. The chief towns in Doris are,

Myndus, a ſea-port ſituated on a ſmall bay called Iaſicus Sinus, and is the ſeat of a Turkiſh baſha.

Halicarnaſſus, once the capital of Caria, but now a heap of ruins. It was famous for the tomb built by queen Artemiſia, in honour of Mauſolus, her huſband, which was ſo ſuperb a ſtructure, that it was eſteemed one of the wonders of the world; and from thence all magnificent tombs have obtained the name of Mauſoleum.

Miletus, now Palatſhia, was anciently a large city, and had a magnificent temple dedicated to Apollo; but is now only an inconſiderable village, conſiſting of ſhepherds cottages.

Æolis and Ionia are likewiſe uſually joined together, and form a long tract of country extending from north to ſouth, and bounded on the weſt by the Archipelago or Ægean Sea. The ancient capital of Æolis was Cuma, which, with Phocea, and ſome other ancient towns, lie oppoſite to the iſland of Leſbos.

Ionia lies to the ſouthward of Æolis, and had ſeveral towns famous in hiſtory; theſe were,

Clazomene, a maritime town about twenty-eight miles to the ſouth-weſt of Smyrna, and is now called Urla. It was a conſiderable city in the time of the Romans, but is now a mean village.

Colophon lies about thirty miles to the ſouth of Smyrna, and claims the honour of being the birth-place of Homer.

The celebrated city of Epheſus was ſituated in a pleaſant country fifty miles to the ſouth of Smyrna, but is now only a poor village of twenty or thirty houſes, though it is near a fine haven, and under the Roman

the metropolis of Asia Minor. This city was famous for the temple of Diana, esteemed one of the wonders of the world, it being four hundred and twenty-five feet long, two hundred and twenty broad, and supported by a hundred and twenty-seven marble columns seventy feet in height; but was destroyed by Erostratus, from no other motive but to eternize his name, who set it on fire the very night in which Alexander the Great was born. St. Timothy was the first bishop of this city, and St. Paul honoured the Ephesians with an epistle. There are still the remains of a Roman circus, a theatre, an aqueduct, and heaps of magnificent ruins.

That part which is at present inhabited is bounded on the east by a large plain that extends as far as the sea, and on the sides by high hills. The most remarkable building in this part is the old church of St. John the Evangelist, which had antiently four gates, but two of them are walled up. On the inside the roof is supported by four columns of porphyry, the shafts of which are twelve feet and a half in circumference, and thirty-six feet in height. It has two domes, and is covered with lead. As the Turks have converted it into a mosque, they have added a minoret, and adorned it after their manner; but its greatest ornaments, when it was a church, were carried to Constantinople to adorn the mosque erected there by Sultan Soliman; so that on the outside it makes but an indifferent appearance.

The largest and richest city at present in Asia Minor is Smyrna, or Ismir, which is situated in thirty-eight degrees twenty-eight minutes north latitude, about a hundred and eighty-three miles west-by-south of Constantinople; and the goodness of its harbour has caused it to be rebuilt several times after it had been destroyed by earthquakes. This was one of the seven churches to whom St. John addressed himself in his Apocalypse. The town runs about half a mile along the shore, from whence it rises gradually on the side of a hill facing the sea. The houses of the English, French, and Dutch consuls are handsome structures; these, with most of the Christian merchants, are washed on one side by the sea, forming a street, named Frank-street, from its being solely inhabited by European Christians. The port is one of the finest of the Levant, it being able to contain the largest fleet; and indeed there are seldom fewer than an hundred ships of different nations.

A castle stands at its entrance, and commands all the shipping which sail in or out. There is likewise an old ruinous castle, near a mile in circumference, which stands in the upper part of the city, and, according to tradition, was built by the empress Helena; and near it is an antient structure said to be the remains of a palace where the Greek council was held when Smyrna was the metropolis of Asia Minor. They also shew the ruins of an amphitheatre, where it is said St. Polycarp, the first bishop, fought with lions.

The city is about four miles in circumference, and nearly of a triangular form; but the side next the mountain is much longer that the others. The houses are built low, and for the most part with clay-walls, on account of the earthquakes to which it is subject; but the caravanseras and some other of the public buildings have an air of magnificence. The streets are wide, and almost a continued bazar, in which great part of the merchandize of Europe and Asia is exposed to sale, with plenty of provisions; though these are not so cheap as in many other parts of Turky, on account of the populousness of the place, and the great resort of foreigners. It is said to contain fifteen thousand Turks, ten thousand Greeks, eighteen hundred Jews, two hundred Armenians, and two hundred Franks. The Turks have nineteen mosques, two churches belong to the Greeks, one to the Armenians, and the Jews have eight synagogues. The Romans have three convents, one of the Jesuits, another of the Franciscans, and a third of the Recollects. There is also one of the fathers Della Terra Santa. Here resides an archbishop of the Greek church, a Latin bishop, who has a salary from Rome, with the title of bishop of Smyrna *in partibus infidelium*, and the English and Dutch factories have each their chaplain.

The walks about the town are extremely pleasant, particularly on the west side of Frank-street, where there are several little groves of orange and lemon-trees, which being always cloathed with leaves, blossoms, and fruit, regale several of the senses at the same time. The vines which cover the little hills about Smyrna afford both a delightful prospect and plenty of grapes, of which good wine is made. These hills are agreeably interspersed with fertile plains, little forests of olives and other fruit-trees, and many pleasure-houses, to which the Franks usually retire during the summer. In the neighbourhood of Smyrna is great plenty of game and wild-fowl, particularly deer and wild hogs, and the Franks frequently take the diversions of hunting and shooting. The sea also abounds with a variety of good fish. The European Christians are likewise allowed all imaginable liberties in the city, and usually clothe themselves after the European manner.

The chief commerce of this city consists in raw silk, silk stuffs, grograms, and cotton yarn.

However, the unhealthfulness of the situation, and more especially the frequent earthquakes, from which 'tis said they are scarce ever free two years together, and have been felt forty days successively, are an abatement of the pleasure that might otherwise be taken here. A very dreadful one happened in June 1688, which overturned great part of the houses; and the rock opening where the castle stood, swallowed it up, and no less than five thousand persons perished on this occasion.

Near Smyrna are a great number of cameleons, an animal which has some resemblance to a lizard, but hath his back gibbous like a hog, and its feet have two claws before and three behind, which are not separated from each other till near the ends. It has a long tail like a rat, and is commonly as big, but it has very little or no motion with its head. The cameleons are in great abundance about the old walls of the castle, where they breed and lie in holes and heaps of ruins. Sir George Wheeler kept two of them twenty days, during which he made the following observations: their colour was usually green, darker towards the back, and lighter towards the belly, where it inclined to a yellow, with spots that were sometimes reddish and at others whitish; but the green often changed into a dark colour like that of earth, without any appearance of green; and the whitish spots often vanished; but sometimes turned into the same dirt colour, and at others into a dark purple. Sometimes from being green all over, they would be spotted with black; and when they slept under a white woollen cap, they would commonly, when uncovered, be of a white or cream colour; but they would also turn white under a red cap, for they never turned either red or blue, though they often lay under those colours; but being placed upon green they would become green, and upon the dark earth would change so as exactly to resemble it.

As our author was walking by the side of the hill near the old castle, he saw many that had changed themselves so as to resemble the colour of the speckled stone-wall, and were grey with spots like moss. He found one on the top of a green bush, which, when he first observed it, was of a bright green; but it no sooner perceived that he saw it, than it immediately dropped to the ground; he then lost sight of it; but searching, he observed it creeping away to a hole in the rock, it being changed to a dark brown, exactly like the earth; which was then, after a shower of rain, of that colour.

The power of thus changing its colour is given it by nature for its preservation; for it moves very slowly, lifting up its legs high, and not quick, as if it searched for hold to climb upwards, which it can do very well up a tree, a bush, or wall. When it saw itself in danger of being caught, it opened its mouth, and hissed like a snake.

The eyes of the cameleon are no less wonderful than the variation of the colours of the body: they are large in proportion to the size of its head, being generally bigger than a pea, and covered all over with a skin of the same substance with the body, the grain being in circles just to the centre, where there is an hole no bigger than a small pin's head, by which it receives light, which must make the angle of its vision very acute. The head being immoveable, it cannot immediately turn to objects,

ject; but to remedy this inconvenience it cannot only move its eyes backward and forward, upward and downward, but one forward and the other backward, or one upward and the other downward, one fixed on one object, and the other moving according to the motion of ſome other object.

The tongue is a kind of little trunk of a griſtly ſubſtance, about half an inch long, and hollow, joined to its throat by a ſtrong membranous and fleſhy ſubſtance, in which it is ſheathed when in the mouth. It will dart this above an inch out of its mouth, ſmeared with a glutinous ſubſtance to catch flies, which ſtick faſt to it as to birdlime, and ſo are brought into the mouth. Theſe flies are their ordinary known food, but, like many other animals of the ſame cold nature, as lizards and ſerpents, they will live a long time without ſuſtenance.

Its tail is of very great uſe in climbing, for it will twine about any thing ſo faſt, that if its feet ſlip, it will ſuſtain and recover its whole body by it. Our author put one he caught into a glaſs ſo deep, that it could not reach near the brim with its fore-feet, nor could take any hold with its claws; and yet it got out, and almoſt eſcaped from him, as he afterwards ſaw, by ſtanding upon its fore-feet, and raiſing itſelf up backwards, till it caught hold of the brim of the glaſs with its tail, by the help of which it lifted out its whole body.

Myſia and Phrygia Minor are bounded on the north by the Propontis, or Sea of Marmora; towards the eaſt by Bithynia and Phrygia Major; on the ſouth by Lydia; and on the weſt by the Egean Sea, or Archipelago. The principal river in this diſtrict is that which was antiently called the Granicus, which riſes in the mountains of this country, and after running fifty or ſixty miles from ſouth to north falls into the ſea of Marmora. This river is famous for the battle fought upon its banks by Alexander and Darius. In this province is alſo ſituated Mount Ida, where the poets repreſent Paris giving judgment between the goddeſſes. The chief towns were,

Troy, or Ilium, which was ſituated near the ſea oppoſite the iſland of Tenedos, and rendered famous by Homer and Virgil for its ten years ſiege: but Mr. Wood obſerves, that there is not a ſingle ſtone to ſhew its exact ſituation.

Troas Alexandria was ſeated to the ſouthward of Troy, and was once the metropolis of the province, though it is now a ruinous place.

Pergamus is ſeated in a plain near the banks of the river Caicus. It was another of the ſeven churches, and was antiently a noble city. Parchment and tapeſtry are ſaid to be firſt invented here; and here Galen received his birth; but it is now a very indifferent town, it having only one Chriſtian church and a moſque.

Abydus, or Avido, a fortreſs oppoſite to Seſtus, at the mouth of the Helleſpont, is celebrated by the poets for the loves of Hero and Leander, and for the obſtinate reſiſtance made by the inhabitants againſt Philip of Macedon, who, when they could no longer defend the place, deſtroyed themſelves. It is now the ſouthern caſtle of the Dardanels, thus named from Dardanus, a little town that lies to the ſouthward of it.

Bithynia, now called by the Turks Becſangil, is ſeparated from Europe only by the Thracian Boſphorus, and is ſo near Conſtantinople that Scutari, which ſtands on the Aſian ſide, is eſteemed only a ſuburb to that city. The principal towns are the following.

Nicomedia, or Iſchmit, is ſituated at the bottom of a bay, in forty degrees forty-ſix minutes north latitude, fifty miles ſouth-eaſt of Conſtantinople. It received its name from Nicomedes, king of Bithynia, who enlarged it, and was once reckoned the capital of that kingdom. It was formerly a very large place, and the ruins of its antient buildings and fine palaces are very conſiderable. However, it is ſtill a place of conſequence, and contains thirty thouſand inhabitants, who conſiſt of Greeks, Armenians, Turks, and Jews. The Turks have twenty moſques; the Chriſtians have alſo ſome churches, and it is the ſee of a Greek archbiſhop; the Jews have likewiſe two ſynagogues. Moſt of the ſhips of Conſtantinople are built here, and the inhabitants carry on a conſiderable trade in ſilk, cotton, glaſs, and earthen ware.

Chalcedon, which ſtood two miles from the place where Scutari now ſtands, was once a flouriſhing city, but is now reduced to a poor village.

Nice, or Iſnic, was antiently a noble city, and is famous for the great general council aſſembled there in 325, who endeavoured to ſuppreſs the doctrines of Arius; and from its being the reſidence of the Greek emperors when Conſtantinople was taken by the Latins. It is ſituated in forty-ſeven degrees fifteen minutes north latitude, ſeventy-five miles ſouth-eaſt of Conſtantinople, in a pleaſant country fertile in corn and excellent wine. The preſent city is large and pretty well peopled, the Jews inhabiting the greateſt part of it: but there are now no remains of its antient ſplendor, except an aqueduct.

Pruſa, by the Turks called Burſa, is the capital of Bithynia, as it was of the Ottoman empire before the taking of Conſtantinople. It is ſituated in thirty-five degrees fifty-three minutes north latitude, ſeventy-five miles ſouth of Conſtantinople, upon ſeveral little hills at the foot of Mount Olympus, from which it is not above two or three leagues diſtant, and at the edge of a large and fine plain, full of mulberry and other fruit-trees. It is watered by ſo many ſprings, which deſcend from Mount Olympus, that almoſt every houſe has a fountain. The moſt conſiderable of theſe ſprings iſſues in a ſtream as large as a man's body, and being conveyed to the town by a marble aqueduct, is diſperſed to every part of the city.

Burſa is about half a league in length, and is ſtill ſurrounded by the antient wall it had when in the poſſeſſion of the Chriſtians, but is much out of repair, it being in ſeveral parts broken and ruinous. The moſques, which are very fine, are covered with lead, and adorned with domes. Theſe ſtructures are ſaid to amount to above thirty. The caravanſeras are magnificent and commodious. The bezeſtine, or exchange, is a large ſtructure full of ware-houſes and ſhops, containing all the commodities of the Eaſt, beſides their own manufacture of ſilk. This city is in general very pleaſant, and the quarter of the bazars is particularly neat and well paved. The city contains above forty thouſand Turks, who alone are permitted to dwell within the walls; but the ſuburbs, which are vaſtly finer and better peopled, are filled with Jews, Armenians, and Greeks, of which there are ſaid to be five hundred families of Armenians, four hundred of Jews, and three hundred of Greeks. The Jews came hither from Granada, in Spain, and it is ſaid, ſtill ſpeak good Spaniſh. Here are the beſt workmen in all Turky, and excellent imitators of the tapeſtry of France and Italy.

The grand Seignior's palace in this city is ſituated on a high rock, and encloſed with a double wall; but it is in a ruinous condition. Here they ſhew the ſepulchres of the firſt Turkiſh emperors, and their ſultanas, in ſmall chapels covered with domes.

The baths of Calypſo are a little more than a mile from the city, and are very handſome ſtructures covered with domes, like thoſe we have already deſcribed, and are ſo famous for the cures they have effected, that people come a hundred miles to receive the benefit of them.

Mount Olympus, which is ſituated in the neighbourhood of the city, is of a prodigious height, and the top of it barren and covered with ſnow; from thence Conſtantinople is ſupplied with it, though it is at one hundred miles diſtance. The middle of the mountain is planted with firs, and other trees, and the vallies beneath abound with a variety of fruits, particularly apples, grapes, mulberries, melons, and nuts. Fleſh, fiſh, and fowl are no where more plentiful than at Burſa, and the fields around it would produce all manner of corn were they cultivated; but the tyranny of the Turkiſh government makes them ſow little more more corn than is neceſſary for their own immediate uſe.

Thus we have given a view of the whole continent of Aſia, the great ſcene of action in the firſt ages of the world, and once the ſeat not only of the moſt mighty empires, but of the arts and ſciences. From the ruins that

that have been described, and from the antient histories of these countries we may form some idea of the magnificence of their cities and temples, which exceeded in splendor every thing of the kind produced by the moderns in Europe; but this splendor and magnificence is no more, and while we judge of it from its ruins, we have reason to be humbled when we consider the instability of all human affairs, which involves in it not only the destruction of arts, but of cities erected with the most durable marble, that seem to have been founded with the expectation of continuing their grandeur to the latest ages, and of empires raised by valour, and supported by the utmost efforts of human policy.

The arts and sciences are now removed to Europe, and some of them are arrived to much greater perfection than ever they were known in the East. May these ever flourish! and while they are protected by moderate governments, founded on reason, and conducted by humanity and virtue, we may justly flatter ourselves they will never decay. It is not the religion of Mahomet or of Paganism that has banished the arts, depopulated countries, and converted the most fertile lands into barren desarts and uncultivated wilds; but savage ignorance, the lawless tyranny of despotic power, the lust of ambition, and those national vices, that degrade the human mind, and call down the resentment of offended heaven.

Indeed, governments founded on the mild laws of Christianity have a more solid basis; and where it shall prevail in all its purity, liberty and the arts shall go hand in hand; the thrones of princes will be as immoveable as the rocks and mountains; ambition will be confined within the bounds of equity; mankind will consider each other as brethren, and the law of nations will be the invariable law of nature and humanity.

CHAP. XXVIII.

Of the ASIATIC ISLANDS subject to the TURKS.

SECT. I.

Of the Island of CYPRUS.

Its Situation, Extent, Climate, and Produce; with a concise Account of the Revolutions that have happened in its Government; of its most considerable Cities, and the Poverty of its Inhabitants.

THE island of Cyprus has been famous in all ages for the fertility of its soil, the excellence of its climate, and the advantages of its situation. It lies between the thirty-fourth and thirty-sixth degree of north latitude, and between the thirty-third and thirty-fifth degree eight minutes east longitude. It is sixty-nine miles south of the coast of Caramania or Cilicia, and thirty-six west of the coast of Syria. This island stretches from the south-west to the north-east, and is about one hundred and fifty miles in length, and seventy in breadth in the broadest part.

This island was in ancient times consecrated to Venus, who was stiled by the poets the Cyprian goddess, probably from the wantonness of its inhabitants. The longest day is fourteen hours and a half, and the weather in summer is extremely hot, so that sometimes their brooks and even their rivers are dried up. It is said, that in the reign of Constantine the Great, this island had no rain for thirty-six years together, on which account it was in a great measure deserted.

It abounds with corn, wine, oil, sugar, honey, cotton, allum, wool, verdigris, turpentine, all sorts of metals, and most excellent salt. They have likewise several kinds of earth fit for the use of the painters, particularly red, yellow, and black; but with these advantages they are subject to swarms of locusts, which visit them in the hot season, appearing at a distance like clouds; and were they not driven into the sea by a north wind, which happens about that time, would devour all the fruits of the earth: they have also great plenty of flesh, fish, and fowl.

This island was antiently governed by kings, and it had nine of them when it was reduced by Cyrus, who rendered them all tributary to himself. Long after this the island was conquered by Alexander the Great, and upon the division of his empire, it fell to the share of Ptolemy king of Egypt, under whose successors it remained, till the Romans, without any colour for invading it, sent Portius Cato to reduce it under their power, which he accomplished and brought back to Rome the spoils of the island, which amounted to seven thousand talents. After the division of the Roman empire, it belonged to the Greeks; from whom it was taken by the Saracens, but was recovered from them and governed by dukes or princes. In 1191 it was conquered by Richard I. king of England, who putting in here for fresh water in his voyage to the Holy Land, met with a very hospitable reception; in return for which he subdued the island, and transferred his right to it to Guy Lusignan, the titular king of Jerusalem, whose family held it for many generations. Under these princes it was divided into twelve counties, containing forty-eight great towns, and upwards of eight hundred villages. The Venetians obtained the possession of it in 1473, and kept it almost an hundred years; but it was at last taken from them by Soliman II. emperor of the Turks, after a long and brave defence.

The capital of the island, named Nicosia, was formerly the residence of their kings, as it is now of the beglerbeg or viceroy. It stands near the middle of the country, and is about three miles in circumference; but is fallen to decay since its being in the power of the Turks. The cathedral, which was dedicated to St. Sophia, is converted into a Turkish mosque. In the city are three or four Greek churches, and it is still the see of an archbishop, who has three suffragans under him; these are the bishops of Larneza, Cerenes, and Batto. The Latins and Armenians have also several churches there.

The other towns most worthy of notice are,

Famagusta, the antient Salamis, a port town on the east part of the island. It had a good harbour defended by two forts, which are opposite to each other; but it is now almost choaked up, and has consequently lost its trade. In the year 1570 it was taken from the Venetians by the Turks after a vigorous defence, and a siege which lasted six months; when, though the place surrendered on honourable conditions, the cruel conquerors, barbarously flayed the Venetian governor alive, and murdered the inhabitants in cold blood.

Paphos, now called Baffo, is situated at the west end of the island, and is a large and agreeable place. There are considerable ruins near the port, particularly some broken columns, which probably belonged to the temple of Venus.

In short, though this island has several good ports; and though it affords all the commodities that can be desired for carrying on a great trade, it is at present thinly peopled, and not half cultivated. Long ago a Turkish basha destroyed all the sugar-canes, to prevent the Cypriots growing too rich; an evil which there is now no reason to fear; for at this day it affords the cleareſt proof how much a bad government can defeat the kind intentions of nature; since, in spite of all the advantages that a country can possibly have, there never was a more dis-

mal or desolate place than this island is at present. From having some millions of people, it has now scarce thirty thousand: from a climate that produced a perpetual spring, it is become both unwholsome and unpleasant: from cities and towns that extended to each other, there are only villages and heaps of ruins; and from the greatest affluence, the inhabitants are reduced to penury. Thus the face of modern Cyprus seems to refute all that the ancients have said in its favour. Such are the dire effects of an arbitrary and despotic government!

SECT. II.

Of the Island of RHODES.

Its Situation, Extent, Climate, Soil, and Produce: with a Description of the City of Rhodes, the Capital of the Island, and of the famous Colossus.

WE shall next proceed to Rhodes, which is situated between the thirty-sixth and thirty-seventh degrees of north latitude, about two hundred and fifty miles to the westward of Cyprus, and not above twenty to the south-west of Natolia. It is about forty miles in length, and fifteen in breadth, and has formerly had the names of Ethræa, Asteria, Corymbia, and some others.

The air is good, and the soil fertile; but, as in other places subject to the Turks, is badly cultivated. The country is exceeding pleasant, and is cloathed with trees and herbage always green; a day scarce ever happens in which the sun does not shine out. Their wines are much admired, and the country affords such plenty of almost every thing that can render life agreeable, that it gave occasion to the fiction of its having golden showers. It does not indeed abound with corn, but then the inhabitants are well supplied with it from the neighbouring continent of Natolia.

This island was subject to the Greeks, from whom it was taken by the Saracens; but in 1309 the knights hospitallers of Jerusalem took it from them and held it above two hundred years, during which they resisted the whole Turkish power: but at last it was taken by the Turks under Soliman II. in 1522, by the treachery of Andrea d'Amaral, chancellor of the order; who, being displeased at not being chosen grand-master at a late election, informed the Turks of their weakness by a letter shot to them on an arrow.

In the island is one town of the same name, and several villages that are well inhabited. The city of Rhodes is situated on the north-east part of the island, and has two harbours; but that called the great port is not very safe when the wind is easterly. On the right at the entrance of this port is a tower, built by the Turks, in the place where the old tower of St. Nicholas stood. It is well furnished with cannon, has a curtain which reaches to the walls of the town, and a bastion behind it. Opposite to this tower is the castle of St. Angelo, which is somewhat ruinous.

This castle and tower were erected in the place where stood the feet of the great Colossus, one of the seven wonders of the world, which was so large that a ship under sail might pass between its legs. This statue, which was of such an enormous size as thus to straddle fifty fathoms, represented Apollo, and was cast entirely of brass by Chares of Lyndus, a town in the isle of Rhodes, who was twelve years in making it; it was seventy cubits high, and every part being in proportion, the thumb was as thick as a man could grasp in his arms; every finger was of the size of an ordinary statue, and, for the direction of vessels into the harbour at night, he held a light-house in his hand. This prodigious statue was thrown down by an earthquake fifty or three score years after its being erected, and is said to have lain on the ground till the Saracens made themselves masters of Rhodes, who having beaten it to pieces fourteen hundred and sixty-one years after it was made, sold it to a Jew; who having carried it by sea to Alexandria, in 954, there loaded nine hundred camels with the metal. But after all, Du Mont has endeavoured to prove, that it is probable, the story of the Colossus is a fable; some other authors have been of the same opinion, and indeed the extravagant dimensions ascribed to it, and such a quantity of brass being suffered to lie on the ground for so many ages, would tempt the most credulous to doubt the truth of the relation.

The port of the gallies, which is covered by the castle of St. Erme, is a good harbour; but its mouth is so narrow, that only one galley can enter at a time. On the sides of this port is a piazza, with some trees and a fountain, and at the bottom of it is the arsenal, where the gallies and saics are built. A little above the port is a burying-place, in which are fifteen or twenty domes of free-stone, well built, and most of them supported by four arches. These were the sepulchres of the beys, or other persons of distinction in Rhodes, who had been killed in the wars.

Part of the city stands on the rising of the hill, and it is three miles in circumference. It has high walls planted on the top with salions, and below are port-houses for great cannon. It has three gates; one to the sea where corn is sold, and two on the land-side. The streets are broad, straight, and well paved with small stones, and for the most part covered on each side with penthouses; but the largest is paved in the middle from one end to the other with marble. It has several handsome buildings, among which is St. John's church, which is turned into a mosque. There are still to be seen the apartments of the knights of St. John of Jerusalem, and the palace of the grand master; but they are very much decayed. This palace is seated on the highest part of the hill, and is now converted into a prison.

The inhabitants consist of Turks, Jews, and Christians; but the latter have only shops within the walls, and are obliged to have their dwellings without the city, and to retire there every night.

SECT. III.

Of the Island of LESBOS, *or* MYTELENE.

Its Situation, Extent, Climate, and Produce. Of Castro, its present Capital, and of the great Men who have rendered this Island famous.

THE island of Mytelene, antiently called Lesbos, is situated in the Archipelago, and extends from thirty-seven to thirty-nine degrees fifteen minutes north latitude, and is about fifty miles in length and twenty-five in breadth. Part of it is mountainous, cool, and covered with trees; and there are many fertile plains which produce good wheat, excellent oil, the best figs in the Archipelago, and its generous wine, which was commended by Aristotle and Horace, still preserves its reputation. The sea affords plenty of fish, especially oysters, which are sent from hence to Smyrna.

This was a very considerable island in the time of the Romans; for Cicero and Vitruvius speak much of its magnificence; and indeed fragments are every where to be seen of its antient grandeur, as broken columns, chapiters, bases, friezes, and the like, of the finest marble, curiously wrought, and interspersed with inscriptions.

The women of the island have always been noted for their freedom and the looseness of their manners; but, though they are not now so bad as they were formerly, they go with their breasts quite naked.

The chief town, named Castro, and antiently Mytelene, is situated on a rocky promontory in the north part of the island, and has two ports. The town is neither large nor well built, but has a castle, with a strong garrison for the defence of the island against pirates, who are very numerous in these seas; and there are above a hundred villages in the country.

Few islands have produced men of greater genius; but all their lectures of philosophy, it seems, were far from reforming the morals of the people; for it was a proverbial saying in Greece, when speaking of a profligate fellow, that he lived like a Lesbian. Theophrastus and Phanios, the disciples of Aristotle, and the famous Arion, who is said to charm the dolphins with his music, with Pittacus, one of the seven wise men of Greece, and Sappho, the celebrated poetess, were natives of this island.

The

The famous Epicurus read public lectures here; and Ariſtotle, with other great men, reſided here a conſiderable time. It is now ſubject to the Turks, and a cadi, who reſides at Caſtro, has the civil adminiſtration of the government, while an aga of the janizaries has the command of the ſoldiers.

SECT. IV.

Of the Iſland of CHIOS, *or* SCIO, *called by the Turks* SAKI SADUCI.

Its Situation, Extent, Soil, and Produce. The Perſons, Dreſs, and Manners of the Inhabitants. Of the city of Scio, and its being taken from the Turks by the Venetians, and conquered back from them by the Turks; on which the Latins, being charged with favouring the Venetians, were deprived of their Privileges. Of the other Towns and Villages, with the Manner of extracting Maſtic from the Lentiſk-Tree. An Account of Neamoni, a rich Monaſtery of Greek Monks. Of the pretended School and Houſe of Homer.

CHIOS, or Scio, is one of the moſt beautiful and pleaſant iſlands in the Archipelago. It is ſituated near the coaſt of Natolia, to the north-eaſt of Samos, and to the ſouth of Mytelene, and extends from thirty-eight degrees eight minutes to thirty-eight degrees thirty-ſeven minutes north latitude. It is thirty-two miles in length, and fifteen in breadth.

The iſle of Chios is very ſubject to earthquakes; it is extremely mountainous and ſtoney, and has ſo little rain, that every ſpring the Greeks, Latins, Jews and Turks make proceſſions in order to obtain it: yet it has been called the Paradiſe of Greece; for the mountains, which are now pretty bare, were formerly covered with woods, and in ſome places they ſtill abound with abundance of citron, orange, olive, mulberry, myrtle, and pomegranate trees, without reckoning maſtic and turpentine.

The country produces corn, but not ſufficient for the inhabitants, who therefore import it from time to time from the continent; but as for wine, Chios has enough and to ſpare, and therefore conſiderable quantities are exported to the neighbouring iſlands. It is pleaſant and ſtomachic, and Athenæus ſays, that the wines of Scio help digeſtion, are wholeſome, and exceed all other wines in deliciouſneſs of taſte.

The inhabitants, ſays Tournefort, plant their vines on the hills: they cut their grapes in Auguſt, and having ſuffered them to dry for ſeven or eight days in the ſun, they preſs them, and let them ſtand in tubs to work; the cellars being all the while cloſe ſhut. In making the beſt wine they mix among the black grapes a ſort of white one, which ſmells like a peach kernel; but in making nectar, which is ſo called even to this day, they make uſe of another kind of grape ſomewhat ſtyptic.

In ſhort, there is ſuch plenty, that every thing is extremely cheap, and excellent partridges may be had for a trifle, as they keep them tame, and have keepers who drive them out in the morning, and whiſtle them in at night, which call they always obey.

The men are tall and well ſhaped, but have very diſagreeable countenances: but their women are beautiful, and their faces extremely fair. Mr. Thevenot, however, obſerves, that their breaſts are ſcorched with the ſun; which, he ſays, is the more ſurpriſing, as they take as little care of the face as of the breaſt. They are neat in their dreſs, wearing very white linen, and the fineſt ſtuffs they can get; but are not permitted to wear gold, ſilver, or jewels.

Their vivacity, wit, and good humour, are great additions to their natural charms. They are extremely talkative, and both ſexes are fond of dancing: on Sundays and holidays they dance promiſcuouſly all night, both in the cities and villages, and freely allow ſtrangers to join with them. They are ſo far from being jealous, that the women ſtand at the doors and talk with the men who paſs by, and will be as merry and familiar with ſtrangers as if they had been long acquainted. Even the women of diſtinction go to market to buy proviſions, and carry them home openly through the ſtreets.

The city of Scio is large, and the beſt built of any in the Levant. The houſes are handſome and commodious; ſome of them are terraced, and others covered with tiles: for the Chiots have retained the Geneoſe method of building; that people having embelliſhed all the towns of the Eaſt where they have been ſettled.

The caſtle is an old citadel, built on the edge of the ſea, and is ſaid to be garriſoned by fourteen hundred Turks. It is defended by round towers, and an indifferent ditch; and on the inſide there are only ſome cluſters of houſes inhabited by the Turks, and a neat moſque.

The port of Scio is a place of rendezvous for all the ſhips that either ſail to Conſtantinople, or from thence into Syria and Egypt; yet the harbour is none of the beſt, for at preſent it has only a very indifferent mole, built by the Genoeſe, level with the ſurface of the water. The entrance is narrow and dangerous on account of the rocks, which are but juſt covered, and could ſcarcely be avoided, was it not for a light-houſe.

Before we leave this city, it is proper to obſerve, that Antonio Zeno, captain-general of the Venetian army, came before the town on the twenty-eighth of April, 1694, with fourteen thouſand men, and attacked the caſtle from the ſea, the only place of ſtrength in the iſland, when it held out no more than five days, though it was defended by eight hundred Turks, ſupported by above a thouſand men well armed, who might have thrown themſelves into it without the leaſt oppoſition on the land-ſide: but the next year the Venetians loſt it with as much expedition as they had before obtained it. Their terror was ſo great, that they left behind them their ammunition and cannon; and their troops fled in ſuch diſorder, that it is a common ſaying in the iſland, that the ſoldiers took every fly for a turban.

The Turks entered it as a conquered country, and the Greeks throwing all the blame on the Latins, they were from thenceforward forbid to wear hats, and obliged to quit the Genoeſe habits, which they had worn till that time: they were likewiſe ordered to alight from their horſes at the city gate, and to ſalute with the greateſt reſpect the meaneſt Muſſulman. Before this event the Romiſh prieſts bore the hoſt to the ſick in full liberty at noon-day; the proceſſion of Corpus Chriſti was made with all its formalities, the clergy walking in their proper habits, under canopies, and bearing cenſers in their hands; in ſhort, the Turks uſed to call this iſland *Little Rome*: for, beſides the churches in the country, the Latins had ſeven in the town: but, upon this change, the cathedral, and the church of the Dominicans were converted into moſques; the church of the Jeſuits was turned into an inn: thoſe of the Capuchins and the Recollects, the lady of Loretto, and that of St. Anne, are all pulled down. The Capuchins had alſo within five hundred paces of the town the church of St. Roch, and this has ſhared the ſame fate with the reſt. The Latin biſhop was forced to fly to the Morea, and the prieſts who remained behind were made ſubject to the capitation-tax, but were afterwards exempted on the application of the French.

The Greek biſhop remains in the ſame circumſtances as before the enterprize of the Venetians, having no leſs than three hundred churches under him, and the iſland is full of chapels; their monaſteries and nunneries alſo enjoy large revenues. The moſt conſiderable of the former is that of Neamoni, or the New Solitude, which is ſituated above five miles from the city, and annually pays five hundred crowns capitation-tax to the Turks. This monaſtery is very ſpacious, and built in the form of a caſtle. No woman is allowed to enter it. There are commonly a hundred and fifty Greek monks under the government of an abbot, and they are never to exceed two hundred. When any places are vacant, thoſe who are willing to ſupply them muſt pay a hundred piaſters, and come with their whole eſtates into the convent, where they may enjoy them for life, and then the eſtates muſt be left to the convent, unleſs any one has a kinſman who will become a monk, in which caſe one-third may be given to him, on condition that at his death that muſt alſo go to the convent. They there live every day upon black bread, bad wine, and rotten cheeſe; and if they have any thing elſe, they muſt procure it for themſelves;

ſelves; and indeed ſome live well on their eſtates, and keep a horſe to ride out for pleaſure. However, on feſtivals and Sundays they eat all together in their hall or refectory. This monaſtery is ſaid to be endowed with an eighth part of the revenue of the whole iſland, and ſome ſay much more, having no leſs than fifty thouſand crowns annually paid them in money.

This monaſtery ſtands on a little hill in a very ſolitary place, ſurrounded by rugged mountains and precipices; the Greeks always pitching upon ſuch ſituations for their religious houſes, quite contrary to the Catholics, who place their monaſteries in the moſt deſirable ſituations. The church of this convent is, however, eſteemed one of the beſt in the Levant, and is ſaid to be adorned with thirty-two columns, whoſe ſhafts and capitals are of jaſper dug in the iſland. It has alſo many paintings; but they are badly executed, and make a very diſagreeable appearance, in ſpite of the gilding with which they are covered.

As to their nunneries, they are very different from thoſe of the Chriſtians in Europe. Mr. Thevenot entered one of them, where he ſaw both Chriſtians and Turks; and having entered the chamber of one of the ſiſters, he ſays he found her kind even beyond the bounds of Chriſtian charity. Theſe nuns purchaſe a chamber on their being admitted into the houſe: they go abroad when they pleaſe, and may leave the convent if they think fit. They are uſually employed in embroidery in gold, ſilver, or ſilk, in which the Greeks are very ſkilful, and the flowers they work upon their handkerchiefs and purſes are very beautiful.

The iſland of Chios, beſides the capital, contains ſixty towns and villages, the principal of which, named Cordomolo, has about five hundred inhabitants. The country round it is very fertile and well watered, yielding annually about a hundred and ſeventy tons of wine.

At five miles diſtance is a fine valley, half a mile long, where is a ſpring of water to which there was a deſcent of twenty-five beautiful marble ſteps, but theſe are all removed; and at the end of the valley was formerly a temple of fine aſh-coloured marble, but it has been pulled down, and the ſtones broken, only for the ſake of the iron and lead uſed in joining them together.

Beyond this valley is Vichi, a village inhabited by three hundred perſons; and beyond it is Cambia, which has an hundred inhabitants, and is ſurrounded by rocks, hills, and woods of wild pine-trees, which they ſell for timber to build gallies.

In a valley below this laſt village ariſes a rock that is almoſt inacceſſible, and on the top of it is a ſmall caſtle, oppoſite to which is the Mount of St. Elias, the higheſt place in the iſland; for it may be ſeen from Tenedos, which is above an hundred miles diſtant. On its top is a church dedicated to St. Elias, which is uſually covered with miſt and ſnow; and in the middle of the mountain is a large ſpring that waters the ſurrounding fields, which are planted with a variety of fruit-trees.

Voliſſo is a conſiderable village, ſeated on a hill, and contains about three hundred houſes. It has a caſtle built by the famous Beliſarius, general to the emperor Juſtinian, who was forced on ſhore by a ſtorm. The adjacent country is very pleaſant and fertile, and the inhabitants annually raiſe five thouſand pounds weight of ſilk.

There are twenty-two villages in the iſland that cultivate lentiſk trees, from whence maſtic is produced. They begin to make inciſions in thoſe trees on the firſt of Auguſt, cutting the bark croſs-ways with very large knives. Next day the nutritious juice diſtils in ſmall tears, which by little and little form the maſtic grains; for they harden on the ground, and are carefully picked up from under the trees. The height of their harveſt is in the middle of Auguſt. They indeed make other inciſions towards the end of September; but the trees then afford maſtic in ſmaller quantities. They ſift this gum, to clear it from the duſt. Theſe villages are ſaid to produce about one hundred thouſand cheſts of maſtic, of which three hundred cheſts of one hundred weight each are annually paid to the Grand Signior. This maſtic is allowed to be the beſt in the world. It is a white gum which enters into the compoſition of many ointment and is chewed by the Greeks to whiten their teeth a ſweeten their breath. The ſultanas conſume the greate part of that deſigned for the ſeraglio; they chew it b way of amuſement, and to give an agreeable ſmell t their breath, eſpecially in a morning faſting; they al put ſome grains of maſtic in perfuming-pots, and in their bread before it goes to the oven. In ſhort, it eſteemed beneficial in diſtempers of the ſtomach; it ſtop bleeding, and fortifies the gums.

The principal of theſe maſtic towns is Callimach which has two gates, ſix Greek churches, and a nunner It is well peopled, and round it are ſaid to be thirt churches belonging to the Greeks.

After mentioning the maſtic, it will be proper to tak notice of the turpentine tree, which grows here witho culture on the borders of the vineyards, and by the high way ſide. It is about as tall as the lentiſk tree, and has reddiſh leaf. They wound the trunk with a hatchet, be tween the months of July and October, on which the tur pentine flows down on a flat ſtone ſet under the trees t receive it. This liquor is an excellent natural balſam, an a noble ſtomachic.

Of their figs they make a kind of brandy, of which the export great quantitities to the neighbouring iſlands.

The olives of Scio, when they have a very good crop do not produce above two hundred hogſheads of oil.

Their ſilk is a more valuable commodity, for they an nually raiſe from the worm about thirty-thouſand pound weight of ſilk, which is moſt of it uſed in the iſland i the manufactures of damaſk, taffety, ſattin, velvet, an other ſilk ſtuffs, with ſome of which they mix gold an ſilver. With theſe they carry on a conſiderable commerc to Egypt, and the maritime cities of Natolia and Barbary but they are ſaid to be ſo very ſharp and diſhoneſt in thei dealings, that a ſtranger ought to have all his wits abou him to avoid being cheated.

This iſland has produced many extraordinary men, an the Chiots not only pretend that Homer was their coun tryman, but ſtill ſhew his ſchool, which is at the foot o mount Epos, by the ſea-ſide, about four miles from th city of Scio: it is a flat rock, in which they have hewn kind of round baſon, twenty feet in diameter, the edg made ſo as to ſit upon. From the middle of this baſo riſes a ſquare ſtone about three feet in height, and two fee eight inches broad, on the ſides of which were antientl carved certain animals, which are now ſo diſfigured tha it is impoſſible to know what they were deſigned to repre ſent, though ſome fancy they bear the reſemblance o lions. Upon this ſquare ſtone the maſter was ſuppoſed t ſit in the midſt of his ſcholars.

Beſides Homer's ſchool they ſhew his dwelling-houſe where he compoſed moſt of his poems, which, no doubt muſt be in a very ruinous condition, as Homer lived nin hundred and ſixty-one years before the birth of Chriſt. I ſtands in a place which bears that poet's name, in th north part of the iſland, near the fields which produc the wine called nectar. But it is very uncertain whethe Homer was a native of Scio, as ſeven great cities con tended for the honour of his birth, which he ſeems t have induſtriouſly concealed.

Learning is, however, now out of uſe, and the peo ple in general are involved in the moſt profound ignorance Thoſe in affluent circumſtance ſit whole days talking un der the trees. They are alſo fond of pleaſure, and are ap to drink to exceſs.

In the whole iſland there are not above ten thouſan Turks, and three thouſand of the Latins: but the Greek are ſaid to amount to one hundred thouſand.

With reſpect to the government of the iſland, it is i time of peace under a cady, or civil magiſtrate; but i war the forces are commanded by a baſha. An aga of th janizaries, with an hundred and fifty men of that body alſo reſides there in time of peace, and with double tha number in time of war.

There are three degrees of Greeks in this iſland, wh are differently taxed; thoſe of the firſt rank pay an nually ten crowns a head, the next three crowns, and th meaneſt two crowns and a half a head. The Greek are allowed to chuſe twelve of their own number in th city

…, to regulate the other taxes, and to preſide over the …munity; and in each village there are ſix choſen, who …de moſt of their differences, ſo that they ſeldom refer …ir affairs to the deciſion of the cady.

SECT. V.

Of the Iſle of SAMOS.

Its Situation, Extent, Climate, Soil, Minerals, Vegetables, and Animals. The Number of the Inhabitants, and the Nature of their Government.

THE iſland of Samos is ſituated in the Archipelago over-againſt Epheſus, and not above ſix miles from the continent of Natolia. It extends from thirty-ſeven degrees forty-five minutes to thirty ſeven degrees fifty-ſeven minutes north latitude, it being about thirty-tow miles in length and fifteen in breadth.

The air of this iſland is generally healthful, except in the low marſhy grounds; and it is obſerved here, as in moſt other iſlands of the Levant, that they have ſeldom any rain, thunder, or tempeſtuous weather, except in the winter; while in our climate we have moſt thunder, and the heavieſt ſhowers in ſummer. A chain of mountains extends through the middle of the iſland from eaſt to weſt. Theſe were formerly called Amphelos, from moſt of the mountains being of white marble; but they are covered with a ſtrata of earth of ſuch depth, as to produce trees and plants, and are watered by fine ſprings. The moſt conſiderable of theſe ſtreams is that of Metelinous, which flows ſouthward into the ſea. In the low lands are iron mines, oker, and emery.

The port of Vati on the north part of the iſland is ſo capacious as to be able to receive a large fleet, and is juſtly eſteemed the beſt in the iſland.

The port of Seitan is on the weſt coaſt, and that of Tigani on the ſouth. This laſt was the port of the ancient city of Samos.

This iſland is incumbered with mountains, rocks, and precipices, but the plains are fertile and pleaſant; and the mountains are covered with two ſorts of pines, the one a beautiful kind which riſes to a great height, and is fit for maſts, and yields a great quantity of turpentine. The others are of the common ſort.

The country produces corn, and abundance of excellent muſkadine grapes, apples, melons, pomegranates, olives, mulberry-trees, lentils, kidney-beans, and white figs, four times as large as the common ſort, but not ſo well taſted: their ſilk is very fine, and their honey and wax admirable.

The horſes and mules of Samos are ſerviceable, but are not admired for their beauty. The inhabitants have conſiderable herds of oxen, ſheep, goats, and hogs, with hares, and other game in great plenty.

This iſland alſo abounds with wild fowl, as woodcocks, ſnipes, partridges, turtle-doves, wood-pigeons, wheat-ears, and thruſhes; beſides which their poultry are excellent.

The preſent inhabitants of Samos are computed to amount to twelve thouſand men, almoſt all of whom are Greeks, except the cady, the aga, and his lieutenant, who are chiefly concerned in levying the Grand Seignior's duties; for with reſpect to the civil government and the adminiſtration of juſtice, the Greeks of the ſeveral towns and villages are allowed to chooſe their own magiſtrates. The Samians live at their eaſe, and enjoy greater freedom than the Chriſtians in any other part of the Turkiſh dominions. There are about two hundred papas or prieſts in the iſland, and a much greater number of monks, who have three monaſteries. There are alſo four nunneries and above three hundred private chapels. The biſhop of the iſland reſides at Cora, and has a revenue amounting to about two thouſand crowns per annum.

The chief town is Cora, which is ſituated on the ſouth ſide of the iſland within two miles of the ſea, adjoining to the ruins of the antient city of Samos. It ſtands in a fertile pleaſant country, but is not very healthful, becauſe the waters, which formerly diſcharged themſelves into the ſea, now ſtagnate in the plain. This town contains about ſix hundred houſes, but many of them are uninhabited.

The city of Samos is entirely deſtroyed. The north part of it ſtood upon a hill, and the other ran along the ſea-ſhore from port Tigani, which is two miles from Cora, to cape Juno. Tigani was the galley port of the antients, and was built in the form of an half-moon; on the left horn of which was the famous pier, which Heredotus eſteems one of the three wonders of Samos, it being twenty fathoms in height, and carried above two hundred and fifty paces into the ſea. From this port begins the walls of the upper town on the declivity of a rugged mountain. The ruins of theſe walls ſhew that they were very magnificent, they being ten or twelve feet thick, with marble towers at proper diſtances.

The brow of the mountain next the ſea was covered with buildings in the form of an amphitheatre, and a little lower may ſtill be ſeen the place where the theatre ſtood.

On deſcending from the theatre towards the ſea, you ſee a multitude of broken columns, ſome fluted and others plain, lying in ſuch order as evidently ſhew that they once ſupported temples, or formed porticos.

The city appears to have taken up in breadth all the fine plain between Cora and the ſea, which is upwards of two miles in length, and to have extended as far as the river which runs beyond the ruins of Juno's temple, which, according to Strabo, was filled with pictures and ſtatues, among which were the loves of Jupiter and Juno. Water was brought to the city from the head of the river Metelinous, by a noble aqueduct cut through a mountain with great labour and art.

The moſt conſiderable town in the iſland next to Cora, is Vati, already mentioned, which is ſituated on the north ſide of the iſland, on the deſcent of a mountain, within a mile of the port, and contains about three hundred houſes, with five or ſix chapels, all of which are very ill built. Beſides, there are ſeveral large villages ſcattered through the country.

Beſides theſe towns there are ſeveral large villages, the chief of which are Poleocaſtro, Maratrocampo, Carlovaſſo, Caſtania, Fourni, Pyrgos, Platano, and Comaria.

SECT. VI.

Of NICARIA, *or* ICARIA, *and* STANCHIO, *or* ISOLA LONGO, *formerly called* COOS.

Their Situation, Extent, and the Face of the Country. Their Produce and Antiquities.

OPPOSITE to Samos is the little iſland of Nicaria, antiently called Icaria from Icarus, the ſon of Dædalus. It extends from twenty-ſeven degrees to twenty-eight degrees forty minutes north latitude, and is full of rocks, in which the inhabitants dwell in caverns. Theſe, who are very poor and ill cloathed, are of the Greek communion, and amount to about three thouſand. They apply themſelves to ſwimming and diving for ſpunges, and for ſuch goods as are loſt by ſhipwrecks. The richeſt men in the iſland, ſays Mr. Thevenot, give their daughters to the beſt divers, who are tried before the maid and her father, and he who remains longeſt under the water wins her. The Grand Seignior's tribute is paid in ſpunges. They have vineyards among the rocks, and of the grapes make a ſort of white wine as clear as water, which paſſes by urine as ſoon as it is drank. With this wine, and with wax and honey, they trade to Chio. The inhabitants are ſtrong and well-ſhaped, but the ſame author adds, the women are miſtreſſes; and as ſoon as the huſband arrives from any place in his boat, the wife goes to the ſea-ſide, takes the oars and carries them home, after which the huſband can diſpoſe of nothing without her leave.

The Greek emperors of Conſtantinople baniſhed thoſe perſons of quality who had offended them, to this iſland.

Stanchio, or Iſola Longo, formerly called Coos, is ſituated to the north-weſt of Rhodes about ſeventy miles to the ſouth of Samos, in thirty-ſeven degrees twenty-ſeven minutes north latitude, and is about eighty miles in circumference.

This iſland affords an agreeable proſpect on approaching it; for it is in general a fine level country, riſing gradually into hills towards the eaſt, from whence ſeveral ſmall rivulets fall into the plain, and render it extremely fertile. The wines of this iſland were admired by the perſons of nice taſte in antient Rome. Here are alſo a great number of cypreſs and turpentine trees, with many other beautiful and medicinal plants.

Mr. Thevenot mentions a cypreſs-tree in this iſland of ſuch prodigious extent, that two thouſand men might ſhelter themſelves under its branches, which were ſupported by pillars, and under their ſhadow were barbers ſhops, and places of refreſhment where people met to regale themſelves in the open air.

Stanchio has one large town, which is of the ſame name with the iſland: it has a good harbour, and is [illegible] a caſtle. Here the Turkiſh gallies frequently [illegible] their ſhips touch in their paſſage from Conſ[illegible] Egypt.

In this iſland there antiently ſtood a temple dedica[illegible] Æſculapius; and it was alſo famous for giving [illegible] Hippocrates, Ariſton, and ſeveral other emine[illegible] ſicians and philoſophers; and particularly to the [illegible] brated painter Apelles, who drew the famous p[illegible] Venus riſing naked from the ſea, which being place[illegible] of the principal temples in the iſland, was from [illegible] carried to Rome and dedicated to Ceſar; that [illegible] being eſteemed the mother of the Julian family. [illegible] this account, it is ſaid, the Coans were freed from a [illegible] part of their annual tribute.

Moſt of the preſent inhabitants are Greeks, except [illegible] garriſon of the town and caſtle, who are Turks.

Theſe are all the iſlands worthy of notice in the [illegible] Aſia; and having now as fully conſidered that grand [illegible] of the earth as the nature and propoſed length of this [illegible] will admit, we ſhall carry our readers to Africa, [illegible] will afford new ſubjects of uſeful entertainment and [illegible] graphical knowledge.

A NEW SYSTEM OF GEOGRAPHY.

BOOK II.

Of AFRICA in general.

AFRICA, one of the four principal diviſions of the earth, is a peninſula of a prodigious extent, joined to Aſia only by the narrow iſthmus of Suez, between the Red Sea and the Mediterranean. It is bounded on the north by the Mediterranean Sea, which ſeparates it from Europe; on the eaſt by the Red Sea, which, with the above iſthmus, divides it from Aſia, and by the Eaſtern Ocean; on the ſouth by the Southern Ocean; and on the weſt by the great Atlantic Ocean, which ſeparates it from America.

Africa is generally repreſented as bearing ſome reſemblance to the form of a pyramid, whoſe baſe, from the iſthmus of Suez to Tangier, is about two thouſand miles; and its length, from the Cape of Good Hope, the top of the ſuppoſed pyramid, to the moſt northern part, is about three thouſand ſix hundred miles; and in the broadeſt part of the baſe, from Cape Verd to Cape Guardafeu, it is three thouſand five hundred: the whole extending in length from twenty-eight degrees ſouth to thirty-five degrees north latitude, and in breadth from thirty-three degrees eaſt to ſeventeen degrees weſt longitude from London.

As the equator divides this extenſive country almoſt in the middle, and the far greateſt part of it is within the tropics, the heat is in many places almoſt inſupportable to an European; it being there greatly increaſed by the rays of the ſun from vaſt ſandy deſarts. The coaſts, however, are generally fertile, and moſt parts of this region are inhabited, though they are far from being ſo populous as either Aſia or Europe. From what has been ſaid, the reader cannot expect to find here a variety of climates. In few parts of Africa ſnow ever falls in the plains, and it is generally never found but on the tops of the higheſt mountains; and the natives would as ſoon expect that marble ſhould melt, and flow in liquid ſtreams, as that water by freezing ſhould loſe its fluidity, be arreſted by the cold, and ceaſing to flow, become like the ſolid rock.

The arts once flouriſhed in Egypt, at Carthage, and in ſeveral other places in the north of Africa; but they are fled, and ſcarce in any place but Egypt is a ſtone left to proclaim the magnificent buildings that did honour to their ſkill in architecture. In the north of Africa commerce carried the bleſſings of nature to diſtant regions, and ſecured a friendly intercourſe of arts, of manufactures, and of the ſuperfluities of each country; but little commerce now remains, and the ſhips and gallies, inſtead of being employed in trade, are ſent out in ſearch of prey, to ſtrip the honeſt merchant of his treaſures, and enſlave thoſe whom they plunder. In ſhort, theſe unhappy people, inſtead of being humanized by Chriſtianity, which once ſpread its mild influence over a conſiderable part of theſe countries, hate the name of Chriſtian, and among them barbarity, ſuperſtition, and all the miſeries that flow from tyranny and deſpotic power, prevail.

All this, however, only relates to the north of Africa; all the reſt of that continent was long unknown to the moderns. The diſcoveries antiently made by the Carthaginians were forgotten, and the Portugueſe, who diſcovered the weſtern coaſt of Africa, were about ſixty years employed in that taſk before they reached the Cape of Good Hope in 1487, before which time it was entirely unknown to the Europeans; and indeed the inland parts of Africa are ſtill in a great meaſure undiſcovered.

The principal rivers in this part of the earth are the Nile, which dividing Egypt into two parts, diſcharges itſelf into the Mediterranean, the Marbea, Gondet, Barodus, Tafilet, Niger, Senegal, Gambia, the river of the Elephants, and ſeveral others which fall into the Atlantic Ocean; the river of St. Chriſtopher, of the Holy Ghoſt, St. Jago, Zebee, Magadoxa, and ſome others of inferior note, which empty themſelves into the Eaſtern Ocean; beſides ſeveral inland ſtreams. Its principal lakes are thoſe of Dambea, Zaſtan, and Zambre, or Zaire.

Africa has, however, a great ſcarcity of water, ſome large diſtricts being entirely deſtitute of that neceſſary element; and in ſome parts are vaſt tracts of light and barren ſands, which the wind ſometimes blows in ſuch prodigious quantities, as to bury whole caravans, and ſuffocate the unfortunate traveller.

Africa has likewiſe many high and extenſive mountains, the moſt remarkable of which are, 1. The Atlas, which had its name from a king of Mauritania, a great lover of aſtronomy, who uſed to obſerve the ſtars from its ſummit, on which account the poets repreſent him as bearing the heavens on his ſhoulders. Theſe mountains extend from the Weſtern Ocean to Egypt. 2. The mountains of the Moon, called by the Spaniards Montes Claros, which are ſtill higher than thoſe of Atlas. 3. Thoſe of Sierra Leona, or the mountain of the Lions, which divide Nigritia from Guinea, and extend as far as Ethiopia. Theſe were ſtiled by the antients The mountains of God, on account of their being ſubject to thunder and lightning; and 4. The Pike of Teneriffe, which

is

is ſaid to be ſtill higher than any of the reſt, and is ſituated on an iſland of the ſame name near the coaſt.

The whole continent of Africa is divided into the following ſtates and kingdoms. On proceeding from north to ſouth along the eaſtern ſide are,

I. Egypt.
II. Abyſſinia, or Upper Ethiopia, comprehending Nubia.
III. The coaſt of Abex and Anian.
IV. Zanguebar and Sofala.
V. Terra de Natal, and Caffraria, or the country of the Hottentots, which ſurrounds the Cape of Good Hope.

To the north of Caffraria, within land, are the countries of,

I. Monomotopa, and
II. Monomugi.

On doubling the Cape, from ſouth to north, are,

I. Mataman.
II. Benguela.
III. Angola.
IV. Congo.
V. Loango.
VI. Benin.
VII. Guinea.
VIII. Nigritia, and Zaara, or the Deſart.
IX. Biledulgerid.
X. Morocco.

On the North Coaſt, called the coaſt of Barbary, are,

I. Algiers.
II. Tunis.
III. Tripoly, and
IV. Barca.

The African Iſlands are divided into ſeveral claſſes.

On the eaſt coaſt of Africa are Zocotra, Babelmandel, the Comora Iſlands, Madagaſcar, Mauritius, and Bourbon.

The principal iſlands on the weſt of Africa, are St. Helena, the Cape Verd Iſlands, the Canary Iſlands, the Madeiras, and a few other iſlands of leſs note.

CHAP. I.

Of EGYPT.

SECT. I.

Its Name, Situation, Extent, and Diviſions. Its Climate and Soil; with a particular Deſcription of the River Nile, the Cauſe of its overflowing, and an Account of its Cataracts.

EGYPT, according to the poets, derived its name from Egyptus, the brother of Danaus, once ſovereign of the country. By the Hebrews and Arabs it is called Miſraim. It has alſo been known by the name of Coptus, the capital city of Upper Egypt; and by the Turks it is called El-kebit, or the over-flowed country.

Egypt being ſituated on the north-eaſt part of Aſia, is bounded on the north by the Mediterranean; on the eaſt by the iſthmus of Suez and the Red Sea, which divide it from Aſia; on the ſouth by Nubia; and on the weſt by the Deſart of Barca and the unknown parts of Africa. It is ſeated between the twentieth and thirty-ſecond degrees of north latitude, and between the thirtieth and thirty-ſixth degrees of eaſt longitude from London; and is therefore about five hundred and fifty miles in length from north to ſouth, and a hundred and twenty-five in breadth where broadeſt.

Egypt is generally divided into Lower, Middle, and Upper Egypt. The greateſt part of Lower Egypt is contained in a triangular iſland formed by the Mediterranean Sea and the two great branches of the Nile, which dividing itſelf five or ſix miles below Old Cairo, one part of it flows to the north-eaſt and falls into the ſea at Damietta, the antient Peluſium; and the other branch runs towards the north-weſt, and falls into the ſea at Roſetto.

We ſhall give a full account of theſe diviſions when we come to treat of the principal towns and antiquities of each.

The climate is in ſummer very hot, from its being ſituated between two ranges of mountains, and from the ſandy ſoil, on which the ſun ſhines with almoſt perpendicular rays at the ſummer ſolſtice; and even in winter the ſun ſhines with great heat towards the middle of the day, though the nights and mornings are then very cold; the ſharpeſt time is about the beginning of February. Near the ſea are ſometimes great rains from November to March; but at Cairo they have ſeldom any rain, except in December, January, and February, and then have only ſmall ſhowers for about a quarter of an hour. In Upper Egypt they have ſcarce any rain; and Dr. Pococke ſays, that when he was there, he was informed that it had been known to rain but twice very hard for half an hour in eight years. But rain in Egypt is eſteemed prejudicial, for the people imagine it produces ſcarcity, the water of the Nile being alone ſufficient for all the purpoſes of vegetation. They have thunder in ſummer without rain; and though earthquakes ſeldom happen, three great ſhocks were felt in January 1740, which overthrew ſeveral moſques and houſes.

The weſt and the north-weſt winds are thoſe that bring the rain; but the moſt frequent winds are thoſe from the north and ſouth: the ſouth-eaſt winds are ſometimes ſo exceſſively hot as to reſemble the air of an oven, and when they blow, people are obliged to retire to their vaults, and to ſhut themſelves cloſe up. This wind generally begins about the middle of March, and continues till May. It alſo ſometimes blows very hard from the ſouth-weſt, when it raiſes the ſand ſo as to darken the air and obſcure the light of the ſun, and the duſt then enters the chambers, beds, and cheſts, though ſhut ever ſo cloſe.

The north, antiently called the Eteſian wind, begins to blow in May, juſt before the riſing of the Nile, and greatly refreſhes the air, rendering the heat ſupportable, and bringing with it health and happineſs. It continues till November, and without this wind there would be no ſailing up the Nile after it riſes, on account of the rapidity of the currents.

Egypt has generally a ſandy ſoil, except where covered by the adventitious earth it has received from the overflowing of the Nile. The hills which bound it on the eaſt and weſt are of free-ſtone; but thoſe eminences on which the pyramids of Giza ſtand, are full of petrified ſhells; and there are ſome low hills eaſt of the Nile which conſiſt of heaps of large oyſter-ſhells, ſome petrified, and others in their natural ſtate.

The ſoil of Egypt is full of nitre, which, Dr. Pococke obſerves, occaſions vapours that render the evening air cold and unhealthful. On the ſmall lakes in the low grounds a cake of ſalt is left on the ſurface after the water has evaporated, which they carry away for domeſtic uſes. This nitre, and the ſediment of the water of the Nile, rend[illegible] Egypt ſo fruitful, that they ſometimes find it neceſſa[illegible] to temper it with common ſand. For within a mile of the mountains the country is ſandy, and lies upon an eaſy aſcent, which the Nile never reaches, and on the edge of it are many villages: but where the mountains extend four or five miles from the Nile,

Nile, there are villages in the mid-way between them and the river, built on eminences raiſed by art; and theſe being ſurrounded by water, during the flood, reſemble ſo many iſlands.

The river Nile, or Abanchi, which in the Abyſſinian tongue ſignifies The Father of Rivers, is generally agreed to have its ſources in eleven or twelve degrees of north latitude, and runs a courſe of about fifteen hundred miles for the moſt part from ſouth to north, and a little below Cairo, as hath been already obſerved, divides itſelf into two branches, one inclining to the eaſt, and the other to the weſt, and falls into the Mediterranean, the mouths being an hundred miles diſtant from each other. While the river is contained within the bounds of the ordinary channel, it is ſaid to be no broader at Old Cairo than the Thames at London; and in the drieſt ſeaſon of the year is in many places fordable.

The water is thick and muddy, eſpecially when the river is ſwelled by the heavy rains which conſtantly fall within the tropics in the beginning of our ſummer, which are doubtleſs the principal cauſe of its annually overflowing the low lands of Egypt. The antients, who were unacquainted with the climates in thoſe latitudes, were much perplexed when they endeavoured to account for this annual deluge. But this periodical inundation is far from being peculiar to the Nile, ſince this is the caſe with all the rivers which have either their riſe or courſe within the tropics: they annually break their bounds, and overflow the lands for many miles before they reach the ſea, particularly in Bengal, Tonquin, and Siam. They likewiſe leave a prolific mud, which, like that of the Nile, fertilizes the land; and though the waters of theſe rivers are alſo very thick, yet when they have ſtood for ſome time, they are neither unpalatable nor unwholſome. Beſides, the north winds, which begin to blow about the latter end of May, drive in the water from the ſea, and keep back that in the river in ſuch a manner as to raiſe the waters above.

The Egyptians, and eſpecially the Coptis, are perſuaded that the Nile always begins to riſe on the ſame day of the year, and indeed it generally begins to riſe on the eighteenth or nineteenth of June. From accounts of its riſe for three years, Dr. Pococke obſerves, that he found it riſe the firſt ſix days from two to five inches every day; for the twelve next days, from five to ten inches; and it thus continues riſing, till it has riſen to the height of ſixteen cubits, when the canal of Cairo is cut: after this it continues riſing ſix weeks longer; but then it only riſes from three to five inches a day; for ſpreading over the land, and entering the canals, though more water may deſcend than before, yet its riſe is leſs conſiderable; for after the opening of that canal, the others are opened at fixed times, and thoſe that water the lower grounds the laſt. Theſe canals are carried along the higheſt parts of the country, that the water may be conveyed from them to all the lower parts.

This river has, however, one thing that ſeems peculiar to itſelf. Other rivers being ſupplied by rivulets, the ground is loweſt near the banks: but as no water flows into the Nile in its paſſage through Egypt, and as it is neceſſary that this river ſhould overflow the land, the country of Egypt is generally lower at a diſtance from the Nile than it is near it; and in moſt parts the land ſeems to have a gradual deſcent from the Nile to the foot of the hills, that may be ſaid to begin at thoſe ſandy parts already mentioned, as being a mile or two diſtant from them, which, riſing towards the mountains in a gentle aſcent, are never overflowed.

Some of the moſt remarkable particulars in relation to the Nile, are its cataracts in Upper Egypt. Dr. Pococke and ſeveral other authors have viſited ſome of them; and the laſt mentioned divine, on approaching the firſt, ſays, that he never ſaw nature diſcover ſo rough a face as appeared in the country. On the eaſt ſide of the river nothing is to be ſeen but rocks; on the weſt the hills are either of ſand or black rocks; above to the ſouth there ſeems to be a high rocky iſland; higher up appear rocky cliffs on each ſide; and below, to the north, are ſo many rocks, that little of the water could be ſeen. The bed of the Nile is croſſed by rocks of granite, which in three places, at ſome diſtance from each other, divide the ſtream, and make three falls at each. The firſt he came to was the leaſt, and appeared not to exceed three feet: the ſecond, which is a little lower down the river, winds round a large rock, or iſland, forming two ſtreams. This iſland is to the north about twelve feet high, and it is ſaid that at high-water the Nile runs over it; but ſuppoſing the river to be then five feet higher below the rock, the fall will not exceed ſeven or eight feet. Farther to the weſt are other rocks, and a third ſtream, which has a greater fall than any of the others.

This account can enable us to form no idea of thoſe cataracts deſcribed by the antients, and even by ſome of the moderns, who inform us, that, under the twenty-third degree of latitude, the water of the Nile iſſues from ſeveral huge openings of a high rock into its bed below, falling two hundred feet with ſuch prodigious noiſe as to exceed that of the firing of cannon, or the loudeſt claps of thunder. The water in its fall reſembles a large white ſheet about thirty feet in breadth, which in its rapid deſcent forms a kind of arch, under which people may walk without being wet; and this ſeems, ſays our author, to have been formerly the amuſement of the neighbouring people, there being ſeveral niches and ſeats in the rock for the convenience of ſitting down. There is alſo under the arch made by the water-fall a kind of platform, and ſome ſubterraneous grottos, into which people uſed to retire in order to cool themſelves; but theſe are now become inacceſſible by the breaking in of the water from ſome freſh gaps of the rock. It is alſo obſervable, that the water in its fall below raiſes a thick miſt, which at a diſtance reſembles a cloud; and yet Lucas, who ſays he ſaw this cataract, tells us, that the natives ſhoot it with rafts. This laſt circumſtance appears very improbable: however, the deſcription he has given of it is comformable to the deſcription of the antients, and particularly of Lucan.

"Who that beholds thee, Nile, thus gently flow,
"With ſcarce a wrinkle on thy glaſſy brow,
"Can gueſs thy rage, when rocks reſiſt thy force,
"And hurl thee headlong in thy downward courſe?
"When ſpouting cataracts thy torrent pour,
"And nations tremble at the deaf'ning roar;
"When thy proud waves with indignation riſe,
"And daſh thy foamy fury to the ſkies."

The accounts of the cataracts given by the learned Dr. Shaw agree with the deſcriptions of the judicious Dr. Pococke and Mr. Norden, and ſeem to diſcredit every thing that is marvellous in this relation: for Dr. Shaw aſſures us, that they are only ordinary falls of water like thoſe we frequently meet with in great rivers, where the ſtream is a little confined: but may not the cataracts farther up the Nile be much higher, and more agreeable to the deſcriptions of the antients than thoſe viſited by theſe gentlemen? This at leaſt ſeems highly probable.

SECT. II.

Of the Methods of Culture uſed by the Egyptians, and the Manner in which the Water of the Nile is raiſed up to the Land where it is higher than the Inundation. Of the Vegetables of Egypt; the Beaſts, Birds, Reptiles, and Fiſhes; with a particular Deſcription of the Crocodile.

MR. Norden obſerves, that the authors who have given deſcriptions of Egypt, contented with ſaying that its fertility is ſolely derived from the annual inundation of the Nile, have by their ſilence given occaſion to think, that Egypt is a paradiſe on earth, where the people neither plow nor ſow, but every thing is produced as it were ſpontaneouſly after the draining of the waters; though there is ſcarce a country where the land has greater need of culture.

Where the land lies higher than the inundation riſes, the people have been taught by neceſſity to form various methods of raiſing the water. At Roſetta and Damietta, where the Nile, when at its height, is not much below the ſurface of the earth; this is done by means of a wheel made with boxes round its circumference, which

receive the water, and as the wheel turns round the boxes, empty themſelves at the top into a trough made for that purpoſe. Where the water is too deep to be raiſed in this manner, they put a cord round the wheel that reaches down to the water, to the end of which are faſtened earthen jars that fill as it goes round, and empty themſelves at the top in the ſame manner as the other; both being turned by oxen. But where the banks are high, the moſt common way is to make a baſon upon them, and fixing in the ground a pole forked at the top, they place another pole by an axle to the top of it. To one end of this laſt pole they tie a heavy ſtone, and at the other a rope and a leathern bucket. Two men draw down the bucket into the water, and the weight brings it up, the men directing it, and turning the water into the baſon. This baſon is frequently made on the ſide of the bank, and running into another is raiſed up higher with the ſame labour; and in Upper Egypt there are ſometimes ſeen five of them, one higher than the other, the uppermoſt only ſerving to water the fields.

However, in Lower and Middle Egypt, where canals have been dug, they have no occaſion for all this labour. The water is conveyed by opening ſluices, or breaking down banks, through canals cut for that purpoſe, into large reſervoirs, which are made to ſupply the lower lands as occaſions require.

Egypt naturally produces few vegetables, moſt of the tender plants being deſtroyed by the heat and inundation; but where the Nile has overflowed, and the land is plowed and ſown, it yields a great increaſe. Egypt, which was antiently the granary of the Roman empire, ſtill produces great quantities of wheat, rice, barley, beans, and other kinds of pulſe, with which the neighbouring countries are ſupplied; beſides ſugar-canes, of which ſome ſugar is made; and likewiſe melons, dates, figs, cucumbers, and other vegetables, which the people eat in hot weather as a cooling food. Upper Egypt ſupplies moſt parts of Europe with ſenna, and coloquintida grows wild in the ſandy grounds: but as Egypt has no common graſs, they ſupply the want of it by ſowing the land with clover, without plowing.

The ſpring corn and vegetables are ſown in November and December as ſoon as the Nile is fallen, and ſooner where that river does not naturally overflow the ground. This corn conſiſts of wheat, lentils, and barley that has ſix rows of grain in one ear; and with this they feed their horſes, for they have no oats. They ſow beans for their camels, and theſe the people alſo eat green both raw and boiled. They have a kind of vetch little inferior to peaſe, with one large grain in each pod; they alſo plant an herb called nill, of which they make a kind of indigo blue.

Egypt ſeems to have few or no trees that have not been tranſplanted from other countries: thoſe in their gardens are doubtleſs exotics, as the cous, or cream-tree, apricots, oranges, lemons, pomegranates, caſſia, moſch, a delicious fruit, and the cotton-tree.

The following are the moſt common trees in Egypt, the ſount, which bears a key or pod uſed inſtead of bark in tanning of leather, the tamariſk, Pharaoh's fig, the ſycamore of the antients, the palm, or date-tree, and another ſpecies of the palm called the dome-tree.

There is no great variety of four-footed beaſts, the cows are large and red, with ſhort horns: the natives make uſe of their oxen to turn the wheel with which they raiſe the water, and to plow the land. They have alſo large buffaloes, which are ſo impatient of heat, that they will ſtand in the water with only their noſes out to breathe; and when this convenience is not to be had, they will lie all day like ſwine, wallowing in mud and water.

With reſpect to the beaſts of burthen, they have a great number of camels and dromedaries, and the Turks eat the fleſh of the young ones as a moſt delicate diſh; but will not permit it to be eaten by the Chriſtians, probably that the breed may not be deſtroyed. The horſes, particularly thoſe of Upper Egypt, are very fine ones; but their necks are too ſhort. They never trot, but walk well, and gallop with great ſpeed, turn ſhort, ſtop in a moment, and are extremely tractable; but they cannot perform long journies, and are only fit to walk in travelling. During the heat of ſummer, when there is no clover-graſs, they are fed with chopped ſtraw and barley. In Cairo all but the great ride on aſſes, of which they have a fine large breed; and there are ſaid to be no leſs than forty thouſand of them in that city.

About Alexandria are great numbers of antelopes, which have longer horns and are more beautiful than thoſe in other countries. The hares and foxes are of a light colour, but the former are not very common. The tyger and the hyena are ſeldom ſeen; however, there are ſome near Alexandria.

Among the feathered race the oſtrich deſerves the preference; it is called in Arabic ter-gimel, or the camel-bird, becauſe in its head, neck, and walk, it reſembles the camel. This bird is common in the mountains ſouth-weſt of Alexandria; its fat is ſold by the Arabs, and uſed as an ointment for the rheumatiſm, palſy, and all cold tumours.

They have here a kind of large domeſtic hawk, of a brown colour, with a very fine eye. Theſe frequent the tops of houſes, where they may be ſeen with pigeons ſtanding cloſe by them; but though they are not birds of prey, they eat fleſh wherever they find it: the natives never kill them, for they, as well as their anceſtors, ſeem to entertain a veneration both for theſe birds and for cats.

The ter-chaous, or meſſenger-bird, would be thought very beautiful were it not ſo common. It is almoſt as large as a dove, and is not only finely ſpeckled, but has on the top of its head a tuft of feathers which it ſpreads when it alights on the ground. They have alſo a beautiful white bird, called by the Europeans the field-hen; it reſembles a ſtork, but is not half ſo large, and is ſeen about the fields like tame-fowl. They have likewiſe a large white bird, with black wings, ſhaped like a raven; but it is very ugly, and not at all ſhy: theſe laſt live in the ſame manner as the tame hawk, and are called Pharaoh's hens.

On the iſlands in the Nile are great numbers of the ibis which were held in great veneration by the antient Egyptians, on account of their delivering the country from the multitude of ſerpents that breed in the ground after the retreat of the Nile. They reſemble the crane, and are of a greyiſh colour, with the wings and tail black.

The Mahometans have the ſtork in the higheſt eſteem and veneration, it being as ſacred among them as the ibis was among the Egyptians, and no leſs profane would that perſon be accounted, who ſhould attempt to kill, or only to hurt and moleſt it. The great regard paid to theſe birds was at firſt, perhaps, leſs occaſioned by the ſervice they are of to moiſt fenny countries, in clearing them of a variety of reptiles and inſects, than from the ſolemn geſticulations they are obſerved to make whenever they reſt upon the ground, or return to their neſts: for they firſt throw their heads backwards, as it were in a poſture of adoration; then ſtrike, as with a pair of caſtanets, their upper and lower bill together, and afterwards proſtrate their necks in a ſuppliant manner quite down to the ground; conſtantly repeating three or four times the ſame geſticulations.

In Egypt are alſo great flocks of wild geeſe of ſeveral kinds, wild ducks, woodcocks, ſnipes, quails, and among the birds of prey are eagles and vultures.

Here are ſeveral ſorts of yellow lizards, among which is the worral, which is ſaid to be affected by muſic; Dr. Shaw ſays he has ſeen ſeveral of them keep exact time and motion with the derviſes in their circulatory dances, turning when they turned, and ſtopping when they ſtopped. This animal, which is of the lizard kind, is four feet long, eight inches broad, and has a forked tongue, which it puts out like a ſerpent, but it has no teeth, and is a harmleſs animal, living on lizards and flies. It frequents the grottos and caverns in the mountains on the weſt of the Nile, where it ſleeps in winter, and is only found during the hot weather.

The vipers of Egypt, which are much eſteemed in phyſic, are of a yellowiſh colour like the ſand in which they live, and are of two ſpecies, one with a kind of horns, which have ſome reſemblance to thoſe of ſnails, but are of a horny ſubſtance; and the others like ours.

There

There are no ſhell-fiſh in the Nile, nor perhaps any ſort of fiſh found in the rivers of Europe, except eels and mullets, which laſt, with ſome others, come at certain ſeaſons from the ſea. Of thoſe moſt eſteemed are the ray, which reſembles a carp, but is ſaid to be ſometimes two hundred pounds weight. The moſt delicate fiſh is the keſher, which is only caught in Upper Egypt; it has a long narrow ſnout, and ſo ſmall a mouth that one would imagine it can only live by ſucking the juice out of the weeds or the ground. In Upper Egypt is a ſmall fiſh called the gurgur, about a foot long: its head is armed with a ſtrong bone; the fin on the back, and thoſe on each ſide under the gills are alſo armed with bone. This fiſh the inhabitants imagine kills the crocodile.

The hippopotamus or river horſe, ſeems to be a native of Ethiopia in the upper parts of the Nile, and the preſent race of the Egyptians are entirely unacquainted with it. Nay, the crocodile ſo rarely appears below the firſt cataracts, that the ſight of it is as great an object of curioſity as to the Europeans.

The crocodile was formerly thought peculiar to this country; but there does not ſeem to be any material difference between it and the allegators of India and America. They are both in the form of a lizard; are amphibious animals, which grow till they are about twenty feet in length, and have four ſhort legs, with large feet armed with claws. They have a flat head; their eyes are indifferently large, and their back is covered with hard ſcales, impenetrable by a muſket ball.

It is obſerved of this animal that he has no tongue; he has, however, a fleſhy ſubſtance fixed all along the lower jaw, which may ſerve to turn his meat. He has two long teeth at the end of his under jaw, and anſwering to them are two holes above to receive them. It is remarkable that the upper jaw is only moveable, and the under one fixed. Theſe animals are very quick-ſighted; for our author obſerves, that on making a circuit to come behind them, they always began to move gently into the water, there being a kind of channel in the head behind each eye, by which the view of objects are conveyed to them from behind. When the crocodile is on land, he is always ſeen on the low banks of ſandy iſlands near the water, with his head towards it, and if he is diſturbed, he walks ſlowly in and diſappears by degrees.

They make a hole about two feet deep in the ſand above the water, and in it lay their eggs, and cover them over; often going into the place, and taking care of their young, which are no ſooner hatched than they run immediately into the water. They lay about fifty eggs, not much larger than thoſe of a gooſe, which are twenty-five or thirty days in hatching. The people ſearch for the eggs with an iron ſpike, in order to deſtroy them.

It need ſcarcely be intimated, that the tears and alluring voice aſcribed by the antients to the crocodile, to draw perſons to him in hopes of devouring them, is a mere poetical fiction. Nor is there any foundation for the ſtory, that the little bird trochileus lives on the meat it picks from the crocodile's teeth; or for what is ſaid of the ichneumon's deſtroying the crocodile, by jumping into the crocodile's mouth, and eating his way out again through his belly. Theſe are traditions of which the learned, who have viſited Upper Egypt, can obtain no information.

If a man or beaſt ſtands by the river, the crocodiles leap out of the water and ſeize him with their fore paws; but if the diſtance be too great, they make a ſpring, and endeavour to beat down their prey with their tails.

The moſt common method of killing them is ſaid to be by ſhooting them in the belly, where the ſkin is ſoft and not covered with ſcales like the back. The natives deſtroy the crocodiles by making ſome animal cry at a diſtance, and when a crocodile comes out, they thruſt a ſpear to which a rope is tied, into his body; then letting him retire into the water to ſpend himſelf, they afterwards draw him out, run a pole into his mouth, and leaping upon his back, tie his jaws together. The people ſay they cannot ſeize a man in the water, and therefore frequently croſs the Nile by ſwimming both by themſelves and with their cattle, even above the firſt cataract, where the crocodiles are pretty numerous.

In that part where the people are much more ſavage than in Lower Egypt, Mr. Norden obſerved ſeveral odd methods of croſſing the Nile, which they perform without the leaſt apprehenſion of falling a prey to the crocodiles. Two men were ſet on a truſs of ſtraw, while a cow ſwimming before, one of them held in one hand her tail, and with the other guided the beaſt by a cord faſtened to her horns. The other man who was behind, ſteered with a little oar, by means of which he kept at the ſame time the balance. The ſame day he likewiſe ſaw ſome loaded camels croſſing the river. A man ſwimming before held the bridle of the firſt camel in his mouth; the ſecond camel was faſtened to the tail of the firſt, and the third to the tail of the ſecond; while another man brought up the rear, and took care that the ſecond and third camels ſhould follow in a row. Theſe ſimple expedients give us ſome idea of the manners of the moſt early ages, before the introduction of arts, or man had learned to form veſſels to ſail upon the water, and croſs rivers, lakes, and ſeas.

SECT. III.

Of the Perſons, Dreſs, Manners, Cuſtoms, Education, and Religion of the Inhabitants.

THE Egyptians are an ill-looking people, for though many of the young children are fair, the ſun ſoon renders them ſwarthy. They are alſo very dirty and ſlovenly, eſpecially the Coptis, who after waſhing their hands when they have eaten, wipe them publickly on the great ſleeves of their ſhirts. Theſe Coptis are the deſcendants of the firſt Chriſtians of this country, who are ſaid to have been called Coptis from their retiring to Coptus, and the adjacent places, during the firſt perſecutions. The Coptic tongue is a corruption of the antient Egyptian, and is now a dead language.

The natives are generally inclined to indolence, and take great delight in ſitting ſtill and hearing tales, and indeed appear to have been always more fit for a quiet than an active life. This probably may be owing to their being enervated by the heat of the country. They are alſo envious and miſchievous; which prevents their uniting and ſetting up for themſelves. The Mahometan inhabitants are either original natives, who live in the villages, or of the Arab race. The latter are divided into thoſe who are alſo ſettled in the villages, and are generally an honeſt harmleſs people; and thoſe who live in tents, and chiefly ſubſiſt on their cattle, which are principally camels and goats, that feed on ſmall ſhrubs. The Turks, who are thus named to diſtinguiſh them from the Arabs and the original natives of the country, are thoſe ſent by the Grand Seignior, and the ſlaves. Theſe are the governing party, and are remarkable for being moſt avaricious, and fondeſt of power. Theſe diſtinguiſh themſelves from the others by wearing what is ſtrictly the Turkiſh dreſs.

Moſt of the children in the country go naked in ſummer, and many of them do ſo all the year round.

The moſt ſimple dreſs of the natives has ſome reſemblance to that worn by the antient Egyptians, who were cloathed in linen, and over it had a woollen garment; and it probably, ſays Dr. Pococke, reſembles the primitive manner of cloathing. They wear a long ſhirt with wide ſleeves, commonly tied about the middle. The common people have over it a brown woollen ſhirt; and thoſe of ſuperior rank a long cloth coat, and over that a long blue ſhirt; but in the dreſs of ceremony, they wear a white ſhirt inſtead of a blue one, which in Upper Egypt they put on upon feſtival days, and when they viſit their ſuperiors. In the lower parts of the country they uſe a garment of the ſame form made of black woollen, which is ſometimes left open before, and the people of rank have them of cloth adorned with furs. Moſt of them alſo wear under all a pair of linen drawers; but do not put the ſhirt into them.

It is almoſt a general cuſtom among the deſcendants of the Arabs, and the native Mahometans, to wear in winter a white or brown blanket, and in ſummer a blue

and

and white cotton ſheet. This the Chriſtians in the country alſo conſtantly uſe, wrapping it round their bodies over the left ſhoulder, and under the right arm, which is left free; and in ſome parts of the country young people and the poorer ſort wear no other cloathing.

The Chriſtians of the country, with the Janizaries, the Arabs, and the Egyptians, wear ſlippers of red leather, while thoſe of the Jews are blue. Within doors the Turks and Chriſtians, out of frugality, wear a kind of wooden clogs, ſome of which are made very fine. People, in ſhort, are diſtinguiſhed by the dreſs of their head and feet; and are fined if they do not follow the cuſtom: hence none but foreign Chriſtians are permitted to wear yellow ſlippers. The dreſs for the head is either the turban, or red woollen cap that ſits cloſe to the head, which is worn by the ordinary people among the Coptis and the Arabs.

The women have their drawers, and moſt of their other garments of ſilk; all but their outward dreſs are ſhorter than the mens, and their ſleeves hang down very low. They wear on their heads a white woollen ſkull-cap, and over it an embroidered handkerchief, round which their hair is plaited. Over all they have a large black veil. As it is eſteemed indecent to ſhew too much of the face, they generally cover the mouth and one eye, if not the whole face. Women of ordinary rank have a large garment like a ſurplice, of blue linen or cotton, and before their faces hang a kind of bib joined to their head-dreſs by a tape over the noſe; thus hiding all the lower part of the face, and leaving the eyes uncovered, which gives them a very odd appearance. The women among the vulgar, eſpecially the blacks, wear rings in their noſes adorned with glaſs beads, and have ear-rings three inches in diameter, that come round their ears, and are adorned with ſtones: they likewiſe wear ſtone rings on their fingers, which among the ordinary people are of lead, while thoſe in better circumſtances have them of gold. The bracelets are generally of wire, but ſome are of plain iron or braſs, but others have them of gold finely jointed. The women among the vulgar paint their lips, and the tip of their chin with blue, and thoſe of ſuperior rank paint their eye-lids black, and their nails and feet yellow.

Education in Egypt chiefly conſiſts in learning to read and write, which the Coptis generally obtain, together with book keeping; but few of the Arabs and native Mahometans can read, except thoſe bred to the law, or educated for ſome poſt. The beſt education is given to the ſlaves, who often underſtand Arabic and Turkiſh, and frequently write both. They are alſo well ſkilled in riding, ſhooting, and throwing the dart; which are eſteemed great accompliſhments.

With reſpect to the religion of Egypt, the Coptic is that of the native Chriſtians. The Greeks are alſo very numerous at Cairo and in Dalmatia; but there are not many of them in the other parts of the country, except a few merchants in the principal towns. The Chriſtian religion would be at a ſtill lower ebb, did not the people find it convenient to have Coptic ſtewards, who are well acquainted with buſineſs and very expert at keeping accounts, which they do in a ſort of Coptic characters that none but themſelves underſtand. They are the protectors of the Chriſtians in every village.

The Coptics, however ſeem extremely irreverent and careleſs in their devotions; yet they ſpend the night before Sundays and feſtivals in their churches, which they no ſooner enter than they pull off their ſlippers and kiſs the pavement. They paſs their holidays in ſauntering about, ſitting under ſhady trees in ſummer, and under their walls in winter. They ſeem to imagine that religion conſiſts in repeating their long ſervices, and in the ſtrict obſervance of their numerous faſts. They uſe the liturgies of St. Baſil, St. Gregory, and St. Cyril; but the firſt being ſhorteſt, is oftenеſt read. However, both the prieſts and people are extremely ignorant with reſpect to the doctrines of their religion; the former perform the ſervice in the Coptic language, which they generally underſtand very imperfectly, but they have books of their liturgy with an Arabic interpretation.

The Coptis are ſaid to faſt ſeven months in the year. The children are eſpouſed at ſeven or eight years of age, and conſummate at eleven or twelve; and a little before that time they are circumciſed. They eaſily procure divorces on account of adultery, long ſickneſs, or diſagreement; and, at their deſire, the patriarch, or biſhop, gives them leave to marry again: but if this be refuſed, they go to the cady, who will do it readily, and this is practiſed by the Chriſtians all over Turky.

At baptiſm the child is plunged three times into the water, and then the prieſt dips the end of his finger into the conſecrated wine, and puts it into the child's mouth; but if the child happens to be ſick, inſtead of being immerſed in water, it is laid on a cloth near the font, and the prieſt, dipping his hands in the water, rubs it all over him; but if the infant be too ill to be brought to church, they then only anoint him, which they ſay is good baptiſm.

They adminiſter the ſacrament in both kinds on Sundays, Wedneſdays, and Fridays, on all their numerous holidays, and every day in Lent; and when the prieſt, in reading the ſervice, mention's Peter's cutting off the ear of the high prieſt's ſervant, the people cry out, Well done Peter. They abſtain from ſwine's fleſh, from blood, and things ſtrangled; pray for the dead, and proſtrate themſelves before pictures; but have no images, except a crucifix. They adminiſter extreme unction, and at the ſame time give abſolution, anointing all the people preſent, that the evil ſpirit may not enter into them.

Though the religion of the Coptis in many reſpects reſembles that of the Greeks, they bear an implacable hatred to them, and have generally as little regard for the Europeans, which proceeds in a great meaſure from the endeavours of thoſe of the Romiſh church to make converts of them; for they ſeldom diſtinguiſh between thoſe of different religions, but include all under the name of Franks.

The Jews are very numerous in Egypt, and, as in times of paganiſm, they were afraid of drinking wine offered to idols, they ſtill have here all they drink made by their own people, ſealed up and ſent to them. This cuſtom they obſerve throughout all the Eaſt. There is a particular ſect among them who live by themſelves, and have a ſeparate ſynagogue: theſe are the antient Eſſenes, who are now called Charaims. They are diſtinguiſhed by their regard to the five books of Moſes, which they ſtrictly obſerve according to the letter, without receiving any written traditions.

The Turks in Egypt are deeply tinctured with the doctrine of predeſtination, which not only inſpires them with courage, but makes them diſcover great magnanimity, when thrown from the height of power into a ſtate of poverty and diſtreſs, ſaying, It is the will of God. They indeed behave better in adverſity than in proſperity: for though perſons in high rank aſſume a becoming gravity, and confer favours in a very graceful manner, they are greedy of money; for nothing is to be done with them without a bribe; and they are apt to fancy that the greateſt villainies are expiated as ſoon as they have waſhed their hands and feet, which is their preparation for prayer. Religion is faſhionable among them; they pray in the moſt public places, and when on a viſit will call for water to waſh, and then perform their devotions; and yet their words generally paſs for nothing, either in their promiſes or profeſſions of friendſhip. Opium is leſs uſed by them than formerly. The Arabs ſeldom drink wine or ſtrong liquors, and the common people pound the leaves of green hemp, make them up into a pill and ſwallow it, in order to render them chearful. They have a high opinion of the magic art, and think there is great virtue in charms and taliſmans.

Though the pooreſt Mahometan thinks himſelf ſuperior to the richeſt Chriſtian, yet the Arabs and people of the country behave with great civility, and ſitting about the ſtranger grow troubleſome, by being too curious and inquiſitive. The Turks likewiſe behave with great civility, either to obtain preſents, or to diſcover your deſigns, in which they are very artful. They treat their ſuperiors with the utmoſt decorum and the higheſt reſpect, and one of great dignity readily holds the ſtirrup to another who is ſtill greater.

The way of ſaluting as they paſs is by ſtretching out the right hand, bringing it to the breaſt, and a little

inclining

inclining to the head. The extraordinary ſalute is kiſſing the hand, and putting it to the head. When they viſit a ſuperior they kiſs his hand; but if he be greatly their ſuperior, they kiſs the hem of his garment. When they take any thing from a ſuperior, or that is ſent by a ſuperior, they kiſs it, and put it to their foreheads; and when they promiſe to ſerve or protect you, they put their hand to their turban.

The entertainments of the Turks and Arabs have been mentioned in treating of Turky in Aſia and of Arabia, and we ſhall only add here, that an Arab prince will frequently dine in the ſtreet before his door, and calling to all that paſs, and even to the beggars, invite them to ſit down by crying in their manner, "In the name of God." Upon this the pooreſt wretch ſits down and dines with his prince; and when he has done retires without ceremony, ſaying, "God be praiſed."

The Mahometans have a moſt extraordinary veneration for idiots, whom they ſuppoſe to be actuated by a divine ſpirit, and conſider as a kind of ſaints. Hence, they receive all poſſible marks of reſpect, and are received into every houſe and at every table. Though naked, they are every where careſſed as ſaints of a ſuperior order, the people flock about them with an air of reverence, and in the publick ſtreets the women kneel before them, and, as among the Gentoos of India, kiſs what other people conceal, as the moſt effectual means of being rendered fruitful. All theſe circumſtances are mentioned by authors of the greateſt reputation. They have a large moſque at Cairo, with buildings adjoining to it, and great revenues for their ſupport. As theſe are recommended by their want of reaſon, ſo are the derviſes by their want of money; for every Turk eſteems poverty as a great degree of perfection in every one but himſelf.

Both the Turks and Egyptians are very frugal in their proviſions, for the latter ſeldom eat meat, and the tables of the great are of little expence, conſidering the number of their attendants, in which they are very extravagant; for it is not uncommon for them to have fifty or ſixty ſlaves, and many other ſervants and attendants. The cloathing of the ſlaves is, however, very expenſive, as are alſo their horſes, it being common for them to have from fifty to two hundred.

People of the middle rank uſually riſe at break of day, and go to the moſque, then to the coffee-houſe, and very late to their ſhops, which they ſhut up by four in the afternoon, and people of rank ſpend moſt part of the day in paying and receiving viſits. On Sundays, Tueſdays, and Thurſdays, they attend the baſha's divan, or court, for theſe are the days of buſineſs; and on Fridays they generally go to the moſque. On other days they go to the meidans, or public places out of town, where they ſee their ſlaves ride, ſhoot, or throw the dart; and in the mean time regale themſelves with coffee and a pipe. They are perpetually in company when they are not in the women's apartment, as they are from twelve at noon till four, and from ſupper-time till next morning, when no body is ſo rude as to diſturb them.

They have public bagnios for men and women, and perſons of diſtinction have them in their houſes. None beſides people of the middle rank reſort to the coffee-houſes. Some of them have muſic at certain hours of the day, and in others a man tells ſome hiſtory, or an Arabian tale, with a very good grace. Tradeſmen often ſend to have their proviſions brought hither, and thoſe who have nothing to do ſpend whole days in theſe houſes.

SECT. IV.

Of the Revolutions in Egypt, and its preſent Government.

THE Egyptians, like the Chineſe, and many other of the eaſtern nations, pretend that they had a race of kings, the firſt of whom reigned many thouſand years before the flood. However, it is generally agreed, that the princes of the line of the Pharaohs ſat on the throne, in an uninterrupted ſucceſſion, till Cambyſes II. king of Perſia, conquered Egypt five hundred and twenty-five years before the birth of Chriſt: and that in the reign of thoſe princes thoſe wonderful ſtructures were raiſed, which cannot now be viewed without aſtoniſhment. After the death of Cambyſes, Egypt continued under the Perſian government. At length Alexander the Great having conquered the Perſian dominions, it became ſubject to that prince, who ſoon after built the celebrated city of Alexandria.

He was ſucceeded by Ptolemy, the ſon of Lagus, three hundred and twenty-five years before the birth of Chriſt, who again rendered it an independent kingdom. Ptolemy Philadelphus, his ſon, collected the Alexandrian library, ſaid to conſiſt of ſeven hundred thouſand volumes; and the ſame prince cauſed that tranſlation of the Scriptures to be made, which is now diſtinguiſhed by the name of the Septuagint. His ſucceſſors ever after retained the name of Ptolemies, and in that line it continued between two and three hundred years, till Cleopatra, the wife and ſiſter of Ptolemy Dionyſius, the laſt king, aſcended the throne, in whoſe reign Egypt became a Roman province, and thus remained till the reign of Omar, the ſecond caliph of the ſucceſſors of Mahomet, who expelled the Romans, after it had been in their hands ſeven hundred years.

The caliphs of Babylon were the ſovereigns of Egypt, till about the year eight hundred and ſeventy, when the Egyptians ſet up a caliph of their own, called the caliph of Cairo, to whom the Saracens of Africa and Spain were ſubject; but the governors of the provinces, under the caliphs of Babylon and Cairo, ſoon wreſted the civil power out of the hands of their caliphs, who had hitherto enjoyed an abſolute power in affairs of religion and government, and left them only the ſhadow of ſovereignty.

In ſhort, about the year 1160 Aſſareddin, general of Norradin, the Saracen Sultan of Damaſcus, ſubdued the kingdom of Egypt, and was ſucceeded by his ſon the famous Saladin, who alſo reduced the kingdoms of Damaſcus, Meſopotamia, and Paleſtine under his dominion, and about the year 1190 took Jeruſalem from the Chriſtians. This prince eſtabliſhed a body of troops in Egypt, which, like the preſent janizaries, was compoſed of the ſons of Chriſtians taken in war, or purchaſed of the Tartars, to whom he gave the name of Mamalukes. The poſterity of Saladin ſat on the throne till the year 1242, when the Mamalukes depoſed Elmutan, and gave the crown to one of their own officers, named Turquemenius. This was the firſt king of the race of the Mamalukes, who engaged in continual wars with the Chriſtians in Syria and Paleſtine, till ſultan Araphus drove them entirely out of the Holy Land. At length Selim, a Turkiſh emperor, killed the ſultan, and conquered Egypt in 1515; and the Turks have had the poſſeſſion of it ever ſince.

With reſpect to the government of Egypt, ever ſince it has been ſubject to the Ottoman emperors, they have governed that kingdom by a viceroy, ſtiled the baſha of Grand Cairo; but as Egypt is ſubdivided into ſeveral inferior governments, theſe governors are neither ſent from Conſtantinople, nor appointed by the viceroy; but are natives of Egypt, and appear to be veſted with ſovereign power in their ſeveral diſtricts. They have the command of the militia of the ſeveral provinces, and many of them are of the race of the Mamalukes. The authority of the baſha is very much limited by thoſe beys, or governors, who are his grand council, and without whoſe concurrence he can tranſact nothing of conſequence. Thus the Egyptians live under a kind of limited monarchy. All the lands in Egypt are indeed held of the Grand Seignior, and ſtill pay him both an annual rent and a fine upon every deſcent; but they, however, deſcend from father to ſon. Hence the baſha, in order to ſupport his authority, finds himſelf under the neceſſity of courting ſome of the leading beys, and frequently foments diviſions among them, leſt they ſhould unite to the prejudice of himſelf or the grand Seignior his maſter.

The baſha has his guards, or bodies of ſpahis and janizaries, like the Grand Seignior at Conſtantinople; but as many of theſe have eſtates in the country, which is under the abſolute power of the beys, the baſha, if he happens to be at variance with thoſe beys, cannot depend on their protection. Indeed the beys are ſaid to be perpetually laying plots to deſtroy each other; and, upon theſe occaſions, the baſha does not fail to take that ſide

which is moſt likely to promote his own intereſt. Dr. Pococke obſerves, that neither the baſha nor any of the beys ſcruple taking off their enemies by poiſon or the dagger, of which he gives the following inſtance: A baſha, knowing that a bey whom he would willingly diſpatch was jealous of his deſigns, ordered his ſervants when he came to viſit him to pour his own coffee and that of the bey's out of the ſame pot. The bey ſeeing this, concluded that it could not be poiſoned, and drank it off; but the ſlave, on his giving the coffee to the baſha, made a falſe ſtep, as he was ordered, and ſpilt it on the floor; upon which the bey perceived too late the baſha's treachery.

The revenues which the Grand Seignior receives from Egypt ariſe from the annual rents, cuſtoms, and a poll-tax on Chriſtians and Jews. The rents of the villages are fixed, and this is the treaſure which is annually ſent to Conſtantinople, and amounts in the whole to ſix thouſand purſes, each purſe being eighty pounds ſterling. This is a very eaſy rent, and when the Nile does not riſe ſixteen cubits, even this is not paid.

SECT. V.

A Deſcription of the Cities of Alexandria and Roſetto.

IN deſcribing the cities of Egypt, we ſhall begin with Alexandria, which was ſo called from Alexander the Great, who, after his return from conſulting the oracle of Jupiter Ammon, built a city in the place where Racotis ſtood, three hundred years before the birth of Chriſt. This city is called by the Turks Scanderia, as among them Alexander is called Scander. It was once an opulent and elegant city, ſeated near the moſt weſterly branch of the Nile, where the ſea forms a ſpacious haven reſembling a creſcent, in thirty-three degrees eleven minutes north latitude, and in thirty degrees thirty-nine minutes eaſt longitude from London.

The port of Alexandria was formed by the iſle of Pharos, which extended acroſs the mouth of the bay, and towards the weſt end was joined to the continent by a cauſey and two bridges, ninety paces in length. On a rock encompaſſed by the ſea at the eaſt end of the iſland was the antient Pharos, or light-houſe, ſo famous in antiquity, that it was eſteemed one of the ſeven wonders of the world; and on the place where it ſtood is a caſtle called Pharillon. Nothing can be more beautiful, ſays the ingenious Mr. Norden, than to view from hence the mixture of antique and modern monuments in this city. On paſſing the ſmalleſt caſtle, called the Little Pharillon, you ſee a row of great towers joined together by the ruins of a thick wall. A ſingle obeliſk is of a ſufficient height to make itſelf remarked where the wall has fallen down. On turning a little farther you perceive the towers appear again, but only in a diſtant view. New Alexandria afterwards makes a figure with its minorets, and at a diſtance riſes Pompey's column, a moſt majeſtic monument; and the view is terminated by hills, towers, and a large ſquare building that ſerves for a magazine of powder.

The outer walls round the old city are beautifully built of hewn-ſtone, ſtrengthened by ſemi-circular towers twenty feet in diameter, and about a hundred and thirty feet diſtant from each other. At each of them are ſteps to aſcend up to the battlements, there being on the top of the walls a walk built on arches. The inner walls of the old city, which appear to be built in the middle ages, are much ſtronger and higher than the others, and are defended by large high towers.

The palace, with the buildings belonging to it, took up a fourth part of the city, and within was the muſeum, or academy, and the burial-place of the kings, where the body of Alexander was depoſited in a gold coffin; but that being taken away, it was put into one of glaſs, and was probably in that condition when Auguſtus, taking a view of the corps, ſcattered flowers over it, and adorned it with a golden crown.

The ſtreet, which extended the whole length of the city, is ſaid to have been a hundred feet wide, and had undoubtedly many magnificent buildings, as appears from the granite columns ſtill remaining in ſeveral places. Among theſe was the Gymnaſium, or public ſchools, to which were porticos that extended above half a quarter of a mile. Theſe may have been where there are great ruins to the weſt of that ſtreet, and ſome large columns of red granite ſtill ſtanding. In this magnificent ſtreet was alſo probably the Forum, or court of juſtice, which was perhaps erected where ſome pillars remain nearer the ſea.

The moſt extraordinary remains of the antient city are the ciſterns built under the houſes for receiving the water of the Nile, as they do at preſent. The canal of Canopus comes to the walls near Pompey's pillar, and has a paſſage under them. But the water is not only conveyed to the ciſterns from the canal on its entering the city, but from ſeveral diſtant parts of the canal, by paſſages under ground, to the higher parts of Alexandria.

The materials of the old city have been carried away to build the new, ſo that there are only a few houſes, ſome moſques, and three convents within the old walls. Among theſe is a moſque, called The moſque of a thouſand and one pillars. Dr. Pococke obſerved that it had four rows of pillars to the ſouth and weſt, and one row on the other ſides. This, it is ſaid, was a church dedicated to St. Mark, at which the patriarch reſided, it being near the gate without which the Evangeliſt is ſaid to have ſuffered martyrdom. There is another great moſque, named St. Athanaſius, which was alſo doubtleſs a Chriſtian church. The Greeks, Latins, and Coptics have each a monaſtery in the old city; but ſome poor Arabs being always encamped within the walls, it is dangerous being abroad after ſun-ſet. All over the city are fragments of columns of beautiful marble, the remains of its antient grandeur and magnificence. Among the reſt an obeliſk, formed of one ſingle piece of granite, riſes ſixty-three feet high; but two of its four faces are ſo diſfigured by time, that the hieroglyphics with which they were antiently covered can ſcarcely be ſeen. This is ſtill called the obeliſk of Cleopatra. Another lies near it broken.

About a quarter of a mile to the ſouth of the walls ſtands Pompey's pillar on a ſmall eminence. As this is not mentioned by Strabo, it was probably erected after his time, and perhaps in honour of Titus or Adrian. Near it are ſome fragments of granite columns four feet in diameter; and it appears that ſome magnificent building was erected there, and that this noble pillar was placed in the area before it. Indeed ſome Arabian hiſtorians ſay, that here was the palace of Julius Cæſar. This pillar is of granite, and, beſides the foundation, conſiſts of only three ſtones: the capital is ſuppoſed to be eight or nine feet deep, and is of the Corinthian order, the leaf appearing to be the plain laurel or bay-leaf, and a hole being on the top, it has been thought that a ſtatue was erected upon it: the ſhaft, including the upper torus of the baſe, is of one piece of granite marble, eighty-eight feet nine inches high, and nine feet in diameter: the pedeſtal, with part of the baſe, which are of a greyiſh ſtone reſembling flint, are twelve feet and a half high, and the foundation, which conſiſts of two tier of ſtones, is four feet nine inches; ſo that the whole height amounts to a hundred and fourteen feet.

About three leagues from Alexandria are the ruins of an antient temple in the water, with broken ſtatues of ſphynxes, and pieces of columns of yellow marble; and near it are the remains of other buildings, part of which appear to have been a grand portico, from there being many pieces of columns of grey and red granite, and from the order in which they lie, they ſeem to have belonged to a round temple. Moſt of them are fluted, and three feet three inches in diameter.

Theſe ruins are ſituated in a wide bay, in which is a little iſland joined to the continent by a chain of rocks; and on the ſhore of this bay are cavities in the rocks, uſed as agreeable retreats, where people may enjoy the cool air, and, without being ſeen, ſee every thing that paſſes in the port. The natural grottos in theſe rocks gave the antients the opportunity of forming them, by the aſſiſtance of the chiſel, into places of pleaſure. Entire apartments are thus formed, and benches are cut for ſeats, where you may be ſecured from the wet, or bathe in

in a part of the grottos, which are entered by the ſea; and on the outſide were formed little harbours, ſheltered from all the winds. Oppoſite the point of the peninſula that forms the port is a cavern, generally termed a temple. The only entrance is a little opening through which you paſs, lighted by flambeaus, and ſtooping for twenty paces, when you enter a pretty large ſquare hall. The ceiling is ſmooth, but the bottom and ſides are covered with ſand, and with the excrements of the bats and other animals that harbour there. A paſſage leads from hence into a round cavern, the top of which is cut in the form of an arch. Here four gates are oppoſite to each other, each adorned with an architrave, a cornice, and a pediment, with a creſcent on the top. One of theſe gates ſerves for an entrance; the others form each a niche, that only contains a kind of cheſt, ſaved out of the rock in hollowing it, and large enough to contain a dead body. Thus it appears, that what is in that country eſteemed a temple, was probably the tomb of ſome great man, or perhaps of a ſovereign prince. A gallery, which continues beyond this ſuppoſed temple, ſeems to ſhew, that farther on there are other ſtructures of the ſame kind.

With reſpect to New Alexandria, Mr. Norden obſerves, that it may be juſtly ſaid to be a poor orphan, who had no other inheritance but the venerable name of its father. The great extent of the ancient city is in the new contracted to a ſmall neck of land, which divides the two ports. The moſt ſuperb temples are converted into plain moſques; the moſt magnificent palaces into houſes of bad ſtructure; an opulent and numerous people have given way to a few foreign traders, and to a multitude of wretches, who are the ſlaves of thoſe on whom they depend. This place, once celebrated for its commerce, is no longer any thing more than a place of embarking: it is not a phœnix that revives from its own aſhes; but a reptile ſprung from the duſt and corruption with which the Koran hath infected the whole country: yet, notwithſtanding the meanneſs of the buildings in general, in ſeveral houſes built round courts on porticos, they have placed a great variety of columns, moſtly of granite, with which the ancient city was adorned.

The great occaſion of the decay of this city, was the diſcovery of the new way to the Eaſt Indies, by doubling the Cape of Good Hope; for till then it was one of the principal marts, to which the ſpices and valuable commodities of the Eaſt were brought, and from thence diſperſed into all the countries of Europe.

The inhabitants conſiſt of Jews, Turks, Coptics, Greeks, and Armenian Chriſtians, and a few European merchants, the principal of which are the French and Engliſh; the former, 'tis ſaid, flatter themſelves with being treated with more reſpect, but the latter have, perhaps, a better trade. The French maintain a conſul dependent on the conſul of Grand Cairo, and enjoy conſiderable trade. The Engliſh have alſo a conſul, and every year there arrives a good number of Engliſh veſſels at Alexandria; but they are not always laden on the account of this nation. The Jews, and even the Turks, often freight them, and carry on a conſiderable trade on board theſe veſſels.

Roſetto, called by the Egyptians Raſchid, is ſituated twenty-five miles to the north-weſt of Alexandria in thirty-one degrees five minutes north latitude, and in thirty-one degrees ten minutes eaſt longitude from London, and ſtands on the weſt ſide of the branch of the Nile, antiently called Bolbetinum, about four miles from its mouth. It is eſteemed one of the pleaſanteſt places in Egypt, and, being refreſhed by the winds that blow from the ſea, is extremely healthy. It is near two miles in length, but only conſiſts of two or three long ſtreets; however, the buildings are ſtately, and the houſes commodious. It is defended by two caſtles, one upon each ſide of the branch of the Nile, by which merchandize is brought hither from Cairo. The fine country of Delta on the other ſide of the Nile, and two beautiful iſlands a little below the town, afford a delightful proſpect; and to the north the country is agreeably improved by pleaſant gardens of citrons, oranges, lemons, and almoſt all kinds of fruit, and is variegated by groves of palm-trees, ſmall lakes, and fields of rice.

The inhabitants carry on a conſiderable manufacture of ſtriped and coarſe linen; but the principal buſineſs of the place is the carriage of goods between this town and Cairo; for all European merchandizes are brought from Alexandria hither by ſea, and ſent from thence in other boats to Cairo; and alſo thoſe brought down the Nile from Cairo are here put into large boats to be ſent to Alexandria. Hence the Europeans have their vice-conſuls and factors in this place to tranſact their buſineſs, and letters are regularly brought from Alexandria to be ſent by the boats from Cairo: however, thoſe of great conſequence that requires diſpatch are ſent acroſs the deſart, which lies betwixt Alexandria and Roſetto, by foot meſſengers.

SECT. VI.

A Deſcription of Grand Cairo. Of the Ceremonies obſerved at opening the Canal; the Egyptian Manner of hatching Chickens in Ovens; the Inhabitants and their Trade.

THE city of Grand Cairo is ſituated about a mile from the eaſtern bank of the river Nile, and extends eaſtward near two miles to the neighbouring mountain. It ſtands in Middle Egypt in thirty degrees fifteen minutes north latitude, and in thirty two degrees twelve minutes eaſt longitude from London. It is about ſeven miles in compaſs, and was much larger before the diſcovery of the Eaſt Indies by the way of the cape of Good Hope, it being then the center of trade, all the ſpices of the eaſt being brought to this city, and from thence ſent to Europe. Grand Cairo at preſent conſiſts of Old and New Cairo, which are a mile diſtant from each other.

Old Cairo is now reduced to a ſmall compaſs, it not being more than two miles round; this is the port for the boats that come from Upper Egypt, and ſome of the beys and European merchants have houſes there, to which they retire at the riſing of the Nile. The Jews have a ſynagogue, ſaid to have been built in its preſent form ſixteen hundred years ago, and it nearly reſembles our churches. They pretend that Jeremiah the prophet was on the very ſpot where they uſually read the law, and that they have a manuſcript of the Bible written by Ezra, which they eſteem ſo ſacred, that none are allowed to touch it, and it is kept in a niche in the wall about ten feet high, before which a curtain is drawn, and lamps kept continually burning.

The Coptics have twelve churches and a convent, and pretend that the holy family were in a cave in the church dedicated to St. Sergius. Theſe churches are commonly adorned with columns in the front; they have two iſles with galleries over them ſupported by pillars, and the part for the altar is ſeparated by a partition, that in ſome of them is finely ornamented with carving and inlaid work of tortoiſe-ſhell and ivory. The Romans have an hoſpital belonging to the fathers of the Holy Land.

There are alſo here about half a dozen moſques, among which one named Amarah is ſaid to have been a church, and is remarkable for having near four hundred columns, which, with their capitals, ſeem to have been collected from ſeveral ancient buildings.

In Old Cairo are what are uſually called Joſeph's granaries; theſe are ſquare courts encompaſſed by walls about fifteen feet high, built chiefly with brick, and ſtrengthened by ſemicircular buttreſſes. The houſes are filled with corn, and room only left to enter at the door. The grain is covered with mats, and the door faſtened only with wooden locks; but the inſpectors of the granaries putting a handful of clay on the locks, fix their ſeal to it. Here is depoſited the corn paid as a tax to the Grand Seignior, which is brought from Upper Egypt, and diſtributed among the ſoldiers as a part of their pay. This granary, notwithſtanding its name, is not very ancient, for it ſeems to have been built during the time of the Saracens. At the north end of the city is a plain building for raiſing the water of the Nile to an aqueduct. This ſtructure is an hexagon, each ſide of which is between eighty and ninety feet in length, and about as many in height. The water flows into a reſervoir below, and is drawn up by five oxen, which turn ſo many Perſian

ſian wheels, that empty the water into the aqueduct. Theſe wheels are turned at the top of the building, to which is an aſcent on the outſide for the oxen to go up. Both this edifice and the aqueduct are built with freeſtone, in order to convey water to the caſtle. The aqueduct is ſupported by about two hundred and eighty-nine arches and piers of different dimenſions, the former being only from ten to fifteen feet wide. Theſe arches are low towards the caſtle-hill, where the water runs into a reſervoir, whence it is raiſed up to the caſtle by ſeveral wheels one over another.

Oppoſite to Old Cairo is a pleaſant iſland named Roida, ſituated in the midſt of the Nile, and extending near a mile in length. Towards the north end is a village of the ſame name, and at the ſouth end is the Mikias, or houſe in which is the famous pillar for meaſuring the riſe of the Nile. This is fixed in a deep baſon, the bottom of which is on a level with the bed of the river, and the water paſſes through it. The pillar, which is placed under a dome ſupported by Corinthian columns, is divided into meaſures for obſerving the riſe of the waters, and is crowned with a Corinthian capital, and from the court that leads to the houſe, is a deſcent to the Nile by ſteps, on which the common people believe that Moſes was found after his being expoſed on the bank of the river.

A canal cut from the Nile runs through the city of New Cairo, but is only to be ſeen from the back of the houſes built on its banks, and though ſeveral bridges are erected over it, yet houſes being built on each ſide of them, the view of the water is intercepted; but when it is dry, it appears like a ſtreet, the common people paſſing along it. However, from the time when it begins to dry, the ſmell of the mud and ſtagnated water is very offenſive.

If we form an idea of ſeveral ſquares or places about the city from a quarter to three quarters of a mile in compaſs, contrived ſo as to receive and retain the water of the Nile conveyed to them by the canal, as the river riſes, we ſhall have a pretty juſt notion of the ſeveral lakes that are about the city during great part of the year, when nothing can be imagined more beautiful; for they are ſurrounded by the beſt houſes in the city, and in the ſummer when the Nile is high, are covered with fine boats and barges belonging to perſons of diſtinction, who ſpend the evenings with their ladies on the water, where concerts of muſic are never wanting, and ſometimes fireworks are added. All the houſes round are in a manner illuminated, and the windows filled with ſpectators. This pleaſing ſcene is, however, entirely vaniſhed when the waters are gone off, and nothing but mud appears. Yet this is ſoon ſucceeded by the agreeable view of green corn, and afterwards of harveſt in the midſt of a great city, and in the very places where the boats were ſailing but a few months before.

Some of the moſt remarkable cuſtoms obſerved at Cairo are the ceremonies practiſed at opening the canal. When the Nile begins to riſe, they caſt up a bank of earth acroſs the end of the canal near the river, and about the middle of Auguſt, when the water is riſen to a proper height, it is broke down with great rejoicings. Mr. Thevenot, who gives the moſt particular account of theſe ceremonies, went to Boulac, the port of all the boats that come up the river, and which ſome reckon a part of Grand Cairo, to ſee the preparations, when he obſerved ſeveral gallies lying in the river, in the ſterns of which were noble rooms, ſome of which were twelve or fourteen paces ſquare, and ſurrounded with rails and balluſters gilt and painted, and the floors covered with rich carpets and cuſhions. About ſeven in the morning the baſha arrived in great ſtate; as he paſſed a ſheep was killed in ſeveral places, and three or four more on the bank of the river. All the beys and great men of Cairo accompanied the baſha in his galley, and having ſailed as high as Old Cairo, he was ſaluted by the guns of the other veſſels, which followed in order. The ſails of the baſha's galley were of ſeveral colours, and worked with large red roſes, and the flags and ſtreamers in this and the other gallies made a very pretty appearance on the water: the trumpets and other muſic played as they paſſed, while the guns fired, and the people ſhouted, to expreſs the general joy. In this manner they moved gently along, till they came to the place where the bank was to be opened to let the water into the canal. Here the mob were waiting in crowds, and there being two paſteboard towers filled with fireworks, theſe were let off as the baſha paſſed; in the mean time the people broke down the bank to give the water a paſſage into the canal, and boat-loads of ſweetmeats were thrown into the river, for which they jumped in and ſcrambled. The viceroy moved forward to his palace in the iſland of Roida, oppoſite to Cairo; and bonfires, illuminations, and fireworks were continued for three nights ſucceſſively. There were particularly two vaſt machines repreſenting a man and woman of gigantic ſtature placed on the river before the baſha's palace, which took up no leſs than two thouſand lamps to illuminate them; beſides all the gallies, barges, and other veſſels were hung full of lamps, and in them the muſic played, and fireworks, with great and ſmall guns, were continually let off.

But the ceremonies are more uſually performed by land, when the baſha, attended by his guards, proceeds on horſeback along the canal, and coming to the end of it, diſmounts, ſtrikes the bank, takes horſe, and riding back, leaves ſeveral perſons to break it down, while great crowds follow him, ſinging and ſtriking each other with cudgels. The water at length flows in, accompanied by a number of men and boys ſwimming. Fireworks are played off, and all the while the canal is filling, it is covered with boats filled with young men, ſinging and playing on muſical inſtruments, to expreſs their joy for the fertility produced by this river.

The ſtreets of New Cairo, as in all other Turkiſh cities, are very narrow, and the wideſt extends the whole length of the place; but in Europe it would only be conſidered as a lane, and the others are ſo narrow, that the people frequently ſpread a ſlight ſtuff acroſs the houſes, from one ſide to the other, to defend them from the ſun. Moſt of the ſtreets, or at leaſt each end of every ward, is ſhut up as ſoon as it grows dark with gates, guarded by two or three janizaries, ſo that no idle people can lurk about them without being diſcovered. Several ſtreets only conſiſt of ſhops, without any houſes, and are alſo locked up at night, when the tradeſmen return home; and the ſhops of the ſame trade are generally together.

The houſes, like thoſe of Turky, have very little beauty on the outſide, being built below of ſtone, and above of a ſort of cage-work, ſometimes filled up with unburnt brick, and few or no windows on the outſide. Within they, however, appear with ſufficient magnificence. Dr. Pococke viſited the houſe of the bey, where he entered a fine ſaloon, with a lobby before it. The grand room, he ſays, is an oblong ſquare, with an octagon marble pillar in the middle, inlaid on two ſides about eight feet high with pannels of grey marble, each bordered with Moſaic work. The ſopha extends all round the room, and has rich velvet cuſhions, and the floor is covered with fine carpets.

Here is an antient palace built by the ſeventh king of Egypt of the race of the Mamalukes, who lived about the year 1279. The entrance to the grand apartment is by a fine door ſomewhat in the Gothic taſte. In this room is a noble ſaloon in the form of a Greek croſs, with a cupola in the middle, and it is wainſcotted, or rather inlaid, ten feet high, in a very expenſive manner. Round the top, about two feet deep, are Arabic inſcriptions; then for two feet more it is covered with mother of pearl, and different kinds of fine marble, in the form of ſmall arches. Below this the wall is covered with pannels, ſome of the moſt beautiful kinds of marble, and others of mother of pearl; while all the pannels are ſurrounded with a border of Moſaic work, in mother of pearl and azure.

This city contains ſeveral magnificent moſques, particularly one on the north-eaſt of the town called Kubbe-el-Azab, which is about ſixty feet ſquare, and has a very beautiful dome raiſed on a baſe of ſixteen ſides, in each of which is a window. It is caſed round with all the moſt beautiful kinds of marble, among which are ſeveral fine ſlabs of red and green porphyry. Theſe are all placed in pannels finely carved and gilt, and above is a ſort of frize covered with ſentences cut in large gilt characters, called the Couphe, in which they here antiently wrote the Arabic tongue. The walls above have Arabic inſcriptions

S. Wale del. J. Hall sculp.

Ceremony upon the Overflowing of the Nile at Cairo.

inſcriptions in letters of gold, and the whole cupola is painted and gilt in the moſt ſplendid manner. All over the moſque are hung glaſs lamps and oſtrich's eggs. Adjoining to this edifice are apartments built for the prieſts, and ſome very fine ones for the perſons of rank who ſometimes chooſe to reſide here.

But a moſque at the foot of the caſtle-hill exceeds all the reſt, both in the ſolidity of the building and in its grandeur and magnificence, which ſtrike the beholder in a ſurpriſing manner. It is very lofty, and erected in the form of an oblong-ſquare, crowned with a cornice all round that projects a great way, and is adorned, after the Turkiſh manner, with a kind of groteſque carving. The entrance is inlaid with ſeveral kinds of marble, carved at the top. The aſcent to it was by ſeveral ſteps, but theſe have been broken down, and the door walled up, becauſe the rebels have often taken ſhelter there when there have been public inſurrections.

The caſtle of Cairo is ſaid to have been built by Saladin. It is ſeated on a rocky hill, and is walled round; but, though it is of very difficult acceſs, it is ſo commanded by a hill to the eaſt, as to be of no ſtrength ſince the invention of cannon. At the weſt end are the remains of very noble apartments, ſome of which are covered with domes, and adorned with pictures in Moſaic work; but theſe apartments are now only uſed for weaving, embroidery, and preparing the hangings and coverings annually ſent to Mecca.

Above the caſtle is a higher ground, near a grand ſaloon called Joſeph's-hall, from which is a fine proſpect of the city, the pyramids, and all the neighbouring country. This was probably a terrace to the ſaloon, which is open on every ſide, except to the ſouth, and is adorned with large and beautiful columns of red granite, ſome of which have capitals of the Corinthian order; ſome are only marked out in lines like leaves, and many are only plain ſtones that have but little reſemblance of capitals.

In the weſt part of the caſtle is the jail, which the common people think to be the priſon in which Joſeph was confined.

About the middle of the caſtle is a large court, on the ſouth ſide of which are the baſha's apartments, and the great divan, where the beys aſſemble three times a week under the kaia, or prime miniſter of the baſha; and the latter ſometimes ſits in a room behind, that has a communication by ſome lattice windows. A ſtranger may enter with the conſul's interpreter, and being afterwards conducted to the baſha's coffee-room, will be entertained by his ſervants with ſweetmeats and coffee.

At a ſmall diſtance ſtands the mint, where they coin their gold and ſmall pieces of iron waſhed over with ſilver. Theſe laſt are called medines, and are of the value of three farthings.

There is a well in the caſtle much admired on account of its great depth; it is cut through the rock, and the water brought up by ſeveral Perſian wheels placed one over another, and turned by oxen. This is called Joſeph's-well, not from the patriarch of that name, but from a grand vizier, who about ſeven hundred years ago had the care of the work under Sultan Mahomet. This caſtle is, in ſhort, about a mile in circumference, and reſembles a little town; but moſt part of it is now very ruinous.

In the rock upon which the caſtle is built are grottos all up the ſide, in many ſtories; but ſeveral of them are now inacceſſible, while there is a way to others by a narrow terrace. Theſe are generally lofty rooms, eight or ten feet ſquare. On the top towards the brow of the hill are two rooms, with holes on the top to let in light, over which is a raiſed place to which the great often go to enjoy one of the fineſt proſpects in Egypt, it commanding a view of Cairo and of all the country as far as the eye can reach. Over the ſouth cliff is a moſque, in which was interred the Sheik Duiſe, whoſe name is given both to the hill and the moſque. The inſide of this ſtructure is painted all over with flowers on a red ground.

Among the curioſities at Cairo we ought not to omit that of their manner of hatching of chickens, by putting the eggs in ovens, which are heated with ſo temperate a warmth, and ſo well imitates the natural heat of the hen, that they produce living chickens. Theſe ovens are under ground, and the bottom covered with cotton, or flax, to lay the eggs upon. There are twelve of theſe ovens together, that is, ſix on a ſide, in two ſtories on each ſide the paſſage. They begin to heat them about the middle of February, with the hot aſhes of the dung of camels or oxen, which affords a ſmothering heat without any viſible fire. This they lay at the mouth and farther end of the oven, daily changing it and putting in freſh dung for ten days, and then lay in the eggs, which ſometimes amount to eight thouſand in an oven. After eight or ten days they pick out the good from the bad, which they diſcover by holding them to a lamp, and then putting out the fire, lay one-half of the eggs in the upper oven, and ſhutting them up cloſe, let them lie about ten days longer; and then opening the ovens they find the chickens hatched. If it has happened to thunder, great numbers miſcarry; and in common they often want a claw, a rump, or are ſome other way imperfect. It is ſaid that the people of only one village are maſters of the art, and that at the proper time of the year they ſpread themſelves all over Egypt. Extraordinary as this method of hatching chickens may appear, it is practicable in other countries. The duke of Florence ſent for ſome of the Coptis employed in thus producing chickens, who hatched them in Italy in the ſame manner; and, ſince that time, the late learned and ingenious M. Reaumur, after many experiments, found it practicable in France, and has ſhewn the manner of doing it in a work on that ſubject, which has been tranſlated into Engliſh.

Few arts in Egypt are carried to any perfection higher up the Nile; and this, with the convenience of water-carriage, renders Cairo a place of great trade, and brings a prodigious concourſe of people to that city.

As to the inhabitants of Cairo, moſt of them ſeem deſcended from the Mamalukes; but there are alſo many Jews, ſome Greeks, and a few Armenians; but there are no other Europeans ſettled in the city but the Engliſh, French, and ſome Italians from Leghorn and Venice. And here it may be proper to obſerve, whenever any of the Engliſh die in any part of the Levant, where there is no Engliſh chaplain, they are interred with the Greeks, and according to the ceremonies of that church.

The European merchants, conſidering how much they are confined, live agreeably among themſelves. They are ſociable with thoſe of their own nation; and, as the country is ſo plentiful, they poſſeſs whatever is capable of making life paſs chearfully. They ſpend the morning in buſineſs, and often paſs the remainder of the day in the fields and gardens to the north of Cairo; and great part of their affairs being tranſacted by the Jews, they have a relaxation from buſineſs both on the Jewiſh and Chriſtian ſabbath. When the Nile has overflowed its banks, and they have little buſineſs to do, they retire to their houſes at Old Cairo and Gize, which is ſituated on the oppoſite bank of the river, and there they paſs their time as agreeably as the circumſtances of the place will admit.

The trade of Cairo chiefly conſiſts in the importation of broad-cloth, lead, and tin; and the exportation of flax, ſena, coffee, and ſeveral drugs, chiefly brought from Perſia. The natives likewiſe import raw-ſilk from Aſia, which they manufacture into ſattins and other ſilks, in imitation of thoſe of India. Sugar of the growth of this country is alſo made here; but it is neither cheap nor fine: furniture for horſes, and lattices for windows, of turned wood, braſs, and iron, are made in great perfection; and they alſo export fine matting made of dried ruſhes, which are not only ſent over the Turkiſh empire, but to moſt parts of Europe.

SECT. VII.

Of the Pyramids of Memphis and Soccotra.

THE moſt extraordinary monuments near Cairo are the pyramids, which were formerly ranked among the ſeven wonders of the world, and cannot now be

viewed without admiration. These are situated upon the solid rock, at the foot of the high mountains that accompany the Nile in its course, and separate Egypt from Libya. Their architecture, both on the inside and without, is extremely different with respect to distribution, materials, and grandeur. Some of these are open, others are ruined, and most of them are closed; but all have been injured by time. The immense quantity of materials used in constructing them renders it impossible for them all to have been built at the same time, and those that were last erected greatly exceed the first in magnificence and grandeur. They are the works, says Mr. Norden, of the remotest antiquity, and even more early than the times of the most antient historians whose writings have been transmitted to us, the very epocha of their beginning being lost at the time when the first Greek philosophers travelled into Egypt. It is not improbable, the above gentleman adds, that the invention of pyramids was owing to the ignorance of the people in having no other method of covering a great circumference, before the art of arching and employing columns to support a roof were invented. It is indeed a mortifying consideration, that the most durable works in architecture have been owing to ignorance. Thus the famous aqueducts of the antients, the remains of which are the wonder and admiration of the present times, were owing to their not knowing that water would rise up nearly to the same height as that from which it falls.

The common people are persuaded that the pyramids, the vast palaces and the temples, whose remains fill the spectators with amazement, were built by giants; and, indeed, it has been supposed, that men some thousand years ago were much larger than at present; but these opinions are fully confuted by the height of the entrances of the caves from whence they have taken stones for these purposes, by the narrowness of the passages of the pyramids, and by the height of the doors of the most antient buildings.

The principal pyramids being situated three or four leagues to the west of Cairo, near the place where the city of Memphis is supposed to have stood, they are commonly called The pyramids of Memphis. They stand on a rocky plain, eighty feet perpendicular above the level of the ground overflowed by the Nile; and it appears that this rock, not being every-where level, has been smoothed by the chissel. It is remarkable that this rock is almost covered by the flying sand brought by the wind from the adjacent mountains; and that in this sand are a great number of shells, and those of oysters petrified, which is the more surprising, as this plain of solid rock is never overflowed by the Nile, which, besides, has no shell-fish throughout its whole course. Here are also found the beautiful flint-stones which, on account of the singularity of their colours, are thought much more valuable than agate, and of which the people of Cairo make snuff-boxes and handles for knives.

There are four of the pyramids that deserve the attention of the curious; besides these, there are seven or eight others, but these last are not to be compared with the former, especially as they are in a very ruinous condition. The four principal are nearly upon the same diagonal line, at about four hundred paces distant from each other; and their four faces exactly correspond to the four cardinal points. The two most northerly are the largest; and Mr. Greaves, who measured the bottom of the first, found that it was exactly six hundred and ninety-three English feet square, and that its perpendicular height is five hundred feet; but if it be taken as the pyramid ascends inclining, then the height is equal to the breadth of the base. It cannot be improper here to observe, that the square of Lincoln's-inn-fields is said to have been formed by Inigo Jones of the size of this pyramid, which if placed in that square would on all sides reach to the houses.

This pyramid is ascended on the outside by steps, which run round the pyramid: the number of them has, however, been very differently related; but they are between two hundred and seven and two hundred and twelve in number, and from two feet and a half to four feet high, and are broad in proportion to their height. The external part is chiefly built of great square stones cut from the rock which extends along the Nile, where to this day may be seen the caves from whence they were taken. The size of the stones is unequal; but they have all the figure of a prism, that they may lie perfectly close. The architect has only observed the pyramidical figure, without troubling himself about the regularity of the steps; and it appears that the inequality of the stones, which differ four, five, and even ten inches, is the reason why so many travellers, who have counted them, always differ with respect to number. These kind of steps, says Mr. Norden, were not designed for ascending and descending, and therefore regularity was no farther sought than was necessary for the general shape of the pyramid and the facility of the work. It appears that the external lays are solely compacted by the weight of the stones, without mortar, lead, or cramps of any metal; but in the body of the pyramid they have used a mortar composed of lime, earth, and clay. At its four corners it is easily perceived that the lower stones are placed on the rock, without any other foundation; but beyond them, quite to the middle of each face, the wind has formed a slope of sand, which on the north side rises so high as to afford a commodious ascent to the entrance of the pyramid, which is about forty-eight feet high.

On ascending to the entrance, you discharge a pistol to frighten away the bats, and then two Arabs, whom you are obliged to have for your attendants, enter and remove the sand, which almost stops up the passage. You then strip yourself to your shirt, on account of the excessive heat constantly felt in the pyramid, and in this condition enter the passage, each of the company having a wax candle in his hand; for the torches are not lighted till you are in the chambers, for fear of causing too much smoke. This passage runs downward ninety-two feet and a half, and is very steep; but at the farther end of it is an opening so small, that it is barely a foot and a half high, and two feet in breadth; yet through this hole you are obliged to pass, but the traveller, instead of creeping, commonly lays himself down, and each of the two Arabs that went before take one of his legs, and thus drag him over the sand and dust.

On having passed this streight, which is luckily no more than two ells long, you enter a pretty large place, where travellers commonly take some refreshment to give them courage to proceed.

It ought not to be omitted that all these passages, except the fourth, are three feet and a half square, and lined on the four sides by great blocks of white marble, so polished that this, with the acclivity of the way, would render them impassable, were it not for little holes cut for resting the feet in. It costs great trouble to advance forward, and if you make a false step, you will slide backwards to the place from whence you set out; but by observing these holes you proceed commodiously enough, though you must stoop till you come to the end of the second passage, which is a hundred and ten feet in length: you then come to a resting-place, on the right hand of which is an opening into a kind of well, in which nothing is to be found but bats of so prodigious a size, that they exceed a foot in length.

At this resting-place begins the third passage, which is a hundred and twenty-four feet in length, and runs horizontally in a straight line to the inferior chamber. The height of this gallery is twenty-six feet, and the breadth six, with benches on each side of polished stone. Before the chamber are some stones, with which the way is embarrassed; but having surmounted this difficulty, you enter a chamber which is also covered with stones. This chamber is lined with granite, finely polished; but at present extremely black with the smoke of the torches used in examining it.

Having visited the lower chamber, you return to the resting-place, and ascend upwards by fastening your feet as before, till coming to the end of the fourth gallery you meet with a little platform. You must then begin to climb again, but soon finding a new opening, where you may stand upright, you contemplate a little room, which is at first no more than a palm's breadth larger than the galleries, but afterwards enlarges itself on both sides; and

and at length, ſtooping for the laſt time, you paſs the remainder of the fifth gallery, that leads in a horizontal line to the upper chamber. This is a very noble room in the center of the pyramid, at an equal diſtance from all the ſides, and almoſt in the midſt between the baſis and the top. The floor, ſides, and roof are all formed of vaſt blocks of granite marble. From the bottom to the top are but ſix ranges of ſtone, and thoſe which cover it of a ſtupendous length, like ſo many huge beams lying flat and traverſing the room, nine of them forming the cieling. This hall is ſomething more than thirty-four feet in length; it is ſeventeen feet broad, and the height is nineteen feet and a half. On the left ſide is what is generally ſuppoſed to be a coffin, formed of one entire piece of granite marble, and uncovered at the top; and, on being ſtruck with a key, ſounds like a bell. This is ſaid to be the tomb of Cheops, king of Egypt. Its form is like that of an altar, hollowed within, and the ſtone is ſmooth and plain without any relief. The exterior ſuperficies contains ſeven feet three inches and a half in length, three feet three inches and three quarters in depth, and as much in breadth. The hollow part within is little more than ſix feet in length, and two feet in breadth. People in this room commonly diſcharge a piſtol, which makes a noiſe reſembling thunder. You then return in the ſame manner you came.

The traveller is no ſooner out of the pyramid, than he dreſſes, wraps himſelf up warm, and drinks a glaſs of ſome ſpirituous liquor, to preſerve himſelf from a pleuriſy, occaſioned by the ſudden tranſition from an extremely hot to a temperate air. Having at length regained his natural heat he aſcends the pyramid, in order to enjoy a delightful proſpect of the ſurrounding country. The method of aſcending it is by the north-eaſt corner, and when the ſteps are high, or one broken, it is neceſſary to ſearch for a convenient place where the ſteps are entire, or a high ſtep is mouldered, ſo as to render the aſcent more eaſy.

The top does not end in a point, but in a little flat or ſquare, conſiſting of nine ſtones, beſides two that are wanted at the angles. Both on the top, in the entrance, and in the chambers, are the names of abundance of people who at different times have viſited this pyramid, and were willing to tranſmit the memory of their being there to poſterity.

Many travellers have aſſerted, that a man ſtanding on the top of this pyramid could not ſhoot an arrow beyond the bottom, but it muſt neceſſarily fall upon the ſteps; however, it is very certain that a good bow and a ſtrong arm will ſend an arrow as far. There is as little juſtice in the remark, that theſe pyramids caſt no ſhadows. Indeed in ſummer-time, and for near three quarters of the year, the pyramids caſt no ſhadow at noon; but every morning and evening in the year, and at noon in winter, they certainly caſt a ſhadow proportionable to their bulk; and, according to Pliny and Laertius, Thales Mileſius, about two thouſand years ago, took the height of theſe pyramids by their ſhadows.

On approaching the ſecond pyramid it appears even higher than the firſt, which is owing to its being placed in a more elevated ſituation; for, in other reſpects, they are both of the ſame ſize, only the ſecond is ſo well cloſed, that there is not the leaſt mark to ſhow that it has been opened; and it is coated on the four ſides with granite, ſo well joined and poliſhed, that the boldeſt man would ſcarcely attempt to aſcend it.

On the eaſtern ſide of this pyramid are the ruins of a temple, the ſtones of which are ſix feet broad, as many deep, and moſt of them ſixteen or ſeventeen feet long, and ſome of them twenty-two feet in length. The whole building was a hundred and eighty feet in front, and a hundred and ſixty in depth.

At ſome diſtance is a ſphynx, whoſe enormous bulk attracts the admiration of every beholder. It is cut out of the ſolid rock; and Dr. Pococke obſerves, that what ſome have thought joinings of the ſtones are only veins in the rock. This extraordinary monument, which is ſaid to have been the ſepulchre of Amaſis, is about twenty-ſeven feet high. The lower part of the neck, or beginning of the breaſt, is thirty-three feet wide, and it is about a hundred and thirteen feet from the ſore-part of the neck to the tail; but the ſand is raiſed about it to ſuch a height, that the top of the back can only be ſeen. This monument of antiquity is very much diſfigured by the pains ſome people have taken to break off part of its noſe.

The third pyramid is leſs than the two former by a hundred feet in height; but in other reſpects reſembles them. It is cloſed like the ſecond, and is without any coating. On the eaſt-ſide of this pyramid was alſo a temple, which is more diſtinguiſhable in its ruins than the other, and was likewiſe compoſed of ſtones of a prodigious ſize.

The fourth pyramid, which is an hundred feet leſs than the third, is alſo without coating; it is cloſed, and reſembles the others, but had no temple. However, it has one ſingularity, which is, its ſummit being terminated by a ſingle ſtone that is very large, and ſeems to have ſerved as a pedeſtal. It is ſituated a little more to the weſt, and out of the line of the others. Theſe four great pyramids are ſurrounded by others that are ſmaller, and which have been for the moſt part opened, and are in a very ruinous condition.

At near ten miles diſtance from theſe pyramids are thoſe of Soccotra, ſo called from a mean village of that name. Theſe pyramids extend from north to ſouth, and are ſituated at the foot of the mountains in a plain that ſeems formed by nature for the uſe to which it is applied, it not being of great extent, but ſo high that it is never overflowed by the Nile; and there is reaſon to believe, that the celebrated city of Memphis extended almoſt thither.

One of the pyramids which riſes above the reſt is called the Great pyramid to the north. Mr. Norden meaſuring this ſtructure found that the eaſt ſide extended ſix hundred and ninety feet, and the north ſide ſeven hundred and ten. The perpendicular height is three hundred and forty-five feet. It has a hundred and fifty-ſix ſteps, from two to three feet in height, and is built of the ſame kind of free-ſtone as the others, but was caſed with a fine hard ſtone, which is ſtill remaining in ſeveral parts of the ſtructure, though a great deal has fallen down. About one-third of the way up is an entrance three feet five inches wide, and four feet two inches deep. The ſtones within are of the height and breadth of the entrance, and about five feet in length. Our author and his companions entered this paſſage, which is ſteep, and has alſo holes cut as reſts for the feet. Having paſſed through it they entered a room twenty-two feet and a half long, and eleven feet ten inches wide. At the height of ten feet ſix inches a range of ſtones projects five inches inwards on each ſide, and in the ſame manner twelve tiers project one farther than the other till they meet at the top. To the weſt of this room is another that reſembles it: theſe rooms are formed of ſmooth white ſtones ſo large that there are only ſeven of them in length, and three or four in breadth.

At the diſtance of a mile to the ſouth-eaſt is another, called the Great pyramid to the ſouth, which is about ſix hundred feet ſquare at the bottom. It ſeems to have been caſed all the way up, and is built within of good hewn ſtone.

On a lower ground, about two miles to the eaſt of the laſt great pyramid, is one built of unburned brick, which ſeems to have been made of the mud of the Nile, it being a ſandy black clay, with ſome pebbles and ſhells in it, and mixed up with chopped ſtraw, in order to bind the clay together, as unburned bricks are at preſent uſually made in Egypt and other parts of the Eaſt. Some of theſe bricks are thirteen inches and a half long, ſix inches and a half broad, and four inches thick; but others were fifteen inches long, ſeven broad, and four inches three quarters in thickneſs, but were not laid ſo as to bind each other. This pyramid is much crumbled, and very ruinous. It extends two hundred and ten feet on the weſt ſide, and is a hundred and fifty feet high; and at the top is forty-three feet by thirty-five. It ſeems to have been built with five degrees, each being ten feet broad and thirty deep, yet the aſcent is eaſy on account of the bricks having crumbled away.

It ſeems not improbable that this pyramid was built by the Iſraelites, and that they alſo made the bricks of which

it

it is formed: for Joſephus ſays, that when time had extinguiſhed the memory of the benefits performed by Joſeph, and the kingdom was transferred to another family, the Iſraelites were uſed with great rigour; they were ordered to cut canals for the Nile, to raiſe walls, and erect the pyramids.

It has been generally thought that the pyramids were erected as ſepulchres for the kings of Egypt; but if this was the caſe, they would ſurely have provided a better entrance, and not made it neceſſary to drag the corpſe through long, narrow, and intricate paſſages before it could be placed in its tomb: and it ſeems improbable that in the firſt pyramid eleven acres of ground ſhould be covered with blocks of ſolid ſtone for ſo great a height, merely for the ſake of a room or two of no extraordinary ſize, in which a coffin was to ſtand. Dr. Shaw is of the ſame opinion, and obſerves, that the great cheſt of granite marble found in the upper chamber of the pyramid, was probably intended for ſome religious uſe, it being of a different form from the ſtone-coffins found in Egypt, which are conſtantly adorned with ſacred characters, and made with a kind of pedeſtal at the feet; for the mummies always ſtand upright, where time or accident have not diſturbed them; but this cheſt lies flat upon the floor, and conſequently wants that dignity of poſture, which, ſays Dr. Shaw, we may ſuppoſe this wiſe nation knew to be peculiar, and therefore would be very ſcrupulous of denying, to the human body.

In ſo ſymbolical a religion as that of the antient Egyptians, it is not improbable that the pyramidical form might convey ſome ſacred meaning; and perhaps the pyramids themſelves might be objects repreſenting the Deity, and to which they offered their adorations; juſt as the Paphian Venus was, according to Tacitus, not of a human, but of a pyramidical form; as is alſo the black ſtone worſhipped by the Gentoos of India, under the name of Jaggernaut, of which we have given ſome account in treating of the religion of the Gentoos of Indoſtan.

SECT. VIII.

Of the Catacombs and Egyptian Mummies.

IN the ſame plain in which theſe laſt pyramids are placed are the catacombs, the entrance into which are by a kind of wells, about four feet ſquare, and twenty feet deep, cut through a ſlaty rock, covered with ſand, which being moved by the wind, ſometimes fills up theſe entrances. However, ſome of them are caſed as far as the depth of the ſand with large unburnt bricks. People are uſually let down with ropes, when being got to the bottom, they find a paſſage five feet wide, and about fifty feet in length, filled up very high with ſand, and having got to the end of it turn down another paſſage to the left hand about ſix feet high, on one ſide of which are little rooms, with benches about two feet above the floor, and on the other ſide are narrow cells juſt big enough to receive a large coffin. At the end of this alley is another, which is narrower, and on each ſide are niches that ſeem deſigned for coffins placed upright. This paſſage leads to rooms in the form of an oblong-ſquare, filled with the remains of mummies. Our author obſerves, that here the inferior perſons of a family were probably depoſited, while the heads of the families were placed in the niches. Each family had originally, perhaps, its burial-place; and as the family increaſed they branched out theſe ſepulchral grottos, that every deſcendant might have a ſeparate place for his family.

In theſe catacombs are found the remains of embalmed bodies, ſwathes ſcattered up and down, and ſometimes coffins ſtanding upright and entire, made of ſycamore or Pharaoh's fig-tree, that have continued in theſe ſubterraneous apartments above three thouſand years, though the wood is to appearance ſpongy and porous. The upper part of the coffin is commonly ſhaped like a head, with a face painted upon it; the reſt is a continued trunk, and the end for the feet is made broad and flat for it to ſtand upright in the repoſitory. Other coffins are made of ſtone, and they are generally adorned with carved work repreſenting hieroglyphical figures.

Upon opening the coffins the bodies appear wrapped up in a linen ſhroud, upon which are faſtened ſeveral linen ſcrolls painted with hieroglyphic characters. Theſe ſcrolls commonly run down the belly and ſides, or are fixed on the knees and legs. On a kind of linen headpiece, which covers the face, the countenance of the perſon is repreſented in gold, or painted; but theſe paintings are very much decayed by time. The whole body is ſwathed by fillets or narrow bandages of linen wrapped round in ſo curious a manner, with ſo many windings and ſo often upon each other, that it is ſuppoſed a corpſe has ſeldom leſs than a thouſand ells of filleting. Thoſe eſpecially about the head and face are laid on with ſuch ſurpriſing neatneſs, that ſome appearance of the ſhape of the eyes, noſe, and mouth may be plainly perceived.

Dr. Pococke brought a mummy to England, which was in a coffin made of wood, the ſeams of which were filled up with linen and fine plaſter. Four folds of cloth were over the head, and the upper one painted blue. Beneath theſe was a compoſition about half an inch thick of gum and cloth burnt by the heat of the things applied to it, and over the ſkin was a coat of gum, or bitumen, of the thickneſs of a wafer. The back part of the head was filled with bitumen, which had been poured in at the noſe, and had penetrated even into the bone of the ſkull. The body was bound round with a bandage of linen tape about three quarters of an inch broad, under which were four folds of cloth, then a ſwathe two inches broad, and under that eight different bandages of the ſame breadth laid acroſs from the ſhoulders to the hips on the other ſide: under this was a cruſt of linen about an inch thick, burnt almoſt to aſhes, but ſticking together by means of the gums with which it had been ſmeared. The arms were laid acroſs the breaſt, the right hand over the left, and both lying towards the face. From the hips to the feet were eight bandages twelve inches broad, and under theſe were bandages an inch thick conſumed by time and the heat of the drugs; but the outer bandages did not appear to have been ſmeared with gums. The coffin in which the body was put was formed of two pieces of wood hollowed ſo as to receive it, and being put together were faſtened with broad pegs in the top fixed in holes in the lower part. This coffin was in the ſhape of an human body, as bound up after its being embalmed; and both the coffin, and body wrapped up in linen, were covered with a thin plaſter and painted.

Among the catacombs is one for the birds and other animals worſhipped by the antient Egyptians; for when they happened to find them dead they embalmed them, and wrapped them up with the ſame care as the human bodies. The catacomb is about thirty feet deep, and has the ſame kind of entrance, only the paſſage from it is about eight feet wide, and almoſt filled with ſand. It is alſo much more magnificent than the others. The birds are depoſited in earthen vaſes, covered over and ſtopped cloſe with mortar. In one of the irregular apartments are large jars that might be for bigger animals. In ſhort, the birds were embalmed by dipping them in gums and aromatic drugs, and bound up, like the human bodies, with many folds of linen.

SECT. IX.

Of the Ruins of Buſiris, Heliopolis, the celebrated Labyrinth, Antinopolis, Hermopolis. Some remarkable Antiquities on the Side of a Mountain: Thoſe at Gaua Kiebra; with a particular Account of the miraculous Serpent Heredy.

WE ſhall now deſcribe the ruins ſtill to be ſeen of ſeveral cities famous in antiquity. Some of the ruins of the cities and temples of Egypt, like thoſe of Palmyra and Balbec, raiſe our ideas of their antient magnificence and grandeur; while others only ſhew the places where the moſt ſplendid cities once ſtood; the vaſt length of time ſince they were built, having levelled them with the duſt, and only left a few ſcattered monuments of the moſt ſuperb ſtructures,

ſtructures, as teſtimonials of the truth of hiſtory, and as ſpecimens of the architecture of the early ages, before it was improved and carried to perfection by the Greeks. Thoſe of which we ſhall treat in this ſection are of the laſt kind, and the moſt imperfect.

A little to the northward of Cairo is the village of Baalbait, ſituated on one of thoſe artificial eminences on which probably ſtood Buſiris, a city celebrated for its temple dedicated to Iſis; there being the remains of a temple, the moſt coſtly in its materials of any in Egypt. From theſe ruins the temple appears to have been about two hundred feet long and an hundred broad, and at about a hundred feet diſtance it is encompaſſed by a mound raiſed to keep out the Nile. The outſide of this ſtructure was of grey granite, and the inſide and columns of red, the capitals being the head of Iſis. There ſeems to have been four rows of twelve columns each in the temple; but what moſt commands the attention of the curious, is, the exquiſite beauty of the ſculpture; for though the figures are only about four feet high, there is ſomething ſo fine and ſo divine in the mien of the deities and prieſts, that exceeds imagination. But the natives are conſtantly employed in deſtroying theſe fragments of antiquity, and frequently cut the columns in order to make them into mill-ſtones.

At a ſmall diſtance near Cairo are the remains of the antient city of Heliopolis, the Or of the Scriptures, a city of great antiquity, famous for the worſhip of the ſun. A large mound encompaſſes the whole, and at the entrance on the weſt are the ruins of a ſphynx of a bright ſhining yellow marble, and almoſt oppoſite to the gate is an obeliſk ſixty-ſeven feet and a half high. The prieſts of Heliopolis were the moſt famous of all Egypt for their ſkill in philoſophy and aſtronomy, and were the firſt who computed time by years of three hundred and ſixty-five days. Herodotus came to this city to be inſtructed in all the learning of the Egyptians; and when Strabo came here, he was ſhewn the apartments of Plato and Eudoxus.

At a ſmall diſtance to the ſouth of the above obeliſk is the village of Matarea, where it is ſaid the Holy Family lay for ſome time concealed when they came into Egypt; and they add, that being in danger from ſome bad people, a tree opened and became hollow to receive and ſhelter them. The Coptics even pretend to ſhew the very tree, which is hollow and of the ſort called Pharaoh's fig, and take away pieces of it as ſacred relicks; but the Romans ſay, that the tree fell down, and was carried away by the monks of Jeruſalem.

At a place called the town of Caroon, is the ſpot on which ſtood the famous labyrinth, which, according to Herodotus, was built by the twelve kings of Egypt, when the government was divided into twelve parts, as ſo many palaces for them to meet in, and tranſact the affairs of ſtate and religion. This was ſo extraordinary a building, that Dædalus came to Egypt on purpoſe to ſee it, and formed the labyrinth in Crete for king Minos on the model of this.

"This labyrinth, ſays Herodotus, has twelve ſaloons "or covered courts with gates oppoſite to each other, "ſix towards the ſouth, and ſix towards the north in "continued lines. They are ſurrounded by the ſame "outward wall. The apartments are on two floors, the "one under ground, and the other over them, and are three "thouſand in all, each floor conſiſting of fifteen hundred. "Thoſe above ground I myſelf have ſeen and gone "through, ſo that I ſpeak from my own knowledge; "but thoſe beneath being the ſepulchres of the kings, "and of the ſacred crocodiles, the rulers of the Egyptians "were by no means willing to ſhew them. The up- "per apartments are greater than any other human "works: for the outlets at the top, and the various wind- "ings through the ſaloons, gave me infinite ſurprize as "I paſſed from a ſaloon into apartments, and from apart- "ments into bed-chambers, and into other rooms out of "the bed-chambers, and from apartments into ſaloons. "The roof of the whole is ſtone as well as the walls. "The latter are adorned with ſculpture: each ſaloon "has a periſtyle of white ſtones admirably joined to- "gether. Quite cloſe to the line where the labyrinth "terminates, is a pyramid of two hundred and forty feet, "on which large animals are engraven; and the en- "trance into it is under ground."

Little, however, is now to be ſeen of theſe boaſted pieces of art, but heaps of ruins, broken columns, ſhattered walls and entablatures. Among the reſt is the foundation of an oblong ſquare building formed of a reddiſh ſtone or marble. Some ſemicircular pilaſters are placed upon it, and the remains of the edifice above are of brick plaſtered over. Whatever this building was, it appears to have been repaired in this rough manner. More to the eaſt are the remains of an oblong ſquare edifice of white hewn ſtone plaſtered over, with a kind of baſe and plinth ranging round. Near it is a kind of ruſtic building that ſeems to have been a gate. At length appears ſome remains of the grand ſtructure itſelf, which is now called the caſtle of Caroon. It had a portico of ruſtic work, which is now no where above ſix feet high, and the front is more ruinous than any other part. On the other ſides are forty-four tiers of ſtone, each nine inches deep, and conſequently it is there thirty-three feet high; it has ſigns of a cornice ranging round with ornaments of ſculpture. There are four rooms in the length of this building with the doors crowned with double cornices, and over each a kind of falſe door ornamented in the ſame manner; on the ſides of the walls are ſeveral niches, and many ſtones are ſcattered about the plain, ſome of which appear to have compoſed the ſhafts of columns.

A little farther to the ſouth are the ruins of the city of Antinoopolis, built by Hadrian in honour of Antinous his favourite, who was drowned there; but now named Enſineh. Among theſe ruins are ſtill ſtanding a large pillar, with a Corinthian capital, on the top of which was a ſquare ſtone, whereon a ſtatue was probably placed. There is alſo a fine gate of the Corinthian order, and of excellent workmanſhip.

A little farther up the river is the village of Archomounain, which Dr. Pococke ſuppoſes to be ſituated on the ruins of the ancient city of Hermopolis. Little appears of the old city, but extenſive heaps of rubbiſh, except a grand portico of an ancient temple, conſiſting of twelve pillars, ſix in a row. Theſe pillars are ſix feet in diameter, and on every part both of them, and of the ſtones laid upon them, are hieroglyphics; on the pillars are alſo ſome remains of paint, and the cieling is adorned with ſtars. Some pieces of columns of granite marble are alſo to be ſeen among the ruins.

Farther to the ſouth is a mountain called Shebat el Kofferi, on the ſide of which are ſome remarkable antiquities. After aſcending the mountain for about two hours, you arrive at a gate which leads into a great ſaloon, ſupported by hexagonal pillars cut out of the ſolid rock. The walls are adorned with paintings, which are ſtill plainly to be diſtinguiſhed, and the gold that was employed glitters on all ſides. There are openings leading to other apartments; but thoſe are filled up with rubbiſh. There is another apartment above to which you may arrive, though with great difficulty, by climbing up on the outſide. It is ſmaller than the firſt, and has no pillars, but is painted like the other. On each ſide of this ſecond grotto is a tomb of the ſame ſtone with the mountain, with which they both form a continued body. One is open and the other is cloſed, but almoſt buried in the ſand. This upper cavern had alſo a communication with other apartments; but theſe are alſo cloſed up.

A little farther to the ſouth is Gaua-Kiebra, where ſtill remains a beautiful portico of a temple, containing eighteen pillars in three rows: theſe have a ſingular kind of capital, and their ſhafts are enriched with hieroglyphics, executed in a moſt maſterly manner. This temple appears to have been extremely magnificent, not only from the grandeur of the portico, but from the vaſt ſtones which formed the walls, one of which Dr. Pococke found to be twenty-one feet long, eight broad, and four deep; and another thirty feet long, and five broad. At ſome diſtance behind the portico is a ſtone ſhaped like the top of an obeliſk, which has on one ſide of it a niche as if for a ſtatue, and is adorned with hieroglyphics.

At ſome diſtance to the ſouth is the grotto of the famous ſerpent called Heredy, where is the tomb of a pretended Turkiſh ſaint, adorned with a cupola raiſed above the

mountain. The Arabs affirm, that this ſaint, who was named Heredy, dying in this place, was buried here; and that, by a particular favour of the Almighty, he was tranſformed into a ſerpent that never dies, but heals diſeaſes, and beſtows favours on all who implore his aid. Of this ſerpent both Dr. Pococke and Mr. Norden have given a very particular account, and perfectly agree in the particulars they relate of it; and therefore we ſhall give an account of it here, as this can hardly fail of being acceptable to the curious reader, who will doubtleſs be inclined to entertain a very mean opinion of the people who could be deceived by this pious fraud: but abſurd as it is, it is not more ſo than the vulgar belief among the antient Romans, atteſted by very credible authors, of Æſculapius entering into a ſerpent, and under that form being brought to Rome and curing a peſtilence.

This miraculous ſerpent it ſeems pays great reſpect to perſons, and is more propitious to the great lords than to the poor: for if a governor be attacked with any diſorder, the ſerpent has the complaiſance to ſuffer himſelf to be carried to his houſe; but a perſon of the common rank muſt not only make a vow to recompenſe him for his trouble, but ſend a ſpotleſs virgin on the important embaſſy: for the fair alone can have any influence on him; and if her virtue ſhould be the leaſt ſullied, he would be inexorable. On her entering into his preſence, ſhe makes him a compliment, and, with the moſt humble ſubmiſſion, intreats him to ſuffer himſelf to be carried to the perſon who wants his aſſiſtance. The ſerpent, who can refuſe nothing to female virtue, begins at firſt with moving its tail; the virgin redoubles her intreaties, and at length the reptile ſprings up to her neck, places itſelf in her boſom, and there remains quiet, while it is carried in ſtate, in the midſt of loud acclamations, to the houſe of the perſon who diſpatched the ambaſſadreſs. No ſooner is it brought into the room, than the patient begins to find himſelf relieved. Yet this miraculous phyſician does not withdraw; for he is very willing to remain ſome hours with the patient, if during the whole time they take care to regale his prieſts, who never leave him. All this is performed to admiration, provided no Chriſtian or other unbeliever comes in, whoſe preſence, 'tis pretended, would diſturb the feaſt; for this ſagacious ſerpent, on perceiving him, would immediately diſappear. The prieſts would ſearch for him in vain, and it would be impoſſible to find him: for was he carried to the other ſide of the Nile, he would return inviſibly to his dwelling in the tomb. The Arabs even boldly aſſert, that were he cut in pieces, the parts would inſtantly join again; and that being deſtined to be immortal, nothing can put a period to his life.

Even the Chriſtians, who ought to claim a degree of wiſdom ſuperior to the Arabs, have the folly to believe that this pretended ſaint is the devil himſelf, whom God has permitted to miſlead theſe blind and ignorant people; and in this belief they are confirmed by a tradition, that to this place the angel Raphael baniſhed the devil Aſmodi, whom, in Tobit viii. 3. he is ſaid to ſend into Egypt.

"But I am perſuaded, ſays Mr. Norden, that both the "Arabs and theſe Chriſtians offend againſt the rules of "reaſon. Before we conſider a thing as miraculous or "ſuperſtitious, it is neceſſary to examine whether the "fact itſelf be true; whether the circumſtances are ſuch "as are pretended, and whether no fraud is uſed. I "agree that the ſerpent is there, but it cannot be im-"mortal; he undoubtedly dies like other ſerpents, and "the prieſts who draw a profit from him ſubſtitute ano-"ther of the ſame kind in his room. Were they indeed "to cut the ſerpent in pieces, and were the parts ſeen "to join again, it might be eſteemed a proof of its im-"mortality; but they can never be brought to this: and "when the emir of Akmim ordered them to make this "trial in his preſence, the prieſts excuſed themſelves "from the experiment. Is there any thing eaſier than "to make a tame ſerpent obey certain ſigns? The "virginity of the ambaſſadreſs is ſecured by her being "ſo young as to be free from ſuſpicion; and ſerpents "are known to be attracted by certain odours and herbs, "with which the girl may be rubbed; at leaſt ſhe is "adorned with chaplets and garlands of flowers, in "which they take care not to forget ſuch as are agreeable "to the ſerpent. In ſhort, if it be aſked how it is poſ-"ſible that it ſhould diſappear from the ſight of ſo many "people, I anſwer, that it is ſufficient to conceive that "theſe prieſts are excellent jugglers, and there will be "no difficulty in imagining them capable of conveying "away the ſerpent in the preſence of a great number "of ſpectators, without the moſt attentive and quick-"ſighted being able to perceive it: whoever has ſeen "the tricks daily played by the mountebanks in the "great ſquare before the caſtle of Cairo, muſt have "been ſtruck with feats much more remarkable than "this." If to all this be added the account given in this work of the dancing-ſerpents, and other particulars relating to thoſe reptiles, in treating of Indoſtan, the fraud muſt appear extremely evident, and every thing myſterious in the affair will vaniſh.

SECT. X.

Of the Ruins of Tentyra and Thebes.

STILL farther up the Nile was ſituated the city of Tentyra, the inhabitants of which paid extraordinary adorations to Venus and Iſis, to each of whom they built a temple. From the many heaps of ruins ſeen here, the city appears to have been of great extent, and to have been much frequented ſince it was in its antient ſplendor. People ſeem to have lived even in the temples, and ſeveral houſes have been built of unburnt brick on the top of the great temple, which is two hundred feet long, and forty-five broad. The principal remains of the antient buildings are near each other; theſe are two gates and four temples. The grand temple already mentioned appears to be that of Iſis, and ſeems entire, only the apartments which appear to have been built at the top are deſtroyed, and ſix or ſeven of the rooms which have been formed below are filled up.

There is an aſcent to the top by ten flights of ſteps. The pillars are adorned with large capitals of the head of Iſis, each capital having four faces, one on each ſide, and over them are compartments in baſſo relievo, finely executed, and in a noble taſte. At the end of the grand room are four ſtories of hieroglyphics in ſeven compartments, each of which has two or three human figures, but ſome of them are defaced. There are likewiſe four ſtories of hieroglyphics on the outſide, and it is not improbable that before the ground was raiſed there were five both within and without. On the outſide of the ſouth end are five coloſſal figures, and two more beautiful than the reſt ſtand at each corner. Round the top of the edifice are ſeveral ſpouts, with an ornament over them repreſenting the head and ſhoulders of the ſphynx.

We ſhall now give a particular deſcription of the ruins of the antient city of Thebes, which are the moſt conſiderable in Egypt, and are generally known by the name of The antiquities of Carnack and Luxerein, two villages ſituated among thoſe ruins.

The great and celebrated city of Thebes was extended on both ſides the river, and, according to ſome authors, was built by Oſiris, and according to others by Buſiris II. who appointed its circuit, adorned it with magnificent buildings, and rendered it the moſt opulent city upon earth. It was originally called Dioſpolis, or the city of Jupiter, and afterwards obtained the name of Thebes. Diodorus Siculus obſerves, "that not only this king, "but many of his ſucceſſors, improved the city with pre-"ſents of gold and ſilver, with ivory, and a multitude "of coloſſal ſtatues; and that no city under the ſun "was ſo adorned with obeliſks of one entire ſtone. "There were four temples of amazing ſize and beauty. "The moſt antient of theſe was thirteen ſtadia in cir-"cumference, its height forty-five cubits, and the thick-"neſs of its walls twenty-four feet. The buildings "have remained to modern times; but the gold and "ſilver, the ivory, and precious ſtones, were carried away "by the Perſians when Cambyſes ſet fire to the temples "of Egypt. It is ſaid that the Perſians having transfer-"red this opulence to Aſia, and having carried artiſts "with them from Egypt, built the magnificent palaces "of

" of Perſepolis, Suſa, and others in Media. It is added " that the riches of Egypt were at that time ſo great, " that from the ruins, after plundering and burning, " were taken above three hundred talents of gold, and " two thouſand three hundred talents of ſilver."

Of the four remarkable temples mentioned by Diodorus, Dr. Pococke, biſhop of Oſſory, imagines, that which he viewed was the ſame which that antient hiſtorian mentions as of a moſt extraordinary ſize, ſince the ruins of this ſtupendous building extended near half a mile in length. The deſcription Diodorus has given of the height and thickneſs of the walls has been thought extravagant, and beyond all the rules of probability; but, on examining the remains of this temple, it will appear, that in both theſe reſpects they in ſome places exceed the account he has given of them.

This temple has eight grand entrances, to three of which were avenues of a great length between ſphynxes, two of them having ſixty of theſe ſtatues on each ſide. Having paſſed between theſe at one of the entrances, you come to four grand gates at a conſiderable diſtance behind each other, in a direct line to the temple; they are about thirty-five feet deep, a hundred and fifty in length, and before the ground was raiſed, muſt have been from fifty to ſixty feet high. Theſe ſtructures leſſen every way like a pyramid, from the bottom to the top: the firſt is of red granite finely poliſhed, and in a beautiful manner adorned on the outſide with hieroglyphics, in four ſeries from the top downwards, and three on the inſide, in each of which are the figures of two men finely executed, and bigger than the life. Farther on each ſide are coloſſal figures, about fifteen feet high, with hieroglyphics under them; and in this laſt manner the other gates are adorned, but without the compartments. On each ſide of theſe gates there alſo ſeem to have been coloſſal ſtatues.

On the outſide of the firſt is on one ſide a ſtatue of red granite, and on the other a ſtatue of a kind of granite that ſeems compoſed of ſmall pebbles. Our author meaſuring the head of one of them found it five feet ſix inches long. The next gate is much ruined, and has only two ſtories of coloſſal figures to the ſouth, and one to the north. The third gate is covered all round with hieroglyphics and coloſſal figures of men, and here are the remains of a ſtatue of white marble, the head of which has a ſerpent on its caſque. This head is four feet and a half from the top to the lower part of the neck. The fourth gate is a heap of ruins, and before the main building is a large pond, that was probably a reſervoir of the water of the Nile for the uſe of the temple. From theſe gates walls had been built, that not only extended to the other gates, to form the entire incloſure of the temple, but to incloſe particular courts between the gates and that edifice.

About a hundred and fifty paces to the weſt is another ſuperb entrance, with the ſame kind of avenue of ſphynxes; and all the reſt have the appearance of extraordinary magnificence.

The grand entrance to the weſt, which may be termed either a gate or a front to the great court before the temple, is extremely noble, and yet has the greateſt plainneſs and ſimplicity, without any ornaments, and nearly reſembles what among us is termed the ruſtic; it is forty feet broad, and the bottom is a ſolid wall of that thickneſs. In the front are two ſtories of ſmall windows; but the upper ſtory is in many parts ſo ruined, that at a diſtance it has the appearance of battlements.

On the inſide of this gate is a large open court, which has a terrace eighty feet broad, and ſix feet above the ground, as it is now raiſed, to which there were probably ſteps to aſcend from a colonade on each ſide of this anti-temple. The pillars of theſe colonades have ſquare capitals, and on each ſide of the middle walk, to the inner part of the temple, was a very grand colonade of pillars above forty feet high, and eight feet in diameter, with large capitals like vaſes worked with figures in lines. At the farther end of this colonade are two coloſſal ſtatues of red granite, much mutilated, and with the heads broken off.

Though the wall of the inner temple is greatly ruined, Dr. Pococke ſays it has more grandeur and magnificence than is to be found in any other building he ever ſaw. The door is very high, and yet in a juſt proportion; and the walls on each ſide are beautifully adorned with hieroglyphics and the figures of men in ſix compartments, above nine feet high, and twelve wide, every compartment having the figures of three men.

On entering the inner temple there appears ſixteen rows of pillars one way, and eighteen another: thoſe in the two middle rows are eleven feet in diameter, and the others eight, with capitals of ſquare ſtone. The temple was higher above the middle rows than in the other parts, and had a kind of windows over the ſpace between every two pillars, with twelve lattices of ſtone in each. Every part of the temple, both within and without, is covered with hieroglyphics, and on the outſide to the north are carved repreſentations of battles, with horſes and chariots, one of which is drawn by ſtags.

On each ſide of the entrance into the eaſt end of the temple is an obeliſk ſixty-three feet four inches high, and ſix feet ſquare. Farther to the eaſt are two other obeliſks ſeventy-three feet high, and ſeven feet ſix inches ſquare; but one of them is fallen down. Theſe obeliſks are all of red granite, and covered with hieroglyphics. At a little diſtance from theſe obeliſks are two walls, ſeparated by an entrance in the middle, and on the weſt ſide of them are coloſſal buſts. Continuing along the middle to the eaſt you come to a ſmall room of red granite, and all along are apartments that were perhaps appropriated to the uſe of the prieſts.

Theſe ruins are ſcattered ſeveral miles round, and there are the remains of ſeveral other temples; and among the reſt one which appeared to have been round, and a hundred and ſeventy-five feet in diameter.

That part of Thebes on the weſt ſide of the river is now called Gournou, from a village of that name ſituated near the ruins. There is in this place a very ſingular ſtreet, for the rocky ground riſing on each ſide of it about ten feet high, has on each hand a row of rooms, ſome of which are ſupported by pillars; and as there is not here the leaſt ſign of raiſed buildings, Dr. Pococke remarks, that he could not help imagining that in the earlieſt times theſe caverns might ſerve as houſes, and be the firſt invention after that of tents, when they might be contrived as a better ſhelter from the weather and the coldneſs of the nights: but it ſeems more natural to ſuppoſe, that the uſe of caverns preceded that of tents, and that the latter were choſen only by thoſe who removed with their flocks from place to place for the ſake of paſture.

Here the traveller paſſing through ſome other vallies, where the mountains riſe to a great height, comes to a round opening like an amphitheatre, and aſcending it by a narrow ſteep paſſage, arrives at the ſepulchres of the kings of Thebes, which are formed in the rocks. The vale in which are theſe grottos, is covered with rough ſtones that have probably rolled from above. It is about a hundred feet wide, between high ſteep precipices, in which grottos are cut in a moſt beautiful manner. Long galleries, or paſſages, are formed under the mountains out of a cloſe white free-ſtone that cuts like chalk, and is as ſmooth as the fineſt ſtucco-work. Generally there are four or five of theſe galleries, one within another, from thirty to fifty feet long, and from ten to fifteen feet high, leading to a ſpacious room, in which is the king's tomb, or coffin, with his figure cut in relief, or painted upon it, at full length. Both the cieling and ſides of the rooms are cut with hieroglyphics of birds and beaſts; ſome of them painted, and almoſt as freſh as if they were but juſt finiſhed, though they cannot be leſs than upwards of two thouſand years old.

One of theſe ſepulchres is moſt beautifully adorned with hieroglyphics cut in the ſtone and painted. The entrance, which has a deſcent, is cut through the rock, and for thirteen feet is open at the top; then for eight feet more the cieling inclines, anſwering to the deſcent under it. The galleries have hieroglyphics carved on each ſide, firſt in a kind of compartments next to the cieling, in the manner of a frize. Below them are carved figures repreſenting mummies, and under theſe are hieroglyphics all down the ſides, divided by lines into different columns. In the middle of the cieling are the

the figures of men, with ſtars on each ſide. The king's tomb is of one ſtone of red granite, ſeven feet nine inches high, eleven feet eight inches long, and above ſix feet broad, the cover being made to ſhut into it. The figure of the king is cut in mezzo-relievo, with an hieroglyphical inſcription. The room is adorned with different columns of hieroglyphics.

In a large room belonging to another of the grottos is the ſtatue of a man holding a ſceptre in his hand, and on the cieling is painted a large figure of a man holding a particular kind of ſceptre, with wings hanging lower than his feet, and covering his whole body. On each ſide of the entrance are four men cut in the ſtone above the natural ſize, with the heads of hawks and other animals.

On the ſouth ſide of theſe mountains are two very extenſive apartments: to one of them is a deſcent of ten ſteps to a ſpacious area cut in the rock, which leads to a room ſupported by ſquare pillars, alſo cut out of the ſolid rock; and beyond it is a long room ſupported by pillars on each ſide. All the apartments are adorned with hieroglyphics; but they are in ſome places black and ſcaled as if damaged by fire. Beyond theſe rooms are apartments, to which there is a deſcent of ſeveral ſteps to the right; and one part leads to a gallery cut round the rock, which has apartments on one ſide, and in them are holes cut perpendicularly down to other apartments below, where there are doors and openings, and probably as many rooms as above. One would imagine, ſays the right reverend Dr. Pococke, that theſe were the habitations of the living, and that they were cut under thoſe of the kings of Thebes, if they were not themſelves palaces, to which thoſe princes retired to avoid the heat.

The other apartments are cut in a ſmall hill near the appearance of a grand entrance under the mountains: the way to which is through a valley, that ſeems to have been divided by walls or mounds into four parts; one of them is dug much deeper than the reſt, and was probably a reſervoir of the water of the Nile, and the others extend towards ſome remains of old buildings. To the weſt is a room that has a well-turned arch, and appears to have been uſed as a Chriſtian church; for the hieroglyphics, which are in ſmall columns, and extremely well cut, have been covered with plaiſter, on which is painted Chriſt encompaſſed with a glory.

A little to the ſouth-eaſt are the ruins of a large temple, and at a diſtance from it the ruins of a pyramidal gate, and of a very large coloſſal ſtatue, broke off about the middle of the trunk. It is twenty-one feet broad at the ſhoulders; the ear is three feet long, and from the top of the head to the bottom of the neck is eleven feet.

In the firſt court of the temple are two rows of ſquare pillars, on each ſide of which is a ſtatue, but their heads are broke off. Each of theſe ſtatues has the lituus in one hand, and the flagellum or whip in the other, as is commonly ſeen in the ſtatues of Oſiris. In the ſecond court are the remains of two coloſſal ſtatues ſitting; they are of black granite, and the head of one of them, which lies on the ground, is three feet five inches long.

A great number of pillars belonging to the temple are ſtill ſtanding, and many others are deſtroyed. Two ſorts of pillars are obſerved in this edifice, one more beautiful than the other. Their thickneſs and ſolidity give them at a diſtance a noble appearance, and on approaching them the eye is entertained with the hieroglyphics; and when you are near them their colours have a fine effect. This ſort of painting has neither ſhade nor degradation. The figures are encruſted with it like painting in enamel; and Mr. Norden obſerves, that it ſurpaſſes in ſtrength every thing he had ſeen of the kind, it being ſuperior in beauty to the al-freſco and Moſaic work, with the advantage of being more durable. It is ſurpriſing to ſee, ſays he, how the gold, ultra-marine, and other colours have preſerved their luſtre to the preſent age.

At a conſiderable diſtance from the temple are what is called the coloſſal ſtatues of Memnon, which front the Nile. The firſt appears to repreſent a man ſitting, and the other a woman in the ſame poſture; and they are both fifty feet high from the baſes of the pedeſtals to the top of their heads. They are ſeated upon ſtones fifteen feet in height, and as many in breadth; but the back part of each ſtone is higher than the fore part by a foot and a half, and they are placed on plain pedeſtals five feet high. The ſtatue to the north has been broken off at the middle, and has been built up with five tier of ſtones; but the other is of one ſingle ſtone: the feet have the toes broken off, and the features are mouldred away by time. The ſides of their ſeats are covered with hieroglyphics; on the pedeſtal of the ſtatue, which has been broken, is a Greek epigram; and on their inſteps and legs are ſeveral Greek and Latin inſcriptions, ſome of them epigrams in honour of Memnon; but moſt of them are the teſtimonies of thoſe who have heard his ſound: for one of them has been thought the famous ſtatue of Memnon, which at the firſt and ſecond hour, it is pretended, uttered a ſound occaſioned by the rays of the ſun ſtriking upon it.

At a little diſtance from theſe ſtatues are the ruins of ſeveral others, particularly one of yellow granite almoſt entire, and twelve feet long from the top of the head to the thigh.

At Luxerein are the remains of a large and magnificent temple, which was alſo a part of the antient Thebes, and is called by Diodorus the ſepulchre of Oſymandus: it is ſituated on the eaſt ſide of the river, to the ſouth of the antiquities juſt deſcribed. On approaching it you come to two obeliſks, which are probably the fineſt in the world; they are at preſent ſixty feet high, and might be ſeventy or eighty, according as the ground has riſen, which is certainly a great deal: they are ſeven feet and a half ſquare, and at bottom might be eight feet. The hieroglyphics extend in three columns down each ſide, and are cut with a flat bottom an inch and a half deep, and the granite has perfectly retained its poliſh, which is as fine as can be imagined. On the top of each ſide a perſon ſits on a throne, and another offers him ſomething on his knees. Theſe figures are likewiſe below. Lower down are three hawks, then three bulls, and at the diſtance of about every foot is an owl. There are alſo monkies, heads of camels, hares, dogs, ſerpents, birds, and inſects.

At a ſmall diſtance is a pyramidal gate, two hundred feet long, and at preſent fifty-four above the ground. On each ſide of the entrance is a coloſſal ſtatue, which riſes thirteen feet and a half above the ſurface of the earth, though the ſhoulders are only three feet and a half above the ground. In the front of the pyramidal gate are windows and ſculpture, particularly a perſon ſeated on a throne, holding out one hand, in which he has a ſceptre or a ſtaff, and is ſurrounded by others in poſtures of adoration. On the other ſide a man is repreſented in a car, galloping and ſhooting with a bow, and followed by many chariots. This may have a relation to the wars of this king againſt the Bactrians. Within this gate is a court almoſt filled with cottages, with ſome pillars that once formed part of a colonade, beyond which was another gate now in ruins, and beyond that another court, which had a large and beautiful altar in the middle, and the hiſtory of the king was cut all round on the walls. The pillars in this court are forty feet high; but the work in the capitals, inſtead of being in relief, is only cut out in lines. The walls of the rooms are adorned with ſculpture, among which a Deity is repreſented carried by eighteen men in a kind of boat, preceded and followed by a perſon holding a particular enſign. Here are alſo a perſon ſitting, and another kneeling to him, with inſtruments of muſic, and men kneeling who have the heads of hawks; and alſo a man leading four bulls with a ſtring.

SECT. XI.

Of the Ruins of Eſne, or Eſſenay; of the Temple of Pallas, at Latopolis; of one at the antient City of Apollinopolis; with the Ruins of Comombo, Elephantine, and Philæ.

AT Eſne, a conſiderable town farther up the river, are the remains of a magnificent temple, that is cloſed on three ſides, and has in the front twenty-four pillars

pillars that ſeem well preſerved. A channelled border runs all round the top of the edifice, and in the middle of the front is a cartouch, or ornament like thoſe ſeen on all the principal gates of Egypt. A ſemi-corona borders the whole edifice, the ſides of which are filled with hieroglyphical figures that appear of the moſt antient kind, and ſeem to have been executed in haſte. The pillars ſupport ſtones placed croſs-ways, on which reſt great tables that form a roof, that is alſo adorned with hieroglyphics. The figures of the inſide are eaſily perceived to be done by another hand, and executed with more care than thoſe without; but none of the hieroglyphics are incruſted with colours. The pillars are likewiſe covered with hieroglyphics, which in ſome places are ſmall and much crowded. It is remarkable, that among all the pillars of this temple there is not one capital that reſembles another; for though the proportions are the ſame, the ornaments are different. The inſide of the edifice is blackened by the ſmoke of the fires formerly made there: however, every part of it is well preſerved, except the gate, and the intermediate ſpaces between the front columns, which the Arabs have filled up, in order to ſhut up their cattle in the temple, which is at preſent applied to no other uſe.

At about three miles from this temple is another, which Dr. Pococke ſuppoſes to be the temple of Pallas at Latopylis, where both that goddeſs and the fiſh Latus were worſhipped. There are here alſo ſeveral different kinds of capitals, ſome of which reſemble the Corinthian, but have a very flat relief. The inſide has three ſtories of hieroglyphics of men about three feet high, and at one end the loweſt figures are as large as the life: one of them has the head of the Ibis, and the figure of a woman ſitting appears in ſeveral parts of the wall. The cieling is adorned with a variety of animals, which are painted in very beautiful colours; and among them is a man ſitting in a kind of boat, with a circle round him. This temple ſeems to have been uſed as a church, there being ſome Coptic inſcriptions on the walls.

At Etfou, where was once ſituated the city of Apollinopolis, is a noble temple and a grand pyramidal gate, which the Turks have converted into a citadel. There runs all round it a ſemi-circular corona, but no cornice is to be ſeen: upon its faces are three rows of hieroglyphical figures, which appear deſigned to repreſent infants, though their ſtature exceeds that of men. The temple, which was dedicated to Apollo, is in a manner buried under ground; and the Arabs have made no ſcruple of employing what they have been able to take away in erecting ſome pigeon-houſes.

Still farther to the ſouth is the village of Comombo, where are ſome beautiful ruins, which it is impoſſible for a curious traveller to view without great ſatisfaction. A noble building reſts upon twenty-three well wrought pillars adorned with hieroglyphics: the ſtones that cover the top are of a prodigious ſize, and the architrave, which is at preſent ſplit, was antiently a ſingle ſtone. The pillars are above twenty-four feet in circumference: part of the buildings is covered with earth, and three quarters of the pillars are under ground.

At about fifty paces diſtance on the declivity of a mountain is another antique monument, about eighteen feet in height. The ſides are thick ſet with hieroglyphics, which are much decayed towards the ground, and the back part is almoſt buried under the ſand. This edifice is entirely built of large ſquare blocks of a whitiſh ſtone that nearly reſembles marble.

Farther up the Nile is the iſland Elephantine, in which was a city of the ſame name, though it is only about a mile in length, and at the ſouth end about a quarter of a mile in breadth. In this iſland was a temple to Cnuphis, and a nilometer to meaſure the riſe of the Nile. In the midſt of the iſland are the remains of one ſide of a magnificent gate of red granite, finely adorned with hieroglyphics. Its ſouthern part is mountainous and covered with ruins, moſt of which are buried under the earth. Among others is an antient edifice ſtill ſtanding, though covered with earth at the top, as well as on the ſides, and this is ſtill called the temple of the ſerpent Cnuphis. It is incloſed by a kind of cloyſter ſupported by columns. At the four corners and in its breadth it has walls, but only a ſingle column is to be ſeen in the middle. This incloſure contains a grand apartment that has two large gates, one to the north, and the other to the ſouth; but the inſide is almoſt entirely filled with ſtones and earth. The walls are covered with hieroglyphics, but are bedaubed with dirt, and blackened by the ſmoke of the fires made there by the ſhepherds.

Farther to the ſouth is the iſland of Philæ, which is high and very ſmall, it not exceeding a quarter of a mile in length, and half a quarter in breadth; and it appears that there were no other buildings in the iſland, but what had a relation to the temples: for Diodorus ſeems to inſinuate, that none but the prieſts were permitted to land, on account of the ſacredneſs of the place; accordingly the whole iſland ſeems to have been walled round, ſomewhat in the manner of a modern fortification, and a great part of that wall ſtill remains. The particular kind of Ethiopian hawk worſhipped here is cut among the hieroglyphics in ſeveral parts, and repreſented with a long neck, extended wings, and a ſerpent coming out of it.

The temple of the hawk is built with free-ſtone on the weſt ſide of the iſland. In the court of the temple, which is of great length, is a row of pillars on each ſide, adorned with a variety of capitals. Beyond this is an inner court, in which are very beautiful pillars with capitals wrought in baſſo relievo, in ſomething like leaves and branches, above which is the head of Iſis on each of the four ſides. On the outſide of this inner court are large coloſſal figures, cut on the ſouth ſide of a great pyramidal gate. At the entrance to the eaſt is an obeliſk of red granite on each ſide, and near each of them a lion. Between the weſt ſide of the grand area and the water is only a narrow terrace, with doors to it from the portico; and the whole ends at the water to the ſouth with a parapet wall, at which are two obeliſks about two feet and a half ſquare raiſed on their pedeſtals. Here the iſland riſes twenty or thirty feet above the water, affording a proſpect above a mile ſouth to the rocks of granite, where the Nile turning, the view is terminated by thoſe rocks in a moſt agreeable and romantic manner, all together having a noble and beautiful appearance.

To the eaſt of this ſtructure is, according to Mr. Norden, the temple of Iſis, which is an oblong-ſquare building, open on all ſides. The capitals of the pillars, which have ſome reſemblance to thoſe of the Corinthian order, may be reckoned among the moſt beautiful in Egypt, and were probably of the laſt invention.

SECT. XII.

Of the Manufactures, Arts, and Commerce of Egypt.

THE manufactures of Egypt conſiſt of woollen, linen, and ſilk. Their flax, of which great quantities grow in the Delta, or that part of Egypt which is encloſed between the two branches of the Nile, is ſpun with a ſpindle, and the thread drawn out from the diſtaff without the uſe of a wheel. They are not now, as formerly, remarkable for their fine linen, for the people of rank commonly wear muſlins: however, the Egyptian linen is exceeding white and cheap; it is chiefly manufactured at Roſetto, where they alſo make ſtriped linens for curtains to defend themſelves againſt the gnats, which are very troubleſome in Lower Egypt. In other parts, they make a ſtrong coarſe linen for ſheets, and great quantities of ſackcloth.

The woollen of this country chiefly conſiſts of unnapped carpets uſed in their ſophas.

Their raw-ſilk is brought from Syria, and manufactured by them into large handkerchiefs for women's veils: they alſo make very rich handkerchiefs worked with gold and flowers of various colours, and ſometimes make coverings of this ſort for their ſophas; they likewiſe manufacture a great variety of taffetas and ſattinets.

The Chriſtians are the perſons chiefly employed in their manufactures and mechanic arts: they are in particular the jewellers and ſilver-ſmiths of Egypt. There is a very great demand for theſe ſort of goods; for tho' the people are prohibited the uſe of plate in their houſes,

or the wearing of gold rings, a great deal of jewellers-work is uſed as ornaments in the dreſs of their women, and plate in the furniture of their houſes.

The Egyptian pebbles are wrought and poliſhed in great perfection, for the making ſnuff-boxes and the handles of knives, which is done with a wheel as they cut and poliſh precious ſtones. They alſo make red leather; but it is not equal to that of Morocco or Conſtantinople.

As Lower Egypt furniſhes the reſt of the country with rice, ſo Upper Egypt ſupplies the Lower with wheat and other grain. Since the Europeans found a way to the Indies by encompaſſing the coaſt of Africa, the foreign trade of Egypt has ſo declined, that Indian calicoes, muſlins, and China-ware, are at preſent dearer in that country than they are in England.

The exportation of rice and coffee from Egypt to any place out of the dominions of the Turks is prohibited; but ſeveral drugs are ſent from thence to Europe, as coloquintida, ſenna, and the red dye called ſaffranon. Flax is alſo exported to other parts of Turky, and likewiſe to Leghorn, and cottons to Marſeilles.

Their importations are ſilk from Venice and Leghorn; Engliſh, French, and Venetian cloth, drugs, dyes, and Engliſh tin, lead, and marble blocks from Leghorn; furs, copper-veſſels and plates from Conſtantinople; ſmall-wares from France, Venice, and alſo Conſtantinople. They likewiſe bring iron from Salonichi, carpets from Aſia Minor, ſilks from Syria, woollen manufactures from Barbary, coral and amber they alſo import in order to ſend it to Mecca.

CHAP. II.

Of NUBIA and ABYSSINIA, or UPPER ETHIOPIA.

SECT. I.

Of NUBIA.

Its Situation, Extent, Climate, Vegetables, and Animals. The Perſons, Dreſs, Cuſtoms, and Manners of the Inhabitants. With a conciſe Account of the cities of Dangala and Sennar; and the Articles of their Commerce.

WE ſhall now proceed up the Nile to Nubia, which is alſo called Sennar, and is bounded on the north by Egypt; on the eaſt by the Red Sea; on the ſouth by Abyſſinia; and on the weſt by the kingdoms of Tagua, Gaoga, and the deſart of Gorham. It is ſituated between the thirteenth and twenty-fourth degrees of north latitude, and between the twenty-fifth and thirty-eighth degrees of eaſt longitude, extending in an irregular oblong-ſquare. Its principal rivers are the Nile, the Nubia, and the Sira.

Though this country is entirely under the torrid zone, it is in many places very fruitful, eſpecially on the banks of the Nile, where the inhabitants, as in Upper Egypt, raiſe the water up to the high banks by art and labour. Hence it produces ſome very fine fruits, with plenty of ſugar-canes; but the natives are unacquainted with the method of making good ſugar. They have alſo a great variety of medicinal plants, roots, and drugs; with others that are extremely obnoxious, particularly a moſt dreadful poiſon, ſo quick and fatal in its operations, that, it is ſaid, a ſingle ſeed taken inwardly gives almoſt inſtant death. Theſe ſeeds grow on the top of a plant that reſembles our nettles, and it is ſaid that conſiderable quantities of it are exported to the neighbouring countries. Nubia alſo affords gold, ivory, ſanders, and other medicinal woods.

In Nubia are likewiſe great numbers of dromedaries, camels, horſes, and various kinds of wild beaſts, as lions, tygers, leopards, crocodiles, vipers, and ſeveral kinds of ſerpents, particularly one of a colour which ſo nearly reſembles that of the duſt, or ſand, in which it lurks, that it is not eaſily avoided, and its bite is commonly attended with almoſt immediate death, and that of the moſt painful and dreadful kind.

The generality of the inhabitants are Mahometans; they are much given to cheating; are a ſtupid debauched people, and are ſaid to have neither modeſty, civility, nor religion: Thoſe that live in villages chiefly apply themſelves to agriculture, except thoſe who inhabit the more deſart parts, who live upon plunder. Mr. Norden, who proceeded up the Nile a conſiderable way into Nubia, found them baſe, treacherous, mean, and avaricious; eſpecially ſome of the great, who ſcruple neither threats nor entreaties to obtain the treaſures of thoſe whom they dare not plunder by open violence.

They are ſwarthy, and ſmall of ſtature. Thoſe of ſuperior rank in the heart of the country wear a veſt without ſleeves; but the common people only wrap a piece of linen cloth about them, and the children go quite naked. However, perſons of quality wear fine looſe long robes of ſilk or cotton, and thoſe of the women reach to the ground; theſe laſt alſo adorn their hair with rings and other trinkets of gold, ſilver, and braſs; yet have nothing on their legs or feet but a kind of ſandal, or leather ſole. As for the women of lower rank, they only wear a ſhort kind of petticoat.

In war they fight to greater advantage on horſeback than on foot, for they are very expert horſemen; but, as they poiſon their weapons, the Turks ſeldom care to attack them; they are, however, almoſt perpetually at war either with the inhabitants of Gorham, the deſart tracts on the ſouth-weſt, or making excurſions into the eaſtern parts as far as the Red Sea.

Poncet, a French phyſician, who paſſed through this country in his way to Ethiopia, ſays, they are ſubject to a prince, who wears a long robe, embroidered with gold and ſilver, faſtened with a girdle of the fineſt cotton. On his head he has a turban of the ſame, and never appears in public without having his face veiled with a ſilk-gauſe of various colours. Strangers who are admitted to pay their homage to him, are obliged to pull off their ſhoes, and kneeling to kiſs the ground two or three times; nor do his ſubjects ever appear before him without being barefooted.

The royal palace is a large confuſed pile of buildings, without any regularity, and ſurrounded with a high brick wall; it is, however, furniſhed with every thing eſteemed curious, rich, and coſtly; and the floors, after the manner of the Eaſtern nations, are covered with the fineſt ſilk carpets. The ſame author obſerves, that this prince applies himſelf five days in the week to affairs of ſtate, and the adminiſtration of juſtice, at which times he ſits at the head of his council, and decides cauſes with the utmoſt expedition. When ſentence of death is paſſed on the criminal, it is immediately executed by laying him flat on his back, and beating him on the breaſt with a ſtick till he expires. It is alſo ſaid, that on the death of the king the grand council aſſemble, and have the inhumanity to cauſe all the brothers of their new ſovereign to be put to death. However, the accounts we have both of this country and Abyſſinia are not entirely to be depended upon; though the author laſt mentioned ſeems to have as much veracity as thoſe writers among the Jeſuits, who have deſcribed the country of Abyſſinia, and have endeavoured, with the utmoſt malignity, to deſtroy his character.

The principal cities of Nubia are Dangala or Dongola, and Sennar.

Dangala, the preſent metropolis of Nubia, is ſituated on the eaſtern bank of the Nile, on the declivity of a dry ſandy hill, in fifteen degrees fifteen minutes north latitude. It is ſaid to be very populous, and to contain near ten thouſand houſes, though moſt of them are mean, and built only of wood daubed over with mud; but the ſtreets are filled with heaps of ſand brought down by the waters from the mountains. The caſtle, which is in the center of the town, is large and ſpacious, but not very ſtrong.

Sennar, which is another of the capital cities, ſtands on the weſtern bank of the Nile, near the frontiers of Abyſſinia, which lies to the ſouth, and of Gaoga which lies to the weſt, and is about two hundred and fifty miles to the ſouth of Dangala. It is ſituated on a fine eminence, from which is a delightful proſpect of a fertile plain covered with a variety of fruit-trees. It is five miles in circumference, and is very populous, it containing near one hundred thouſand inhabitants; but the houſes, which are flat roofed, are only one ſtory high, and very ill built: thoſe in the ſuburbs are much worſe, they conſiſting only of poor ſmall cottages formed of wood and mud, and covered with reeds. Every thing here is in the greateſt plenty, ſo that a camel may be bought for the value of eight or ten ſhillings; an ox for three or four; a ſheep for about one, and a fowl for a penny. But in this city the heats are ſo inſupportable, that in the daytime, from January till the end of April, a man can hardly breathe; but then the rainy ſeaſon begins, and continues three months, at which time the air is extremely unhealthy, and often produces a great mortality among both the men and cattle.

Their commodities are elephants teeth, gold duſt, tamarins, civet, and tobacco. There is in this city a market every day in the middle of the town, where all ſorts of proviſions and goods are ſold. It is ſaid, that the females ſit on one ſide, and the males on another, and that the Egyptian merchants buy great quantities of the above goods every year. The merchandizes required at Sennar, are ſpices, paper, hard-ware, braſs, glaſs beads, and a black drug with which they colour their eye-lids and eye-brows. There are here a few merchants, who travel to Suaquen on the Red Sea, from whence they go with their commodities into Arabia Felix, and there exchange them for thoſe of the Eaſt Indies, which they bring back.

SECT. II.

Of ABYSSINIA, *or* UPPER ÆTHIOPIA.

Its Name, Situation, and Extent, Face of the Country, Climate, Mountains, Salt-pits, Rivers, and Lakes.

THE empire of Abyſſinia is indifferently called Abyſſinia, Abiſſinia, Abaſia, or Habeſſinia, from the Arabic Herbeſh, which ſignifies a mixture, the country being peopled by various nations; but the inhabitants themſelves call it Itjopia or Ethiopia. It has alſo been known, though abſurdly, by the name of Preſter John's country. It extends from twenty-ſix to forty-five degrees of eaſt longitude, and from ſix degrees thirty minutes, to almoſt twenty degrees north latitude. It is bounded on the north by the kingdom of Nubia; on the eaſt it had formerly the coaſt of Abex on the Red Sea; but this is diſmembered from it, and makes a ſeparate province under the dominion of the Turks; and partly by the kingdom of Dancala: on the ſouth it is bounded by Alaba, and Ommo Zaidi, and on the weſt by Gorham and Gingiro.

As Abyſſinia is ſituated between the tropic and equator, it may reaſonably be ſuppoſed to be in a very hot climate, but the extreme heat is only felt in the champaign country, the villages, and low-lands; for the tops of the mountains, moſt of which are of a great height, enjoy a delightful coolneſs. Hence this country is very healthful, but is ſubject to terrible thunder and lightning.

Moſt of the mountains are ſaid to exceed Olympus, in height; yet their ſteep, and to appearance inacceſſible rocks, are inhabited. They are ſurrounded with deep and extenſive valleys, which, with the flat lands, are dry in winter, and commonly overflowed in ſummer by the rains, which inſtead of falling by drops, pour with ſuch vehemence, that the torrents from the mountains ſweep away trees, houſes, and ſometimes rocks, while all the rivers, overflowing their banks, lay the country under water; which, on its retiring, leaves the land covered with a thick ſlime or mud. This overflowing of the rivers of Abyſſinia is an advantage not confined to that empire, but ſpreads its happy influences over all Egypt, and extends the bleſſing of plenty from Abyſſinia to the Mediterranean.

Some of their winds appear no leſs dreadful than their thunder and lightning, particularly one called in their language ſengo or the ſerpent, which ſometimes blows down the houſes, trees, and rocks, and even ſnaps the maſts of ſhips in the harbours. But theſe periodical rains and theſe ſtorms are not peculiar to Abyſſinia; in almoſt all countries within the tropics, the former pour in torrents, overflow the land, and the rivers ſwelling above their banks, fertilize the land. The reader has ſeen too that theſe ſtorms are alſo periodical; but in China and the Eaſt Indies they are called by our mariners tuffoons or typhons.

Some of the mountains have large plains on their tops, covered with trees and other verdure, and afford excellent ſprings. Some are well cultivated, though the acceſs to them is extremely difficult and dangerous; ſometimes through a craggy way incumbered with huge ſtones, which muſt be climbed up with ladders, and the cattle drawn up with ropes. Many of the mountains abound in gold, as plainly appears from the duſt found upon them, or waſhed down by the torrents, ſome pieces of that metal being of the ſize of a pea. But no mines of ſilver have yet been diſcovered.

However, the ſalt-pits of Abyſſinia are as valuable as mines of gold and ſilver, ſince theſe not only ſupply the inhabitants of that extenſive country with this neceſſary commodity, but ſalt there anſwers all the purpoſes of money, and they exchange it with other nations for whatever commodities they deſire to purchaſe. The principal place where ſalt is procured is on the confines of Dancala and Tigra, where there is a large plain four days journey in extent; one ſide of which is incruſtated all over with a pure white ſalt, in ſuch quantities, that ſome hundred of camels, mules, and aſſes, are conſtantly employed in fetching it from thence.

There are ſeveral conſiderable rivers, the moſt famous of which is, 1. The Nile. 2. The Niger, which Mr. Ludolph aſſures us is no more than the left channel of the Nile. 3. The Tacazee riſes in the kingdom of Angola, and after conſiderable windings falls into the Nile. 4. The Maleg, which, after a long courſe, falls into the White River. 5. The Howaſh, which after running through ſeveral kingdoms, loſes itſelf in the ſandy deſart in the kingdom of Adel. 6. The Zebee, which riſes in the kingdom of Nerea, and, after a long courſe, flows into the Indian ocean. 7. The White River, which receives ſeveral ſmaller ſtreams, and after ſurrounding the kingdom of Changaia, which lies to the weſt, falls into the Nile, ſixty leagues below Sennar in Nubia.

Here are few conſiderable lakes, except that of Dambea, called by the natives the ſea of Tzana, from the chief iſland in it. This lake is ſituated in thirteen degrees north latitude, and may properly be conſidered as the ſcource of the Nile, which flows out of it. It is computed to be about ninety miles long, and thirty-ſix broad; its water is clear, ſweet, and wholeſome; it abounds in fiſh, and the natives ſail upon it in flat-bottomed boats, made of the bamboos which grow along the banks. It contains about twenty-one iſlands, ſome of which are very fertile, and are covered with groves of orange and citron trees, and in ſeven or eight of them are old monaſtries, which appear to have been elegant ſtructures.

SECT.

SECT. III.

Of the Fertility of the Soil of Abyſſinia. The Corn produced in the Country; with the Trees, Plants, Beaſts, Birds, Reptiles, amphibious Animals, and Fiſhes, among which is a particular Account of the Camelopardus, Hippopotamus, and other extraordinary Animals.

SOME of the lands in Abyſſinia are ſo fertile as to yield two or three harveſts of very good millet, barley, and wheat. They have no rye, inſtead of which they make uſe of a ſmall grain called teff, which is of much the ſame taſte and flavour, and yields very good nouriſhment. It is ſmaller than our poppey-ſeed, and a little oblong; but at the ſame time the people in general live very poorly, and even naſtily, and their cattle ſeem to fare much better than they do themſelves. As they have no oats, they feed their horſes, camels, dromedaries, and other large beaſts with barley; for though their low lands produce plenty of graſs ſufficient to feed a prodigious number of cattle, yet they never make any hay, which is here the more neceſſary, as it muſt be frequently ſcorched up by the heat of the ſun, and even when it is moſt plentiful, it is liable to be deſtroyed by the vaſt flights of locuſts, with which they are ſometimes infeſted, which cover the ſurface of the earth, and ſoon devour every blade of graſs.

The trees of this country are ſaid to be crowned with a conſtant verdure, and if the inhabitants have a ſcarcity of fruit, it is rather owing to their negligence than to any fault of the ſoil, which is capable of producing as great a plenty and variety of them as any country in Africa. They cultivate the black grape, peach, ſour pomegranate, ſugar-canes, and ſome citrons and oranges: they have alſo ſeveral kinds of figs, and among others one called enſette, which grows to a prodigious ſize, and which Ludolph has endeavoured to prove to be the dudaim of Moſes, which ours and other verſions render mandrakes.

There are here not only the ſame variety of medicinal and odoriferous plants, herbs, and roots that are to be met with in Europe, and which here grow without cultivation, but many more unknown to us. The country produces great quantities of ſenna, and there are plains covered with cardamoms, and a kind of ginger that has a moſt agreeable ſcent, and is four times as large as that of India.

We ought not to omit the aſſazoe, which has ſuch an effect, that it ſtupifies the ſerpents and venomous reptiles that approach it, and its root is a certain cure for thoſe who are bitten by them.

The cotton ſhrub is extremely plentiful, and produces a great quantity of cotton.

The banks of the rivers are, during the greateſt part of the year, adorned with jeſmines, roſes, lilies, jonquils, and a prodigious number of flowers unknown in Europe.

Scarce any country produces a greater variety of both domeſtic and wild animals: among the former are camels, dromedaries, horſes, aſſes, mules, cows, ſheep with great tails, and goats, which are bred in vaſt numbers, they being the principal wealth of the inhabitants. Their fat oxen are ſaid to be of ſo monſtrous a ſize, that at a diſtance they have been miſtaken for elephants; whence it has been ſaid, that horned elephants were common in Abyſſinia, and theſe horns travellers have repreſented as being ſo large, that one of them will contain above ten quarts of liquor, and ſay they are uſed by the people inſtead of pitchers and other veſſels to carry water, wine, milk, or other liquids. But beſides theſe large oxen, which are fatted for ſlaughter, they have an ordinary ſort deſigned for labour and carriage, whoſe horns are ſaid to be ſo ſoft and flexible, that they hang down like a dead weight.

They have here a very fine breed of horſes, which, like thoſe of Europe, are of various colours, but the black are the moſt numerous and in the greateſt eſteem. Theſe are only uſed for war and for travelling. In long journies they make uſe of mules, which are commonly very gentle, ſure-footed, and fit for the craggy mountains; they have a quick eaſy pace, and are commonly preferred by the Abyſſinians to their beſt horſes in travelling.

Among the animals of the camel kind is the camelopardus, which is ſaid to be much taller than an elephant, but as ſlenderly made as that is clumſy and unwieldy; its fore-legs are repreſented as of an amazing length, and tho' the hinder are ſomewhat ſhorter, its belly is ſo far from the ground, that a tall man may eaſily paſs under it without ſtooping. The neck is of a proportionable length, to enable it to reach the ground, and feed upon the graſs, which is its proper food.

The elephant ought here to be placed among the wild beaſts, as they are extremely numerous, and none were ever known to be brought up tame in this empire. They make dreadful havock among the corn and other grain, deſtroying much more by trampling it down than by feeding upon it.

One of the moſt beautiful animals in this country is the zebra, which is of the ſhape and ſize of a mule, but more ſleek and ſlender; it is here curiouſly marked with white, black, grey, and yellow ſtreaks acroſs the back from the neck to the tail. This animal is not, however, very common, ſince it is ſo much admired as to be thought a preſent of ſufficient value to be offered to the monarch.

This country abounds with lions, tygers, panthers, leopards, wolves, monkies, foxes, wild cats, civit cats, hares, rabbits, ſquirrels, and a variety of other animals.

Thoſe who have viſited Abyſſinia mention a very extraordinary animal, which is probably one of the many ſpecies of monkeys. They repreſent it as no bigger than a cat; but as having the face of a man, with a mournful voice. It lives upon the trees, where they ſay it is brought forth and dies: but it is ſo very wild, that there is no poſſibility of taming it; for when any of them have been caught in order to bring them up, all the care that can be taken of them will not prevent their pining away till they die.

There are a great variety of the feathered kind, both wild and tame, many of which are found in Europe; but thoſe here excel ſeveral of ours in beauty and ſize, particularly their partridges, which are ſaid to be as large as our capons; they have ſeveral kinds of them, and alſo of pigeons and turtle-doves. Among the birds which ſeem in a manner peculiar to the country is the maroc, or honey-bird, ſo called from its particular inſtinct in diſcovering the hidden treaſures of the induſtrious bees.

The oſtrich, the largeſt and moſt unwieldy of all the feathered race, is common, not only here, but in the greateſt part of Africa. The ibis, a bird which deſtroys innumerable ſerpents, is alſo known in Nubia and Upper Egypt. In this country are alſo the pipi, ſo named from its conſtantly uttering thoſe two ſyllables, and is ſaid to direct huntſmen to their game, when it feeds on the blood of the beaſt killed by its direction. The cardinal is ſo called by the Portugueſe from the beautiful redneſs of his feathers, except thoſe on its breaſt, which reſemble the fineſt black velvet; and the white nightingale, is a beautiful bird that has a tail two ſpans long.

There are alſo a multitude of obnoxious animals, particularly ſerpents and inſects; many of the former are extremely venomous, and their bite attended with almoſt inſtant death, if the above remedy be not immediately taken. But none of theſe are capable of doing an hundredth part of the miſchief produced by the locuſts, which ſometimes appear in ſuch thick clouds as to eclipſe the light of the ſun, and to lay whole provinces deſolate.

Among the amphibious animals the crocodile and hippopotamus, or river-horſe, are the largeſt and moſt deſtructive. The former we have already deſcribed in treating of Egypt, and as the latter is ſeldom ſeen in that country, and only inhabits the upper part of the Nile, a deſcription of it can no where be more properly placed than here. It is not eaſy to conceive how this animal came to be called a horſe, to which it has ſcarce any reſemblance; its body is like that of an ox, but is twice as big as that of a bull; its legs are ſhort, and reſemble thoſe of a bear, it having large round feet, with four claws

claws in each; the tail is like that of an elephant, and it has no more hair on its body than there is upon that animal. In the lower jaw it has four large teeth, two of them crooked like the two tuſks of a wild boar, and the other ſtraight, but ſtanding forwards, and all of them as thick as the horns of an ox. Its eyes and ears are ſmall, conſidering its bulk; but it has a wide mouth, great open noſtrils, and an upper lip like a lion's, on which grows a briſtly beard. He ſpends the day commonly in the water, and the night on land, when he feeds on the graſs, which is his principal food: his teeth are eſteemed more valuable than ivory, on account of their not being ſubject to turn yellow.

There is great plenty and variety of fiſh in the lakes and rivers, among which is the torpedo, which upon being touched by the finger, while alive, conveys a ſurpriſing numbneſs to the whole arm.

SECT. IV.

Of the Perſons, Dreſs, Manners, and Cuſtoms of the Abyſſinians; their Buildings, Furniture, Hoſpitality to Strangers, and Ignorance in Arts and Manufactures.

THE Abyſſinians are generally tall and well ſhaped; their complexion may be called black, but ſome of them are inclined to the tawny, and to a reddiſh brown. Among them the olive is reckoned the fineſt complexion, and next to that the jet black; but the reddiſh, and particularly the yellowiſh brown, is eſteemed the moſt diſagreeable. Their noſes are not flat, nor their lips protuberant, as among the natives of Guinea; but they have regular and agreeable features, and their eyes are black, briſk, and lively.

They are ſtout and ſtrong, briſk and healthy; and their labour, together with the temperance they uſe in eating, prolongs their lives to a good old age. Moſt of them are ſo nimble and active as to climb up the talleſt tree, or ſteepeſt rocks, with ſurpriſing eaſe and agility. The women greatly exceed thoſe of Europe and Aſia in ſtrength and ſprightlineſs; they breed eaſily, are delivered without help, and can take care both of the child and themſelves, without the aſſiſtance of a nurſe. But this ſingular quality is common to all the women in theſe hot climates, except where they are weakened by a ſedentary life.

The habit of the men of quality is a long fine veſt, either of ſilk or cotton, tied about the middle with a rich ſcarf; that of the citizens is much the ſame, but of cotton only, they not being allowed to wear ſilk, neither is their cotton of the ſame fineneſs. The common people have only a pair of cotton drawers, and a kind of ſcarf, with which they looſely cover the reſt of their bodies; and, till about a century ago, this was the common dreſs of all the people, none but the emperor, the royal family, and ſome diſtinguiſhed favourites, being allowed to wear any other; and this ſcarf, or a piece of cloth, ſerves them at night to wrap themſelves in.

As to the women, they are allowed to appear as fine and genteel as their circumſtances will admit; for they are far from being kept in ſo recluſe a manner as thoſe among the more Eaſtern nations. Thoſe of high rank uſually dreſs in the richeſt ſilks and brocades, their upper garments are wide and full, not unlike ſurplices: they adorn their heads and hair an hundred different ways, and take care to have the richeſt pendants in their ears; beſides, they ſpare no expence in adorning their necks with the moſt coſtly ornaments of chains, jewels, and other embelliſhments.

Both the men and the women are extremely curious about the management of their hair, on which they laviſh a great deal of butter, to render it ſmooth and ſhining. This vanity is perhaps the more excuſable, as none but the emperor is allowed to wear either a cap or any other covering for their head, which, as they have a great deal of idle time upon their hands, is an inducement to them to beſtow ſome part of it in this amuſement. Indeed, their hair not being apt to grow thick and long, but moſtly thin and frizly, ſome additional art ſeems neceſſary to keep it in tolerable order, ſo as to diſtinguiſh each ſex; and therefore while the men take much pains in braiding it up in various forms, the women ſtrive to have it hang looſe in a variety of curls and ringlets, except the fore-top, which they take ſtill greater pains to adorn with jewels or trinkets according to their rank.

Upon the whole, their dreſs is chiefly accommodated to the climate. The exceſſive heat, which will hardly ſuffer them to allow any cloaths to touch their fleſh, makes them contrive to have them as light, and to hang as looſe as poſſible during the heat of ſummer

Hence the cloth that covers their bodies, their breeches, and the womens drawers, are made wide and long to let in as much air as poſſible; but in the cooler ſeaſons, they bring them much cloſer to their bodies, and the rich then appear in handſome veſts, open only to the waiſt, and cloſed with ſmall buttons: theſe have ſmall collars, and very long and ſtraight ſleeves gathered in at the wriſt. Some authors have miſtaken them for ſhirts, though they have another light garment under them next to the ſkin made of thin taffety, ſattin, or damaſk, according as the ſeaſon and their circumſtances will permit.

They are not ſo temperate in their drinking as in their food, eſpecially at their feaſts, where, after a full meal, they uſually drink to exceſs; according to a proverb of theirs, Plant firſt and then water. Their liquors are indeed more tempting than their meat. As they have plenty of honey, they have excellent mead; they have likewiſe ſome other liquors made of various fruits, and a third ſort made of barley without hops. Theſe exceſſes are attended with no ill conſequences; for they live peaceably and ſeldom quarrel among themſelves; or if they do, their conteſts ſeldom go farther than exchanging a few blows; and in matters of conſequence, they generally decide the controverſy by umpires choſen among themſelves, or lay the affair before the ruler of the place. Here they are allowed to plead their own cauſe without the help of a lawyer; and when judgment is given, whether by the judge or the arbitrator, they faithfully ſtand to it, without grudge, murmuring, or appeal.

Both the men and women are ſaid to be witty and ingenious; but thoſe of the kingdom of Nerea are ſaid to exceed the reſt in ſenſe, bravery, generoſity, affability, and other ſocial virtues. They are extremely inquiſitive and fond of learning: yet the people of Tigra and the neighbouring kingdoms are repreſented as being for the moſt part haughty, inconſtant, revengeful, cruel, and perfidious.

The Abyſſinians are naturally docile, and fond of knowledge, which is alledged to have been one of the principal motives that induced them to give the Jeſuit miſſionaries ſo kind a reception at their firſt coming; and, though there is but little learning found amongſt them, it is rather for want of proper means than of capacity of attaining it.

They are entirely negligent with regard to the ſymmetry and architecture of their buildings, which is owing to their living in tents or camps, after the manner of their monarchs; ſo that, except a few old royal palaces, here are neither public ſtructures nor private buildings worthy of notice to be ſeen throughout the whole empire; for thoſe they ſtile houſes would hardly deſerve the name of huts among us, they being built of clay and laths put together in the meaneſt and moſt ſlovenly manner, ſo as to be eaſily reared, and as readily abandoned, when they think proper to remove their quarters. Theſe buildings belong to the inferior ſort, who follow the royal camp, and being unable to purchaſe tents erect theſe huts with almoſt as little trouble as is commonly taken in rearing a large tent.

The very emperors themſelves had neither caſtles nor palaces, till the Portugueſe miſſionaries came among them, but lived in their ſtately pavilions, where they were attended by all their nobles, guards, and other retinue.

Such ſtrangers were they not only to all kinds of ſtately edifices, but even to common regular buildings, that when father Pays undertook to build a magnificent edifice for Sultan Segued, none of that prince's ſubjects knew ſo much as how to dig the ſtones out of the

quarries, much leſs how to ſquare or work them fit for uſe. He was therefore obliged to teach them both that, and how to make the proper tools for the maſons, carpenters, joiners, and in ſhort for every part of the work; and alſo how to join the ſtones, which was performed with a red clay of ſo glutinous a nature, that it makes a good ſtrong cement, without the help of quick-lime. The people were filled with amazement at beholding not only a large ſtupendous ſtructure, erected with much ſtrength and regularity, but even high and ſtately ſtories raiſed one upon another, for which they had not even a proper word, but ſtiled them babeth-laibeth, or houſe upon houſe.

Their tables are generally round, and among the rich are large enough for twelve or fourteen perſons to ſit about them; but they are very low, as the people, like the inhabitants of moſt of the countries in the Eaſt, ſit upon carpets, and the meaner ſort upon mats, or on the ground.

Their furniture, even among thoſe of high rank, is mean: they have no fine paintings, tapeſtry, or other ornaments; and indeed their way of living is in ſome meaſure incompatible with any ſuch finery. Even their beſt beds are no better than couches, on which they lie upon hides or ſoft furs wrapped in their upper garments. Indeed, ſome of their princes and perſons of wealth purchaſe Indian quilts, with ſilk borders, which now come to them from the ports on the Red Sea; and theſe they ſpread upon their couches, chiefly in their outward apartments, that they may be ſeen by thoſe who come to viſit them. But the poor moſtly lie on mats, or a hide or two ſpread on the ground.

They have neither inns, taverns, nor caravanſeras for the entertainment of ſtrangers. Theſe are rendered unneceſſary by that ſpirit of hoſpitality which prevails amongſt them. If a traveller ſtays longer in a village or camp than three hours, the whole community are ready to lodge and furniſh him with proper neceſſaries for himſelf, his ſervants, and cattle, at the public expence. He need only enter the firſt hut or tent he likes, and reveal his wants to the maſter of it, who immediately goes and informs the chief perſon of the place, upon which an ox is ordered to be killed, and ſo much of it is ſent to him as will be ſufficient for him and his company; together with a proper quantity of bread, liquor, and conveniencies for lodging. All theſe they are the more careful to ſupply him with, as they are liable to be puniſhed for their neglect with a fine of double the value of what they were bound to furniſh him with, ſhould he prefer a complaint of their neglect to a proper magiſtrate. However, this laudable cuſtom is attended with great inconveniences, as it gives encouragement to a number of idle vagabonds to abuſe it.

They have but few manufacturers among them, and though they are chiefly dreſſed in linen and cotton, and their country is as proper for producing them as any in Africa, they are ſo indolent, that they raiſe no more than will juſt ſerve their preſent wants, and the leſs of either ſerves them, as they make no uſe of any either at their tables or for their beds, and a ſmall quantity is ſufficient to ſerve the common people as a covering for their bodies. The Jews are ſaid to be their only weavers, as they are in moſt parts of the empire their only ſmiths, and work in all kinds of metal. What joiners, carpenters, and maſons are produced in this country may be eaſily gueſſed from the meanneſs of their buildings and furniture; and the ſame may be ſaid of other trades, as taylors, ſhoemakers, &c. from the plainneſs of their dreſs. Indeed the potters, and makers of horn-trumpets and drinking-cups, are in the higheſt requeſt. Theſe and other inferior artiſts are incorporated into tribes or companies, and have their ſeveral quarters, neither intermingling nor intermarrying with the reſt, the children commonly following the buſineſs of their parents.

Jewellers, gold and ſilver-ſmiths, and other curious artificers of the like kind, are altogether unknown to them, unleſs by ſome of their works being brought by way of traffic or exchange, and theſe are only to be found among the great and opulent. The ſame may be ſaid of their carpets, tapeſtry, ſilk, brocades, velvets, and other coſtly ſtuffs, which are all brought hither by the Turks, by the way of the Red Sea, and exchanged for gold-duſt, emeralds, and fine horſes. The Jews, Armenians, and Arabians, are the common brokers between them and the Abyſſinians, who ſeldom or never travel out of their own country, or indeed are ſuffered to do ſo by the Turks, who, being poſſeſſed of all the ſea-ports on the Red Sea, enrich themſelves by this monopoly, and are extremely careful to prevent any trade from being opened into the country by any other nation, or of its being carried on by any other hands but their own.

Beſides the above articles of commerce, the Turks bring them ſeveral kinds of ſpices, in very ſmall quantities, which they keep up at ſo high a price that none but the richeſt of the Abyſſinians can purchaſe them. In return for theſe the Abyſſinians bring them ivory, honey, wax, ſkins, furs, and leather in great quantities, for which they are obliged to take what the brokers pleaſe to give them.

It ought not to be omitted, that in Abyſſinia the people have no idea of money; but in purchaſing what they want, exchange one commodity for another. The moſt common article of trade exchanged by them is ſalt, by which they rate the value of every thing elſe; and which in general anſwers the purpoſes of money, by being exchanged for all the neceſſaries and conveniencies of life.

SECT. V.

Of their Marriages, their Treatment of their Wives, Divorces, and Funeral Rites.

MARRIAGE among the Abyſſinians is little more than a firm bargain, or contract, by which both parties engage to cohabit and join their ſtock, as long as they like each other; after which they are at liberty to part. The cuſtom of meeting and bleſſing the married couple at the church-door is doubtleſs derived from the Jews; and it is ſaid that none but prieſts and deacons are married within the body of the church. In this part of the matrimonial ſervice ſeveral ceremonies are performed. Alvarez, who was preſent when the abuna, or patriarch, officiated at one of them, ſays, that the bridegroom and bride were waiting at the church-door, where a kind of bed or couch had been prepared for them, and on which the patriarch ordered them to ſit; he then, with his croſs in one hand, and a cenſer in the other, made a kind of proceſſion round them; and then laying his hands on their heads, told them, that as they were become one fleſh, ſo they ought to have but one heart and one will. This was followed by a ſhort exhortation ſuitable to the occaſion; after which he went into the church, and celebrated divine ſervice, at which they both aſſiſted; and that being ended he gave them his bleſſing, which renders the marriage valid, and then diſmiſſed them. The more religious ſort not only attend divine ſervice, but receive the holy communion, either juſt before or after their being joined. What feſtivities and rejoicings attend theſe nuptials we are not told. The huſband and wife, after conſummation, keep ſeparate tables; or if they agree to eat together, each brings their own proviſions ready dreſſed, or ſends them in before by their ſervants or ſlaves.

The married women are permitted to appear abroad, and to viſit their friends and relations: and the princeſſes of the royal blood have ſtill greater privileges, and are ſaid to think no gallantries, however injurious to their honour, ought to be denied them by their huſbands; in which liberties they are ſo far upheld by their own relations, that all complaints againſt them will not only be in vain, but taken very ill.

But this is far from being the caſe of thoſe of inferior rank, who are generally obedient and faithful to their huſbands. Theſe are commonly obliged, eſpecially among the meaner ſort, to perform ſome of the moſt laborious offices of the family, and particularly to grind all the corn uſed in it, which the very ſlaves of the other ſex will refuſe to do: for as they have only hand-mills, they are forced to grind corn either for bread or drink every day.

They

They forbid marriage between perſons in the ſecond, third, and even fourth degree of conſanguinity, and therefore eſteem it unlawful to have more than one wife at a time; yet many amongſt them are ſaid to have a plurality of wives: theſe are indeed deprived by the church of the benefit of the holy communion; but as polygamy is not deemed by the ſtate detrimental to ſociety, they are ſuffered to live with them without moleſtation.

They admit, as hath been already intimated, of divorces, not only on a breach of conjugal fidelity, but for want of children, diſagreement, bodily infirmities, and the like; in all which caſes the women have the ſame privilege of abrogating the marriage-contract as the man. In ſuch caſes the diſſatisfied party applies to the biſhop, and having obtained the deſired divorce, which is ſeldom denied, if the party cannot be prevailed on to withdraw the ſuit, they next petition for a licence to contract a freſh marriage, and obtain it with the ſame eaſe.

Hence theſe divorces are very frequent, eſpecially among thoſe of high rank. But, with reſpect to the grand motive, the breach of fidelity on either ſide, they frequently compromiſe the affair; for as both the huſband and wife have their ſeparate lands, goods, and chattels, they can make what is eſteemed a ſuitable compenſation for the tranſgreſſion. But where ſuch a compenſation cannot be agreed on between the injurer and the injured, the women are uſually the moſt ſeverely puniſhed: ſhe is condemned to loſe all her goods, and to leave her huſband's houſe in a mean ragged dreſs, and never to enter it more; carrying with her a ſewing-needle, by which ſhe may earn her livelihood; and ſometimes ſhe is ſentenced to loſe her head of hair, which is her chief ornament, and to be cloſe ſhaved, except a ſingle lock on her fore-top. But the huſband, if he pleaſes, may take her again; or if he does not, they may both marry. If the huſband be the offender, he is alſo liable to be puniſhed, as well as the partner in his guilt; but a fine is generally laid upon them both, and appropriated to the uſe of the wife. Thus likewiſe the man who has debauched the wife, if convicted, is ſentenced to pay a fine of forty cows, horſes, ſuits of cloaths, &c. and if unable, he becomes the priſoner of the huſband, till the debt be paid. If the injured huſband ſuffers him to go, he obliges him to ſwear, that it is to fetch what will ſatisfy him; upon which the guilty perſon ſends him a piece of beef and ſome liquor, after which they ſometimes eat and drink together; and then, upon his aſking pardon, the huſband firſt remits one part of the fine, and then another, till at laſt he forgives him the whole.

With reſpect to their funerals, after waſhing the body, they perfume it with incenſe, ſprinkle it with holy water, and wrapping it in a ſheet, place it on a bier. The bearers then take it, and hurry it away with ſuch ſwiftneſs, that thoſe who attend can hardly keep pace with them. When they come to the church, or the church-yard, for they bury in either, they again incenſe it, and throw plenty of holy water upon it. After the prieſt has read the fourteen firſt verſes of the Goſpel of St. John, they ſhoot the corpſe into the ground, inſtead of letting it down gently; the prieſt repeating ſome pſalms, till the body is covered with earth.

They bewail their dead many days; their lamentations begin early in the morning, and continue till the evening; the parents, relations, and friends meet at the grave, together with women-mourners hired to accompany the ſolemnity with their out-cries, all clapping their hands, ſmiting their breaſts, and uttering, in a doleful tone, the moſt affecting expreſſions.

If the deceaſed be a perſon of diſtinction, his horſe, ſhield, lance, and other accoutrements are alſo brought to the place, offerings are made to the church and the clergy, and proviſions given liberally to the poor. This ceremony continues, according to the quality of the perſon, from three to forty days, and is repeated afreſh on the anniverſary; and, during the mournful ſolemnity, they all pray to God to be merciful to the ſoul of the deceaſed.

SECT. VI.

Of the Power, Authority, Deſcent, and Titles of the Emperor. Of his Camp, and its Removal. The Manner in which the Princes were formerly confined, and raiſed to the Throne. The Marriage of the Emperor; and the Revenues of the Empire.

THE Abyſſinian empire appears to have been from its firſt foundation entirely deſpotic, and, according to their annals, there never was a period of time ſince its firſt origin, when the princes of this country did not claim an abſolute right over the lives, liberty, and fortunes of their ſubjects, as well as an uncontroulable authority in all eccleſiaſtical affairs; and it is not known that there ever were any written laws to reſtrain this exorbitant power, or ſecure the liberties of the ſubject.

Theſe princes boaſt their being deſcended from Mentlehech, the ſon of Solomon, king of Iſrael, by the queen of Sheba. According to them, this princeſs reigned twenty-five years after her return from Judea, and was ſucceeded by this ſon, from whom deſcended a ſeries of princes in a direct line down to the year nine hundred and ſixty, when the crown paſſed into another family, but was afterwards reſtored to it again. Hence the emperor ſtill retains the pompous titles of the Beloved of God, Son of the Pillar of Sion, Kinſman to the race of Judah, Son of David and Solomon, and Emperor of the Great and High Ethiopia, its kingdoms and provinces, &c. They alſo bear in their arms a lion holding a croſs, with this inſcription in the Ethiopic tongue, "The lion "of the tribe of Judah is victorious."

The reſpect paid to this prince amounts almoſt to adoration; thoſe who are admitted to his preſence fall proſtrate before him, and kiſs the earth as they approach his perſon; and it is ſaid that even in his abſence they never hear his name mentioned without bowing very low, and touching the ground with their hand. The other marks of grandeur chiefly conſiſt in the retinue with which he is attended; for he is not only accompanied by his own houſhold and guards, which are very numerous, but by all the grandees and officers of the empire, who ſtrive to outvie each other in the greatneſs and ſplendor of their retinue, in the richneſs of their dreſs, and the magnificence of their pavilions. We have already obſerved, that they chiefly live in tents; the emperor's camp always takes up a large ſpace of ground, and makes a very ſplendid appearance, to which the regular diſpoſition of the ſtreets, and great variety of tents, ſtreamers, and other ornaments, and eſpecially the many lights and fires at night do not a little contribute; ſo that the whole appears like a vaſt open and regular city, in whoſe center, or on ſome eminent part of it, ſtands the imperial pavilion, which outvies all the reſt in height, bulk, and grandeur. Next to it are thoſe of the empreſſes and royal family, and then thoſe of the officers of the court, all appearing with a proportionable though inferior luſtre: to theſe may be added thoſe large and ſtately pavilions which ſerve as churches, upon which they beſtow no ſmall expence, in adorning them both within and without. In ſhort, the imperial camp is of vaſt extent; and yet good order is commonly obſerved in it. It has markets, courts of juſtice, and places where young perſons of rank perform a variety of exerciſes on horſeback. But all the reſt only reſembles a great number of long extenſive lanes, of mean ordinary taſte, or low miſerable huts of lath and clay covered with ſtraw, which ſerve the emperor's guards, ſoldiers, and a prodigious multitude of ſuttlers and other attendants.

When the emperor removes his camp, or, as it may be properly ſtiled, his metropolis, which is chiefly occaſioned either through the want of wood, proviſions, or the different wars in which he is engaged, the chief care is to chooſe a convenient and ſpacious ſpot well furniſhed with water, and eſpecially with wood, of which they make ſuch havock, that vaſt foreſts are frequently laid bare in a ſhort time; and they are amazed, and think it incredible, that ſuch great cities as are in other parts

of

of the world ſhould be able to ſubſiſt ſo long a time in one place without being in extreme want of wood.

The emperor in his march, whether in time of peace or war, is always attended by his chief miniſters; he appears with a crown on his head made of pure gold, with ſilver lilies, intermixed with pearls, and fixed on a cap of blue velvet, on the top of which is a gold croſs.

Some time before the emperor begins his march, officers are ſent before to the governors of every province and place through which he is to paſs, with orders to clear and repair the roads, and to open the woods thro' which his way lies, by cutting down branches of trees, the briars, and every thing elſe that may retard the march; and to provide neceſſaries both for him and the whole army, which travels but ſlowly, and by ſhort journies, on account of the multitude of women, children, and cattle, which follow the camp. At the time appointed all the governors punctually come in with their quotas of corn, cattle, beer, and other liquors; all which are diſtributed, with the utmoſt exactneſs, among the ſeveral ranks and orders of the army. In theſe marches the titmerari, an officer who commands the van-guard, fixes his pike on the ſpot he chooſes for the imperial pavilion; after which every one of the reſt knowing his own rank, and the ground he is to take up, eaſily gueſſes by his eye where the tents are to be pitched; ſo that the whole encampment is ſoon completed with ſurpriſing readineſs, and in ſo exact and regular a manner, that, notwithſtanding their being ſo frequently removed, every one knows the ways and paths ſo well, that he can go to the tent of any one with the ſame facility as he can to his own, or as we can find a ſtreet, lane, or houſe in any of our cities.

The camp is always divided into ſeven pariſhes, each of which has its miniſter, deacons, and inferior officers, who aſſiſt in the inſtruction of youth, in performing divine ſervice, and the other functions of the miniſter's office. Whenever an enemy is near, the army is ordered to march cloſe and in the beſt order; the van-guard and rear drawing up cloſe to the main body; the wings ſpread themſelves out, and the emperor keeps in the center with his guards, great officers, and ladies, a ſufficient interval being left for incloſing the baggage. At other times little order is obſerved in their marches, only there is always a number of warlike inſtruments ſounding before, and a particular guard marching round the emperor. He generally mounts and lights in his tent; but if he has occaſion to diſmount by the way, the guards immediately make a ring about his perſon, ſpreading their cloaths to keep him unſeen; and if he diſmounts in order to take reſt, a couch, which is commonly carried for that purpoſe, is brought him, on which he lies on cuſhions covered with carpets of the fineſt ſilk.

It has been already hinted, that the crown of Abyſſinia is hereditary, and muſt be preſerved in the ſame family; but the emperor, if he pleaſes, may chooſe any one of his children whom he thinks moſt worthy to ſucceed him. This probably gave birth to the ſevere cuſtom, formerly obſerved in this empire, of confining all the princes of the blood to the fortreſs, or rock, called Ambaguexen, which ſome have deſcribed as a ſevere and diſagreeable place of confinement, on the ſummit of a lofty mountain; while others repreſent it as an earthly paradiſe, in which theſe princes enjoyed every bleſſing except liberty, and were educated in a manner ſuitable to their birth.

The manner in which any of theſe young princes were brought out of this abode to aſcend the throne, was as follows: After due conſultation, and a ſtrict enquiry into the character of the prince, or after the emperor's having declared him his ſucceſſor, which precluded all ſuch conſultations, the viceroy of Tigra went at the head of ſome forces, and encamped at the foot of the mountain, whence, with a proper retinue of grandees and officers, he aſcended it, and entering the cell of the prince elect with great formality, fixed the imperial ear-ring to his ear, as a token of his election; and inſtantly the other young princes were ſent for to pay him homage, and congratulate him on his acceſſion to the throne. The new emperor was no ſooner come down from the mountain, than the governors and other officers met him at the head of the army, and all alighting together ſaluted him. After which, upon his giving them the ſignal, they mounted again, and taking him into their center conducted him to the debana, or imperial pavilion, with the ſound of trumpets, kettle-drums, and other muſical inſtruments, intermixed with loud acclamations of joy. Here he alone alighted within, while all the reſt did the ſame without the pavilion. He was ſoon after ſolemnly anointed by a prelate, and the reſt of the clergy accompanied the ceremony with pſalms and hymns ſuitable to the occaſion. Soon after he was inveſted with the imperial robes, and the crown ſet upon his head. The ſword of ſtate was then drawn and put into his hand, and he being ſeated on the throne an herald proclaimed him emperor, and was ſuddenly anſwered by the loud acclamations of the whole aſſembly and army, who came to pay him their homage. Upon theſe occaſions a kind of ritual, which perhaps contained the duty of a good ſovereign, was read and explained before him, either by the metropolitan, by whom he was anointed, or by ſome of his ſubſtitutes. From thence the new ſovereign went and aſſiſted at divine ſervice, and received the holy communion; after which he returned, accompanied by his court and army, to the royal tent, through the joyful acclamations of the people, with the ſound of muſical inſtruments; and the ſolemnity was cloſed with feaſting and other tokens of joys.

The Abyſſinian monarchs, like their antient progenitor Solomon, king of the Jews, allow themſelves a plurality of wives; and not only imitate him in that, but in taking thoſe of different religions, even Mahometans and Gentiles; and ſome have carried this ſo far, as to allow their heathen wives to have their own temples and idols; ſo that on one ſide might be ſeen the church of God, and on the other a pagan temple. Others, however, have had ſo much regard to their religion, as to cauſe thoſe Pagan or Mahometan ladies to be inſtructed and baptiſed before they married them. The generality of theſe princes, however, chooſe to marry the daughters of noble families among their ſubjects; while others pay a greater regard to the natural endowments of the mind, or the beauty of the perſon, than to their noble extraction.

The monarch has no ſooner pitched upon a young lady for his wife, than ſhe is taken from her parents, and lodged with ſome of his relations, in order to obtain a better knowledge of her good qualities. If he is ſatisfied with her, he takes her with him to church, and having both received the holy communion, they are conducted to the imperial pavilion, attended by the whole court in their richeſt attire, and there the abuna, or chief prelate, commonly performs the matrimonial ceremony; which being ended, the emperor, as at other times, dines by himſelf in his own apartment, and ſhe in hers, in company with a number of other ladies. The nobles and clergymen are treated at other tables in ſeparate tents with variety of meats and liquors; and the feaſt generally continues among the male gueſts till all the liquor is drank, after which every one lays himſelf down and ſleeps till morning.

It was formerly the cuſtom for the emperors never to appear in public, and they were ſeldom known to trouble themſelves with the affairs of government, the care of which was committed to two miniſters, called *bahluded*, or favourites: but this cuſtom has been long aboliſhed, and they ſhew themſelves to their ſubjects at leaſt three or four times a year, though none is allowed to ſee them eat, except the pages who feed them; (for both they and all the great have their meat cut into bits, and conveyed to their mouths by young pages): and when they give audience to foreign ambaſſadors, they always ſit out of ſight behind a curtain.

The revenues of the empire ſeem to be very inconſiderable, and chiefly ariſe from the four following branches: the firſt is the tribute paid by the governors of ſuch provinces and kingdoms as abound with gold, which amounts to no more than about five or ſix thouſand ounces per annum, one year with another. The next branch ariſes from the ſale of all the great offices of the empire, and the yearly tribute they pay him. The third branch

branch conſiſts of a tenth of all the cattle of the empire levied every third year, and the fourth of a piece of cotton cloth paid for every cotton loom.

SECT. VII.

Of the great Officers, and the Forces of the Empire; the Manner of trying Cauſes; and the Puniſhments inflicted on Criminals.

THE emperor has a chief officer, who is called Raſh, or principal, and is generaliſſimo of all the forces; he has under him two great officers, one of whom is a kind of high-ſteward, and is called lord of the ſervants, whoſe power extends not only over the civil judges of the empire, but over all the viceroys, governors of provinces, and the generals of the army. The other, who is only a kind of under ſteward to the king's houſhold, is ſtiled lord of the leſſer ſervants.

Theſe have in a good meaſure the management of the empire and the regulation of the army, which is indeed far from being anſwerable to the extent of the country, as they ſeldom exceed forty thouſand men, of whom between four and five thouſand are horſe, and the reſt foot. About fifteen hundred of the former are well ſized and properly mounted; but the reſt are indifferently armed and accoutred, having no other arms but ſpears and a buckler. The ſpears are of two ſorts, the one like our half pikes, and the other reſembles a halbert or partiſan. The ſtaves of the former are ſlender, and the iron narrow like our pike, but the iron of the other is broad and thin; the firſt is to be darted at the enemy, and the laſt to be uſed in cloſe fight with one hand, while the other holds the buckler, which is uſually very thick and ſtrong, and made of a buffaloe's hide.

Each common ſoldier carries two ſpears, and thoſe of a higher rank have likewiſe ſwords, which they ſeldom uſe in battle, but rather wear them as a mark of diſtinction, and chiefly in time of peace, commonly holding them in their hands when in converſation; but if they walk, their ſervants carry them under the arm. As theſe are chiefly worn by way of ornament, they have the hilt of gold, or ſilver gilt, and the ſcabbard of velvet or rich damaſk, which is commonly red.

They likewiſe wear a kind of dagger under their girdle, and ſome alſo carry a club of ſome hard heavy wood, with a dagger in it. This weapon they commonly uſe when they come to a cloſe engagement with the enemy, and ſometimes dart it at them.

The horſe are armed much like the foot, and are all ſaid to be very good horſemen; they mount and ſit their horſes extremely well; but in other reſpects both they and the foot are very ill diſciplined.

The Abyſſinian ſoldiers are but little acquainted with fire-ams, and as poorly furniſhed with powder and ball. The Abyſſinians have not above fifteen hundred muſquets, and there are not more than three or four hundred muſqueteers in any action, who are generally ſo ill trained to the uſe of arms, that they never fire above once for want of powder and ball. Theſe they ſeldom have at their exerciſes, except a few of the higher rank, who uſe a reſt with their muſquets.

Their army is generally drawn up with little regularity, ſo that the firſt ſhock frequently begins and ends the battle, one ſide turning their back, and the other purſuing; for it is ſo common to run from the enemy, that it is not conſidered as any diſgrace, and they never endeavour to rally their troops, or indeed know how to go about it. This behaviour is entirely owing to their want of diſcipline, for they are commonly hardy and inured to hunger, thirſt, and fatigue, to which they are trained up from their youth; and as they continue in the field the greateſt part of the year, they are equally capable of bearing the moſt exceſſive heat, the ſharpeſt cold, and the moſt violent rains, with very little for their ſuſtenance; and even this they procure by their labour from the lands the emperor allows to thoſe in his ſervice. Another diſadvantage is, their taking their wives and children with them; and theſe are generally ſo numerous, that a camp of thirty thouſand men always conſiſts of above a hundred thouſand perſons, all of whom are obliged to live on the produce of the lands aſſigned for their maintenance.

The army is attended by drums, and kettle-drums, larger and louder than ours, beſides trumpets, hautboys, flutes, and other inſtruments; and alſo by a vaſt number of prieſts, who not only perform the divine ſervice in pavilions, but eſcort and attend the ſacred utenſils with great pomp and ceremony, and with vocal and inſtrumental muſic.

With reſpect to the civil government, the viceroys and governors of provinces, as well as the military commanders and civil magiſtrates, hold their ſeveral courts of judicature, in which all cauſes, whether civil or criminal, are decided; only thoſe of the martial kind have martial officers, who preſide in them, and the others are tried by the civil judges, who alone are allowed to ſit, while the plaintiff, defendant, and the reſt of the company ſtand. Theſe, upon proper occaſions, will even ſit upon the ground in the highway or open field, and try a cauſe brought before them, when every one who pleaſes may be preſent. They make uſe of no writing, nor keep any records, nor do they allow of attornies and counſel to plead on the merits of the cauſe; but both the plaintiff and defendant plead their own cauſe, the former ſpeaking firſt, and the latter after him: each may anſwer and reply three or four times by turns, after which the judge commanding ſilence, aſks the opinion of the byſtanders, and then pronounces ſentence upon the ſpot. In criminal caſes, if the accuſer be caſt, he is either kept priſoner by the judge till he has made ſatisfaction to the accuſer, or if the crime be capital, as in the caſe of murder, he is delivered up to the plaintiff to be puniſhed with death at his diſcretion, and that of the relations of the deceaſed, who either ſell the murderer, or put him to death in what manner they pleaſe. But when a murder cannot be ſufficiently proved againſt any man, all the inhabitants of the place where it was committed are ſeverely fined, or ſuffer ſome bodily puniſhment.

The Abyſſinians have three kinds of capital puniſhments; the firſt burying the criminal quite up to his mouth, then covering his head with thorns and briars, they lay a heavy ſtone upon them. The ſecond is beating them to death with thick clubs about two feet long; but the moſt uſual method is running them through with their lances, in which caſe the neareſt relation of the deceaſed makes the firſt thruſt, and the reſt follow in due order; even thoſe who come after the criminal has expired, generally dip their weapons in his blood, to ſhew that they are alſo concerned to revenge the murder of a relation. But what is ſtill more barbarous, is the feaſting and loud rejoicing made by thoſe relations from the time the criminal is delivered into their hands till his execution, and more particularly on the night preceding it, to all which the priſoner himſelf is a witneſs. This frequently exaſperates his friends ſo far, that it commonly ends in the death of ſome of his moſt zealous proſecutors.

SECT. VIII.

Of the Religion of the Abyſſinians, both before and ſince their Converſion to Chriſtianity.

IT has already been intimated, that the Abyſſinians boaſt their having received both their kings and the Jewiſh religion from Solomon. Of this they have an antient record, which gives the following account of this ſingular event: "That a great and potent queen, "named Azeb, or Maqueda, reigning in Ethiopia, be- "ing informed by a merchant, named Tamerin, of the "great power and wiſdom of Solomon, travelled to Je- "ruſalem, attended by a retinue of the greateſt princes "and nobles of Ethiopia, and with immenſe treaſure. "There Solomon inſtructed her in the knowledge of "the true God; and upon her return home, at the end "of nine months, ſhe was delivered of a ſon, who was "called Menilehech, and alſo David. This ſon after- "wards going to Jeruſalem to ſee his father Solomon, "was magnificently entertained by him, and anointed

" king of Ethiopia by Zadoc and Joaſh, the high-prieſt; " and when he was thoroughly inſtructed in the law of " God, which he was to cauſe to be obſerved in his do- " minions, Solomon aſſigned ſeveral of the firſt-born " of Iſrael to attend and ſerve him in Ethiopia, and fur- " niſhed him with officers and ſervants belonging to the " houſe of Judah, with a high-prieſt, levites, and doc- " tors in the law of Moſes."

There is nothing in this account very improbable; but the ſame record adds many circumſtances that are evidently falſe; as, that the firſt-born of Iſrael, at the inſtigation of Azariah, the ſon of Zadoc, went to Jeruſalem and fetched the ark out of the temple; and, being aſſiſted by a train of miracles, eſcaped the purſuit of Solomon, and arrived with it in Ethiopia. However, it is not improbable that the prince of Abyſſinia might cauſe another ark to be made like that formed by Moſes, and that this ſtory might be afterwards invented, in order to procure it a more general veneration.

This ark is ſaid to be ſtill kept, and ſo cloſely concealed, that even their monarchs are not admitted to the ſight of it. Since the Abyſſinian emperors have aſſumed the cuſtom of living in tents, this precious relic is no longer confined to a temple, but always accompanies the royal camp, and is carried about with the greateſt form and ceremony, attended by four prelates in their pontifical habits, and about forty or fifty other prieſts, who chant before and after it, while one marching backwards before with a cenſer in his hands, incenſes it all the way, till it be depoſited in the grand pavilion, which is the church of the imperial court.

The Abyſſinians maintain, that they were converted to Chriſtianity by the eunuch or prime miniſter of their queen Candace, or, as they call her, Handake, who, after his converſion by Philip, they ſay returned into Ethiopia, and gave his queen a full account of all that had paſſed; upon which that princeſs alſo believed in the Goſpel.

However, in the year 335, Athanaſius, patriarch of Alexandria, ordained Frumentius biſhop of Axuma, and ſent him to preach the Goſpel in Ethiopia. This he performed with great ſucceſs; the diſcipline of the church was then ſettled conformably to that of Alexandria; prieſts and deacons were every where ordained; liturgies, articles, and canons were ſettled and confirmed; and the Abyſſinian church was brought to acknowledge herſelf wholly ſubject to and dependant upon that of Alexandria.

The Abyſſinians, however, retain many of the Jewiſh ceremonies beſides that of attending the ark. They circumciſe not only the male but the female infants, which laſt is done by cutting off a ſmall piece of ſkin from the clitoris. They abſtain from blood, things ſtrangled, the fleſh of ſwine, and the other animals prohibited by the Moſaic law. They uſe purifications and waſhings after certain defilements. They oblige a man, if his brother die without male iſſue, to marry his widow and raiſe up ſeed to his name; and they keep the ſeventh day ſabbath.

On the other hand, they believe the doctrine of the Trinity, and that Chriſt ſhall come again in glory to judge the quick and the dead, when the juſt ſhall inherit the kingdom of heaven, and unrepenting ſinners be ſent into hell.

The Abyſſinian clergy are allowed to marry. The people never enter their churches without pulling off their ſhoes or ſandals. The divine ſervice conſiſts of a ſet of prayers, pſalms, and hymns ſuitable to the ſeaſons, and for the moſt part performed with great decency and devotion, without any of that pomp and ceremony uſed in the church of Rome. They have no bells, but call the people to church by the ſound of wooden hammers, which they ſtrike upon a hollow board; at the hearing of which both the clergy and laity repair thither with a decent gravity, ſaying ſome prayers all the way they go; and when there, neither ſtare about, whiſper, cough, or ſpit. The prieſts and laity are ſeparated from each other; the former are in a kind of choir, with a curtain drawn before them, which hinders the people, who are in the body of the church, from ſeeing, though not from hearing the divine ſervice. They have neither pews, benches, nor haſſocks, but continue ſtanding all the time. In none of theſe edifices, whether ſumptuous or mean, are any ſtatues or carved images of any kind, except pictures: they will not ſuffer any crucifixes, whether carved or caſt in metal, to be ſeen in them, or to be worn about their necks.

They baptize by a three-fold immerſion, if the infant be capable of bearing it, without danger of its life; if not, the three-fold aſperſion of water is deemed ſufficient. The firſt immerſion is only of one-third of the body, in the name of the Father; the ſecond of two-thirds, or up to the breaſt, in the name of the Son; and the laſt of the whole body, by plunging in the head, in the name of the Holy Ghoſt. They then anoint the whole body, eſpecially the joints, with the holy chryſm, and afterwards adminiſter the holy communion to the child in both kinds, by dipping a bit of the conſecrated bread into what they call the wine, and applying it to the child's lips.

Every church has a ſmall room behind the eaſt end, in which are the materials for making the communion-bread, which is a leavened cake, that they conſecrate every time they adminiſter the Lord's ſupper, dividing the whole among the communicants, and having it freſh made every time. Inſtead of wine, from which they wholly abſtain, they keep in this little room a ſmall quantity of dried raiſins, which they ſqueeze and macerate in a greater or leſs quantity of water, according to the number of the communicants, for they adminiſter the cup alſo to the laity, and receive both the elements as ſymbols and channels conveying to them the benefits of Chriſt's death. They do not admit laymen and women to come up to the altar to receive, but adminiſter it to them at the door of the choir; nor do they oblige them to receive it kneeling, but ſtanding.

Their clergy are little verſed in the ſacred writings, having neither expoſitors, commentators, concordances, nor any of thoſe helps which are in uſe amongſt us, except a few homilies upon ſome ſelect parts of the Goſpel, or upon a few theological points; but as they never preach or expound them to the laity, it is not ſurpriſing that they are extremely ignorant, and in many particulars groſsly ſuperſtitious. Like the Romans, they offer up their devotions and prayers to the ſaints, and have proper offices, faſts, and feſtivals to their honour. Though they do not believe a purgatory in the ſame ſenſe as the Greek and Roman churches, nor have any particular office for the dead, yet they make mention of them in their common ſervice, and pray to God to abſolve them from their ſins, and to make them fit for the joys of heaven. They likewiſe keep a kind of anniverſary of their departure, on which they give alms, according to their ability, to the prieſts, monks, and poor, to pray for their ſouls.

They receive the ſame canonical books, both of the Old and New Teſtament, that we do; the former are tranſlated into Ethiopic from the Greek verſion, called the Septuagint; and the latter alſo from the Greek text: they have likewiſe the Apoſtolical Conſtitutions, which, in many reſpects, differs from the work we have under that name. This they believe to be of divine authority, and to have been written by St. Clement, whoſe name it bears. They have alſo the Nicene creed, but not that called the Apoſtles.

In ſhort, like the oriental churches, they obſerve four Lents, viz. the Great Lent, which laſts fifty days; that of St. Peter and St. Paul, which laſts forty days, more or leſs, according to the nearneſs of their Eaſter; that of the Aſſumption of our Lady, which continues fifteen days; and that of Advent, which laſts three weeks. In all theſe Lents they abſtain from eggs, butter, cheeſe, and neither eat or drink till after ſun-ſet, which is never later than between ſix and ſeven in the evening; and after that time they may eat and drink till midnight. Inſtead of butter they uſe oil, which they extract from a ſmall grain, and is far from having an unpleaſant taſte.

They faſt with the ſame ſtrictneſs on all the Wedneſdays and Fridays throughout the year, and on thoſe days always go to prayers before they begin their meals. The very peaſants leave their work to have time to perform that duty, before they break their faſt.

Neither the old nor young, nor even the ſick, are excuſed from faſting, though in ſome caſes they make ſome abatement

abatement in the rigour of it. The monks are more ſtrict than the reſt, for ſome of them eat but once in two days of their meagre fare, and others, authors ſay, paſs the Holy Week in devotion, without either eating or drinking till the ſabbath; and perform many other acts of mortification equally incredible.

SECT. IX.

Of the antient Churches of Abyſſinia; their Monaſteries, the different Orders of Monks, and their Manner of Life.

AS the Abyſſinians did not always live in tents, and ſtill ſpend ſome part of the year, which is doubtleſs the rainy ſeaſon, in houſes, they have ſeveral towns which are in a ruinous ſituation, and ſeveral antient churches ſtill ſtanding: ſome of theſe, particularly thoſe belonging to their moſt celebrated monaſteries, appear to have been formerly large and ſumptuous ſtructures, moſtly built after the model of the temple of Jeruſalem; but ſome of them are round, and have a ſquare chapel in the centre built of ſtone, with four gates facing the four cardinal points. The portals and windows are generally of cedar, and the roof riſes in the form of a cupola; but within appears dark and gloomy, on account of the dome having no opening to admit the light. The body of the church, between this ſquare ſtructure and the round walls, were wainſcotted with cedar, and the roof ſupported with cedar pillars. Moſt of them are, however, gone to decay, and of ſome of them little more is left than the ruins. From theſe ſtructures it is probable, that the arts once flouriſhed in Abyſſinia.

But thoſe churches that are moſt worthy the attention of the curious reader, are nine of them cut out of the ſolid rock, all begun and completed by the command of Lalibela, one of their monarchs. Their names are St. Saviour, St. Mary, the Holy Croſs, Golgotha, Bethlehem, St. George, the Martyrs, Marcoreos, and Lalibela, which was thus named from its founder, and is by far the nobleſt ſtructure of them all. This prince, being ſenſible of the ſcarcity of architects and workmen in his own empire for carrying on ſuch vaſt deſigns, ſent for a number of them out of Egypt, and theſe, by his munificence, we are told, compleated all theſe churches in the ſpace of twenty-four years, which is the leſs incredible, as it is ſaid, the rock out of which they were ſo curiouſly cut, was of ſo ſoft a nature as to be eaſily wrought by the tools of the workmen; though they afterwards hardened and acquired great ſolidity by being expoſed to the ſun and weather.

The monaſteries of Abyſſinia have not the leaſt reſemblance to thoſe of the Roman, Greek, Armenian, and other Chriſtian churches, either with regard to their ſtructure, form, church-ſervice, government, diſcipline, and way of life. Inſtead of being incloſed with ſtrong high walls, they only reſemble ſo many large villages in which each monk has a hut at a diſtance from the reſt, and all of them ſcattered round the church. Inſtead of being confined within the walls, and not being allowed to ſtir out without leave from their ſuperior, theſe, except at the times of devotion, may range where they pleaſe. Inſtead of leading an idle life, and living upon the charity of the laity, theſe ſpend moſt of their leiſure in cultivating the ſpot of land aſſigned to each individual. Inſtead of eating in common, and having their tables ſerved with variety of fleſh, fowls, fiſh, and other dainties, with plenty of wine to help their digeſtion; theſe eat within their homely cells their ſmall pittance, which is commonly the produce of their own grounds, and of their own cultivation; a few herbs, pulſe or roots, with only a little ſalt; and on holidays a little butter, and nothing to dilute their frugal meals, but plain water. Inſtead of excluding women from their communities, ſome orders among them marry, and bring up their families in the ſame way of life; but they do not admit their wives and daughters into their churches, but have particular chapels for their uſe, to which they repair at all the canonical times of the day and night, with the ſame exactneſs as the men, and uſe much the ſame divine ſervice, except the additional muſic of drums and tabors, which are peculiar to the latter.

There are however other orders of them, who abſtain from all commerce with the other ſex, and never admit them to live within the limits of their monaſteries.

There are likewiſe a third ſort, who prefer the eremitical life as moſt adapted to contemplation, and chooſe to abide in caves, or on the top of high rocks and other loneſome and unfrequented retreats; and theſe are generally more highly reverenced than the reſt.

In the huts of all theſe monaſteries nothing is to be ſeen but meanneſs; their very churches and chapels are moſt of them thatched and void of all ornaments, except a few ordinary paintings; yet on the inſide they are well lined with timber, and have ſome accommodations for the old and weak to lean their elbows upon, becauſe they chant all their ſervice ſtanding. They have neither refectories nor halls, and their huts or cells are of clay, ſmall, low, and thatched, and ſo meanly furniſhed, that every thing within is anſwerable to their mortified life; thus their only bed is a poor mat ſpread on the floor.

Two different orders of them are diſtinguiſhed by the name of their founders, or rather reformers: theſe are thoſe of Tekla Haymanout, a native of Ethiopia, and of Abba Euſtatius, an Egyptian. Thoſe of the former order have a kind of general amongſt them, choſen by the heads of the monaſtery; and the other has a ſuperior ſtiled Abba, or Father, over each monaſtery, elected by the majority of votes of the monks belonging to it. The habit of both is nearly the ſame, or, to ſpeak more properly, differ in each particular; for, except their aſhæma, which is only worn by the Abbas or Priors, and is no more than a braid of three thongs of red leather which they put about their necks, and faſten with an iron or copper hook, every one cloaths himſelf as he thinks fit; but all are meanly dreſſed, and the cloth or ſkin which covers their body is girt about them with a leather ſtrap. Some go bare-headed like the laity; others wear a kind of hat, others ſome ſort of cap, and ſome cover their heads with a piece of cloth. Thoſe who affect a more aſcetic life ſometimes retire into the deſarts, and afterwards return again and diſtinguiſh themſelves as they pleaſe, ſome by having a yellowiſh ſkin about their neck, others by a piece of cloth of the ſame ſhape and colour, and a third ſort by a kind of black mantle. Thoſe of the monks who obſerve celibacy are generally more eſteemed than thoſe who marry, and are often, eſpecially their abbots, employed by the emperors in public affairs, negotiations, &c.

SECT. X.

Of the ſeveral Kingdoms or Provinces of Abyſſinia, with a particular Account of the Gallas, a barbarous Nation who have conquered the greateſt Part of that Empire.

HAVING given an account of Abyſſinia in general, and of every thing worthy of notice, in relation to the manners, cuſtoms, and religion of its Chriſtian inhabitants, we ſhall juſt take notice of the kingdoms of which it is compoſed, and of the neighbouring ſtates, and ſhall begin with Tigra, as being the moſt eaſterly, the neareſt to the Turkiſh dominions and conqueſts, and of the largeſt extent.

Tigra or Tigre is bounded by Nubia on the north; by the Red-Sea on the eaſt; by the kingdoms of Angot and Dancali on the ſouth; and by the kingdoms or provinces of Dambea and Bagamender on the weſt. Its length from north to ſouth is computed to be about three hundred miles, and its breadth about a hundred and ſixty. It is under the government of a viceroy, and is divided into thirty-four diſtricts.

The principal place of this kingdom or province was the city of Axuma, formerly its capital, and that of the whole empire; it was ſituated in fourteen degrees, forty-five minutes north latitude, and in thirty-five degrees forty-five minutes eaſt longitude, on a ſpacious and delightful plain, watered by ſeveral rivulets, and was once adorned with ſtately palaces, churches, obeliſks,

obeliſks, and arches. There are particularly the remains of a large and magnificent ſtructure, ſome of the ſtones of which are of a prodigious length and thickneſs; but it has now ſcarcely two hundred houſes left, and thoſe very mean. There are but few other towns either in this province, or the whole empire.

Contiguous to Tigra is the kingdom of Angot, which was formerly rich and fertile; but is now almoſt ruined by the Gallas, who have ſubdued the greateſt part of it, and the ſmall remains they have left are ſcarce worthy of notice.

The kingdom or province of Bagemeder, or Bagamedri, lies weſt of Tigra, and extends from it to the Nile. It is about a hundred and eighty miles in length, and ſixty in breadth; but a great part of it is mountainous, rocky, and inhabited by wild nations. It has ſome towns, particularly one of its own name, which is the metropolis, but is an inconſiderable place, and the others are ſtill more unworthy of notice. This province is however divided into thirteen governments, moſt of which are fertile, and well watered by ſmall rivers.

The province of Amara or Amhara lies to the ſouth of the laſt mentioned province, and on the weſt is divided by the Nile, which ſeparates it from the province of Gojam. It is computed to extend about forty leagues from eaſt to weſt, and has thirty-ſix diſtricts. This is conſidered as the moſt noble province in the empire, from its being the uſual reſidence of the Abyſſinian monarchs, and conſequently of the chief nobility. It has a peculiar dialect different from all the reſt, which is become that of the court, and of the polite throughout the empire. Here ſtand the rocks of Ambaguexen, where the princes of the blood were formerly confined and educated; and this province is conſidered as the centre of the empire.

Farther to the weſt, and on the other ſide of the Nile, is the province of Gojam, which is almoſt encompaſſed on every ſide by that river, except to the north-eaſt, where it is bounded by the Dambean lake. Its length from the north-weſt to the ſouth-eaſt is ſomewhat above a hundred and fifty miles, and its breadth from eaſt to weſt, where it is broadeſt, is about ninety. This country is fertile, but in the middle is high and mountainous, and theſe eminences are partly inhabited by a people ſaid to be deſcended from Hagar, Abraham's Egyptian bondmaid. The northern parts are altogether mountainous and rocky, and ſaid to be inhabited by Jews; but it is more probable that they are ſome of the ancient Abyſſinians, who have never yet embraced the Chriſtian religion; for though there are great numbers of Jews diſperſed through the whole empire, yet that people are never known to prefer deſart habitations before the inhabited plains and places of commerce: nor is it probable, that they would reſide among the inhoſpitable rocks, unleſs we ſuppoſe ſome rich mines lie hid amongſt them, which keep them more profitably employed. This country contains twenty diſtricts or governments.

To the north of Gojam lies Dambea, which is ſeparated from it by the lake of its own name and the Nile. This is one of the flatteſt countries in all Abyſſinia, and is therefore frequently overflowed. It is about ninety miles in length from eaſt to weſt, and about thirty in breadth from north to ſouth. Notwithſtanding its being eſteemed a level country, it has ſome mountains of an extraordinary height. Geographers mention ſeveral conſiderable towns; but it does not appear that there are any, except Gubea, which is the reſidence of the queen, as well as that of the emperor whenever he leaves his camp. This province is divided into fourteen diſtricts.

The laſt kingdom or province worth notice is that of Narea, or Enarea, which extends ſouth as far as the ſixth degree of latitude, and conſequently to the extremity of the empire. It was formerly governed by its own monarchs, who, as well as their ſubjects, were pagans; but being conquered about a century ago, they embraced Chriſtianity. However, a conſiderable part of the country is ſtill unſubdued, and perhaps unconverted. The whole kingdom is eſteemed rich and fertile, and produces a great number of cattle. The inhabitants carry on a conſiderable trade with the Caffres, who bring them abundance of gold, which they exchange for cloth, ſalt, and other commodities.

The Abyſſinians themſelves allow the Nareans to be the beſt and handſomeſt people in all Ethiopia. They are tall, ſtrong, and well ſhaped; and in their dealings honeſt, wi e, faithful, and undiſguiſed. They are alſo brave and warlike, and have always defended their country with great gallantry againſt the incurſions of the wild and barbarous Gallas, who have ſubdued even half of the Abyſſinian empire. The tribute they pay to the emperor of Abyſſinia appears rather to proceed from their loyalty than any for e; for they receive no aſſiſtance from him againſt thoſe common invaders, nor does he maintain any ſtanding forces, garriſons, or fortreſſes there to keep them in awe. This kingdom is ſaid by ſome authors to abound in gold; but that is probably owing to the great quantity of that metal brought into it by the neighbouring Caffres, unleſs it be ſuppoſed that they deſignedly conceal and forbear ſeeking for it, leſt the fame of their wealth ſhould induce the Turks, or the plundering Gallas, to invade them.

As the Gallas have obtained ſo conſiderable a part of the empire, it is proper to give ſome account of them. Theſe people, who are alſo called Galli and Balli, are commonly diſtinguiſhed according to their ſituation, with reſpect to Abyſſinia, into eaſtern, weſtern, and ſouthern. They are a bold warlike people, who live by the ſword, and conſider that as giving the beſt title to every thing, and as being the ſureſt means of preſerving what they have acquired. They are brought up to arms from their infancy, and are early taught to love glory and conqueſt, and to deſpiſe ſlavery and death. Their youth are not allowed the privilege of cutting their hair, which they eſteem the badge of manhood, till they have killed an enemy or ſome ſavage beaſt. The greater number of brave actions a man has performed, the more he is reſpected, and this gives them the precedence at councils and at feſtivals, on which account they ſave the heads of thoſe enemies that fall by their hand as the moſt valuable trophies. After an engagement they lay them before the proper officers on the field of battle, where they are regiſtered in favour of the perſons by whom they are brought; after which the owner may carry them to his own tent, together with his ſhare of the plunder, which is adjudged to him according to the ſhare he had in the victory.

Their weapons are the bow, the arrow, and the dart, when they fight at a diſtance. Thoſe of high rank cloſe in upon the enemy with their ſwords, and the reſt have a club, with one end hardened in the fire. Their ſhields are chiefly made of the hide of a bull or buffaloe. They had formerly no cavalry, but have ſince learned to fight on horſeback; and though their horſes are but indifferent, yet they fight ſo cloſe, and in ſuch good order, that the Abyſſinians, though much better mounted, cannot bear the ſhock. It is even a capital crime among them to give way after the onſet is begun; hence they all fight to conquer or die, neither giving or aſking quarter; ruſhing with ſuch fury on the foe, that it is very difficult to make head againſt them; whence they have gained many ſignal victories over Abyſſinian armies that have been much more numerous, and provided with better horſes and arms. Whenever therefore the Gallas make excurſions into the territory of an enemy, inſtead of truſting to numbers, they commonly chooſe a ſelect body of determined youths, not exceeding eight or ten thouſand at the moſt, who being all ſworn to ſtand by each other to the laſt, fight with ſuch intrepidity as ſeldom fails of putting an enemy of twice or three times their number into diſorder.

They deſpiſe agriculture as a ſlaviſh employment; and though they admire the bread they take from the Abyſſinians and other neighbours, are generally above ſowing corn; and if they do, leave that work to their ſlaves and women, while they follow what they eſteem the more manly exerciſes of war and hunting. They, however, feed numerous herds of cattle, and live chiefly upon their milk, and ſuch productions of the earth as the country affords, ſhifting from place to place for the ſake of paſture,

paſture, and carrying their wives and children with them wherever they go.

They are ſaid to be divided into above ſixty tribes, each of which has a particular head or prince; and theſe chooſe from among themſelves a luva, or luba, who preſides over all the reſt, but whoſe authority extends only to military affairs, and is confined to eight years. He convenes the grand council, in which the affairs of peace and war are determined; and if they agree upon the latter, he heads the army as commander in chief, diſtributing to each of the heads of the tribes his proper province and duty; and after the war or expedition is over, aſſigns to each his proper honours, rewards, and ſhare of the plunder; but if any diſpute ariſes, it is commonly decided by the general council.

With regard to religion, the Gallas acknowledge a Supreme Governor of all ſublunary things, and yet they are ſaid to pay no outward worſhip, and to be extremely ignorant of every thing relating to religion; but their very enemies allow that they are extremely honeſt and true to their promiſes, and are never known to violate an oath.

CHAP. III.

Of ABEX and ANIAN.

SECT. I.

Of ABEX.

Its Situation, Extent, Climate, Face of the Country, Inhabitants, and principal Towns; with a conciſe Deſcription of the little Kingdom of Dancali.

ABEX, or Habaſh, is only a narrow ſlip of land which extends along the weſtern or African ſhore of the Red Sea, and was formerly a part of Upper Ethiopia, though it is at preſent ſubject to the Turks, who ſeized on all its bays and ports from Egypt to the Streights of Babelmandel, by which means the natives of Abyſſinia were excluded from all intercourſe with the Red Sea.

This territory is hot and ſandy, and the air not only ſultry, but foggy and unwholeſome, eſpecially after ſunſet; and the country is ſo parched by the ſun, that it is almoſt barren, and produces few of the neceſſaries of life. It has however ſome deer, and alſo ſheep of a prodigious ſize, with large tails like thoſe we have deſcribed in treating of Syria: it is alſo ſaid to abound with a great number of lions, tygers, and other wild beaſts.

The weſtern part of this tract of land is ſecured by a long chain of inacceſſible mountains, which prevent the paſſage of an army from Abyſſinia into their country, there being only two narrow paſſes, that of Suakin and that of Arkico; and even in theſe paſſes the road is ſo rugged and difficult, that there is no travelling above five or ſix miles a day, and conſequently they may be eaſily defended by a handful of troops againſt a numerous army.

The inhabitants conſiſt of a mixture of Turks, Egyptians, Ethiopians, Arabs, and Caffres.

The principal towns are Suaquam and Arkico, or Ercoco, and a number of villages of fiſhermen. Suaquam is built on a ſmall iſland of its own name, ſituated in nineteen degrees forty-five minutes north latitude, and in thirty-ſeven degrees thirty minutes eaſt longitude, and is one of the beſt ſea-ports in the Red Sea; the entrance into the harbour is by a narrow ſtreight that reaches into a lake, in the midſt of which is the iſland on which the town is built. All the houſes are of ſtone and mortar, and here reſides a Turkiſh governor under the baſha of Cairo. This city is chiefly inhabited by Turks and Arabs.

Arkico, or Ercoco, is ſituated in ſixteen degrees five minutes north latitude, on the coaſt of the Red Sea, and is defended by a caſtle; but is ſmall, and neither rich nor populous.

To the ſouth of Abex are ſeveral petty kingdoms ſcarce worthy of notice: one of the principal of theſe is Dancali, or Dancaly, which extends beyond the Streights of Babelmandel. The ſoil is for the moſt part dry, ſandy, and barren; for the whole country labours under a great ſcarcity of water, and that which they have is very brackiſh. The land produces little beſides ſome hardy vegetables which ſerve to feed the goats, which are in a manner the only quadrupeds in the country. It has, however, ſome good ports on the Red Sea, the principal of which is Baliur; and having ſome ſalt-mines, the produce of them is ſent into other countries; and in return they receive the neceſſaries of life. Its king, tho' a Mahometan, is ſaid to be tributary to the emperor of Abyſſinia.

SECT. II.

Of ANIAN, *or* AJAN.

Its Situation, Extent, Climate, Soil, and Inhabitants in general. Of the Kingdom of Adel; its Country, Cities, Produce, Commerce, and Inhabitants.

THE country of Anian extends along the ſouthern coaſt of the gulph of Babelmandel to Cape Guardafuy, and from the twelfth degree of north latitude to the equator; it being bounded on the north by the gulph of Babelmandel, on the eaſt by the Indian ocean, on the ſouth by Zanguebar, and on the weſt by Abyſſinia and the unknown parts of Africa.

As the climate is exceeding hot, all the eaſtern coaſt is a mere ſandy barren tract, producing neither corn, fruit, nor any animals but of the wild kind, on which account it is generally called the Deſart Coaſt; but the northern coaſt, which is waſhed by the gulph, is a fertile country that produces plenty of proviſions, in which the natives carry on a conſiderable commerce. They have alſo an excellent breed of horſes, which foreign merchants purchaſe in great numbers, in exchange for ſilks, cottons, and other ſtuffs.

The inhabitants along the north coaſt are for the moſt part white, with long black hair, and grow more tawny, or even quite black, on proceeding towards the ſouth. Here are likewiſe many negroes, who live and intermarry with the Arabs ſettled in the country, and carry on a great commerce with them in ſlaves, horſes, gold, and ivory, which they commonly bring from Abyſſinia, with which they are almoſt conſtantly at war; and, by their frequent inroads into that kingdom, have rendered themſelves a warlike people.

In this tract is included ſeveral kingdoms, the moſt conſiderable of which is that of Adel, ſo called from its metropolis, which authors have not deſcribed; it is alſo named Zeila, from another ſea-port ſituated on the ſouthern coaſt of the Red Sea.

This kingdom has the Streights of Babelmandel on the north, part of the eaſtern ocean on the eaſt, and the Gallas with the kingdoms of Dancali and unknown countries on the weſt.

The city of Zeila is ſeated on a ſpacious bay, to the ſouth-eaſt of the mouth of the ſtreights of Babelmandel, in eleven degrees ten minutes north latitude, and forty-four degrees thirty-five minutes eaſt longitude from London. It is extremely populous, the ſtreets

are regularly laid out, and the houſes built of free-ſtone. Its haven is very commodious, and it carries on a conſiderable commerce, it being the place through which the greateſt part of the merchandize carried into the Abyſſinian empire commonly paſs, as well as thoſe that are conſumed in the kingdom of Adel. The ſoil about Zeila is only a dry barren ſand, and the inhabitants are obliged to fetch freſh water at the diſtance of two days journey from the city, where the country abounds with corn and fruit to ſuch a degree, that the inhabitants cannot conſume it all, on which account the people of the neighbouring places come thither to purchaſe proviſions.

The next city is Barbora, ſituated at the bottom of a bay, on an iſland of its own name. It has been all along a kind of rival in commerce with Zeila, and is no leſs reſorted to by foreign merchants. The iſland, which is almoſt contiguous to the continent, is very fertile, and produces plenty of corn, fruit, and cattle, great part of which is exported into other countries. The other parts of the kingdom of Adel being generally flat, and with very few hills, they have ſeldom any rains; but that defect is abundantly ſupplied by the many rivers that run through it.

One of theſe rivers named the Hawaſh, flows down from the Abyſſinian mountains, and receiving ſome other rivers, takes a circuit before it enters the kingdom of Adel. This river is very broad and deep, but it has ſcarce run ſix miles through the country of Adel, before the inhabitants divide it into ſuch a multitude of canals, that it is in ſome meaſure exhauſted before it reaches the ſea. This renders the country ſo rich in grain, fruit, and other proviſions, that part of it is conveyed into the neighbouring kingdoms. In particular, they have plenty of wheat, barley, and millet, and a variety of cows, ſheep, and other beaſts; but their principal traffic conſiſts in gold-duſt, elephants teeth, frankincenſe and negro ſlaves, which the inhabitants of Adel carry to the port of Zeila, where they never fail of meeting with merchants from Arabia, Guzarat, and other parts, who give in exchange for them cloaths of cotton, ſilk, and linen of various ſorts, collars, bracelets, and other ornaments of amber and cryſtal; with dates, raiſins, fire-arms, and other commodities.

The Adelites are brave and warlike, and fight with ſurpriſing intrepidity againſt the Abyſſinians, who are far from being equal to them in valour, diſcipline, and offenſive weapons, the Adelites being furniſhed by the Turks and Arabs with variety of fire-arms. Their dreſs chiefly conſiſts of a piece of cotton cloth, which covers them only from the girdle to a little below the knee, all the reſt of their body being naked; but the king and nobles of both ſexes wear a kind of looſe garment which covers their whole body, and a cap on their heads; all the women, however, are very fond of adorning their necks, arms, wriſts, and ankles with bracelets of glaſs, amber, and other trinkets.

SECT. III.

Of the Kingdom of Magadoxa, and the Republic of Brava.

THE next conſiderable kingdom on the coaſt of Anian is that of Magadoxa, which is ſituated to the ſouth of Adel, and extends from five degrees forty minutes north latitude to the equator, where the river or gulph of Jubo divides the coaſt of Anian from that of Zanguebar; but how far it extends towards the weſt is uncertain. It has its name from its capital, which is ſituated on a large bay, formed by the mouth of the river of the ſame name, that annually overflows like the Nile. Some authors have pretended to fix the ſpring-head of this river, but chuſe different mountains. Indeed, we are ſo little acquainted with theſe inland countries, that the ſource of this and other rivers is as much unknown, as that of the Nile was formerly. However, its courſe is probably a very long one, as it has a conſiderable channel; and this farther appears from its regular and extenſive inundations; the whole country being rendered ſo fertile by the numberleſs canals cut from it, that it produces a great quantity of wheat and barley, variety of fruit, and a multitude of horſes, oxen, ſheep, and other animals, wild and tame.

The city of Magadoxa is a place of great trade, and of vaſt reſort from the countries of Arabia, India, and other parts; whence their merchants bring cotton, ſilk, and other ſtuffs, ſpices, and a variety of drugs, which they exchange with the inhabitants for gold, ivory, wax, and other commodities.

Some of the people are white, others tawny, and others quite black; but all ſpeak the Arabic tongue. The king and his court are Mahometans, and moſt of the inhabitants are of the ſame religion; they are bold and warlike, and, among other weapons, uſe poiſoned arrows and lances.

Within the kingdom of Magadoxa, and on its ſouthern extremity is the republic of Brava, which is perhaps the only government of that kind in all Africa; it was founded by ſeven Arabians, who were all brethren, and fled hither from the tyranny of Lacah, one of the petty monarchs of Arabia Felix. Here they found a moſt convenient and delightful ſituation, in a ſmall country bounded on each ſide by a river, or, as others ſuppoſe, by two branches of the ſame river.

This republic is ſaid not to extend much farther than the coaſt; its chief dependence being on the great commerce of its capital of the ſame name, which is conveniently ſituated on a bay formed by the mouth of the northern branch of the river, about the diſtance of one degree from the equator.

This city, which ſeems to be the only one that belongs to this republic, is large and well peopled, chiefly by rich merchants, the deſcendants of the ſeven Arabs juſt mentioned, whoſe chief trade conſiſts in gold, ſilver, ſilk, cotton, and other ſtuffs, elephants teeth, gums, and other drugs, particularly ambergriſe, with which this coaſt abounds.

The houſes are large and well built, and the town is ſtrong, well fortified, and eſteemed one of the moſt celebrated and greateſt marts on the whole coaſt. Both the city and the republic are governed by twelve magiſtrates, choſen out of the principal families of the ſeven founders above-mentioned, and to them the adminiſtration of juſtice, and the management of all public affairs are committed. The people are chiefly Mahometans, and yet are under the protection of the king of Portugal, to whom they annually pay a ſmall tribute of five hundred mitigates, amounting to about four hundred French livres.

SECT. IV.

Of the Iſlands of Babelmandel and Zocotra, Socotra, or Socotora, ſituated on the North Coaſt of Anian.

THE iſland of Babelmandel gives name to the ſtreights at the entrance into the Red Sea, and is ſituated in thirteen degrees north latitude, and in forty-three degrees thirty-three minutes eaſt longitude from London. The Abyſſinians and Arabians formerly contended with great fury for the poſſeſſion of this iſland, on account of its great importance, from its commanding the entrance into the South Sea, and preſerving a communication with the ocean; but the Turks having obtained the poſſeſſion of both ſhores, the iſland is now in a manner deſerted.

Babelmandel is about four or five miles in compaſs, rocky, barren, and expoſed to all the winds: it has a barren ſoil, ſcorched by the heat of the ſun, and affords ſcarce any ſuſtenance for man or beaſt.

The iſland of Zocotra, or Socotora, is ſituated in the Eaſtern Ocean, thirty leagues to the eaſtward of Cape Guardafuy, and extends from the twelfth degree to the twelfth degree twenty-five minutes north latitude. It is fifty miles in length and thirty-two in breadth, and is particularly famed for the aloes brought from thence, which, from the name of the iſland, are called Socotrine aloes. This iſland alſo produces great quantities of frankincenſe, dates, and rice, which are exported from thence to Goa and other parts of the Eaſt Indies; from whence they bring other merchandizes. They likewiſe trade

trade all along the coaſt of Arabia. The iſland alſo abounds in cattle and fruit.

The climate is extremely hot, and it is ſaid that the rainy ſeaſon does not laſt above a fortnight or three weeks: however, here are ſome rivers which are never dry, and on the coaſt are wells dug by the Arabs. There are two pretty good harbours, where the European ſhips uſed formerly to put in, when they were diſappointed of their paſſage to India by the monſoons: but now this ſeldom happens, as our mariners are well acquainted with the winds and ſeaſons in this part of the world.

The inhabitants conſiſt of negroes of a large ſtature, with diſagreeable features, and frizzled hair: but thoſe who live in the middle of the iſland, and are probably the original inhabitants, are much fairer, and have features that nearly reſemble thoſe of the Europeans. Theſe are ſolely employed in fiſhing, and attending their flocks. On the coaſt are a conſiderable number of Arabs, who are maſters of the country, and people of a mixed breed, produced from the Arabs and negro women.

The people are cloathed with a ſtuff made of goats-hair, of which they make long gowns, which are faſtened round the waiſt with a ſaſh. They have alſo a kind of cloak, which they throw about their ſhoulders, and wrap the whole body in it. The people in the heart of the iſland have no other cloaths but a piece of cloth or the ſkin of a beaſt faſtened round the waiſt. The men wear caps like thoſe of the Abyſſinians, and the women go bareheaded.

Their food conſiſts of the milk and fleſh of their cattle, with dates, rice, and herbs.

As to the religion of the people, the greateſt part of them are Pagans; but the Arabs, who are the trading part of the iſland, are Mahometans.

In the iſland is but one city, which is alſo called Socotora, and this is the reſidence of the king; ſome ſay there are likewiſe conſiderable villages inhabited by the Arabs. The original natives live in cottages diſperſed over the country.

CHAP. IV.

Of ZANGUEBAR, and SOFALA.

SECT. I.

Of the Country of Zanguebar and Sofala in general. Its Situation, Extent, Climate, and Diviſion. A Deſcription of the Kingdom and City of Melinda. The Perſons, Dreſs, and Manners of the People; the State of the King, and the Manner in which Juſtice is adminiſtered. With a particular Account of the Reception of the Portugueſe on their firſt Arrival at Melinda.

ZANGUEBAR and Sofala include a large part of the eaſtern coaſt of Africa, extending from the equator to twenty-three degrees ſouth latitude, and from thirty-four to forty degrees eaſt longitude, from London. It is therefore about fourteen hundred miles in length, and three hundred and fifty in breadth. It is bounded on the north by Anian, on the eaſt by the Indian ocean, on the ſouth by Caffraria, and on the weſt by Monomugi and the unknown parts of Africa.

The air of this country would be intolerably hot, was it not cooled by the annual rains which overflow the country, and by refreſhing breezes from the ſea. It is alſo well watered by rivers, which renders the ſoil exceeding fruitful. Zanguebar is divided into ſeveral kingdoms, which, beginning at the north, are Melinda, Mombaze, or Mombaza, Quiloa, Moſambique, or Moſambico, and Sofala. The Portugueſe are indeed ſovereigns of all the coaſt, and have many black princes ſubject to them.

The kingdom of Melinda begins, according to moſt geographers, under the equinoctial, and extends to the river Quilmanci, between the third and fourth degree of ſouth latitude. The coaſt of Melinda, eſpecially near the capital, is extremely dangerous and difficult of acceſs, it being full of rocks and ſhelves, and at certain ſeaſons the ſea is frequently tempeſtuous.

This kingdom is however for the moſt part rich and fertile, producing almoſt all the neceſſaries of life, except wheat and rice, both of which are brought thither from Camboya and other parts; and thoſe who cannot purchaſe them make uſe of potatoes in their ſtead: theſe are very plentiful, and are fine and large. The country alſo abounds with great variety of fruit-trees, roots, plants, and other eſculents, with melons of exquiſite taſte. It is alſo covered with citron-trees, with whoſe odoriferous ſmell the air is generally perfumed almoſt all the year. There is great plenty of oxen, ſheep, veniſon, and other game; with geeſe, and ſeveral kinds of poultry.

The city of Melinda is agreeably ſituated on a beautiful plain, and ſurrounded with many fine gardens and orchards, which abound with all ſorts of fruit-trees, particularly oranges and citrons. The houſes are built of ſquare ſtone; theſe are for the moſt part handſome ſtructures, with flat roofs; ſome of them are even magnificent, and all of them are richly furniſhed, they being chiefly inhabited by rich merchants. Melinda is much reſorted to by foreigners, who carry on a great trade with the city in gold, copper, quickſilver, ivory, wax, drugs, &c. which are here exchanged for corn, ſilks, cotton, and other ſtuffs; beſides various other commodities. The only inconvenience attending this city is, that ſhips are obliged to anchor at ſome diſtance from it, on account of the rocks and ſhelves which render the acceſs to it difficult and dangerous.

The inhabitants are a mixture of blacks, and of perſons of a ſwarthy, tawny, and whitiſh complexion. The laſt are chiefly the women, who are moſtly either inclining to the white, or an olive colour. Their dreſs is very agreeable, for they never ſtir out but in fine ſilks girt about them with a rich gold or ſilver girdle. They wear a collar and bracelet of the ſame metals, and their heads are covered with a veil.

The men do not here go bare-headed, as in moſt other parts of Africa, but wear a kind of turban wrought with ſilk and gold; but ſome are only cloathed from the waiſt downward with ſilk and cotton ſtuffs; others wear a ſhort cloak of calico, and a ſword and dagger handſomely ornamented; while their legs and feet are bare. The meaner ſort, and thoſe who live farther from the coaſt, wear little more than a piece of cloth about their middle. Theſe carry a ſhield, bow and arrows, the ſcymetar and the javelin; in uſing which they are extremely expert, they being eſteemed the braveſt ſoldiers on all that coaſt; for they go to war with undaunted ſpirit, and maintain their ground with greater intrepidity than any of their neighbours. They are alſo ſaid to be very courteous and obliging; they are free from flattery and fraud, and live in a very friendly manner with the Portugueſe, who are commonly buried amongſt them, without any other mark of diſtinction than a croſs over their tombs.

As to their religion, they are a mixture of Mahometans and idolators; but the Roman Catholics are ſo numerous in the city, that they have built no leſs than ſeventeen churches and chapels in it, before one of which they have erected a croſs of gilt marble.

The

The government is monarchical, and the king ſeldom ſtirs out of his palace, without being carried in a pompous ſedan on the ſhoulders of four or more of the greateſt nobles of his kingdom. Whenever he paſſes through the ſtreets of the city, incenſe and other perfumes are burnt before him, by a multitude of ladies who come to welcome him with ſongs in his praiſe, playing on ſeveral kinds of muſical inſtruments, which, though not extremely harmonious, they touch with great art and dexterity. If he goes upon any expedition, whether civil or military, he is then mounted on a ſtately horſe richly capariſoned, and attended by a numerous retinue, with great crowds of his ſubjects, who fill the air with loyal acclamations. At his ſetting out he is met by his prieſts, or ſoothſayers, who bring a deer juſt ſacrificed, with its blood ſtill reeking, over which he leaps his horſe three times; which is no ſooner done, than theſe ſoothſayers examine the entrails, and from thence pretend to foretel the ſucceſs of his expedition.

The ſame ſuperſtitious ceremonies are alſo obſerved when any prince, or an ambaſſador from a prince, comes to his court, in order to learn whether the viſit or negotiation will be attended with good or bad ſucceſs. Upon this occaſion the prince, or ambaſſador, is accompanied by a great number of women through the ſtreets, ſome burning perfumes before him, others ſinging or playing on inſtruments.

The kings of Melinda are in a manner obliged to ſubmit to the ceremonies performed by the ſoothſayers, and to regulate their reſolutions by them, whether it be for peace or war, or on any other exigence, even whether they give any credit to them or not; for on this in a great meaſure depends the honour, affection, and veneration they receive from the people, which would quickly degenerate into hatred and contempt, if not into open rebellion, ſhould they fail to ſhew an implicit obedience to the determinations of the ſoothſayers, who have an entire influence over all the people. It is, however, not improbable, that theſe pretended predictions, calculated to amuſe the multitude, are privately directed by the prince, in order to make the people enter with confidence, and a firm aſſurance of ſucceſs, into all their meaſures.

However, the kings of Melinda are ſaid to take a more rational method of ſecuring the loyalty and affection of their ſubjects, by their conſtant application to public affairs; by their vigilance in watching the conduct of their miniſters, governors, and other magiſtrates; by their aſſiduity and attention in liſtening to the complaints of their ſubjects; and by the ſtrict and ſevere adminiſtration of juſtice on all delinquents, of what rank or degree ſoever; but more particularly on thoſe who attempt to impoſe upon, or miſlead them, by fraud or artifice.

When any complaint or appeal is preſented to the king, he cauſes the plaintiff to be detained till the defendant, who is inſtantly ſummoned to appear before him and his council, has heard his accuſation, and made his defence. If an inferior complains againſt a governor, a miniſter of ſtate, or any other grandee, he is no leſs obliged to appear than the meaneſt ſubject; with this difference, that on his approach to the court he cauſes the horn or trumpet to be blown, to give notice of his coming: upon which ſome of the king's officers go and receive him into their cuſtody, and, having diſmiſſed his retinue, conduct him to the hall of juſtice. In ſuch caſes the accuſer muſt be provided with ſufficient evidence; for if that be wanting, he is immediately condemned to die, and is inſtantly executed; but if the accuſation be fully proved, the defendant is ſentenced to make reſtitution ſuitable to the wrong he has done, and is alſo fined and obliged to ſuffer corporal puniſhment; which, if the offender be a perſon of rank, is commonly being baſtinadoed with greater or leſs ſeverity, according to the nature of the offence, and the dignity of the offender, in which caſe the baſtinado is inflicted by the king himſelf.

No ſooner is the ſentence pronounced, than the offender is conducted out of the hall into another chamber, where he muſt acknowledge his fault, and the juſtice as well as lenity of his puniſhment, in the humbleſt terms and poſture. He is then ſtripped, and laid with his face on the ground; when the king taking his ſtaff of juſtice in his hand, gives him as many ſtrokes as he thinks proper; and having at length received the offender's thanks for this kind correction, he bids him riſe, and put on his cloaths; which having done, he kiſſes his majeſty's feet, and accompanies him with the reſt of the attendants into the hall, with a ſerene countenance that betrays not the leaſt grief or diſcontent. The king there graciouſly diſmiſſes him before the whole court, charging him to be careful to adminiſter juſtice to his ſubjects, and then cauſes him to be accompanied with the uſual honours and perfumes to the gates of the city, and the affair is huſhed up as if nothing had happened, the people without being entirely ignorant of what has been tranſacting within. The fine and expences of the ſuit are levied out of the offender's eſtate, or, if a favourite, out of the king's coffers.

The Portugueſe boaſt of the good underſtanding that has always ſubſiſted between them and the kings of Melinda ever ſince their being admitted into their dominions, and more particularly of the extraordinary reſpect which that prince pays to the ſubjects of Portugal. Indeed, on their firſt entering that kingdom, they were treated in a very friendly manner; and as theſe Portugueſe were the firſt Europeans who had ever appeared before that city, a particular account of their reception will not, we imagine, be diſagreeable to our readers, eſpecially as it will alſo ſerve to give ſome idea of the manners of the people.

Vaſco De Gama, who commanded a Portugueſe fleet ſent to diſcover the Eaſt Indies, appearing before Melinda, in the year 1498, was overjoyed at ſeeing a city like thoſe of Portugal, and anchored within a league of it; but nobody coming on board, for fear of being made priſoners, he cauſed an old Moor to be ſet on a ſhelf of the rocks over-againſt the city, from whence a boat came immediately to fetch him. Being carried before the king he informed him, that the general, for ſo the admirals were then called, was deſirous of entering into a league with him. The king returned a favourable anſwer, with a preſent of ſheep, fruit, and other refreſhments; in return for which De Gama ſent a net, two branches of coral, three braſs baſons, ſome little bells, and two ſcarfs. The next day the Portugueſe anchored nearer the city, when the king ſent to let him know, that he himſelf would viſit him the next day, and that the meeting ſhould be upon the water. Accordingly the next day, in the afternoon, the young king, to whom his aged father had devolved his authority, came in a large boat, dreſſed in a gown of crimſon damaſk lined with green ſattin, with a rich ſcarf rolled round his head. He ſat in a beautiful chair, neatly inlaid with wire, on a ſilk cuſhion, with another by him, on which lay a hat of crimſon ſattin. Near him ſtood an old man, who carried a very rich ſword, with a ſilver ſcabbard. He was attended by about twenty of the nobles of his court richly dreſſed, and a kind of muſic. De Gama went to meet him in his long-boat, which was adorned with flags, carrying with him twelve of the chief men belonging to the ſhips; and after many ſalutations, went, at the king's deſire, into his boat, where he was honoured as a prince. The king's behaviour was polite, and his converſe full of good ſenſe; he viewed his new gueſt and his men with great attention, enquiring after the country he came from, the name of his king, and for what purpoſe he entered thoſe ſeas. The general having anſwered theſe queſtions, the king, at his deſire, promiſed him a pilot for Calicut, and invited him to take the pleaſures of his palace. But De Gama excuſed himſelf, promiſing to call there at his return; and at the ſame time made the king a preſent of thirteen Moors he had a little before taken priſoners; which the king ſaid, he received with greater pleaſure than if he had given him ſuch another city as that of Melinda.

The king then rowed among the ſhips, which he beheld with ſurprize, and was greatly delighted at the firing of the ordnance, telling the general, that he never ſaw any men that pleaſed him ſo well as the Portugueſe, and wiſhed he had ſome of them to aſſiſt him in his wars. De Gama, at parting, let two men, at the king's requeſt, accompany him; and had, as hoſtages for their ſafety, his ſon

ſon and a prieſt. The next day De Gama and one of his principal officers went with armed boats along the ſhore to ſee the king's horſemen run and ſkirmiſh. In a little time there came ſome footmen from the king's palace, which was in ſight, and bringing his majeſty in a chair carried him into the general's boat, where he very courteouſly intreated him to land and go to the city, becauſe his father, who was lame, was deſirous of ſeeing him, offering to ſtay with his children on board the ſhip till his return; but De Gama, fearing to truſt himſelf, pretended that he durſt not, on account of his having no licence from his ſovereign; and at length, having obtained a very expert pilot, he took his leave.

De Gama, at his return, took with him an ambaſſador from the king of Melinda, whom he brought to Portugal; and every thing being ſettled to the ſatisfaction of both monarchies, the Portugueſe aſſiſted the king of Melinda againſt his enemies, and that prince gave them free leave to ſettle and build a fort in his capital.

SECT. II.

Of the principal of thoſe ſmall Iſlands and Kingdoms which lie along the Coaſt of Melinda, particularly Pate, Lamo, Pemba, and Zanzibar, or Zanguebar.

NEAR the coaſt of Melinda are ſeveral iſlands and petty kingdoms, the moſt conſiderable of which we ſhall here deſcribe, beginning with the kingdom of Pate, which takes its name from its capital, ſituated on a ſmall iſland, at the mouth of a commodious bay, named by the Portugueſe Baye Formoſa, in about the firſt degree of ſouth latitude. This city is large, well built, and populous. It has a good and convenient port, and carries on a conſiderable commerce with the neighbouring kingdoms and iſlands, particularly thoſe of Lamo, Ampaſa, Sian, and Chelichia, which ſurround it at a ſmall diſtance, and have alſo their names from their reſpective capitals; but all of them are too inſignificant to require a farther deſcription.

The king of Pate is a Mahometan, as are alſo moſt of his ſubjects, and is tributary to the Portugueſe, who have a fort in the city, under the command of the governor of theſe coaſts, who is little better than a tyrant over them. Pate had another town and port, named Mondra, but it was taken and razed by a Portugueſe admiral, named Thomas de Souſa, for refuſing, or perhaps only neglecting, to pay the uſual tribute.

The iſle and kingdom of Lamo has alſo its capital of the ſame name, which has a good port, and is well walled and fortified. The iſland is ſituated at a ſmall diſtance from the mouth of the river Quilmanci. The king and government, being Mahometans, are frequently at war with the reſt of the inhabitants, who are idolaters. It is remarkable, that in the year 1589, the king of this iſland was beheaded by the Portugueſe. He was named Panebaxita, and his crime, whether real or pretended, was his having baſely betrayed Rock Britto, governor of the coaſt, for which he was ſeized, with four of his Mahometan ſubjects, in his own capital, by the admiral Souſa Contingo, and carried to Pate, where they were publickly executed in the preſence of that and ſome other petty kings of the neighbouring iſlands; from which time Lamo has continued tributary to Portugal.

The iſle and kingdom of Pemba is ſituated oppoſite to the bay of St. Raphael, in the kingdom of Melinda, and De Liſle places it in four degrees fifty minutes ſouth latitude. It is ſmall and inconſiderable, though its princes aſſume the title of kings.

The iſle and kingdom of Zanguebar, or Zanzibar, is alſo ſituated oppoſite the bay of St. Raphael, between the iſlands of Pemba and Momfia, at the diſtance of about eight or nine leagues from the land, and has been tributary to Portugal ever ſince their fleet appeared on this coaſt, when the king ſubmitted to pay annually a certain weight of gold and thirty ſheep.

This iſland abounds with rivers of excellent water, and produces plenty of rice, millet, and ſugar-canes: it has alſo foreſts of citron-trees of an extraordinary ſize and odoriferous ſmell, intermixed with a multitude of orange trees; and the natives carry on a very conſiderable trade with the adjacent kingdoms.

The iſlands of Quirimba, Aniſa, Amfia, &c. have little worthy of notice, except their breeding great numbers of large and ſmall cattle, and abounding with corn and fruit; all which, except what is conſumed among them, is carried to the continent of Africa, and great advantage is made of this commerce. The iſland of Quirimba alſo abounds with a coarſe kind of manna, of a greyiſh red; it is difficult to diſſolve, but is as purgative as the beſt.

The inhabitants are ſlender, meagre, and weakly, notwithſtanding their being great feeders. Their dreſs reſembles that of the inhabitants of Melinda, and the women are equally fond of adorning themſelves with chains and bracelets of gold and ſilver. The men in general apply themſelves to agriculture and commerce; for which they are better formed than for war. Their trading veſſels are ſlightly made, the timber being faſtened together by ropes made of flags inſtead of nails, and their ſails are formed of mats. Thoſe of Zanguebar are not only ſtronger and better built, but carry ſome great guns on account of their being commonly laden with the richeſt merchandize of that coaſt, while the greateſt part of the others carry only cattle, rice, and fruit.

SECT. III.

Of the iſland of MOMBASO, *or* MOMBAZA.

Its Situation, Extent, Climate, and Produce; with a Deſcription of the city of Mombaza, and a conciſe Account of its Inhabitants.

THE iſland of Mombaza, or Mombaſo, is contiguous to that of Melinda, and is ſituated in four degrees five minutes ſouth latitude, in a convenient bay formed by the river Quilmanci already mentioned, and is ſaid to be about twelve miles in circumference.

The climate is pretty temperate, conſidering its ſituation, and the air healthy. The iſland abounds with excellent ſprings of freſh-water, and the ſoil, which is exceeding fruitful, produces rice, millet, and other grain; with variety of fruit-trees, and other vegetables and eſculents. Here alſo are bred great numbers of cattle, and various kinds of poultry. Their cattle are well fed, and agreeably taſted: they have great plenty of paſture, and ſome of their ſheep have thoſe large and fat tails which we have frequently mentioned as weighing between twenty and thirty pounds.

The inhabitants live long and happily, eſpecially in the capital, where they enjoy great plenty, with eaſe and elegance. Their bread, which is made either of rice or millet, is in flat cakes, and mixed with ſugar, herbs, and other ingredients, to give it a more agreeable taſte. They have drink made of rice, and other liquors made of honey, or of particular ſorts of fruit, which are here excellent, eſpecially their oranges, ſome of which are very large, and of exquiſite taſte and flavour. Theſe liquors are uſually kept in veſſels of different ſorts and ſizes, neatly made of bullocks horns, and of the ſame materials are their drinking-cups, and other houſhold utenſils; they having plenty of horns, and their artiſts work them with great ſkill and neatneſs.

The city was originally built on a peninſula; but the ſpot on which it ſtands has been ſince turned into an iſland, by cutting a canal through the iſthmus in ſuch a manner, that one corner of it covers the city, ſo that it cannot be ſeen till a perſon enters the port. The houſes are built of ſtone, cemented with mortar; the ſtreets are ſtraight, though narrow; and the houſes being contiguous, and terraſſed on the tops, one may walk upon them from one end of the ſtreet to the other, without interruption. The city is defended by a ſtrong citadel, and before the town is a moſt commodious bay, in which the trading veſſels have all the depth and room to ſail and tack about that can be wiſhed, the channel being wide enough for the largeſt of them to enter with all their ſails diſplayed. Within this incloſure is a dyke, or cauſeway, on the farther ſide, built of ſtone, and running acroſs the channel, ſo that at low water one may paſs from one

ſide to the other. Beſides the channel which ſurrounds the town, there are ſeveral other navigable ones that run into the land.

Here is a great variety of inhabitants, ſome black, ſome ſwarthy, others olive, and others white; but they generally dreſs after the Arabian manner, and the richer ſort very magnificently, chiefly of the richeſt ſilks and ſtuffs; and the women wear gold and ſilver tiſſue. The furniture of their houſes is no leſs elegant, it conſiſting in rich carpets, paintings, hangings, and a variety of utenſils and ornaments imported from Perſia, Cambaia, and other countries. The people are repreſented as being the moſt affable and civil to ſtrangers of any upon this coaſt, though they conſiſt of many nations, complexions, and religions. They were once all Pagans, but the Portugueſe, upon their ſettling in this kingdom, made a ſmall number of converts; but afterwards the far greater part of them either returned to their antient paganiſm, or turned Mahometans, after the example of one of their monarchs who had been brought up in the Chriſtian religion, and in the year 1631 married a Chriſtian; but falling out with the Portugueſe governor, on account of his being guilty of ſome acts of injuſtice or oppreſſion, he drove him out of the citadel, maſſacred all the Portugueſe that fell into his hands; and, in order to obtain the protection of the Turks, turned Mahometan.

SECT. IV.

Of the Iſland of QUILOA.

Its Situation; the Extent and Fertility of the Territory belonging to it; a Deſcription of the City of Quiloa, and of the Manners of the Inhabitants; with a conciſe Account of the ſmall Kingdoms of Mongalo and Angos.

THE iſland of Quiloa is ſituated in eight degrees twenty minutes ſouth latitude, and was firſt diſcovered by the Portugueſe in the year 1498. It has its name from its capital, which is a large and opulent city, and the kingdom, which alſo bears the ſame name, lies oppoſite to it on the continent, and extends about two hundred miles from north to ſouth along the coaſt, but how far to the ſouth is unknown. It is ſeparated from the iſland by a narrow channel, and the ſoil of both is ſo nearly of the ſame goodneſs and fertility, that they are thought to have been formerly contiguous. The country, though low, is very pleaſant and fertile in rice and millet, fruit, and good paſture; the inhabitants breed abundance of cattle and fowl of all ſorts, both wild and tame; they have likewiſe great plenty of very good fiſh, and, according to moſt travellers, the climate is healthy and pretty temperate.

The city of Quiloa is large, rich, and well built: the houſes are handſome, and built of ſtone and mortar: they are ſeveral ſtories high, and have behind each a pleaſant garden, well watered and cultivated, here being plenty of ſprings of freſh-water. The houſes are terraſſed at the top with a hard kind of clay, and the ſtreets, as in moſt places under the tropics, are narrow. On one ſide of the town is the citadel, which is the reſidence of the Mahometan prince; it is adorned with ſtately towers, and ſurrounded with a ditch and other fortifications: it has two gates, one towards the port, where is a view of the ſhips ſailing in and out, and the other towards the ſea.

The king and his ſubjects are Mahometans; part of the latter are black, and part tawney: they all ſpeak Arabic, and ſeveral other languages, which they learn from the nations with which they trade. Their dreſs reſembles that of the Arabians, and is not very different from that of the inhabitants of Mombaza, nor do they come behind them either in the finery and richneſs of their cloaths, the elegance of their furniture, or in their manner of living; for they here enjoy the ſame plenty. The women in particular are fond of making a gay appearance, and of having a variety of ornaments about their necks, arms, wriſts, and ankles; in particular they have bracelets of ivory curiouſly wrought, which upon the death of a parent, a huſband, or other near relation, they break in pieces, as a token of their ſorrow; while the men expreſs their grief by abſtinence from food, and ſhaving off their hair.

There are two ſmall kingdoms or ſtates between Quiloa and Moſambique: the former is called Mongalo; but though very ſmall, it is well peopled, moſtly with Arabs, and the inhabitants carry on a conſiderable trade in gold, elephants teeth, gums, &c.

The other is named Angos from its capital, and by the French and Italians is called Angoche and Angochia. This kingdom is much ſmaller than that of Mongalo, which is ſaid to extend far weſtward into the continent. Both of them are fertile, produce a great deal of rice and millet, and breed abundance of cattle. The inhabitants of both are chiefly Mahometans, but intermixed with negroes, who are idolaters, and are remarkable for the ſmallneſs of their ſtature. They go naked from the middle upwards, and wear round the waiſt a piece of ſilk and callico; ſome wear a turban, and others go bareheaded, according to their circumſtances: they are all fond of trade, which they carry on chiefly with the kingdoms of Quiloa, Melinda, Mombaza, and Monomotapa.

SECT. V.

Of the Kingdom of MOSAMBICO, *or* MOSAMBIQUE.

Its Situation, Vegetables, Animals, and Minerals; with a Deſcription of the City of the ſame Name, and of its Importance to the Portugueſe.

THE next kingdom of any note ſtill farther to the ſouth is that of Moſambico, or Moſambique, thus named from its capital, which is ſituated on an iſland in the ſixteenth degree of ſouth latitude, and is the chief of the three iſlands of which this kingdom is compoſed; the others are called by the Portugueſe St. George and St. James, and all three lie at the mouth of the river Magincata, or Megincata, between the kingdom of Quiloa, and that of Sofala.

Though the iſland of Moſambico is the largeſt of the three, it is nevertheleſs very ſmall, not being above two bow-ſhots in breadth, and about ſix in length. It is ſituated about two miles from the continent. The bay is about three miles in circuit, the points of land on each ſide advancing into the ſea; and the two iſlands of St George and St. James lie on each ſide of it, facing the continent. The bay, which ſerves for a haven both for the iſlands and continent, is convenient and ſafe, it having ſeldom leſs than eight or ten fathoms water, which is ſo clear, that one may ſee every bank, rock, and ſhallow, and may ſail into it without a pilot.

The ſoil of this iſland is only a white barren ſand, yet the wealthy part of the inhabitants have in many parts of it found means to procure an artificial ſoil, on which grow very fine ananas, citrons, oranges, figs, and other fruit, notwithſtanding there being great ſcarcity of water; but the far greateſt part of their other fruits, pulſe, and roots, are brought thither from the continent, where the ground is fat, and produces plenty of rice and millet, with a variety of fruits, pulſe, and roots.

Among the plants they have one called by the Portugueſe pao d'antac, or antac wood, which ſpreads itſelf along the ground, and bears a fruit like our pears, but ſomewhat long, ſoft, and green: its chief virtue lies in the root, which, they ſay, is a ſovereign remedy againſt a diſtemper to which they give the name of antac, and is occaſioned by the too great familiarity of the Europeans with the negro women of that country; this being the only remedy they know againſt it.

The inhabitants make ſeveral pleaſant liquors from their fruits; but their moſt common drink is made of millet, and called puembo.

They alſo breed many cattle, great and ſmall, particularly the ſheep with large tails. There are likewiſe great numbers of wild beaſts, as wild boars, ſtags, and elephants ſo miſchievous that the inhabitants are obliged to kindle large fires round their corn-fields, to prevent their deſtroying the fruit of their labours.

The woods are filled with wild-fowl of all ſorts, particularly with a kind of wild poultry, not unlike thoſe common

common among us, except their being as large as turkeys, ſpotted with white and grey; but their heads are ſmaller in proportion, and their combs are ſhorter, thicker, and of a more vivid red than thoſe of our fowls. Their fleſh is black, but more delicious than that of any other fowl, as the fleſh of their hogs, which are here in great abundance, is finer eating than that of any other beaſt. The fowl above-mentioned are extremely wholeſome, and ſome of the people eat them quite raw, without feeling any inconvenience from it. The only defect is the blackneſs of the fleſh, which when boiled turns the broth of the ſame diſguſtful hue, and makes it reſemble ink; but thoſe who feed upon it receive ample amends from its exquiſite taſte and flavour, as well as from the wholeſome nouriſhment it yields.

The country abounds in gold, which is waſhed down by the rivers in great quantities, and forms a chief part of the commerce of the country. Ivory, ebony, ſlaves, and cattle, are likewiſe exchanged for European goods, ſuch as little bells, knives, ſciſſars, and razors. Theſe laſt were ſo valued among them, that when the Portugueſe firſt came there, they would give fifteen cows for one of them. They have likewiſe ſome ſilver and other metals, but the inhabitants do not trade with it; and indeed are ſo miſtruſtful of ſtrangers, that they do not like to have any dealings with them, but wholly confine their trade to the coaſters, to whom they convey their merchandize in ſmall boats made of a ſingle piece of timber; but if the nature or quantity of the cargo require a more capacious veſſel, they make them of planks joined together with ropes, made of the bark of the palm-tree, without the aſſiſtance of either pegs or nails.

The city of Moſambico is very handſome, and the houſes well built, eſpecially the churches and convents. The fort is alſo one of the ſtrongeſt and beſt contrived the Portugueſe have on this coaſt; it is of a ſquare form, with each corner flanked by a bulwark, and defended by ſome pieces of artillery. It is alſo ſurrounded by a threefold rampart and large ditch, and is ſo ſtrong as to be proof againſt all the attempts made by the Dutch againſt it. Upon the whole, the port of Moſambico is in a manner the key of the Eaſt Indies to the Portugueſe, which if once loſt, or wreſted from them by an European trading nation, they would find it difficult to carry on their commerce into the Eaſt Indies; it being almoſt impoſſible to continue their voyage thither without ſuch a place of refreſhment, where they can take in freſh water, proviſions, and other neceſſaries. We need not therefore wonder at the Dutch having made many ſtrenuous, though hitherto fruitleſs, attempts to wreſt it out of their hands, particularly in the year 1606, when admiral Paul Van Caerden laid ſiege to it with forty ſtout ſhips; but after lying before it thirty-two days, finding all his efforts fruſtrated, he was glad to raiſe the ſiege, and continue his voyage to the Indies.

SECT. VI.

Of the Kingdom of SOFALA.

Its Situation, Climate, Soil, Produce, and Face of the Country. The Perſons, Dreſs, Food, Employments, and Religion of the Natives: with the Manner in which the Portugueſe ſubdued the Country.

TO the ſouthward of Zanguebar lies Sofala, or Cefala, a kingdom which, from its abounding in gold, many of the learned have ſuppoſed to be the Ophir, whence king Solomon annually drew ſuch prodigious quantities of that valuable metal.

This kingdom extends along the coaſt from the river Cuama on the north, to that of Magnico, ſince called Rio de Spirito Sancto, on the ſouth; that is, from the ſeventeenth to the twenty-fifth degree of ſouth latitude, having, according to the lateſt obſervations, Cape Coriantes about two degrees from the laſt mentioned river, and not in the middle between them, as ſome geographers have placed it. It is bounded on the eaſt by the Indian ſea, and on the weſt by the empire of Monomotapa, and according to Marmol, is ſeven hundred and fifty leagues in compaſs.

The temperature, ſoil, and produce of the country are much the ſame with thoſe of Zanguebar; only, as it is farther from the Line, the heat is more moderate, and the land more fertile in rice, millet, and paſturage. The beſt part of the country lies between Cape Coriantes and the river de Sancto Spirito, where are the moſt numerous herds of cattle, eſpecially of the larger kind, which are the more neceſſary as the inhabitants have ſcarcely any other fuel but cows dung; and the country is much expoſed to the ſoutherly winds, which are as piercing on that ſide of the Line, as our northern winds are on this. Here alſo the elephants herd in large droves, and being the chief food of the common people, ſuch numbers of them are killed for the ſake of their fleſh, that, according to the report of the natives, they ſeldom kill fewer than between four and five thouſand one year with another, which is in a great meaſure confirmed by the vaſt quantity of ivory exported from thence by the Europeans.

On the contrary, that part of the country which extends from Cape Coriantes to the river Cuama abounds with mountains covered with large woods; and the vallies, being watered with a variety of ſprings and rivulets, are extremely fertile and agreeable; and here the king and his court ſpend the greateſt part of the year. Among other advantages, we are told that this diviſion of the country enjoys ſuch an odoriferous verdure, that, the coaſt being low on that ſide, the fragrance which exhales from it is frequently perceived by mariners at a great diſtance before even the land itſelf appears: but from the above cape to the river of Sancto Spirito the country is rough, barren, and leſs inhabited, except by elephants, lions, and other wild beaſts.

Moſt of the natives of Sofala are black, with ſhort curled hair, there being but few of a tawney or ſwarthy complexion. They are taller, and have a genteeler ſhape than the negroes of Moſambique and Quiloa; and thoſe who live near Cape Coriantes are eſteemed extremely courteous.

Their common dreſs is the ſame with that of the inhabitants of Moſambique, that is, a piece of ſilk cotton wrapped round their waiſt, and hanging down to the knees, the reſt of the body being naked, only thoſe in more affluent circumſtances wear a turban on their heads, and all of them adorn their neck, arms, wriſts, and ankles with rings of gold, ſilver, amber, or coloured beads, according to their rank. Theſe ſtuffs and ornaments are chiefly brought to them by the Portugueſe; and the perſons of diſtinction wear ſwords.

They cultivate plenty of rice and millet, which ſerves them for bread, and eat both the fleſh of elephants, that of their large and ſmall cattle, and alſo fiſh, of which both the ſea and rivers yield great plenty and variety.

They have likewiſe a kind of beer made of rice and millet, and ſome other liquors made of honey, palm, and other fruits. The honey is here in ſuch plenty, that great part of it lies neglected, no more of it being gathered by the people than they themſelves uſe, or than is ſufficient for extracting ſo much wax out of it as will procure them ſilks and painted cottons in exchange. For though they make great quantities of white cloth, they have not yet learned the art of dying it; they are therefore obliged to ſend it, or at leaſt their thread, to be dyed at Guzurat, or other places, of ſuch colours as are moſt in vogue among them. Their chief commerce is with the inhabitants of Melinda, Mombaſo, Quiloa, and Moſambique, who come hither in their ſmall barges, which are laden with a variety of the above-mentioned ſtuffs of all colours, which they exchange for gold, ivory, wax, and ambergriſe; and the Sofalans uſually go and exchange theſe ſilks and coloured cloths with the inhabitants of Monomotapa for gold, not by weight but in ſuch quantities as will ſatisfy the ſeller, ſo that the profit of the exchange commonly amounts to ninety or ninety-five per cent.

Beſides the gold they obtain from Monomotapa, the kingdom of Sofala has conſiderable quantities of that valuable metal, which, according to the Portugueſe inhabitants,

bitants, yield the value of two millions of metigals annually, each metigal being valued at about fourteen French livres; and it is ſaid that the merchants from Mecca and other parts export, in time of peace, about the ſame quantity. The ſoldiers are paid in gold duſt, juſt as it is gathered, which is of ſo pure and of ſo fine a yellow, that it greatly exceeds ours, no other gold being ſuperior to it but that of Japan.

As to the metropolis, it ſtands in a low and unhealthy ſituation, and was at the firſt arrival of the Portugueſe but an inconſiderable town, neither large nor walled, it having no other fence than a hedge of thorns; but it has been ſince fortified, and in every reſpect greatly improved by thoſe Europeans, who called it Cuama, as well as the fort which they built for its defence; the city being conveniently ſituated on a ſmall iſland at the mouth of the river Cuama: but it has ſince reſumed its antient name, and both pilots and geographers now call it Sofala. There are two other towns on the coaſt, one called Haulema, and the other Dardema; beſides the villages of Gaſta, Bocha, Savona, and ſome others.

At the firſt arrival of the Portugueſe the people uſed no other weapons than the javelin, the ſcymetar, the bow and arrow, the dagger, and the hatchet; but they have been ſince taught the uſe of fire-arms, both ſmall and great. The king keeps a great number of forces in pay, but the Portugueſe are become ſo powerful as to keep the whole kingdom in awe, and their governor keeps veſſels of obſervation to prevent what they call an illicit trade, particularly the exportation of gold, without his ſpecial licence.

As the Arabs have been for ſome centuries ſettled on the coaſt, they, as in many places in the Eaſt Indies, have obtained the dominion, and both the king and his court, with a great part of the people, are deſcended from them; they ſpeak the Arabic tongue, and are ſtill of the Mahometan religion. But the original natives retain their antient cuſtoms, both of a civil and religious nature: they are ſaid to acknowledge one Supreme Being, whom they call Mozimo, or Guimguimo, and have neither idols, altars, nor ſacrifices; but abhor the idolatrous rites of the reſt of the African negroes and their prieſts, and puniſh them with the utmoſt ſeverity, not from a ſpirit of perſecution, but from their thinking them deſtructive to ſociety. They alſo puniſh theft and adultery with great rigour, and, with reſpect to the laſt, make it death for any man to be found ſitting upon a ſopha, or mat, with a married woman: yet they allow of polygamy as much as the Mahometans. They never marry any woman till ſhe has had her monthly courſes, as being held incapable of having children till then; and this no ſooner happens, than the family make rejoicings and a feſtival on the occaſion. They do not ſeem to have any religious ceremonies, except in obſerving ſome particular days of the moon, as the firſt, ſixth, ſeventh, eleventh, ſixteenth, &c. on which they pay a kind of offering to their deceaſed friends, particularly to their parents, whoſe bones, after the fleſh is conſumed, they preſerve in a place appropriated to that uſe; and, in remembrance of their owing their being to them, ſet plenty of proviſions before them, and offer up their petitions to them as if they were ſtill alive, not forgetting to pray for the preſervation and proſperity of the king. Having ended their petitions, they ſit down in their white garments, which is the proper colour on theſe occaſions, and eat what had been ſerved up to the dead, which concludes the ceremony. This cuſtom is alſo practiſed by the Chineſe and many other pagan nations.

We ſhall conclude this article with an account of the manner in which the Portugueſe obtained the power and authority they exerciſe throughout the kingdom of Sofala.

Franceſco Gnaja, by others called Anaga, was the firſt Portugueſe admiral who came to anchor before the city of Sofala. He had with him only four of his ſmalleſt veſſels, for two of his fleet were ſo large that they could not enter the port. Having engaged in his intereſt Zacote, one of the court, he ſent him to the king, whoſe name was Juſef, and was then blind with age, to obtain leave to build a fortreſs near the city, which he pretended would be of great ſervice to the king, as well as to the Portugueſe. By the good offices of his friend Zacote he met with a kind reception from the old Mahometan monarch, whom he afterwards viſited, notwithſtanding the ſtrenuous oppoſition of the Arabs againſt his landing, the dangers they told him he muſt run before he could reach the royal palace, and the difficulty he would find in getting acceſs to the king; he even met with all the ſucceſs he could wiſh for, the old monarch not only granting him free leave to build the fortreſs, but, as a farther mark of his regard, delivered up to him about twenty of his countrymen who had been lately ſhipwrecked on that coaſt, and who had been treated with the utmoſt hoſpitality.

The old monarch had, however, a ſon-in-law, named Mengo Muſaf, a brave and warlike prince, who boldly laid before him his apprehenſions of the danger that would attend his receiving thoſe ſtrangers into his dominions; and much more at his permitting them o fortify themſelves there at the imminent hazard of his own ſafety and that of his ſubjects. Whatever were the king's views, he endeavoured to diſſipate Muſaf's fears, by telling him, that time, which brings every thing to light, would ſoon diſcover his motives for thus encouraging theſe dreaded ſtrangers. "Thou wilt ſoon, ſaid he, perceive them "dwindle into nothing, through the heat and inclemency of a climate to which they are unaccuſtomed, "and then it will be time enough to drive them out of "their fort, if they do not abandon it of their own accord." The prince acquieſced in his reaſons, and the fortreſs was carried on with double vigour, the king having ordered his ſubjects to lend the Portugueſe all poſſible aſſiſtance.

His majeſty was, however, ſoon alarmed by the pathetic remonſtrances of the Mahometan merchants, who endeavoured to awaken him to a ſenſe of his danger, from the well known perfidy of the Portugueſe; and addreſſing themſelves to him in a body, reminded him of the repeated warnings they had given him, and then added: "To what end do theſe ſtrangers build a fort in "your dominions, but to increaſe their own power, in "order to ſtrip you of yours and of your kingdom? "Have they not by the like artifices expelled the king "of Quiloa, and robbed many other princes in Africa "and India of their dominions? Where, in ſhort, have "they ever got a footing without leaving numberleſs traces "of their villainy and cruelty? If therefore you have any "regard for your ſafety and welfare, deſtroy them be"fore they are become too powerful, leſt hereafter you "be unable to avert the ruin and deſtruction which they "will bring upon yourſelf and kingdom."

This ſpeech had the deſired effect, and the alarmed monarch began to ſee his folly and danger. He aſſembled a number of troops, and appointed a day when they were to fall upon the Portugueſe, while they were employed in building the fort. Unhappily for him, he had a traitor who watched all his motions; this was Zacote, who was originally of Abyſſinian extraction, but having been taken priſoner when young by the Mahometans of Sofala, had embraced their religion, and by his addreſs, had raiſed himſelf to the higheſt degree of credit with the old king; but being now corrupted by the Portugueſe, he betrayed all his maſter's ſecrets, and failed not, on this occaſion, to ſend them timely notice of the deſign formed againſt them; on which Gnaja prepared to give them a warm reception.

Accordingly on the day appointed the Sofalans furiouſly attacked the fort by throwing lighted brands into it, while others aſſailed the walls with their warlike engines. The beſieged, with Gnaja at their head, made a very brave defence; but being reduced to thirty-five men, the reſt being either ſick or invalids, they would have ſtood a poor chance againſt ſix thouſand men, had not Zacote found means to enter the fort at the head of a hundred men, who immediately attacked the beſiegers with ſuch bravery that a deſperate conflict enſued, in which the Portugueſe, now inſpired with freſh courage, diſcharged their artillery and darts with ſuch vigour, that the beſiegers ſoon fled with the utmoſt precipitation and terror, leaving them in the quiet poſſeſſion of their fortreſs; but the Portugueſe boldly ruſhing out purſued them with the utmoſt fury, not only into the city, but

forced

forced their way into the royal palace. They even crowded into the very apartment into which the old king had retired, and found him lying on his couch; but their inſolence ſoon rouſed his courage, ſo that blind and old as he was, he haſtily aroſe, and darted ſeveral javelins at them, which, as they crowded thick upon him, did ſome execution, ſeveral of them being wounded; and among the reſt Gnaja received a wound in his neck: when on a ſudden the Portugueſe agent advanced with his drawn ſcymetar towards the king, and at one blow ſtruck off his head, which filled his attendants with dread and horror.

Gnaja, fully ſatisfied with ſeeing the good old king lying in his blood, and headleſs at his feet, immediately forbad his men to offer any farther violence towards a people whom he pretended he wanted to gain by acts of friendſhip, rather than to terrify with farther proofs of the Portugueſe bravery and martial proweſs; adding, that as they had by this time ſufficiently experienced the one, he was now ready and willing to give them the moſt convincing proofs of the other, by acts of humanity and compaſſion to their preſent diſtreſs. This plauſible ſpeech had the deſired effect; and the Sofalans, finding they had to do with a nation that was too ſtrong and artful for them to contend with, forbore all farther hoſtilities.

Oſſorio obſerves, that Gnaja, having ſucceeded ſo far, thought it now time to ſettle this newly ſubdued ſtate, and, as a mark of the Portugueſe generoſity and gratitude, to reward the perfidious Zacota for his friendſhip and fidelity to them in the ampleſt manner. He accordingly cauſed him to be ſent for in great pomp, and then proclaimed him king of Sofala, enjoining the people to obey him as their ſovereign. He next obliged him to take the oath of fidelity and allegiance to the king of Portugal, and to promiſe to behave on all occaſions as his moſt faithful tributary.

CHAP. V.

Of the COMORA ISLANDS.

SECT. I.

Of their Situation; with a conciſe Account of Comora the principal of them, and of Mayotta, Mohilla, and Angazeja. Of the delightful Iſland of Johanna: a View of it from the Road; and the ſpeedy Cure of the Sick who are ſet on ſhore. The Face of the Country, as it appeared in a Walk taken by two Engliſh Gentlemen: with an Account of the Fruits, Beaſts, Birds, and Fiſhes.

THE Comora iſlands take their name from Comora, the largeſt of them; they are five in number, and the other four are diſtinguiſhed by the names of Mayotta, Mohilla, Angazeja, and Johanna. The laſt is ſituated in twelve degrees fifteen minutes ſouth latitude, and all of them lie oppoſite the ſhore of Zanguebar, and north of the great iſland of Madagaſcar.

Comora, the largeſt and moſt northerly of theſe iſlands, is not frequented by any Europeans, it having no ſafe harbour, and the natives being untractable and averſe to any commerce with ſtrangers. For this perhaps they have ſufficient reaſon, as it was too common for the Portugueſe, eſpecially at their firſt entering thoſe ſeas, to take advantage of the ſimplicity of the inhabitants, unacquainted with arms and incapable of defence, and to land parties in order to rob and commit all poſſible outrages on the natives, whom they frequently carried away ſlaves. This may have given them a traditional averſion to all ſtrangers; and it is not improbable, that the revenge they might take on the next who viſited them, without diſtinguiſhing the innocent from the guilty, may have gained them the inhoſpitable character which they ſtill retain.

Angazeja, Mayotta, and Mohilla, are but little reſorted to, on account of the ſuperior advantages of Johanna, in the ſafety of its road, and the civilized diſpoſition of the inhabitants, which, together with the fineneſs of the country, have induced the Europeans to touch there for refreſhments.

The ſhips on their arrival anchor in the road on the weſt ſide of the iſland, where the high hills, covered with evergreens, ending in a delightful valley, form the moſt pleaſing landſcapes that can be imagined. The ſailors uſually pitch a tent on ſhore for the reception of the ſick, when, ſuch is the excellence of the climate, that thoſe ever ſo much diſabled with that dreadful diſeaſe the ſcurvy, generally recover their health with ſurpriſing ſpeed, which is probably as much owing to the reviving influence of the earth, as to the variety of excellent refreſhments with which the country abounds. The common ſailors who arrive in health, are however in danger, by their intemperance in eating the delicious fruits the iſland affords, of laying the foundation for diſtempers to break out when they go again to ſea. It has alſo been ſaid, that lying aſhore is prejudicial to them, on account of the moiſt vapours diffuſed from the neighbouring hills; but all the danger here is probably occaſioned by a tent being not ſufficient to preſerve them from the keenneſs of the night-air, and from the damps which riſe from the earth.

We cannot give a better or more perfect idea of this beautiful iſland, which is no more than about ninety miles round, than by giving a deſcription of a walk taken by the ingenious Mr. Groſe and another Engliſh gentleman the ſecond day after their arrival, which we ſhall do in his own words.

" As we ſet out pretty early in the morning, we made " a ſhift to penetrate about five miles into the country " before the ſun began to be any-ways troubleſome; and " this was no ſmall ſtretch, conſidering the mountainous " way we had to go. We had fowling-pieces with us, " and the view of excellent ſport in ſhooting, could we " have reached the places where we might perceive the " game lay: but we could not conquer the aſcent of the " hills, though we endeavoured to ſcramble up them on " our hands and knees. We were obliged therefore to " reſt ſatisfied with what ſmall birds preſented themſelves " in the vallies and hills that were paſſable. We made " our breakfaſt on pine-apples, and the milk of cocoa-" nuts, which ſerved to quench our thirſt. About noon, " coming to a beautiful piece of water, we ſeated our-" ſelves in the ſhade by the banks of it, to make a ſe-" cond meal, as well as to enjoy the tinkling of ſeveral " little ſprings and natural caſcades that fell from the " rocks, and, according to their diſtance, ſeemed to " ſound a gradation of notes, ſo as to form a kind of " agreeable ſoothing water-muſic.

" The orange and lime-trees, which ſtood in great " numbers about that ſpot of ground, bending under " the weight of their fruit, diffuſed a moſt fragrant " odour. There were alſo pine-apples which grew " wild of, eleven and thirteen inches in circumference, " of a much richer flavour than thoſe I afterwards met " with in India. Our guides too made us diſtinguiſh " a number of goyava, and eſpecially plumb-trees, the " ſize of whoſe fruit is about that of a damaſcene, and " leaves a pleaſing reliſh on the palate for ſome minutes " after it is eaten. All theſe growing promiſcuouſly, and " without the leaſt arrangement or order, combined with " the falls of water and the ſtupendous height of the " ſurrounding hills, covered with trees and verdure, and

" in their various breaks and projections exhibiting the " boldeſt ſtrokes of nature, altogether compoſed what " might, without exaggeration, be called a terreſtrial " paradiſe, compared to which the fineſt gardens in Eu- " rope, with their ſtatues, artificial caſcades, compart- " ments, and all the refinements of human invention, " would appear poor indeed! Here it was impoſſible for " art to add any thing, but what would rather ſpoil than " adorn the ſcenery.

" It was not then without regret that we quitted ſo " charming a ſpot, after having feaſted our eyes with " the beauties of it; to which it may be mentioned, as " no inconſiderable addition, that there was no fear of " wild beaſts or of venomous creatures mixed with our " pleaſure, the iſland being ſo happy as to produce none. " We returned then to our tent, well paid for the ſlight " fatigue we had undergone in this little excurſion."

Beſides the fruit already mentioned, and many others common in the Indies, there is a remarkable ſort of ſweet oranges of a ſmall ſize, not exceeding that of a common apricot, but filled with a juice that has a much more delicious flavour than the larger ſort generally imported here from Portugal, under the name of China-oranges; and their being gathered ripe and freſh from the tree is doubtleſs an advantage to their taſte.

In the woods are a great number of monkies of different kinds and ſizes, and a beaſt of about the bigneſs of a common monkey, with a head nearly reſembling that of a fox; it has a lively piercing eye, its coat is woolly, and generally of a mouſe colour; and its tail, which is about three feet long, is variegated with circles of black, within an inch of each other, quite to the end; the natives call it a mocawk, and when taken young it ſoon grows exceeding tame: the country alſo abounds with ſquirrels, which are generally large and ſhy; but neither well ſhaped, nor of an agreeable colour.

Their oxen, which are very numerous, are of a middling ſize, and, like thoſe in the Eaſt Indies, are remarkable for their differing from ours in having a large fleſhy excreſcence between their neck and back, which when kept in pickle for ſome time, is generally preferred either to tongue or udder, it taſting like firm marrow, and nothing can be imagined ſweeter than their fleſh.

Their fowls are alſo extremely good and fat; but our author obſerves, that he had no opportunity of taſting their game, of which they are ſaid to have great variety; but the natives are very indifferent ſportſmen, either with a net or gun.

The ſea alſo furniſhes them with fiſh of different ſorts, and in great abundance, which they are very expert at catching. Among the reſt they have a particular ſpecies called the parrot-fiſh, which is beautified with the livelieſt colours that can be imagined; it is about three feet and a half in length, thick in proportion, and is eſteemed delicious eating. They have likewiſe ſome flat fiſh that nearly reſembles the turbot, and alſo thornbacks, mullets, and ſeveral other ſorts.

SECT. II.

Of the Perſons, Dreſs, Food, Language, and Manners, of the Natives; with a Deſcription of their Huts, and of the Town of Johanna.

MOST of the inhabitants are tall of ſtature, ſtrong, and well proportioned; they have piercing eyes, long black hair, lips ſomewhat thick, and their complexions in general are of a colour between olive and black; but their women are rather more clumſily made than the men.

The common people only wear a ſkull-cap of any ſort of ſtuff, and a coarſe wrapper round their loins; but thoſe of a ſuperior rank have a kind of wide ſleeved ſhirt hanging over a pair of long drawers, and a waiſtcoat, which is either thick or thin according to the ſeaſon; few wear turbans, except thoſe of high rank: theſe are alſo uſually diſtinguiſhed by the nails of their fingers and toes, which they ſuffer to grow to an immoderate length, and tinge them with alhenna, a yellowiſh red, furniſhed by a ſhrub that grows in the marſhy places of the iſland. They uſually carry large knives, or poniards, which are ſtuck in a ſaſh they wear round their waiſts; ſome of them have ſilver or agate handles, but they have commonly wooden ones carved.

The women take more pains in their dreſs, and wear a ſhort jacket and petticoat, with a ſort of looſe gown, and a veil to cover their faces. They uſually adorn their arms and wriſts with a number of bracelets made of ſilver, pewter, copper, iron, and glaſs, according to their rank and circumſtances. Their fingers and toes, and the ſmall of their legs, are likewiſe decked with chains and rings. Their ears are ſtuck ſo full of mock-jewels and ornaments of metal, that the lobes are in particular greatly dilated and weighed down, which they are taught from their infancy to conſider as a ſingular beauty.

The children of both ſexes are ſuffered to go ſtark naked from the time of their birth till they are ſeven or eight years old; which proceeds leſs from any conſideration of the heat of the climate, than from phyſical reaſons; for they imagine, that infants are more apt to be hurt by heat than by cold, and that the free acceſs of the air to every part of the body is nutritious and more favourable to their growth, than their being heated by ſwathing and cloaths, which deprive them of a hardineſs conducive to health; and in caſe of any diſpoſition to deformity obſtruct the free courſe of nature, which ſtrives to free itſelf from any imperfections. By this means they are alſo preſerved from the galling and chafing of cloaths, which frequently occaſion ſuch cryings and ſtrainings, as if not carefully attended to terminate in ruptures.

As the ſoil is of itſelf ſo naturally fertile as to produce every thing they covet for food, ſo their conſtitutional indolence keeps them ſatisfied, without any attempts to improve it by tillage or cultivation. They chiefly ſubſiſt on milk and vegetables, both which they poſſeſs in great plenty and perfection. Inſtead of oil and vinegar to their ſallads, which are of the lettuce kind, they uſe a liquid which has ſome reſemblance to our treacle, and is a preparation of the juice yielded on inciſion from the cocoa-nut tree.

Their language is a corrupt Arabic, mixed with the Zanguebar tongue of the oppoſite part of the continent, from whence the Comora iſlands were probably firſt peopled: but thoſe of the faireſt complexion, who are generally of the beſt rank, or at leaſt the moſt eſteemed amongſt them, derive their colour partly from the Arab mixture, and partly from their communication with Europeans, which was formerly much more common than at preſent.

Their manners ſtill retain much of the ſimplicity of uncultivated nature. The mildneſs of the climate renders them indolent and prone to venery. They frequently make uſe of the liberty granted them by their religion, which is that of Mahometaniſm, of divorcing their wives upon ſlight pretences, for the ſake of novelty; they have uſually two or three of them, and may have as many concubines as they can maintain.

Though they are forward to beg whatever they like, they are from being thieviſh. They treat the Engliſh in a very friendly manner, not merely from a principle of intereſt and convenience, though this has doubtleſs ſome influence, but alſo from a ſenſe of gratitude for the effectual aſſiſtance they formerly received from them in their wars with the Mohilians, and from their being aſſured, by frequent intercourſe with them, that they have no intention to invade their country or liberty, of which they retain a ſtrong jealouſy againſt the Portugueſe and other European nations; but chiefly place their ſafety on the inacceſſibility of their mountains, which nature has formed as an impenetrable barrier and defence of the inland country.

The huts of the lower ſort of people have ſome reſemblance to our barns, the ſides being formed of reeds tied together, and plaſtered over with a mixture of clay and cow-dung; and the roofs are thatched with cocoa-leaves. That man is thought very great who has a houſe erected with ſtone and mud.

The town, or more properly village, of Johanna is compoſed of about two hundred houſes and huts together. Thoſe houſes, which are of ſtone, belong to the chief, who is honoured with the title of king of Johanna, and

and to the principal men of the country. Their beſt buildings are very low, and only of one ſtory high. They permit ſtrangers to come familiarly into their firſt apartment, all the others being reſerved for their families. The houſe in which the king reſides is built, like the reſt, of ſtone and mud, and does not make a better figure than a common Engliſh alms-houſe; it being wretchedly furniſhed, and aukwardly hung with pieces of coarſe chintz, with here and there a ſmall looking-glaſs. Yet with all this inferiority in point of ſtate and grandeur, in compariſon with what is ſeen in more extenſive and civilized kingdoms, his title of king cannot be improper, he having all the eſſentials of royalty, and an unlimited power over his ſubjects both in temporals and ſpirituals; with the government of ſeventy-three villages, and near thirty thouſand inhabitants.

SECT. III.

Of the Manner in which Johanna became ſubject to the preſent Race of Kings. The Preſents neceſſary to be made him. The Manner in which Trade is carried on in Canoes. The Canoes and Panguays deſcribed.

THE grand-father of the preſent king, ſays our author, was an Arab, or Mooriſh trader to Moſambique, where on a quarrel with a Portugueſe, with whom he was dealing for ſlaves, he killed him; and being obliged inſtantly to fly, put to ſea in the firſt boat he could ſeize on the ſhore, when the firſt land he made was Johanna; where meeting with an hoſpitable reception, he remained ſome years in obſcurity, till an Arabian veſſel being driven in there by ſtreſs of weather, he made himſelf known to his countrymen, and procured them all the relief the place afforded. In the mean while he had perfectly learned the language, was become acquainted with the manners of the inhabitants, and was ſo pleaſed with the fertility and pleaſantneſs of the country, that he not only laid aſide all thoughts of leaving it; but formed a ſcheme to raiſe himſelf to the ſovereignty of it; and the Arabs his countrymen readily entered into his views, from the advantages they hoped to derive from his ſucceſs.

Inſtead of proceeding on a plan of violence, he made himſelf neceſſary to the natives by inſtructing them in the uſe of arms, before unknown to them, particularly the lance, which thoſe of any rank amongſt them now handle with great dexterity. This, with his teaching them other methods of war, entirely new to thoſe ſimple ſavages, proving of ſingular advantage to them, by enabling them to repulſe the inhabitants of the neighbouring iſlands, eſpecially of Mohila, with whom they were conſtantly at variance, ſometimes invading and at others invaded by them, acquired him ſuch reſpect and authority, that ſoon availing himſelf of it, he cauſed himſelf to be elected their chief, or king, and to be inveſted with deſpotic power. In obtaining this point he proceeded by degrees, and made uſe of all his art; but he had no ſooner gained the ſummit of his ambition, than he made them repent of their confidence and credulity; for he not only ſtrengthened himſelf by inviting ſome of his countrymen to ſettle in the iſland with their families; but choſe for his guards the moſt bold and reſolute of the natives, by which means he was ſoon able to eſtabliſh an arbitrary government. Thoſe who endeavoured to oppoſe his pretenſions and innovations he forced from their families, and ſold for ſlaves to the Arabs, who, upon this change, reſorted more than ever to the iſland for the ſake of trade; and this they ſtill continue. In ſhort, he overcame all oppoſition, and before his death bequeathed the ſovereignty of the iſland to his ſon, who was about forty-three years of age when his father died, and obtaining the peaceable poſſeſſion of the kingdom enjoyed it during his life; and dying a few years ago left two ſons, the eldeſt of whom ſucceeded him, and was on the throne in 1750.

The king for the moſt part reſides about nine miles up in the country, ſeldom coming to what they call the lower town by the ſea-ſide, except when the European ſhips lie there, and he is then accompanied by a numerous retinue.

On his coming on board our veſſels, which he ſeldom miſſes, he expreſſes a great deſire of knowing the name of every thing that is new to him; and as he has obtained a tolerable ſmattering of the Engliſh tongue, he is very inquiſitive in relation to our wars in Europe, and is particularly pleaſed with the civility of the Engliſh captains, who regale him with European fare, and generally ſalute him with five guns, both on his coming on board and at his departure. This is a ceremony he would not willingly diſpenſe with, as it is a mark of reſpect that gives him an air of importance, and tends to increaſe, or at leaſt preſerve the eſteem of his ſubjects. His attendants, however, are far from ſtanding ſo much upon ceremony as their ſovereign, and have a forward way of begging any thing they fancy, and even put on an air of diſſatisfaction if they are refuſed.

When any ſhip arrives, it is neceſſary to obtain the licence of this prince for dealing with the natives, eſpecially for the more conſiderable articles of refreſhment, ſuch as oxen and goats, and alſo for wooding, watering, and landing the men. His permiſſion, however, is purchaſed at a reaſonable expence, conſiſting of a few preſents, as a little gun-powder, a few muſquets, ſome yards of ſcarlet cloth, or other European commodities.

Indeed a ſhip has no ſooner caſt anchor than it is ſurrounded by a number of canoes, the people hurrying aboard with refreſhments of the produce of the iſlands; and it is diverting enough to obſerve the confuſion and ſtrife among the rowers, all of whom exert their utmoſt endeavours to get firſt to their market the ſhip. When the ſea runs high, they are ſometimes over-ſet; but this is attended with no danger, on account of their being excellent ſwimmers, and therefore they only loſe their little cargoes of greens and fruit. Moſt of theſe canoes are balanced on each ſide with out-leagers, formed of two poles each, with one acroſs to prevent their overſetting, which has ſome reſemblance to the flying-proas we have deſcribed in treating of the iſland of Tinian and others in the Eaſt Indies. They uſe paddles inſtead of oars, and both ends of theſe veſſels are formed for cutting the water, without any diſtinction of head and ſtern, and conſequently they can ſail backwards and forwards without tacking about. Their larger boats, called panguays, are raiſed ſome feet above the ſides with reeds and branches of trees, well bound together with ſmall cord, and afterwards made water-proof with a kind of bitumen or reſinous ſubſtance. The maſt (for few of them have more than one) carries a ſail or two made either of the leaves of a cocoa-tree, or of ſheer-graſs matted together; and in theſe boats they will venture out to ſea for trips of three or four weeks, and ſometimes longer.

Not long ago it was common for the natives, when they came off to the ſhips with cocoa-nuts, plantanes, fowls, &c. to deal entirely by way of barter for handkerchiefs, rags, glaſs bottles, bits of iron, and in ſhort almoſt any thing, without regard to money; but they now begin to know its value, and will part with only the moſt inconſiderable articles in this manner. However, they ſell every thing as cheap as can well be deſired.

If the Engliſh want to purchaſe cattle, fowls, or cowries, they deſire to be paid in ſpecie, fire-arms, or gunpowder. They likewiſe ſolicit all who come there, particularly the paſſengers, to contribute a dollar or two towards improving the navigation they carry on with the continent of Africa, and, to influence them by the force of example, produce ſeveral liſts of perſons who have ſubſcribed; ſo that they ſometimes collect thirty or forty dollars from a ſhip that touches there: and when the captains leave the place, they generally make it a point for them to ſign, and alſo to leave with them a certificate of the good uſage they have received.

CHAP.

CHAP. VI.

Of MADAGASCAR, and the Iſles of MAURITIUS and BOURBON.

SECT. I.

Its Name, Situation, and Extent. The Face of the Country: its principal Rivers, Minerals, Trees, Plants, Beaſts, Birds, Reptiles, and Fiſhes.

MADAGASCAR, the largeſt of the African iſlands, and one of the biggeſt in the known world, is called by the natives Madacaſc: but the Portugueſe, who firſt diſcovered it, gave it the name of St. Laurence; the French call it l'Iſle Dauphin, or the Dauphin's iſland; and the Nubian geographers, Perſians, and Arabs, call it Serandib. It is ſituated between the twelfth and twenty-ſixth degrees of ſouth latitude, and between the forty-fourth and fifty-firſt degrees of eaſt longitude from London, about forty leagues to the eaſt of the continent of Africa, it being about a thouſand miles in length from north to ſouth, and generally between two and three hundred miles broad. Its ſouthernmoſt end, which leans towards the Cape of Good Hope, is the broadeſt; for towards the north it grows much narrower, and terminates in a point. At a diſtance from the ſea are many high and ſteep mountains, yet it abounds in ſpacious plains that have excellent paſture, and has ſeveral large foreſts always green, in which lemons, pomegranates, and a variety of other fruits grow wild. It has alſo ſeveral conſiderable rivers and lakes.

The iſland is divided into ſeveral countries and provinces, inhabited by different nations, who ſpeak the ſame language, but differ in their complexions. Theſe ſeveral nations are perpetually at war with each other, not from the deſire of ſubduing each other's territories, but in order to plunder each other of their goods and cattle.

The principal rivers of this iſland are thoſe of St. Auguſtine, called by the natives Onghelahe, Ampatres, Caremboulle, Mangharac, Munherei, Vohitſinenes, Manumpani, Maranzari, and Franſhere.

In this country are found gold, ſilver, copper, tin, and iron, of which the natives make razors, lances, hatchets, and other inſtruments. Here are alſo ſeveral ſorts of precious ſtones, as topazes, amethyſts, agates, and ſeveral ſorts of jaſpers: frankincenſe and benzoin are found in abundance; and ambergriſe is gathered on the ſea-coaſt.

Among the fruit, beſides the lemon and pomegranate trees already mentioned, they have palmettos, plantanes, bananas, tamarinds, a currant which grows on a tree, and not on a buſh as in Europe, and is very pleaſant.

They have a large tree that bears a kind of a plumb, which when ripe is black, and of the ſize of a cherry, and on the inſide are little ſtones like thoſe of grapes; this tree has thorns two inches long.

They have a very tall tree, the leaf of which reſembles that of the pear-tree; it has a fruit ſpeckled like a ſparrow's egg, and of the ſame ſize; it is full of ſeeds, and of a ſweet juice eſteemed a certain cure for fluxes.

They have a kind of nut which ſmells of all ſorts of ſpices; it is as large as a nutmeg, but browner, and more round.

They have pepper, which grows in ſmall quantities, no care being taken to cultivate it; this pepper grows in cluſters upon ſhrubs that trail upon the ground.

Here is a tree whoſe leaves and tender ſprigs ſting like nettles, but the root is of great uſe where there is a ſcarcity of water, which is the caſe of many parts of the country; for it retains a great deal of juice, which is extracted by beating the root in a wooden mortar, and preſſing out the liquor; and of the bark of this tree they make ropes. Here is likewiſe wood proper for building, as alſo cedar and ebony; but none fit for maſts. They have alſo ſugar-canes, oats, barley, and rice.

The plains are covered with ſeveral ſorts of graſs of different colours, which grow to a much greater height than any in England: the natives never cut any for hay; for before the old is withered, new graſs ſprings up under it; but they commonly ſet the old graſs on fire.

There is alſo tobacco, which is ſmoked in reeds or ſhells. The natives are alſo fond of ſmoking a plant, to which they give the name of jermanghler; this plant grows about five feet high, bearing a long and ſlender leaf, and a pod which contains about a dozen ſeeds like hemp-ſeed. The natives mix the leaves and ſeeds together, and lay them three or four days in the ſun, till they are very dry and fit to be ſmoked; but it ſtrongly intoxicates the people: their eyes, after ſmoking it, look red and fiery, their aſpect fierce and wild; and they are even more active, bold, and vigorous while the effect continues; but thoſe who uſe it much are weak and diſpirited whenever they are not intoxicated by ſmoking it.

In ſhort, the ſoil is ſo fertile that it produces two crops in a year of every thing, except ſugar-canes, which muſt be left two years ſtanding, that they may grow to a proper ſize.

The country abounds with oxen which areprodigiouſly large, and yet ſo nimble and unruly, that they will leap very high fences: they are beautifully coloured, ſome of them being ſtreaked like a tyger, others are black with white ſpots, and ſome are white with black ſpots. They have a protuberance between their ſhoulders, which has ſome reſemblance to that of a camel, and conſiſts of fat and fleſh; ſome of theſe humps are ſaid to weigh between three and fourſcore pounds. The cows do not give ſo much milk as ours in England, nor will they ever ſuffer themſelves to be milked till the calf has firſt ſucked; ſo that they keep a calf for every cow till ſhe is again with calf, for they ſeldom miſs a ſeaſon. Here are ſome ſheep with great heavy tails, and alſo goats; but they keep no tame hogs, theſe being ſufficiently numerous in the country, and ſo very miſchievous to the plantations of potatoes, and other roots, that they are forced to ſet traps in order to catch them. They have alſo wild dogs, and foxes, which are very fierce, and will ſometimes attack a man; but they have no lions, tygers, or any other ſavage beaſts.

They have excellent fowls, with plenty of turtle-doves, partridges, pigeons, ducks, teal and other wild fowl.

The bees of Madagaſcar are very numerous, and great quantities of honey are found in the woods. The natives alſo keep bee-hives; for they not only eat the honey, but make a palatable liquor of it, called toack, which has a conſiderable ſpirit, and of which they frequently drink till they are intoxicated; this is the common liquor drank at their entertainments.

There are two or three kinds of ſilk, found in plenty in almoſt every part of the iſland, ſome of a browniſh colour, and one ſort white, the outſide of which is full of ſmall pointed prickles. The cone is about three inches long, ſhaped like a ninepin, and at the top is found a ſmall hole, out of which a blackiſh worm is ſometimes ſeen to creep; but we have no account of its changing its form in the manner of the common ſilk-worms, though it probably becomes a flying inſect. There are, however, no mulberry trees in the iſland, and theſe worms and ſilk are found on three or four different ſorts of trees, adhering to the thick branches or trunk. The people pull out the cone on their knees, teazing it to pieces with their hands, and then ſpin it with

with a ſpindle made of a bone, and a rock-ſtaff, after which they weave it, and it makes pretty fine lambers to wear round their waiſt.

In ſome parts of the country is a tree called roſeer, which is of great uſe to the lower or middling ſort of people, from its furniſhing materials for a cloth to wear round their waiſt. The leaf reſembles that of the cocoa-tree, but is longer by two feet, and bears a plum almoſt like a damaſcene. The outer bark they take away, and the inner, which is white, they peel off entire, and beat with a ſtick till it is ſoft and pliable. It then reſembles a long, white, thin ſhaving. After this they ſoak it in water, then ſplit it into threads, which they tie together, and weave into cloth. They frequently dye a part of it, and make their lambers ſtriped.

They have large ſnakes, but they are not poiſonous; they ſeldom bite any one, and when they do, it is attended with no worſe conſequence than the bite of any other animal.

Here are great numbers of lobſters and craw-fiſh, excellent turtle, eels, the ſword-fiſh, the ſea hedge-hog, and many kinds of fiſh common to other countries in the ſame climate. In the rivers are many alligators.

SECT. II.

Of the Perſons, Dreſs, Manners, Cuſtoms, and Food of the People.

AS to the perſons of the natives, they are commonly tall, well made, of an olive complexion, and ſome of them pretty black. Their hair is not woolly, like that of the negroes of Guinea; but it is always black, and for the moſt part curls naturally; their noſes are not flat, though they are ſmall, nor have they thick lips.

The men wear only a piece of cotton cloth or ſilk round their waiſt, called a lamber; ſome of theſe they make themſelves, but thoſe who are rich buy the ſilks and calicoes at ſea-port towns, giving a great price for them, as a cow and a calf for no more than will make one lamber. The men and women of diſtinction alſo adorn themſelves with rings on their wriſts; ſome are of gold, ſome of ſilver, but moſt of them of copper. They curl their hair, and make it lie cloſe and ſmooth, and thoſe of ſuperior rank adorn their hair with rings, and other ornaments.

The women wear a lamber which reaches to their feet, and above it a garment like a ſtraight ſhift, which covers all the body, and has ſhort ſleeves. This is commonly made of cotton, and dyed of a dark colour. The women of ſuperior rank adorn it with beads, eſpecially in the back, where they are ranged in rows, and croſs each other; theſe being of different colours, form a large double croſs ſo like the Union flag, that one would imagine they copied it.

The women are remarkable for their obedience to their huſbands, their good temper, and agreeable converſation. Indeed, the people in general are of a humane and friendly diſpoſition; they ſhare with their neighbours what they take in hunting, and the great even take a pride in relieving the diſtreſſed, though they were before at enmity. In ſhort, they have many virtues; but, as in other countries, there are conſiderable numbers who violate the laws of juſtice and humanity, in order to gratify their paſſions; but theſe perhaps are not more numerous than in civilized countries.

They are not deficient in point of underſtanding, but are capable of reaſoning upon any ſubject where they have not been blinded by ſuperſtition; and many of them are endued with admirable good ſenſe.

The moſt reſpectful ſalutation is licking the feet of a ſuperior. This kind of abject ſubmiſſion is practiſed by all inferior perſons when they addreſs their prince, and by the women when they come to welcome their huſbands on their returning from the wars: the ſlaves alſo pay the ſame prepoſterous mark of reſpect to their maſters; but thoſe of ſuperior rank lick only the knees of their ſovereigns.

The riches of the inhabitants conſiſt in cattle, and in fields of rice and roots, which are under the management of their ſlaves. Gold and ſilver here ſerve only for ornaments; for whatever they purchaſe, it is by way of exchange, the uſe of money not being known amongſt them.

The common food of the inhabitants is cow's milk, rice, and roots, and they ſometimes roaſt large pieces of beef with the hide on; they frequently broil meat on the coals, and ſometimes bake it, by making a hole in the earth, on the bottom of which they lay ſtones, then making a great fire in it, let it burn till the ſtones are red-hot: then placing ſticks over the embers, they put in their meat, and covering up the hole, let it continue there till it is baked. They alſo ſometimes boil their meat and fowls, but have no bread, inſtead of which they make uſe of various roots.

SECT. III.

Of the Dreſs and Power of the Sovereigns. Their Cities deſcribed; and their Manner of making War.

MR. Drury mentions a king to whom he was preſented, whoſe hair was twiſted in knots, beginning at the crown of his head, where they formed a ſmall circle; below them was another ring of knots, and thus they were continued in ſeveral circles, each larger than that above it. On ſome of theſe knots hung fine beads; he had alſo a forehead-piece of beads that hung ſo low as to reach his noſe. About his neck he had a fine necklace, formed of two ſtrings of beads, ſeveral of which were of gold; this necklace hung down before in the manner of an alderman's chain, and on each wriſt he had five or ſix ſilver bracelets, and four rings of gold upon his fingers. On each ankle were near twenty ſtrings of beads ſtrung very cloſe, and exactly fitted to his legs. He had a ſilk mantle over his ſhoulders, and another piece of ſilk, as uſual, about his waiſt. But theſe ſovereigns are as different in the diſpoſition of their ornaments, as in their paſſions. They uſually give audience to their ſubjects ſitting croſs-legged on a mat.

Though they have an abſolute power over the lives of their ſubjects, and ſometimes kill thoſe who exaſperate them with their own hand; they will talk familiarly with every body, and yet preſerve a decent ſtate.

They have cities, towns, and villages, noblemen and ſlaves. Many of the cities contain upwards of a thouſand huts, which are built with branches of trees, and covered on the top with leaves, in ſuch a manner as to keep out the rain. But theſe buildings are extremely low, and cannot be entered without ſtooping. The houſe of the prince is built up with boards, formed by the hatchet out of the trunks of trees; for they have not the uſe of ſaws. Theſe buildings, though handſomer than the others, are not raiſed much above ſix or ſeven feet from the ground.

Their cities are ſurrounded with ditches near ſix feet deep, and as many in breadth, with paliſadoes on the bank of the ditch next the houſes; and ſometimes, when they apprehend the approach of an enemy, they defend themſelves by trees cut down, forming a kind of wall; and if it be in a ſtony place, this defence is made with a ſtone wall without mortar.

Yet the princes have no regular bodies of troops trained to war, but make uſe of their vaſſals, who endeavour to imitate their bravery, but generally fly when they ſet them the example, or when they are killed. Their arms are lances and hatchets made in the country, and guns purchaſed of the Europeans who frequent their ports.

When they make war, it is very common for parties to go out and ſurprize their enemies by night when leaſt expected. On theſe expeditions every man generally carries a piece of meat in his hand, and entering the town in the dead of night, throws the meat to the dogs to prevent their barking. When they are all entered one fires a muſket, at the noiſe of which the inhabitants ſuddenly

riſing, haſtily endeavour to get out of the doors of their low huts in a ſtooping poſture, but are ſtabbed with lances. The children and women they take captive, and driving away all the cattle they can find, they burn the town, and then return home with the plunder and the cattle by private ways.

Indeed it is cuſtomary with them in time of war to hide their wives, children, and cattle in remote and ſecret places in the woods, that the enemy may not find them when they plunder the country; but the women and children are never with the cattle, leſt their bellowing ſhould make a diſcovery. In this caſe the women, to prevent their being traced by the track they leave, draw boughs after them when they retire to their ſolitary retreat.

Though they have no knowledge of letters, they have a conciſe ſyſtem of laws, which are handed down by memory from father to ſon; and theſe, for the moſt part, ſeem founded on good ſenſe.

If one man aſſaults another maliciouſly, and breaks a leg or an arm, the offender is fined fifteen head of cattle, which he muſt pay to the ſufferer.

If a perſon breaks another's head, and the wounded has not returned the blow, he has three cows or oxen for the damage.

If two men quarrel, and one curſes the other's father and mother, whether they be dead or alive, and his antagoniſt retorts not the curſe againſt his father and mother, he recovers two oxen for the damage.

If a man is catched robbing his neighbour of an ox or a cow, he muſt reſtore ten for it; and this is rigorouſly executed, though it is frequently violated by the great men, who, as in other countries, are ſeldom held by the ordinary laws of their country.

If a perſon is taken ſtealing Guinea corn, caravances, potatoes, &c. out of a plantation, he forfeits a cow and calf to the owner, or more in proportion to the offence. If one man's cattle breaks into another's plantation, for every beaſt found there the owner muſt give an iron ſhovel.

If a man borrows a cow of his neighbour, in a year's time ſix calves are ſuppoſed to be the proper value which he ought to return; and if he then neglects paying, thoſe calves are ſuppoſed to be three ſteers and three heifers, and the increaſe computed to ariſe by their growth and production is due to the man of whom the cow was borrowed.

If any man be caught ſtealing another's hive of honey, the fine is three iron ſhovels; for it muſt be obſerved, that ſhovels and hoes, in the courſe of exchange, ſerve the purpoſe of ſmall money.

If a man lies with the wife of his ſuperior, he forfeits thirty head of cattle, beſides a great number of beads and ſhovels; but if the man is of an equal rank, he is fined twenty cattle: but to lie with one of the wives of the king is death. Notwithſtanding this, if a man has two wives, and his brother or an intimate friend comes to viſit him, he makes no ſcruple of letting him lie with one of them.

SECT. IV.

Of their religious and ſuperſtitious Rites; their Manner of adminiſtering an Oath; the Form of Circumciſion; their Funeral Ceremonies; and of the Umoſſees, or pretended Magicians.

THEY acknowledge and adore the one Supreme God, whom they call Deaan Unghorray, which ſignifies the Lord above; but they ſay, there are four other lords, each of whom has his reſpective quarter of the world, as the northern, the eaſtern, the ſouthern, and the weſtern lords. The eaſtern lord they ſay is the diſpenſer of plagues and miſeries to mankind, by the permiſſion or command of the Supreme God; and though the others alſo fulfil his commands, they are chiefly the diſpenſers of benefits. Theſe lords they conſider as mediators between men and the great God, on which account they have an high veneration for them, and recommend themſelves to them in their prayers and ſacrifices.

They have in their houſes a ſmall portable image, or idol, conſecrated to religious uſes: this they call the Owley. It is made up of a peculiar wood in bits neatly joined, almoſt in the form of an half moon, with the horns downwards, between which are placed two alligators teeth; it is adorned with ſeveral ſorts of beads, and behind it is faſtened a ſaſh, which the maſter of the houſe is to tie round his waiſt when he goes to war. This is ſuppoſed to be a kind of taliſman, or vehicle, to which their ſpirit, or guardian genius, is attached, and by which, as a proper medium, he will be invoked. Almoſt every perſon is ſuppoſed to have a diſtinct and ſeparate ſpirit who preſides over his actions, and preſents his prayers to the great God; and the people expect, that after a ſacrifice theſe ſpirits will tell them in dreams what they are to do, and warn them of the dangers that await them. This naturally renders them ſuperſtitious with reſpect to dreams, and the common affairs of life.

When they offer their adorations they take two pieces of wood forked at one end, and fixing them in the ground, lay a ſlender piece of wood about ſix feet long over the forked ends of the two poles, and on this they hang the Owley: behind it is a long pole, to which they tie a bullock. They then place a pan with live coals under the Owley, and ſtrewing ſweet-ſcented gums into it, take ſome of the hairs of the tail, the chin, and the eye-brows of the bullock, and put them on the Owley; after which they addreſs a prayer to the Supreme God, the four lords of the earth, the guardian ſpirits, and particularly that who is attached to the Owley, and to the ſpirits of their anceſtors, begging for what bleſſings they want, and returning thanks for thoſe they have received.

This being done they throw the ox on the ground, with his legs tied, and the chief perſon preſent cuts his throat; for they having no prieſt, the chief man, whether of the country, town, or family, performs all the ſacred offices himſelf, and the people join with him in their devotions.

Their oath or manner of ſwearing is performed in a very ſingular manner, which will appear from the following inſtance: The maſter of a French ſhip putting in at Port Dauphine, where the French, by their behaviour, had made the natives their mortal enemies, pretended to be an ambaſſador from the French king; and going aſhore in great ſtate, entered into an alliance with the queen of that part of the country, on which ſhe cauſed her Owley to be elevated in the above manner; and a bullock being killed they took ſome of the tail, and ſome of the hair of the noſe and eye-brows, and put on the live coals that were ſmoking under the Owley, which they alſo ſprinkled with the blood of the victim. The liver was then roaſted, one piece of which was placed on the vehicle of the guardian ſpirit, and two pieces ſtuck on two lances, which were fixed in the ground between the queen and the ambaſſador; and then the queen took the oath in the following terms:

"I ſwear by the great God above, by the four Gods "of the four quarters of the world, by the ſpirits of my "forefathers, and before this holy Owley, that neither "myſelf, nor any of my offſpring or people, who aſſiſt "at this ſolemn oath for themſelves and their offſpring, "will willingly kill any Frenchmen, unleſs they firſt "kill ſome of us; and if we, or any of us, mean any "other by this, but the plain and honeſt truth, may this "liver which I now eat be turned to poiſon in my belly, "and inſtantly kill me." When ſhe had ſaid this, ſhe took the piece of liver off the lance and ate it; after which the ambaſſador did the ſame.

Theſe people perform the rite of circumciſion, but with very different ceremonies from thoſe practiſed by the Jews and Mahometans. It is commonly performed when the child is about a year old, but they have no certain time of doing it. Great preparations are made by preparing toack, a liquor made of honey and the honeycombs together; and the people, before the ceremony begins, give themſelves up to mirth and rejoicing, many drinking to exceſs. A bull is tied and laid on the ground, and the relations and friends bring preſents of cows, calves, beads, hatchets, &c. till at length the principal relation

relation runs with the child in his arms to the bull, and putting the child's right hand on the bull's right horn, ſays, "Let the great God above, the lords of the "four quarters of the world, and the guardian ſpirits "proſper this child, and make him a great man; let "him be ſtrong, like this bull, and overcome his "enemies."

If the bull roars while the boy's hand is on his horn, they conſider it as an unfortunate omen of his being ſickly or unhappy. Any experienced man in the neighbourhood performs the office, by cutting off the fore-ſkin as cloſe as he can, while two men hold the child's legs and arms. When the fore-ſkin is cut off, it is put upon a ſtick like a gun-rammer, the biggeſt end of which is cut pointed, and a man goes with it to the wood and throws it eaſtward. The ceremony being finiſhed, the boy is delivered to his mother, who is ſeated on a mat ſurrounded by women, and the bull being killed, perhaps with ſeveral oxen, if that be not ſufficient, to feaſt the whole company, the meat is boiled, ſome parts broiled, and others roaſted; and the weapons of the men being ſecured to prevent miſchief, they are plentifully ſupplied with toack, and the revel continues with ſinging, drumming, hollowing and blowing of ſhells as long as they are able; and the feaſting ſometimes laſts all night.

The veneration they have for their forefathers, and the aſſurance of their ſpirits always exiſting, appear in almoſt every circumſtance of the few religious offices they perform. The burial of the dead is very ſingular and ſolemn. As they treat each other in all calamities and misfortunes with great humanity, ſo they frequently viſit the ſick, and contribute all in their power to aſſiſt the afflicted family, and to reſtore thoſe to health who are ill. When a perſon dies, all the relations and neighbours come to the houſe, the women lament, and the men aſſiſt in preparing for the funeral. The firſt thing to be done is to pitch upon a tree for the coffin; then a cow or an ox is killed, and ſome of the blood ſprinkled on it, while they offer up their prayers to their forefathers, their guardian ſpirits, and demi-gods, to aſſiſt them, taking care that the tree be not ſplit in falling, nor that any man be hurt in felling or cutting it. After the tree is down they cut the trunk about a foot longer than the corpſe, and then ſplit it in the middle, for they always chooſe a tree which they know will ſplit. They then dig both parts hollow, in the manner of two troughs, and it is then fit to be carried to the houſe. In the mean time the corpſe is waſhed and ſewed up in a lamber, or perhaps in two. Frankincenſe, or a gum very like it, is all the while kept burning in the houſe. The corpſe is ſeldom kept above a day, eſpecially in hot weather; but being put into the troughs they are neatly cloſed together, and carried on ſix men's ſhoulders.

Every family has a peculiar burying-place, which none dare to break into. It is encloſed with a kind of paliſadoes, and when they come near the place, the corpſe is ſet down on the outſide, and four fires are made, one at each corner without the burying-place. On thoſe fires they burn an ox or cow, which was before killed on purpoſe, and divided into quarters, conſuming the whole. They then ſprinkle frankincenſe on the coals, and ſpread them about: which being done, the chief, or eldeſt of the family, goes to the gates of the burying-place, and hollows aloud ſeveral times; after which he calls upon all the dead there depoſited, beginning at the earlieſt and proceeding to the laſt, mentioning every one diſtinctly by name; and concludes with telling them, that a grandchild, or relation, is come to lie amongſt them, and hopes they will receive him as a friend. He then opens the gate, and two or three perſons are ſent in to dig the grave, which is commonly ſeven or eight feet deep; and the body being placed in it, is covered with earth, without any farther ceremony.

Nobody is permitted to enter the burying-ground but ſome of the neareſt relations and the bearers; and they have no ſooner left it than the door is cloſed up. There are generally a great number of people without, who are buſily employed in cutting up and dividing among themſelves the cattle which the rich cauſe to be brought for that purpoſe; but thoſe who are poor cannot gratify their friends ſo bountifully. They commonly go once a year to this burying-place to clear it of weeds, but never enter it till they have burnt a bullock or a cow before it.

It ought not to be omitted, that their manner of mourning does not conſiſt in the colour or form of the garment, but in ſhaving their heads; and every man under the juriſdiction of a king, or lord, who does not do this at the death of his prince, is eſteemed diſaffected.

The ſuperſtition of theſe people appears in nothing more evident, than in their implicit obedience to all the directions of their umoſſees, or magicians, who pretend to know the ſecret powers of nature, and how to engage the aſſiſtance of the guardian ſpirits on all occaſions. They pretend by their charms and incantations to ſearch into futurity, and by mixing certain ingredients to be carried before an army, to inſure their ſucceſs, while, by throwing it towards their enemies, they can defeat all their deſigns. By ſprinkling the bee-hives they are ſuppoſed to make the honey poiſonous to thoſe who ſteal it, while thoſe to whom it belongs may eat it in ſafety; and ſuch faith have the people in theſe impoſtures, that thoſe whom no laws could bind are deterred by the dread of death from touching what the umoſſee has rendered an object of terror. Nothing of importance can be undertaken without conſulting them, and it appears that ſome of the lords, who are men of ſenſe, keep one of theſe conjurers out of policy, only to amuſe their people, who, they think, ought to be humoured in their bigotry, and captivated by the artifices of theſe impoſtors, in order to render them more tractable and obedient. Indeed the ſucceſs promiſed by their incantations does not always happen; but when it fails, they are never at a loſs for a reaſon: and as they frequently gueſs right, and what they promiſed comes to paſs, their wiſdom and ſkill are admired, and they meet with eſteem, reputation, and rewards.

Theſe umoſſees, however, never interfere in the acts of religion, except in fixing the proper minute of performing them: nor, in religious matters, is any one offended becauſe his neighbour has ſome ceremonies of his own, and deviates from the general forms.

SECT. V.

The Manners, Cuſtoms, and Religion of a different People from the common Inhabitants of Madagaſcar.

TO the ſouth-weſt of Madagaſcar, are a people who ſeem almoſt of a different ſpecies from the other inhabitants of the iſland. Theſe are called Virzimbers. Their heads are of a very ſingular ſhape, the hinder part being as flat as a trencher, and the forehead nearly ſo, which, our author obſerves, was probably occaſioned by their preſſing the child's head from its birth. Their hair is not long, like that of the other natives, nor is it quite ſo woolly as the hair of the inhabitants of Guinea. They have alſo a language peculiar to themſelves, though they ſpeak that of the iſland.

The religion of theſe people is likewiſe different from that of the other natives, they having no Owleys in their houſes; but pay an extraordinary attention to the new moon, and to ſeveral animals, as a cock, a lizard, and ſome others. When they ſit down to their meals, they take a bit of meat, and throwing it over their heads ſay, "There is a bit for the ſpirit." Then cutting four more little bits, they throw them to the lords of the four quarters of the earth. This is the general practice of thoſe who have a regard for religion, though there are many who neglect it, juſt as in Europe, many neglect ſaying grace at their meals. But theſe people, like the others, have neither prieſts nor temples: nor is difference of religion conſidered as a crime.

The Virzimbers alſo dreſs their food in a better and more orderly manner than the other inhabitants, boiling plantanes or potatoes with their meat, and making a kind of ſoup.

Theſe people make very good earthen ware, as pots, diſhes, and jugs, glazing them both within and without, and are very ingenious artificers in many other things.

SECT.

SECT. VI.

Of the Places where the Europeans have attempted to make Settlements.

THE places remarkable on the coaſt from the Europeans having traded thither, are the Bay of Antongil, the iſland of St. Mary, Fort Dauphin, and the Bay of St. Auguſtin.

The Bay of Antongil is ſituated on the eaſtern coaſt, in the 16th degree of ſouth latitude; it extends about 14 leagues due north, and is 9 leagues broad at its entrance. In the bottom of the bay is a ſmall iſland, which affords plenty of proviſions, good water, and a ſafe harbour for ſhipping.

This bay was once frequented by the Dutch, who had a kind of factory there, conſiſting of fourteen men, for buying of ſlaves and rice; but ſome of them died with ſickneſs, and others were murdered by the inhabitants, whom they treated with inſolence.

The iſland of St. Mary, alſo called Naſſi Ibrahim, or the Iſle of Abraham, is ſituated to the ſouthward of the bay of Antongil, in the 17th degree of ſouth latitude, and is 54 miles long from north to ſouth, but its greateſt breadth from eaſt to weſt does not exceed nine miles. The neareſt part of this iſland is about two leagues diſtant from the coaſt. The iſland is entirely ſurrounded with rocks, over which canoes may paſs at high water; but at ebb there is not above half a foot depth, and on theſe rocks may be ſeen the fineſt white coral in the world. Ambergriſe is often found on the eaſtern coaſt of the iſland, and the iſland itſelf affords many ſorts of gums. Since the ſettlement of the French upon it, it is become much more populous than formerly, and the prince of Antongil, who uſed to make war on the inhabitants, does not dare to attack them ſince the French took them under their protection.

Fort Dauphin, which was erected by the French, is ſituated near the ſouth-eaſt point of Madagaſcar, in twenty-four degrees twenty-five minutes ſouth latitude, near the mouth of the river Franſhere; but the French finding that the trade there did not anſwer the expence of keeping the colony, have left it.

St. Auguſtine's bay is on the weſtern coaſt of Madagaſcar, in twenty-three degrees thirty minutes ſouth latitude, that is, juſt under the tropic of Capricorn. It is formed by the mouth of the river Yong Lahe. The Engliſh formerly traded for ſlaves at this bay, and at other places on the weſtern ſide of the iſland.

Indeed the Europeans who frequented the iſland of Madagaſcar, purchaſed ſcarce any thing there but ſlaves and cattle, which the natives exchanged for guns, gunpowder, beads, cloathing, and hard-ware; and here the ſhips bound to and from India ſometimes ſtop, in order to furniſh themſelves with water, freſh proviſions, and fruits, for which they give pieces of ſilk, calicoe, and ſome of the above articles.

It was once expected that the pirates would have made a ſettlement in this iſland, and uſurped the dominion of, at leaſt, great part of it, they having ſix or ſeven ſhips of force, with which they uſed to infeſt the Indian ſeas, returning with their prizes to a place of ſecurity on the north-eaſt coaſt, where they took poſſeſſion of a harbour or difficult acceſs, and defended from ſtorms by St. Mary's iſland; but they are now diſperſed.

SECT. VII.

Of the Iſlands of Mauritius and Bourbon.

THE only remaining iſlands worthy of notice, to the ſouth eaſt of the Cape of Good Hope, are thoſe of Mauritius, which belongs to the Dutch, and Bourbon, which is claimed by the French.

Mauritius was ſo called by the Dutch, in honour of prince Maurice their Stadtholder, under whoſe adminiſtration they made themſelves maſters of it. It is ſituated in twenty degrees ſouth latitude, an hundred leagues to the eaſt of Madagaſcar. It is of an oval form, and about fifty leagues in circumference, abounding with high mountains, from whence the rivers fall in torrents; and it has great quantities of wood of various kinds, particularly of ebony. The Dutch found it uninhabited, and without any other cattle but deer and goats; and took poſſeſſion of it, as a proper place of refreſhment between Europe and India, they having no other place to touch at in that long voyage before they made themſelves maſters of the Cape of Good Hope.

The Dutch have a fort and garriſon of fifty men in the iſland; beſides which there are about eighty families that keep abundance of negro ſlaves, who are employed in huſbandry and other laborious works. They have now introduced almoſt all the excellent plants of Europe and Aſia, and well ſtocked the iſland with cattle and poultry; rice, ſugar-canes, and tobacco, are alſo raiſed here, but in no great quantities. The Dutch ſtill touch here in their paſſage from the Cape to Batavia, in order to take in refreſhments.

The iſland of Bourbon or Maſcarin is ſituated in twenty-one degrees ſouth latitude, about forty leagues to the ſouth-weſt of Mauritius. This iſland is alſo of an oval figure, and about ninety miles in circumference: it has plenty of wood and water, and is finely diverſified with mountains and plains, foreſts and fields of paſture, watered by ſprings and rivulets. The air is exceſſive hot; but it is much refreſhed, and rendered healthy by almoſt inceſſant breezes. The iſland produces tobacco, aloes, oranges, lemon and other fruit-trees, ebony, trees that produce odoriferous gums, as benzoin, &c. and many proper for timber. It abounds with black cattle, hogs, goats, parrots, turtle-doves, pigeons, and other fowl; the rivulets have plenty of fiſh, and on the ſhores are great numbers of turtle, where are alſo found conſiderable quantities of ambergiſe, coral, and fine ſhells. It was diſcovered by the Portugueſe in the year 1545, who ſtocked it with hogs and goats; but afterwards deſerted it. Captain Caſtleton, an Engliſh commander, landed in this iſland in the year 1613, and was ſo delighted with the beauty of the place, that he gave it the name of the Engliſh Foreſt; but though our Eaſt India company did not think it worth their while to fix a colony here, the French took poſſeſſion of it in the year 1654, and gave it the name of Bourbon, leaving a few people and ſlaves there, who afterwards came away in an Engliſh ſhip. They however formed a regular ſettlement there in 1671, when they quitted Madagaſcar; and have now three pretty conſiderable towns on the iſland; St. Paul, St. Denis, where the govenor reſides, and St. Suſanna; and here their Eaſt India ſhips caſt anchor to take in refreſhments; there being about the iſland ſeveral good roads for ſhipping, but no ſafe ports to ſecure ſhips from the violent ſtorms that frequently rage in theſe parts.

CHAP.

CHAP. VII.

Of CAFFRARIA, or the Country of the HOTTENTOTS.

SECT. I.

Its Situation, Form, and Extent; the Mountains viſible on approaching the Coaſt; the Face of the Country, and a general Account of the Situation of the ſixteen Hottentot Nations.

WE now come to Caffraria, the moſt ſouthern part of Africa, which lies in the form of a creſcent about the inland country of Monomopata, and is bounded by the ocean on the eaſt, ſouth, and weſt; extending from the tropic of Capricorn on the eaſt, to the moſt ſoutherly part of Africa, called Cape D'Aguilas, which is ſituated in the thirty-fifth degree of ſouth latitude; and from thence it runs up on the weſtern ſide of Africa as high as the ſame tropic.

This country is divided into two parts, Caffraria Proper, which lies to the north, and the country of the Hottentots, ſituated to the ſouth between the twenty-eighth and thirty-fifth degrees of ſouth latitude, and between the eaſtern and weſtern ocean; extending about three hundred miles from eaſt to weſt, and about four hundred from north to ſouth; the Dutch town at the Cape of Good Hope lying in latitude thirty-four degrees fifteen minutes, and in ſixteen degrees twenty minutes eaſt longitude from London.

On approaching the Cape of Good Hope, three remarkable mountains are viſible at a conſiderable diſtance; theſe are the Table Hill, the Lion's Hill, and the Devil's Hill, which may be ſeen at ſea at the diſtance of forty or fifty miles.

The Table Hill is the moſt lofty, and was thus named by the Portugueſe, from its reſembling at a diſtance a ſquare table: the perpendicular height is upwards of eighteen hundred and fifty feet, and yet on the top of it are ſeveral fine ſprings of clear and well-taſted water. In the ſummer ſeaſon, which begins in September, and continues till March, a cap of clouds conſtantly encompaſſes the ſummit of this hill before a ſtorm, and thus gives the ſailors notice to prepare for it.

The Lion's Hill lies contiguous to the ſea, to the eaſt-ward of the Table Mountain, from which it is ſeparated by a narrow valley. According to ſome it obtained its name from its reſembling a lion couchant, with his head erect; and, according to others, from its being infeſted with lions, when the Dutch firſt ſettled in this country. On this hill is a flag guarded by ſoldiers, who give notice of the approach of ſhips, and ſhew their number, and from what quarter they come, by hoiſting and lowering the flag.

The Devil's Hill, ſuppoſed to be thus named from the furious ſtorms that iſſue from it, when the top is covered with a white cloud, is not ſo high as either of the former: it extends along the ſhore, and is only ſeparated from the Lion's Hill by a cleft, or ſmall valley. Theſe three hills lie in the form of a creſcent about the Table valley.

The greateſt part of the country about the Cape is indeed full of rocks and mountains, which long after the diſcovery of this country, being only viewed at a diſtance, were thought to be barren; but their ſpacious tops are covered with rich paſture, every where enamelled with a variety of flowers of uncommon beauty and fragrance, and abound with delicious ſprings flowing in many ſtreams into the vallies. The ſkirts of the mountains are interſperſed with groves that afford excellent wood for the joiners and turners. The plains and vallies all conſiſt of delightful meadow lands, where nature appears with ſuch a profuſion of beauties as to charm the eye of the beholders, and are adorned with the fineſt trees, plants, and flowers, that fill the air with the ſweeteſt odours.

The ſoil is ſo amazingly rich as to be capable of every kind of culture; it bears almoſt all ſorts of grain, and every kind of fruit-trees.

The country alſo abounds with ſalt and with hot baths of mineral-waters, that have been found ſalutary in many diſeaſes.

But the region about the Cape is ſubject to boiſterous winds, which generally blow from the ſouth-eaſt or north-weſt, and have certain ſeaſons for reigning in each of thoſe quarters. While the ſun is in the ſouthern ſigns, they hold in the ſouth; while in the northern ſigns, in the north-weſt. In the ſouth-eaſt they are troubleſome, and dangerous to the ſhips coming in; in the north-weſt to the ſhips at anchor; and frequently blowing in a hurricane, they not only endanger the ſhipping, but do incredible damage to the corn on the ground and the fruit on the trees: yet theſe boiſterous winds are of excellent uſe; for, by purifying the air, and keeping it as they do almoſt continually in a very briſk agitation, they generally contribute to the health of the inhabitants, who, when theſe winds lie ſtill for a week, or ten days together, complain of the head-ach and other diſtempers, which vaniſh when they blow again.

The Hottentot nations who inhabit the country are ſixteen in number: theſe are the Gunjemans, the Cochaquas, the Suſſaquas, the Odiquas, Chirigriquas, the Greater and Leſſer Namaquas, the Attaquas, the Koopmans, the Heſſaquas, the Sonquas, the Dunquas, the Damaquas, the Gauroes, the Houteniquas, the Chamtours, and the Heykoms.

The Gunjeman nation lie neareſt the Cape, and ſold their territories to the Dutch, with whom they ſtill dwell promiſcuouſly, but hold only a ſmall part of their antient poſſeſſions.

Bordering on them to the northward are the Cochaquas, in whoſe territories are ſpacious meadows, in the poſſeſſion of ſuch Europeans as are particularly employed in ſupplying the company's ſhips with proviſions; and here the Dutch have ſeveral fine ſalt-pits. The Cochaquas ſtill poſſeſs moſt of the land, and, like the other Hottentot nations, remove with their cottages and cattle from one part of their territories to another for the convenience of paſturage. When the graſs is too old and rank they ſet it on fire, and leaving the place, return when it grows up again, which is very ſpeedily; for the aſhes of the graſs enrich the ſoil, which is uſually in no want of refreſhing rains. Thus as the graſs grows thick and high, the country is ſometimes ſeen in a blaze for ſeveral miles round. In this particular the Europeans at the Cape imitate the Hottentots, but uſe the precaution of making ditches round the land where they would burn the graſs, in order to put a ſtop to the progreſs of the flames; but the Hottentots are not willing to give themſelves ſo much trouble.

To the northward of the Cochaquas are the Suſſaquas, who were a numerous people, and had great herds of cattle, till they were plundered and diſperſed by the Dutch freebooters, who in the infancy of the ſettlement, ravaged ſeveral Hottentot nations. As this territory is but thinly peopled, it has few villages, and indeed there is but little ſpring-water in the country; but though it is mountainous, it affords plenty of graſs, not only in the vallies, but on the tops of the higheſt hills; both which are adorned with the gayeſt flowers, and the moſt odoriferous herbs.

The territory of the Adiquas lying contiguous to that of the Suſſaquas, theſe two nations formerly entered into a confederacy againſt their neighbours the Chirigriquas, with whom they had many long and bloody wars; but, by the mediation of the Dutch, they have been reconciled.

The Chirigriquas extend along the ſhore by the bay of St. Helen's, and are a numerous people remarkable for their ſtrength and dexterity in throwing the haſſagaye or lance. The ſoil of their country is much ſuperior to that poſſeſſed by the two laſt nations. This territory is mountainous, but, as in the other Hottentot countries, the higheſt hills have their tops covered with rich paſture, as are alſo the vallies, which are adorned with flowers, but abound with ſnakes. Through the middle of the country runs the Elephant river, which is very large, and is thus named from the elephants reſorting to it in great numbers. Here are alſo woods of thick and tall trees, different from thoſe of Europe, and inhabited by lions, tygers, leopards, and other ravenous beaſts. Through theſe woods are formed roads, over which the branches of the trees meeting at the top, render them gloomy in the brighteſt day, and in ſome places ſo dark, that it ſeems as if the traveller was proceeding through a cavern. Theſe roads, however agreeable from the advantages of ſhade and verdure, are rendered dangerous by the wild beaſts.

We now come to the two nations called the Greater and Leſſer Namaquas. The Greater is the next nation eaſtward, and the Leſſer is ſituated on the coaſt. Tho' theſe nations have the ſame name, they differ in their form of government and manner of life; yet both are much reſpected by the other Hottentot nations, on account of their ſtrength, bravery, and diſcretion; and they are ſo populous, that upon occaſion they are able to take the field with twenty thouſand fighting men. They are ſuperior to the other Hottentot nations in ſenſe; they ſpeak little, their anſwers are ſhort, and they never return them without taking time to deliberate.

Both theſe territories are full of mountains bare of graſs, the ſoil being ſtony and ſandy; beſides, there is little wood, and only one ſpring in all the country; but the Elephant river running through it, ſupplies the inhabitants with water. Here are numbers of wild beaſts, and alſo deer ſpotted with white and yellow; theſe are ſmaller than thoſe of Europe, but exceeding ſwift: they always keep together by hundreds, and ſometimes there are thouſands in a company. The veniſon is generally very fat and delicate.

North of Namaqua is Attaqua, which has a very indifferent ſoil, and is but ill ſupplied with water: on which account the inhabitants live in ſmall companies on the moſt fertile ſpots, and have generally no more cattle than, with the game they catch, is neceſſary for their ſupport: yet they are brave, and as lively and contented as if they enjoyed the moſt flouriſhing country. They live in tranquility, and are ſeldom at war with their neighbours. When they are in danger of an invaſion, they haſten, like the Swiſs, to the tops of their higheſt mountains, where they light fires that caſt a great ſmoke by day, and a clear flame by night. Upon this ſignal all who are able haſten with their beſt arms to one conſtant place of rendezvous, and a numerous army is ſpeedily aſſembled.

We ſhall now return to the Cape, and trace the ſeveral nations that lie to the eaſtward.

Next to the Gunjemans are the Koopmans, ſo called from Koopman, a captain of that nation, whoſe territory extends far to the eaſtward. Many Europeans have ſettled here, and enjoy large and rich tracts of land, this being a fruitful country, well watered, and abounding in woods.

To the north-eaſt of the Koopmans are the Heſſaquas, who are perhaps the richeſt of any of the Hottentot nations. Their paſtures are covered with herds of horned cattle and flocks of ſheep. Their oxen for carriage exceed all others in ſtrength and beauty. They traffic with the Europeans for brandy, tobacco, and beads, more perhaps than any of their neighbours, and are conſequently more luxurious and effeminate. Their villages are larger, more numerous, and better peopled than thoſe of any other Hottentot nation. The country abounds with game, and furniſhes more of the accommodations and luxuries of life than any other of theſe territories.

Bordering on the Koopmans to the eaſtward are the Sonquas, a lively daring people, very dexterous in the management of their arms. This proficiency and martial genius they owe to their living in a mountainous rocky country, that affords but little ſubſiſtence for man or beaſt, and therefore obliges them moſtly to become a kind of mercenaries to the other Hottentot nations in their wars, ſerving barely for food from day to day. The barrenneſs of their land likewiſe renders them dexterous at the chace: they purſue all the game they diſcover, and it rarely eſcapes them. Hence they are far from being numerous, for they have only a few ſmall villages, and cattle great and ſmall are ſo ſcarce, and eſteemed ſo valuable, that they kill none, when any other food is to be had, except on certain ſolemn occaſions. But plants, herbs, and roots fit for food, are here and there found in plenty; with woods that ſerve for firing to keep off the wild beaſts from their villages. Theſe people are very dexterous in robbing the bees of the honey they lay up in hollow trees, though they are not fond of it themſelves; but they exchange it with the Dutch for brandy, tobacco and pipes, knives, and other implements of iron and braſs. They put it into leathern ſacks, and exchange a ſackful for a very trifle.

Next to the Sonquas are a people called the Dunquas, who poſſeſs a fine and fertile country, well watered by ſeveral rivulets. Both the hills and plains are covered with plenty of graſs, herbs, and flowers; and in all the parts of this territory cattle and game abound.

Bordering on them are the Damaquas, who inhabit a tract of land as fine and fertile as the former, and much more level. It abounds with cattle and game, and produces water-melons and wild hemp; but has ſuch ſcarcity of wood, that the inhabitants are hard put to it for fuel to dreſs their proviſions. There are likewiſe ſeveral ſalt-pits; but theſe being at a conſiderable diſtance from any European ſettlement, no uſe is made of them, as the Hottentots eat no ſalt. The Palmet river runs through the country with many turnings and windings, and the inhabitants paſs it in canoes, and on floats of timber. The Damaquas being great lovers of the fleſh of ſuch wild beaſts as are fit for food, they are often engaged in the chace, and are plentifully provided with furs for their apparel.

Bordering on this nation are the Gauroes, a numerous people, who inhabit a ſmall country; in which the ſoil is every where ſo rich and fertile, that they all live in eaſe and plenty. The paſtures are covered with cattle, and the territory ſwarms with wild beaſts of every kind, more than any other about the Cape, in which the inhabitants glory, as it calls for the frequent exerciſe of their courage and dexterity, which they are fond of ſhewing, moſt of them wearing the ſkins of lions, tygers, wild cats, and other animals, as trophies of their bravery.

To the north-eaſt of theſe people, on the coaſt, dwell the Houteniquas, in whoſe territory are ſeveral woods of ſtately trees, and between them fine meadows adorned with wholeſome herbs, and a variety of the moſt beautiful and odoriferous flowers.

Next to theſe are the Chamtours, who poſſeſs a fine flat country, in which are many little woods that conſiſt of the talleſt trees in all the country of the Hottentots. Here is great plenty of game, with all ſorts of wild and ravenous beaſts. The land is divided by ſeveral large ſtreams, that contain different kinds of wholeſome and very delicate river fiſh, and ſometimes fiſh from the ſea; the ſea-cow in particular often appears in their channel. It is ſaid that neither elephants nor buffaloes are to be found in the woods, though thoſe in all the other Hottentot countries abound with them: but the Chamtours perhaps kill or chaſe them out of the country, whenever they are found.

To the north-eaſt of the Chamtours is ſituated the nation of the Heykoms, who poſſeſs a mountainous country, unprovided with freſh water, and only fertile in the vallies: yet it is pretty well ſtocked with cattle of every ſort, which thrive upon the brackiſh water of the rivers, and the reeds on their banks. The country likewiſe abounds with game and wild beaſts of all the kinds ſeen about the Cape, but the people are under great difficulties in procuring freſh water.

SECT.

SECT. II.

Of the moſt remarkable Trees, Plants, and Fruits; with a conciſe Account of the Kitchen Gardens at the Cape.

THE vegetables of the Cape countries are extremely numerous, but we ſhall only mention a few. Among thoſe which are natural to the ſoil is the aloe, of which there are many ſorts, and not a few of them are planted in the Company's gardens. On the mountains and in the clefts of the rocks they are ſeen in great numbers, and one ſort or other is in bloſſom throughout the year. Their flowers, which are of different colours, ſome white, ſome red, and others variouſly ſpotted, appear very beautiful.

The amaquas-tree, called by the Cape Europeans keurboom, grows ſo quick that in two years time it riſes from a ſmall plant to a tree of eight or nine feet in height, and of a conſiderable thickneſs. The leaves reſemble thoſe of the bird-pear-tree, but the bloſſoms are of a whitiſh red, like thoſe of the apple-tree, and of a fragrant ſmell. From theſe riſe pods, which contain from five to ſeven ſeeds of the bigneſs of a pea, but brown and of an oval form. The ſeeds are bitter and aſtringent, but are applied to no manner of uſe at the Cape. The root ſpreads very much, and is ſo attractive of nouriſhment, that it ſtarves moſt of the trees that are near it; on which account the Cape Europeans do not care to have it near their vineyards, orchards, or gardens.

Another tree at the Cape is called by the Cape Europeans cripple-wood. Theſe are dwarf trees, which have very crooked knotty branches: the leaves are broad, thick, rough, and ſhaped like thoſe of the apple-tree. The fruit reſembles the pine-apple, the bark is thick and wrinkled, and is uſed by the Cape tanners; the phyſicians pulverize it, and adminiſter it with ſucceſs in dyſenteries.

The ſtink-wood-tree grows to the ſize of an oak, and the leaves are three fingers broad. It is called ſtink-wood from its filthy ſcent; for while it is under the tool, it ſends forth ſo nauſeous a ſtench, that the workmen can ſcarcely endure it; but, after ſome time, the ſtench goes quite off. The wood is beautifully clouded, and the Cape Europeans have tables, preſſes, and ſeveral other uſeful and ornamental pieces of furniture made of it.

In the Company's fine garden are figs of various kinds, all of them admirably ſweet and good. The choiceſt and largeſt are thoſe called piſang-figs, which grow upon a plant that has no ſooner brought them to maturity, than it withers away; and the next year a new plant ſprings up from the ſame root, yielding the ſame tribute. This plant has no ſtock; but its leaves, which are from ſix to ſeven ells long, and from two to three ells broad, embrace each other from the ground upwards, forming a kind of barrel, in the place of a ſtock. Its bloſſom conſiſts of four leaves, which form themſelves into a kind of bell, at the mouth of which, in the proper ſeaſon, hang fifty or more of the moſt delicious purple figs.

In this garden is alſo a tree of Indian extraction, called the quajaves. Its fruit is ſhaped like an apple, and, when ripe, is yellow and green, with the inſide extremely yellow. It contains a number of oval white ſeeds, and is a wholeſome fruit, of an exquiſite flavour.

The ananas, or pine apple-trees, at the Cape are of the American race, and there are three ſorts of them in the Cape colonies, one called jujama, the apple of which is the largeſt and beſt taſted. It is from ſix to eight inches long, and pretty thick. The colour on the outſide is red and dark yellow, but within it is almoſt of a perfect yellow.

The other ſorts are the bonjama and the jajagna: the apple of theſe laſt ſpecies is white on the inſide, and the taſte of the jajagna reſembles that of rheniſh wine. The pine-apples at the Cape have a certain acrimony, which the Cape Europeans take off by cutting them in ſlices, and laying them in ſpring water; and if after this they are laid in rheniſh wine, with ſugar ſcattered upon them, they eat deliciouſly, having much the taſte of ſtrawberries. The Cape Europeans preſerve pine-apples in ſugar. On the top of the fruit is a part that has ſome reſemblance to a crown, which being cut off and planted, yields fruit the next year.

There are here four ſorts of camphire-trees, one tranſplanted thither from the iſland of Borneo, which is much the beſt: the other three ſorts were brought from Japan, China, Sumatra, and Sunda; they all grow very quick, and to the ſize of a walnut-tree. The outſide of the leaves is graſs-green, and the other aſh-coloured. The leaves, on being rubbed between the fingers, ſend forth a ſtrong odour like that of camphire. Theſe trees are ſo ſoft and tender, that they are frequently ſtripped by the wind of many of their branches, and ſometimes nothing is left ſtanding but the trunk.

The Indian gold-tree at the Cape grows about ſix feet high, and has ſmall leaves of a yellow colour ſpeckled with red. Theſe leaves, which are nearly of the colour of gold, are very beautiful, and ſtrike the eye where theſe trees are ranged in gardens among other trees. The bloſſoms are very ſmall, and of a greeniſh colour, but they have no manner of ſcent.

Quince-trees are ſeen in great numbers in the Cape colonies, and the fruit is ſaid to be larger and better than the quinces produced in any other part of the world. Of this fruit the Cape Europeans make great advantage; for they have ſeveral ways of preparing and preſerving quinces, which they ſell to the ſhips that touch at the Cape; they alſo make and ſell a great deal of marmalade.

There are here two ſorts of Indian orange-trees, which are larger than any other trees of the ſame ſort, and the fruit much bigger, and ſpotted like the ſkin of a tyger: the bloſſoms are white, like thoſe of the apple-tree.

There are here likewiſe ſeveral ſorts of ſweet and ſour lemon-trees, and in the gardens are walks of them of a great length.

In the Cape colonies are alſo many citron-trees, which yield fruit all the year round.

The Cape pomegranate-trees are much larger than thoſe of any other part of the known world. The fruit is likewiſe ſo large, and in ſuch plenty, that it is frequently neceſſary to prop up the branches, to prevent their being broke down by their weight. There are two ſorts of theſe trees, one of which yields yellow kernels, and the other kernels of a crimſon colour: the firſt ſort are chiefly planted near ponds. The kernels of both contain a very pleaſant cooling juice, which is very refreſhing in hot weather.

There are two ſorts of the netted melons, or pompions, which grow very plentifully in the Cape colonies, and are of the Indian kind. In ſhape and ſize they come pretty near our melons. The colour on the outſide of both is a dark green, and within the fruit of one ſort is of a whitiſh colour with white ſeed, and in the other of a carnation with black ſeed. Theſe fruits are extremely comfortable and refreſhing in fevers, ſpeedily and very deliciouſly quenching the thirſt, without any ill conſequence. Both ſorts are very juicy, and as ſweet as ſugar; but that with the black ſeed is eſteemed the beſt.

Peaches grow ſo plentifully at the Cape, that in ſome ſeaſons the Europeans there have more than they can well conſume, and therefore throw many of them to the hogs; however, ſome people preſerve them for winter.

Vines were tranſplanted to the Cape from the Rhine, from Perſia, and many other countries; and are ſo vaſtly increaſed, and yield ſo plentifully, that the Cape Europeans have much more wine than they can drink, and ſell a great deal to the ſhips that touch there.

In ſhort, "there is no other ſoil in the world, ſays "Mr. Kolben, that has for all ſorts of vegetables ſo "cheriſhing a boſom; nor any other clime ſo benign to "them. All the ſplendors of the vegetable world ſhine "out at the Cape. The hills and dales are covered with "its moſt radiant beauties, and the air is enriched with "its nobleſt odours."

We ſhall now take a ſhort view of the kitchen gardens at the Cape, which in many reſpects reſemble thoſe of Europe; and there is not a houſe or cottage in all the colonies without one. They are ſupplied with ſeeds from Europe; but though they produce moſt of our herbs and roots

roots in perfection, it is remarkable that the ſeeds of the third product of the European herbs degenerate in the Cape kitchen gardens, ſo as to be not worth ſowing; the colonies therefore ſtill continue to be ſupplied with ſeeds from Europe.

In theſe gardens the ſeeds are ſown in May and June, and appearing in Auguſt are tranſplanted into other grounds, which are by that time well moiſtened by the rains; they then grow apace, and become larger and much ſweeter than the ſame herbs produced in Europe. In the dry ſeaſon they are watered from the next rivulet; but they have neither hot-beds or winter-houſes for the forcing or preſervation of any thing.

The head of the white or blue Cape-cabbage weighs at its full growth from thirty to forty pounds; as does alſo the head of the Cape cauliflower, the ſeed of which is brought from Cyprus and Savoy, and all are as ſweet and ſerviceable as in their native ſoil.

Potatoes are brought to the Cape from the Indies, and are there of two ſorts, white and red. They are in general ſhaped like turnips; but are much larger, a Cape potatoe weighing from ſix to ten pounds; four of them will afford a meal for above twenty perſons, and they are extremely well taſted, very wholeſome, and nouriſhing. From theſe potatoes there run ſtrings or branches three or four ells in length; theſe are cut off cloſe, and in Auguſt or September are planted half a foot deep, being wound up in the form of a ring.

The Aſian and European trees alſo need leſs culture at the Cape than in their native ſoil. The fruit or ſeeds put into the ground ſoon take root; ſo that if an almond in its hard ſhell be ſet in the Cape ſoil, in ſix weeks time it ſends forth a fine infant tree; and if it be tranſplanted a year or two after, it quickly arrives at perfection: ſo if a young branch of almoſt any tree be ſet pretty deep in the earth, it ſpeedily takes root.

SECT. III.

Of the tame Cattle and the Huſbandry of the Cape Colonies.

THE colonies at the Cape abound with great and ſmall cattle, as do all the Hottentot countries. The Cape cows, like the cows of Europe, bear every year a calf; but they will ſeldom ſuffer themſelves to be milked till their calves have ſucked a while, after which they yield milk to the hand very liberally. If their calves die, the only method of obtaining milk in the colonies is wrapping the ſkin of the dead calf about a living one, and applying this counterfeit to the teats: this cheat is generally very ſucceſsful; for the cows taking the counterfeits for their own calves, yield their milk very plentifully. But many of the cows in the colonies, eſpecially the young ones, are ſo wild and miſchievous, that it is dangerous to approach them till they are tied ſhort by the horns, and their legs are alſo tied together. The Cape oxen generally weigh from five hundred to ſix hundred pounds weight, and ſome a great deal more.

The Cape mutton is extremely good and well taſted, and the ſheep have the great tails ſo often mentioned, which furniſhes the Europeans at the Cape with a joke which they are fond of paſſing upon ſtrangers at their tables: "You have no appetite, ſay they, you are not "able to manage a ſheep's tail."

They have alſo two ſorts of tame hogs, one brought from Europe, and the other from the Iſle of Java, which have ſhort legs, large hanging bellies, and are without briſtles.

They have likewiſe a great number of horſes, which were originally brought from Perſia, and have multiplied exceedingly: they are in no want of aſſes and mules.

The paſture-grounds about the Cape are covered with an aſtoniſhing number of great and ſmall cattle, and they are no where in the world either ſo numerous or ſo cheap. The Hottentots ſell many of them annually to the Europeans for brandy, tobacco, or ſome inconſiderable trinkets; and, when Mr. Kolben was there, a pound of tobacco would purchaſe a fine fat ox, and half a pound a fat ſheep.

Among the cattle of the colonies, as among thoſe of the Hottentots, great depredations are ſometimes made by the lions, tygers, and wild dogs, &c. When the tygers get into a herd or flock, they kill great numbers merely for the ſake of their blood, which they ſuck. The wild dogs are infinitely worſe; for when they attack an herd, or flock, they are not guided in their ſlaughter by their appetites, but worry all before them: the lion, contented with a ſingle carcaſe, makes off with it, and never looks for freſh prey till he has eaten that. The cattle run as faſt as they can, whenever they diſcover any wild dogs. They do the ſame on the approach of a lion, tyger, or leopard, which they ſmell at a conſiderable diſtance; but the great cattle running ſwifter than the ſmall, the latter always ſuffer moſt by the enemy.

We ſhall now give a conciſe account of the art of huſbandry, as practiſed at the Cape colonies.

When a piece of uncultivated land is laid out for a corn-field, vineyard, or garden, it is firſt plowed up and cleared of all the weeds, and every thing which it is imagined will prove detrimental to the intended ſeeds or plants.

The ploughs uſed by the Europeans at the Cape are furniſhed with two wheels of unequal diameter; that towards the furrow being conſiderably larger than that on the ſide towards the ridge. The plough-ſhare is divided in two, one ſide bending conſiderably outward, the other pointing ſtraight forward, and the coulter is ſtraight.

They plow only with oxen, and though they are prodigiouſly large, often put five pair to one plough, and ſometimes more; becauſe the ſoil, being generally fat and heavy, the plough does not eaſily paſs through it. Indeed in the dry ſeaſon the ground frequently becomes ſo hard, that twelve oxen are not ſufficient to paſs a plough through it; and in the rainy ſeaſon it becomes in many places ſo light and ſoft, that an ox ſinks up to the belly. This buſineſs is therefore principally performed in the months of June and July, which are their winter months.

Corn is not ſown ſo thick at the Cape as in Europe; for if it was, the grain would be choaked up, the ears would be ſmall, and the crop be neither ſo plentiful nor ſo valuable as it proves upon being ſowed more thinly.

But, notwithſtanding all that has been ſaid of the fertility of the ſoil, oats and lentils cannot be brought to perfection; great pains have been taken to raiſe the former, but it has always happened, that when the crop was almoſt come to maturity, the ſouth-eaſt winds have blown almoſt every grain out of the ears, and ſcattered them over the neighbouring fields, where they have taken root, and produced wild oats. The other grain, however, produce very plentiful crops; for one buſhel of wheat ſown at the Cape yields from thirty to forty buſhels; one of barley from fifty to ſixty, and ſometimes ſeventy; one of peaſe and beans from twenty to twenty-five; but the peaſe and beans ſuffer ſo much from the caterpillars and locuſts, that ſometimes what is reaped is hardly ſufficient for the next year's ſeed.

The Europeans at the Cape, inſtead of threſhing out their corn, have it trodden out by oxen or horſes in the open air. In performing this they chooſe a level piece of ground, and taking cow-dung and chopped ſtraw, mix and work it into a loam with water, then ſpread it pretty thick on the earth in a circle of about ten yards diameter; and leaving it to dry by the heat of the ſun, in a few days it becomes as hard as ſtone: then on this floor they lay two circles of ſheaves ear to ear, and drive over them a team of eight horſes or oxen, round and round, now and then turning the ſheaves, till they judge all the corn is trodden out. This is a much more expeditious method of getting the corn out of the ear than threſhing it; for a team of eight horſes or oxen will tread out more corn in a few hours, than a dozen men can threſh out in a whole day. Indeed, the crops of corn are in general ſo large, that it would probably coſt the farmers the whole winter to threſh it out; whereas, by treading, the whole buſineſs is performed in leſs than a month.

When the corn is trodden out they winnow it, and paſs it through a machine that performs the buſineſs of a ſieve,

ſieve, and clears the corn of all ſand, and other dirt, too heavy to be carried off by the wind.

The Company have a tenth of the crops of all the corn raiſed at the Cape, which is all they get by the grant of lands for tillage; and whatever is not uſed in the families of the farmers is ſold to the Company for ready money, and depoſited in their magazines.

There is hardly a cottage in all the colonies without a vineyard, and there are but few ſettlers who do not produce from their own vineyards a plentiful proviſion of wine for themſelves and families; and many, when their own cellars are ſupplied, have large quantities for ſale.

In Auguſt, when the ſpring commences, the Cape vines are pruned, and in September the leaves appear. The grapes ripen from the beginning of December to the end of February, which is the heat of ſummer; and the vintage continues from the end of February till the end of March.

The Cape wines are extremely rich, and, by being kept about two years, aſſume the taſte of ſack; and Cape wine that has been kept till ſix years old ſparkles like old hock, and is as racy as the fineſt Canary.

SECT. IV.

Of the wild Beaſts in the Country of the Hottentots; containing a Deſcription of the Elephant, the Rhinoceros, the Buffaloe, the Elk, the Lion, the Leopard, Tyger, Tyger-Wolf, Wild Dog, Porcupine, Baboon, ſeveral Species of wild Goats, the Earth-hog, Rattle Mouſe, and Stinkingſem.

IN treating of the wild beaſts we ſhall begin with the elephant, the largeſt of them all: thoſe of the Cape are of a prodigious ſize, and of proportionable ſtrength. Their ſkins are without hair, and have a multitude of ſcars and ſcratches, which they receive in making their way through the thorns and buſhes. The tail ends in a large tuft of hair, each hair being about a foot and a half long, and as thick and as ſtrong as a hog's briſtle. The teeth are exceeding large, each weighing from ſixty to a hundred and twenty pounds weight.

The female elephant is much leſs than the male: her dugs fall from her breaſt between her fore legs. The male and female retire for the conſummation of their love to ſome unfrequented part, and there remain till conception, when they return to their ordinary haunts; and the female never admits of freſh embraces till a conſiderable time after ſhe has brought forth her young, which ſhe carries two years. Some authors have pretended, that elephants ſleep ſtanding; but this is a miſtake, for they lie down like other beaſts. Their ordinary food is graſs, heath, roots, and the tender branches of ſhrubs. Sometimes they enter the corn-fields, and do a great deal of damage, not only from their eating the grain, but the immenſe quantity they ſpoil by trampling it under their feet. Theſe incurſions are generally made in the months of Auguſt and September, when the fields are ſtrictly watched, and fires are kindled about them in the night to frighten them away. However, the elephants will ſometimes venture in, and are ſhot for their pains. One would imagine, from the ſize and clumſineſs of the Cape elephant, that he muſt travel very ſlowly; but this is far from being the caſe, for they walk ſo faſt, that it would be no eaſy taſk for a man well mounted to keep up with them.

The Cape rhinoceros is of a dark aſh colour, approaching to a black: his ſkin, like that of the Cape elephant, is without hair, and is full of ſcars and ſcratches; yet is ſo hard that it is difficult to pierce it with a ſharp knife. Indeed the painters repreſent him as armed all over with a kind of ſcales; however, he has none upon his body, but the numberleſs ſcars and ſcratches which interſect each other make him look at a diſtance as if fenced with ſcales. His mouth reſembles that of a hog, but is ſomewhat more pointed. Upon his ſnout grows a dark grey horn, a little bent, and larger or ſmaller according to his age; but it never exceeds two feet in length. When he is angry he tears up the earth with his horn, and throws it furiouſly over his head: he will alſo throw ſtones with it to a vaſt diſtance behind him. With this he will likewiſe tear up the roots of trees, and almoſt every thing he can fix it in. This horn is very ſolid, and the end of a lighter colour than the reſt. On his forehead is another horn, which upon a young rhinoceros is about a hand high, and upon an old one not above ſix inches. It is in the form of a bowl inverted, and is hollow. His ears are ſmall, and his legs ſhorter than thoſe of the elephant.

His ſenſe of ſmelling is very ſurpriſing, for he catches the ſcent of any creature that is at a conſiderable diſtance to the windward of him; and if it be his prey, he immediately marches towards it in a right line, furiouſly tearing his way through all oppoſition of trees and buſhes, grunting like a hog; when his breaking the trees, and throwing the ſtones, if he meets with any in his way, give warning of his approach.

He never attacks a man unprovoked, unleſs he is dreſſed in a red coat, and then he is all in a flame for his deſtruction, rending and deſtroying every thing that oppoſes the gratification of his rage. If he ſeizes him, he throws him over his head with ſuch force, that he is killed by the fall; and he then feeds upon him, by licking, with his rough and prickly tongue, the fleſh from the bones.

It is remarkable, that the eyes of the rhinoceros are extremely ſmall in proportion to his body, and that he ſees only in a right line; and therefore if the paſſenger ſlips but a few paces aſide when he is near, it coſts him a great deal of awkward trouble to get him again in his eye, by which means he has a fair opportunity of eſcaping. This I myſelf, ſays Mr. Kolben, have experienced, for he has more than once made towards me with the utmoſt fury.

He is not fond of feeding upon graſs, but rather chooſes ſhrubs, broom, and thiſtles, and is fondeſt of a ſhrub that reſembles the juniper, which the Cape Europeans call the rhinoceros-buſh. This animal is in perpetual enmity with the elephant, and whenever he diſcovers him makes at him with the utmoſt rage. The elephant knows him to be his mortal enemy, and therefore when he ſees him, gets out of the way as faſt as poſſible. If the rhinoceros ſurprizes the elephant, he rips up his belly with the horn on his ſnout, by which means the elephant's entrails fall out, and he ſoon expires.

The fleſh of the rhinoceros, which Mr. Kolben ſays he has often eaten with great ſatisfaction, is not ſo ſinewy as ſome authors have repreſented. The ſame gentleman mentions, that the horn of the rhinoceros will not endure the touch of poiſon, of which he ſays he has often been a witneſs. Many people of faſhion at the Cape have cups turned out of the horn, ſome ſet in gold, and others in ſilver. If wine be poured into one of theſe cups it immediately bubbles up, as if it were boiling; and if there be poiſon in it, the cup immediately ſplits. This, ſays our author, is known to thouſands of perſons at the Cape. The chips made in turning one of theſe cups are carefully ſaved, they being eſteemed of great ſervice in convulſions, faintings, and other diſorders; and the blood of the rhinoceros is ſaid to have great virtue in the healing of inward ſores.

Buffaloes are numerous in the Cape countries, and are larger than thoſe of Europe; they are of a brown red, but the European buffaloes are black. Thoſe of the Cape are well proportioned, and hold their heads aloft. On their foreheads grow hard frizzled hair. They have ſhort horns, which incline towards the neck, and bend inwards, ſo that their points almoſt meet. Their ſkin is hard and tough, and it is difficult to kill them without very good fire-arms; but their fleſh is neither ſo fat nor ſo tender as that of a common ox. A Cape buffaloe is, like the rhinoceros, enraged at the ſight of red cloth, and at the diſcharge of a gun near him. On theſe occaſions he roars, ſtamps, tears up the ground, and runs with ſuch fury at the offending party, as to beat down all oppoſition, paſſing through fire and water to come at him.

A large body of Europeans at the Cape once chaced a buffaloe, and having driven him to the Water-place, as it is called, near the Cape harbour, the beaſt turned and ran with all his fury at one of his purſuers, who was in a red waiſtcoat. The fellow nimbly ſkipped aſide, and

ran towards the water, whither the buffaloe purſuing him, obliged him to plunge in, in order to ſave his life. He ſwam well and as quick as poſſible; but the buffaloe leaping in after him, purſued him ſo cloſely, that he could only ſave himſelf by diving. The buffaloe thus loſing ſight of him, ſwam towards the oppoſite ſhore, which was at three miles diſtance; and our author obſerves, that he would undoubtedly have reached it, had he not been ſhot by the way from one of the ſhips in the harbour.

The African elk is much larger than either the European or the Aſian, it being generally five feet high. The head reſembles that of the hart; but is ſmall in proportion to the body. The horns are about a foot long, and run up twiſting; but the ends are ſtraight, ſmooth, and pointed: the neck is ſlender and beautiful, and the upper jaw ſomewhat larger than the other: the legs are long and ſlender; the hair of the body ſmooth, ſoft, and of an aſh colour; and the tail about a foot in length. The taſte of the fleſh reſembles that of good beef, and is agreeable either boiled or roaſted.

Theſe elks are generally found on high mountains, where there are good paſture-grounds, and near ſome ſpring. They climb the higheſt and rougheſt rocks, and paſs the moſt difficult ways with ſurpriſing diſpatch and ſecurity. They ſometimes viſit the vallies, and frequently attempt to enter the gardens of the colonies. The inhabitants therefore place traps before thoſe gardens, which are moſt expoſed to their inroads, in the following manner: The Cape gardens being uſually encompaſſed with a ditch, over which is a bridge at the entrance, they fix in the ground at one corner of this bridge a ſtrong, pliant, taper pole by the broad end: to the ſmall end of the pole is fixed a long rope, by which that end of the pole is pulled down to the other corner of the bridge, where it is faſtened ſo ſlightly, that by a ſmall touch it is freed, and flies up with a ſtrong elaſticity. When the ſmall end of the pole is properly fixed, the remainder of the rope is formed into ſeveral coils and nooſes, and laid under the arch of the pole. An elk coming to one of theſe gardens, and finding no communication but by the bridge before the door, he ſteps upon it through the arch, and hampering his legs in the coils of the rope, ſhakes the pole, on which the ſmall end flying up and faſtening him in one of the nooſes, he is drawn up and unable to eſcape. If by ſtruggling he breaks the pole, it is a hundred to one but he falls into the ditch; and, if he eſcapes that, he drags a piece of the pole after him, which ſo embarraſſes him in his march, that he is eaſily taken.

The hart of the Hottentot countries differs only from the European in the horns. Theſe have no branches, are about a foot long, and run up twiſting in the manner of a ſcrew to about half the length; then running aſide a little outward, they are ſtraight and ſmooth quite up to the point: they are about three times as far aſunder at the point as they are at the head.

The lion is uſually called the king of the beaſts, but it is ſuch a king as lives upon the blood of his ſubjects; and whatever compliments are paid to his majeſtic air, he can only be compared to the moſt ſavage tyrants. Theſe animals are common at the Cape, where they are very large; every limb is expreſſive of the greateſt ſtrength: his ſparkling eyes, his dreadful paws, and the firmneſs of his tread, command the attention, and ſhew his ſuperior ſtrength to that of other animals. Some modern writers have affirmed, that the bones of the lion are not ſo hard as they have been repreſented by the antients; but they are miſtaken. The hollow which runs through the ſhin-bone of a lion, Mr. Kolben obſerves, is as ſmall as that which runs through a tobacco-pipe; and when the bone is broken to pieces, and the greaſineſs is exhauſted by the heat of the ſun, theſe pieces appear as hard, as ſmooth, and ſolid as flints, and ſerve altogether as well to ſtrike fire with. Indeed a conſiderable part of his ſtrength lies in the hardneſs of his bones; for when he comes upon his prey he knocks it down dead, and never bites till he has given the mortal blow, which he generally accompanies with a terrible roar.

When the lion is enraged, or pinched with hunger, he erects and ſhakes his mane, laſhing his back and ſides with his tail. When he is thus employed, it is certain death to come in his way; and as he generally lurks for his prey behind buſhes, travellers are ſometimes devoured by him: but if the lion neither ſhakes his mane, nor makes any great motion with his tail, a traveller may be fully aſſured that he ſhall paſs by him in ſafety. A horſe no ſooner diſcovers a lion than he runs at his full ſpeed; and if he has a rider throws him, if poſſible, that he may run the faſter. When a traveller on horſeback diſcovers a lion, the beſt method of preſervation is for him immediately to diſmount and abandon his horſe, for the lion will purſue the horſe only without taking notice of him. The fleſh of the lion eats ſomething like veniſon, and has no ill taſte. Our author ſays, that he has eaten of it ſeveral times when killed with ſhot, but could never be prevailed on to eat any of the fleſh when the lion had been killed with the poiſoned arrows of the Hottentots.

The leopard and the tyger are beaſts of the like nature, and in point of fierceneſs next to the lion. The only difference between them is in their ſize, and the figure of their ſpots. The tyger is much larger than the leopard, and is diſtinguiſhed by rings of black hair incloſing ſpots of yellow; while the black ſtreaks on the leopard are not round, but formed with an opening in the manner of a horſe-ſhoe.

In the year 1708 two leopards, a male and a female, with three young ones at their heels, entered a ſheep-fold at the Cape; and having killed near an hundred ſheep, feaſted on the blood of the ſlain. When they had ſucked their fill, they tore a carcaſe in three pieces, and carried one of them to each of the young ones they had left at the door of the fold. Each then took a whole carcaſe, and the troop thus laden with their booty began to move off; but having been perceived at their firſt entering the fold, they were way-laid on their return, and the female, with the three young ones, were killed; but the male made his eſcape.

We ſhall add another inſtance of the ravenous nature of the tyger. Mr. Bowman, a burgher at the Cape, walking by himſelf in the fields was ſurprized by a tyger, who leaped at his throat, and endeavoured to fix his teeth in it in order to ſuck his blood; but, though terribly frightened, he had the courage to contend for his life; and ſeizing the tyger by his head, ſtruggled with him, and threw him on the ground, falling upon him. Having got him down, he held him with one hand and the weight of his body, till with the other he drew a knife out of his pocket and cut the tyger's throat, on which he immediately expired; but Mr. Bowman received ſo many wounds, and loſt ſo much blood in this brave conflict, that it was long before he recovered.

The fleſh of a tyger or leopard is white, tender, and well taſted; and, in our author's opinion, is much finer eating than the beſt veal. It has every good quality that can be wiſhed for in meat; and the fleſh of the young ones is as tender as that of a chicken.

There are two ſorts of wolves in this country, one which agrees in every particular with the wolves in Europe, and the other called tyger-wolves. The latter are of the ſize of an ordinary ſheep-dog, or ſomewhat larger; the head is broad like that of an Engliſh bull-dog. The jaws of this animal are large, as are his noſe and eyes. His hair is frizzled, and ſpotted like that of a tyger. His feet are large, and armed with ſtrong talons, which he draws in as a cat does her claws; and, like a cat, he is not heard in his tread. His tail is ſhort. He keeps all day in holes in the ground, or in the clefts of the rocks, ſeeking his prey only in the night, which he might generally do in ſafety, were it not for his diſmal howling while he is out upon the prowl, which rouzes the dogs who keep the flocks; theſe join together againſt him, and drive him away: but if he gets ſafe into a fold, he generally kills two or three ſheep; and having fed heartily upon the ſpot, carries a carcaſe away to his den. He alſo frequently ſcratches open the graves of the Hottentots, and devours the bodies he finds in them. The lion, tyger, and leopard are bitter enemies to the tyger-wolf, and following him by his howl come ſoftly near him; and then ſuddenly leaping upon him, tear him to pieces.

There are wild dogs which range the Hottentot countries in troops, and ſometimes make great havock among the cattle. They ſeem a ſpecies of hounds, and packs of thirty,

thirty, and ſometimes forty of them encounter lions, tygers, and other animals, which by their numbers they conquer. They ſpend the greateſt part of the day in the chace, and drag what they kill to a place of rendezvous, where they ſhare it amongſt them. It is uſual both for the Europeans and Hottentots, when they diſcover theſe dogs on the chace, to follow them to the place of rendezvous, and to take what they think proper of what the dogs have killed; which they permit them to do very quietly, without any manner of grumbling. The Hottentots eat what they take from the dogs, and what the Europeans take they ſalt for their ſlaves. Theſe dogs ſometimes deſtroy ſeventy or eighty ſheep in one flock.

The porcupine, which is pretty common in the Cape countries, is about two feet high, and three long. His head and feet are like thoſe of a hare, and his ears reſemble the human. His whole body is armed with a ſort of quills, partly black and partly white, very ſharp at the outward points, and not much unlike gooſe-quills ſtript of the feathers. He has ſome quills on the top of his head, but they are very ſhort. The quills on his back are about ſix inches long, thoſe on his ſides are ſomething ſhorter, but the longeſt are on his hind parts, and thoſe he darts at his purſuer, whether man or beaſt; but he never darts one of them till his purſuer is pretty near him, and ſometimes he does it ſo effectually that it ſticks in the fleſh, and cauſes great pain and inflammation. If he is not angered, his quills lie cloſe upon his body; but on his being enraged, he ſpreads them out.

As this animal is very fond of the produce of the gardens, he frequently enters thoſe of the colonies, and does much damage. When the breach is diſcovered by which he enters, the people plant a muſquet there, charged and cocked, and tie a ſtring to the trigger, from which it runs cloſe along by the barrel to the muzzle of the piece, where a turnip or carrot is tied to it. As the porcupine always enters the garden by the ſame way as long as it is open, and inſtantly begins to devour the turnip or carrot, he by that means pulls the trigger and is ſhot. His carcaſe, gutted and ſtripped of the quills, weighs about twenty pounds. His fleſh is well taſted and wholeſome.

Baboons are pretty numerous in the Cape countries. They are a large kind of monkeys, but the head has ſome reſemblance to that of a dog, and the features are very ugly. The fore part of his body nearly reſembles that of a man, and the teats of the female hang from her breaſt. The teeth of the baboon are very large and ſharp: his fore paws reſemble human hands, and his hind paws human feet; but they are all armed with very ſtrong and ſharp talons. His whole body is hairy, except his poſteriors, which are bare, and marked with ſtreaks and ſpots of a blood colour. When the baboons are beſet with dogs, or cudgelled by men, they ſigh, groan, and give a cry, as men and women in extreme fright or pain. As they are very fond of grapes, apples, and garden-fruits, they ſometimes enter the vineyards, orchards, and gardens. It is alſo ſaid they have a method of catching fiſh, and will attack and kill deer and other animals; but whatever truth there is in this, it is very certain that they will eat neither fleſh nor fiſh that has not been roaſted, broiled, or ſome other way fitted to the palates of men. If they diſcover any traveller reſting in the fields, and regaling himſelf, if he does not look ſharp about him, they will ſteal part of his proviſions; and having run to ſome diſtance, they turn about, and reſting on their poſteriors, hold what they have taken in their paws ſtretched out towards him, as if they would ſay, Here, will you have it again? at the ſame time falling into ſuch ridiculous geſtures and grimaces, that if a man was robbed of all the victuals he had, he would find it difficult to forbear laughing.

They go about every thing with ſurpriſing cunning, as is particularly ſeen in their robbing of an orchard, which they generally do in a troop. When a company of them have entered an orchard, or garden, a party is ſet to watch upon the fences, and give notice of the approach of danger. Some of them then begin the pillage, while the reſt extend themſelves at proper diſtance from one another, from the orchard, or garden, to the place of rendezvous on the mountains. The melons, pumpkins, and other fruit they gather in the gardens, and the apples and pears they gather in the orchards, they toſs to the baboon at the head of the line; he toſſes them to the next, and thus the fruit paſſes ſwiftly up the hills; theſe creatures being ſo very nimble and quick-ſighted, as hardly ever to fail catching in their paws the fruit that is thrown to them. But if the baboons upon the watch diſcover any perſon approaching, they give a loud cry, and all ſcour away up to the mountains, the young ones jumping upon the backs of the old ones, and poſting away in a very diverting manner.

It is even ſuppoſed that they puniſh their ſentinels for neglect of duty with death; for when any of the troop are ſhot or taken before the cry is given, a loud quarrelling noiſe is heard among them after they have got back to the hills, and ſome of them have been found torn to pieces in the way; and theſe are judged to have had the watch.

There are here ſeveral ſpecies of goats, the moſt remarkable of which we ſhall now deſcribe.

They have blue goats, ſhaped like thoſe of Europe, but as large as an European hart. Their hair is very ſhort, and of a fine blue, but the colour fades when they are killed to a blueiſh grey. Their beards are pretty long, but their horns are ſhort and very neat, running curiouſly up in rings till within a little of the point, which is ſtraight and ſmooth. Theſe are only to be met with far up in the country.

Spotted goats are ſeen in great numbers, there being ſometimes above a thouſand of them together. They are covered with red, white, and brown ſpots, and are rather larger than the blue goats. Their horns, which are about a foot long, incline backwards, and run up twiſting to the middle, from whence to the end they are very ſtraight and ſmooth. Their beards are of a brown red, and very long. Their legs are well proportioned to their bodies, and their joints about their fetlocks are of a dark brown. The young ones are eaſily taken, and made ſo tame as to run with flocks of ſheep. Their fleſh is very agreeable food.

There is another ſort of goat, which is ſaid to be not yet diſtinguiſhed by any particular name. His head is very beautiful, and adorned with two ſmooth, bending, pointed horns three feet long, and the points two feet diſtant from each other. A white ſtreak runs from the forehead along the ridge of his back to his tail, and is croſſed by three ſtreaks, one over his ſhoulders, another on the middle of the back running down on both ſides to his belly; the third croſſes it above his buttocks, and runs down them. The hair on all the other parts of his body is greyiſh, with little touches of red, only the belly approaches to white. His beard is grey, and pretty long, as are alſo his legs. The fleſh of theſe goats is very agreeable food. The female is leſs than the male, and without horns.

The diving-goat at the Cape is almoſt as large as an ordinary tame one, and is of much the ſame colour. As ſoon as he ſees any perſon or thing from which he apprehends danger, he ſquats down cloſe in the graſs; and ſeeing nothing but graſs about him, perhaps imagines himſelf unſeen; for thus he lies, giving now and then a peep out, and pulling his head ſuddenly down again, till either the danger is paſt, or he is ſeized, ſhot, or knocked on the head.

The Cape rock-goat is ſeldom larger than an European kid of a quarter old, and his horns are about half a foot long. He frequently enters the vineyards and gardens, where he does great miſchief, and is therefore narrowly watched and often taken. His fleſh is eſteemed a great dainty.

The earth-hogs in the Hottentot countries have ſome reſemblance to the European ſwine, only their colour approaches to a red; their heads are longer, their ſnouts more pointed, and they are quite toothleſs. The tongue of the earth-hog is long and pointed; and when he is hungry he ſearches for an ant-hill, and lying down with his head pretty near it, ſtretches out his long tongue, and the ants ſoon mount in great numbers upon it; and the upper part being very clammy, they are held faſt by the legs, ſo that they cannot return. When he has thus hampered a conſiderable number of thoſe inſects, he draws in his tongue and ſwallows them, and then

ſtretches

ſtretches it out for more. This is his method of feeding. His legs are long and ſtrong, and he has alſo a long tail. He ſcratches holes in the ground, in which he burrows, and is very quick at his work; if he gets but his head and fore legs into one of theſe holes, he keeps ſuch faſt hold, that the ſtrongeſt man cannot pull him out. Both the Europeans and Hottentots go frequently in ſearch of him, and knock him down; for a blow on the head with but a ſmall cudgel will kill him. His fleſh is well taſted and wholeſome, and reſembles that of the wild hog.

In the Cape Colonies is alſo a creature called a rattle-mouſe, though it is larger than an European ſquirrel, and has a head ſhaped like that of a bear. The hair on the back is of a liver colour; but that on the ſides is almoſt black. With its tail, which is neither very long nor very hairy, it makes, from time to time, a rattling noiſe, and thence obtained its name. It purs like a cat, feeds on acorns, nuts, and the like; and lives moſtly on trees, leaping from one tree to another after the manner of the ſquirrel. It is ſo nimble and bites ſo cloſe, that it is ſeldom taken alive.

One of the moſt extraordinary animals at the Cape is called by the Dutch ſtinkbingſem, or ſtinkbox; ſtinking being the grand defence nature has given this creature againſt all its enemies, and is a more effectual defence than horns are to the bull, or ſharp teeth and talons are to the lion and the tyger. It is ſhaped like a ferret, and is of the ſize of a middling dog. When its purſuer, whether man or beaſt, is come pretty near, it pours from its tail ſo horrid a ſtench, that it is impoſſible to endure it. A man is almoſt knocked down by it, before he can get away; and a dog, or other animal, is ſo ſtrangely confounded by it, that he is obliged every minute to ſtop, to rub his noſe in the graſs, or againſt a tree. The ſtinkbingſem having thus ſtopped his purſuer, gets a great way a-head of him before the chace can be renewed; and if he comes up with him a ſecond time, he gives him another doſe, and by that means eſcapes again. Thus he procceds till his purſuer is ſtunk out of the field. This animal is ſometimes ſhot by the Europeans, but they are obliged to ſuffer it to lie till it rots; for it is no ſooner dead, than its body contracts all over ſo nauſeous a ſmell, that if you do but touch it with your fingers, they retain a ſtench that you can neither endure, nor eaſily get off by any kind of waſhing.

Beſides theſe there are at the Cape a conſiderable number of other quadrupeds; among which are wild horſes. Here is alſo that beautiful creature called the zebra, which we have already deſcribed in treating of Abyſſinia; and one of which is now in the poſſeſſion of the queen. Here are likewiſe ſeveral ſpecies of wild cats, which are larger than the tame; ſome of theſe are all over blue, and retain that colour after the ſkins are dreſſed: others have a ſtreak of bright red running along the ridge of the back from the neck to the tail, loſing itſelf in grey and white on the ſides. Another called the buſh-cat, from its keeping in hedges and buſhes, is very large, and ſpotted like a tyger. They have alſo the muſk-cat, the ſkin of which has a very ſtrong ſcent. Beſides theſe there are many of the quadrupeds common in Europe.

SECT. V.

Of the feathered Race, particularly the Oſtrich, the Flamingo, the Crane, the Spoonbill, the Knor-Cock and Hen, Eagles of ſeveral Kinds, the Blue-Bird, the Long-Tongue, the Gnat-Snapper, the Wood pecker, and the Edolio.

WE ſhall begin our deſcription of the birds of the Hottentot countries with the oſtrich, the largeſt of them all; and theſe are ſo numerous, that a man can hardly walk a quarter of an hour in the Cape countries without ſeeing one or more of them. The feathers of ſome of the Cape oſtriches are black, and ſome of them white. The head is very ſmall in proportion to the large ſize of the body, and the bill is ſhort and pointed: the neck is long like that of a ſwan: the legs are thick and ſtrong, and the feet are cloven, reſembling thoſe of a goat. Theſe birds are eaſily tamed; and many tame ones are kept in the Cape fortreſs. Their eggs are ſo large, that the ſhell of one of them will contain the yolks of thirty hens eggs: they are pretty good eating, and one of them will ſerve three or four perſons.

The oſtriches at the Cape do not ſuffer their eggs to be hatched merely by the heat of the ſun; for they ſit upon them like other birds, and the male and female perform that office by turns. I have a hundred times (ſays Mr. Kolben) found both the male and female oſtrich hatching of eggs, and have as often driven them from their neſts and carried their eggs off, with which I feaſted both myſelf and friends, but ſometimes found them almoſt hatched. Nor do the oſtriches at the Cape forſake their young as ſoon as they are out of the ſhell; for being then unable to walk, they are attended and fed by the old ones with graſs; and when they can walk, they accompany the old ones till they are ſtrong enough to take care of themſelves. The old ones are then watchful to keep them out of danger, and are ſo enraged if they happen to loſe one, that it is dangerous to go near them.

Yet if any body does but touch the eggs in the neſt of an oſtrich, without doing them the leaſt harm, the oſtrich will forſake them.

This bird has ſo large and heavy a body, that ſhe cannot fly, and on ſeeing herſelf in danger runs away, aſſiſting her flight by fluttering her wings, by which means ſhe runs ſo faſt, that a man muſt be well mounted to overtake her. But if ſhe finds ſhe cannot eſcape her purſuer, ſhe hides her head where ſhe can, and ſtands ſtock-ſtill till ſhe is ſhot or ſeized.

Theſe birds will ſwallow pebbles, pieces of iron, and the like; but they do not digeſt them, for they come from them in much the ſame condition in which they were ſwallowed.

The flamingo, called by Mr. Ray the phœnicopterus, is a very fine and beautiful bird, larger than a ſwan; the bill is very broad, and the upper mandible, which is longer than the other, is very crooked, and bends conſiderably over it. The hollow of the lower mandible is filled with the tongue, which is large and flat; the bill is black at the point, but every where elſe of a dark blue, and is furniſhed with ſharp teeth. The neck is much longer than that of a ſwan, and both the neck and head are as white as ſnow; the upper part of the wing feathers are of a high flame colour, and the lower part of them black. The legs, which are of an orange colour, are half as long again as thoſe of the ſtork, and the feet like thoſe of the gooſe. Theſe birds, which are very numerous in the Cape countries, keep in the day-time on the lakes and rivers, and at night retire to the hills, where they lodge among the long graſs; their fleſh is wholeſome and well taſted, and their tongue eats like marrow.

Cranes are more numerous at the Cape than perhaps in any other part of the world. They reſemble in ſhape, colour, and ſize, thoſe of Europe, feed upon graſs, herbs, worms, frogs, and ſerpents. I never ſaw a flock of them, ſays our author, but ſome of them were planted on the ſkirts of it, as centinels to give notice of the approach of danger. Theſe ſtand upon one leg, and every minute ſtretch out their necks, this way and that, to ſee if any enemy approaches; and as ſoon as they diſcover him, they give notice to the reſt, and inſtantly the whole flock is on the wing. During the night, ſome of them are planted on the ſkirts of the flock to watch while the reſt ſleep, and ſtanding upon their left legs each holds in his right foot a ſtone, that if he ſhould be overcome by ſleep, its falling may awake him. The fleſh is unfit to eat.

The ſpoon-bill, called by the Europeans the ſerpent-eater, is ſomething larger than a full-grown gooſe, which it reſembles in its neck; the eyes are grey; the bill broad, long, and ſtraight, ending in ſomewhat like a ſpoon, and the feathers of the tail are about ſix inches in length. Theſe birds feed upon ſerpents, toads, or frogs, &c. and are ſo deſtructive to the former, that the people ſeldom ſhoot at them.

Among the wild fowl at the Cape is a ſort of birds, the male of which is called by the Europeans there, the knor-cock, and the female the knor-hen. Theſe birds are a kind of centinels, and give warning to all other birds

birds of the approach of danger; for they no ſooner diſcover a man, than they make a loud noiſe, crying crack, crack, which they repeat very clamorouſly, and thus frequently diſappoint the ſportſman; for the other birds no ſooner hear the noiſe, than they fly away quite out of ſight. This bird is of the ſize of a common hen, the bill is ſhort and black, and the feathers on the crown of the head alſo black, the reſt are a motley of red, white, and aſh colour; the wings are ſmall, conſidering its ſize, which prevent its flying far at once, and the legs are yellow. Theſe birds generally keep in heaths, and in places remote from the habitations of men, where they build their neſts in buſhes; but never lay above two eggs in a ſeaſon. The fleſh is of an agreeable taſte.

There are at the Cape a kind of eagles which will feed upon fiſh, aſſes, and moſt other creatures which they find dead; they alſo kill many animals for food, devouring cows, oxen, and other tame beaſts, and leaving nothing but the ſkin and bones; the fleſh is, as it were, ſcooped out, and the wound by which the eagles enter the body being in the belly, the beaſt ſeems to lie dead, and no body would imagine that his bones were picked. The Dutch at the Cape call theſe kind of eagles dung-birds, from their tearing out the entrails of beaſts. The ſize of this eagle or dung-bird is larger than that of a wild gooſe; the feathers are partly black, and partly a light grey, but moſtly black. The bill is large and crooked, with a very ſharp point, and the talons are alſo very large and ſharp. It frequently happens, that an ox freed from the plough in order to return home, lies down to reſt himſelf by the way, and if he does, he is in great danger of being devoured by theſe eagles. They attack an ox or cow in a body conſiſting of a hundred and upwards; they watch for their prey ſo high in the air as to be out of human ſight; but their own ſight is ſo extremely piercing, that they ſee every thing beneath them, and when they diſcover their prey, fall down right upon it.

There is another kind of eagle, diſtinguiſhed by the name of the duck-eagle, from their being fond of ducks. Theſe frequently carry off young ducks in their talons, and tear and devour them in the air.

A third kind of eagle in the Cape countries is called the oſſifrage, or the bone-breaker; theſe feed upon land tortoiſes, which they carry to a great height in the air, and then let them fall upon ſome rock, in order to break the ſhell.

The Cape blue bird is of the ſize of a ſtarling, the feathers of the neck and thighs are of a ſky blue, and the back and wing feathers of a dark blue, approaching to a black. The bill is between three and four inches long, and pointed, and the under mandible is of a dark red. This bird is ſometimes ſeen in gardens, but it keeps for the moſt part upon high hills. The fleſh is delicate food.

There is a little bird which the Cape Europeans call the long-tongue: it is ſomething larger than the goldfinch; the feathers on the belly are yellow, and the reſt ſpeckled: the tongue, which is long and pointed, is as hard as iron, and as ſharp as the point of a needle. When any perſon endeavours to ſeize this bird, it pricks and wounds him with his tongue, which is its defenſive weapon againſt its enemies: its feet are like thoſe of the nightingale, and its claws are pretty long. Its fleſh is wholeſome and well taſted.

The gnat-ſnappers, or honey-eaters, live entirely on gnats, flies, bees, and honey: their bill is long, ſtraight, very ſtrong and red: the feathers on the upper part of the breaſt are of a deep azure, and thoſe on the lower part of a pale blue; their wings and tail feathers are black, as are alſo the legs, which are very long. Theſe birds are a ſort of guides to the Hottentots in the ſearch of honey, which the bees lay up in the clefts of rocks.

Among the ſeveral kinds of wood-peckers in the Cape countries, is one called the green peak, which is a beautiful bird, it being all over green, except a red ſpot on its head, and another on its breaſt. It ſometimes builds its neſt on high and ſteep rocks, but generally in buſhes in the vallies. It feeds on a ſmall inſect, which it picks from the bark of trees.

The edolio perfectly reſembles the European cuckoo, and is moſtly ſeen in high trees and thickets. In fine weather it diſtinctly repeats in a low melancholy tone, Edolio, Edolio; and this is all its ſong.

In ſhort, the Cape abounds with a prodigious variety of fowls, among which are, wild geeſe of ſeveral ſorts, water hens, wild peacocks, ſnipes, ravens of different colours, pheaſants, ducks, yellow hammers, larks, green-finches, black-birds, finches, wagtails, tit-mouſes of ſeveral ſorts, bats, canary birds, ſtarlings, pigeons, ſwallows, thruſhes, quails, daws; and in ſhort, the turkeys and poultry are ſo numerous in the Cape countries, that they are cheaper than butcher's meat. Theſe laſt exactly reſemble the cocks and hens in Europe.

SECT. VI.

Of the Serpents, Scorpions and Inſects at the Cape of Good Hope.

THERE are many kinds of ſerpents or ſnakes at the Cape of Good Hope, ſome of which are very dangerous, while others are entirely free from poiſon.

The aſp is of an aſh colour ſpeckled with red and yellow. The head and neck are very broad, the eyes flat and ſunk in the head, and near each grows a fleſhy protuberance about the ſize of an hazle nut. Theſe ſerpents are of various lengths, ſome even ſeveral yards long.

The tree ſerpent is thus named from her being ſeen moſtly in trees. This reptile, which is about two yards long, and three quarters of an inch thick, winds herſelf about the branches of trees, and thus remains for a long time without motion, when ſhe is ſo like the branch ſhe covers, that a man who has not a very good eye, or ſome knowledge of her ways, would be miſtaken: all the difference in point of colour is her being a little ſpeckled; and hence perſons have ſometimes been ſurpriſed by her. If any one ſtands near the ſide on which ſhe is lodged, ſhe darts her head at their faces, and ſometimes wounds them. She has no ſooner done this, than drawing in her head, ſhe turns about in order to deſcend from the tree, by winding herſelf from one part to another, but is ſo ſlow in doing it, that it is eaſy to knock her on the head before ſhe gets to the ground.

The dipſas, or thirſt ſerpent, is thus named from its bite cauſing a burning thirſt. This reptile, which is frequently met with in the Cape countries, is about three quarters of a yard in length, has a broad neck, and a blackiſh back. It is very nimble in its aſſault, and its bite ſoon inflames the blood, and cauſes a moſt dreadful thirſt. Our author ſays, he knew a man at the Cape, who on being bitten by the dipſas in the calf of the leg, immediately tied his garter very tight above the knee, and above the garter tied ſome other thing he had at hand, to ſtop the courſe of the poiſon upwards, and then made all poſſible haſte to the neareſt houſe, which happened to belong to a ſmith, with whom he was acquainted. Before he got thither his leg was much ſwelled, and he was ſeized with a burning thirſt; he impatiently aſked the ſmith for water to drink, and at the ſame time let him know his misfortune. The ſmith being acquainted with the nature of the poiſon, and having an antidote againſt it, would not ſuffer him to drink any thing; but told him he muſt immediately conſent to have his ſwelled leg laid open, and truſt to him for a cure. He ſubmitted, and on opening the leg, there iſſued out a great deal of a watery yellow humour. The ſmith then prepared a pretty large plaiſter, and tied it over the inciſion, adviſing his patient to refrain from drink for a quarter of an hour. He did ſo, and in that time his thirſt was conſiderably abated, and the plaiſter had drawn a great deal more of the yellow humour, and being cleanſed was put on again. The ſwelling was by this time conſiderably abated; the patient grew eaſy, and was ſoon perfectly cured.

The Cape hair-ſerpent is about a yard long, and three quarters of an inch thick; its poiſon is reckoned more malignant than that of other ſerpents, its bite cauſing immediate death, unleſs an antidote be inſtantly applied.

Some aſſert, that there is a ſtone in the head of the hair-ſerpent, which is a never failing antidote both againſt the poiſon of this, and of every other ſerpent. But our author, after killing many hair-ſerpents at the Cape, and ſearching the heads of all of them very narrowly, in order to find this ſtone, could never diſcover any ſuch thing. The ſerpent ſtones in the poſſeſſion of the Cape Europeans, are all artificial ones brought from the Eaſt-Indies, where they are prepared by the Bramins, who are alone poſſeſſed of the ſecret of their compoſition Our author ſays, he ſaw one of them tried upon a child at the Cape, who had received a poiſonous bite in one of the arms, but it could not be diſcovered from what creature. When the ſtone was brought, the arm was prodigiouſly ſwelled and inflamed; the ſtone on its being applied to the wound ſtuck to it very cloſely, without any bandage or ſupport, drinking in the poiſon, till it could receive no more, when dropping off, it was laid in milk, that it might purge itſelf of the poiſon, and it did ſo, the poiſon turning the milk yellow. The ſtone was then applied again to the wound, and when it had drank in its doſe, was again laid in milk, and this was repeated till the ſtone had exhauſted all the poiſon; after which the arm was ſoon healed. The artificial ſerpent ſtone is ſhaped like a bean, the matter in the middle is whitiſh, and the reſt of a ſky blue.

There is a ſort of ſnakes at the Cape called houſe ſerpents, from their loving to be in the houſes. Theſe are from an inch and a quarter, to an inch and a half thick, and about an ell long. They are very fond of getting into people's beds, and lying with them all night. They will ſlip through the hands like eels, and when you drive them out of bed, if you uſe them in what manner you will, ſo that you don't diſable them, they will return, and get into bed again if they can. If they are offended, they bite; but their bite is not poiſonous, nor attended with any ill conſequence.

In ſhort, there are many other kinds of ſerpents in the Cape countries; one ſort is moſtly ſeen upon rocks, and another on flat ſandy ground. There is a ſort uſually ſeen about the roads, and a ſmall ſnake of a black colour that loves to harbour in ſtraw and reeds. Numbers of theſe laſt are in the thatch upon the houſes in the colonies, where they lay their eggs, and breed their young; a full grown ſnake of this laſt ſort is no longer than a man's middle finger, nor thicker than a gooſe quill.

Scorpions are ſo numerous at the Cape, where they generally harbour among ſtones, that the Cape Europeans are very cautious of putting their hands among them, for fear of being ſtung by thoſe creatures. The Cape ſcorpions are from two and a half to three inches long, and of a dark green ſpeckled with black. They reſemble the craw-fiſh in every part but the tail, which is longer and narrower. Their ſting cauſes intolerable pain, and frequently endangers life.

Among the ſpiders at the Cape, of which there are many ſorts, there is one no bigger than a white pea; but of which the Cape Europeans are very cautious. It is of a black colour, and very active. In houſes it faſtens on the walls, or ceiling, and in the fields fixes its web in the graſs; and its bite is ſo poiſonous, that it cauſes death, unleſs an antidote be uſed in time. Our author mentions a negroe who died of it, and an European boy who ſuffered the moſt tormenting pain from the bite of this inſect; but his life was ſaved by applying the ſerpent ſtone. This inſect frequently does damage to both the great and ſmall cattle.

There are here alſo a few of the centipedes, which are red and white, and about a finger long, but ſcarce half ſo thick: they are downy like Cape caterpillars, and provided with two horns; the bite of this inſect is as dangerous as that of a ſcorpion, but the ſerpent ſtone is an effectual remedy, as is alſo the application of roaſted onions applied to the wound.

There are various kinds of caterpillars at the Cape, different from thoſe in Europe: theſe quickly arrive at maturity, ſoon after which they fix themſelves to a plant, tree, or flower, and ſometimes to a wall, where they change their form in the manner of the ſilk-worm which we deſcribed in treating of China, and are covered with a cruſty matter or ſhell fourteen or fifteen days, when the ſhell opening, there iſſues from it a moſt beautiful butterfly, the wings of which are enamelled with gold and various other lively colours. There are indeed as many ſorts of butterflies as there are of caterpillars; and every butterfly at the Cape retains much of the colour of the caterpillar from which it was changed.

The ſea-flea is thus named from its leaping after the manner of a flea; it is nearly of the ſhape of a ſhrimp, and ſometimes continues under water. As it is provided with a ſting, it is a great plague to fiſh; for when it lights on them, it ſtings them ſo grievouſly, that they fling themſelves in a fury up and down, and then ſwim as quick as they can to a ſea-rock, or ſtony-ſhore, in order to rid themſelves of this enemy by rubbing themſelves againſt it.

The ſea-louſe reſembles a horſe-fly, but is broader, and covered with a hard ſhell. It has many legs, each of which ends in a hook. This inſect keeps generally under water, and when it gets upon fiſh clings faſt to it by its claws, and gives it great torture by ſucking it; and it is ſaid, that if the fiſh finds not ſome means to rub it off, this inſect will ſuck it to death.

SECT. VII.

Of the Sea and River Fiſh at the Cape of Good Hope.

AMONG the fiſhes at the Cape are the leſſer whale, called the grampus, which is frequently ſeen there; but we ſhall find another opportunity of deſcribing the whale when we come to thoſe countries on the coaſts of which theſe enormous fiſh are caught.

The blower, ſo called from a faculty it has of blowing itſelf up into a globular form, is frequently ſeen about the Cape. This fiſh is without ſcales, and very ſmooth; the mouth is ſmall, but furniſhed with four broad teeth; and it has a white belly. This fiſh is not food for man, it being very unwholeſome.

The torpedo cramp-fiſh is frequently taken at the Cape. It is of the cartilaginous kind, and roundiſh, being blown up as it were into that form. The head does not project from the body; but the mouth and eyes are fixed in it much in the ſame manner as you might carve them on a bowl. The eyes are very ſmall; and the inſides have a mixture of black and white. The mouth, which is ſhaped like a half-moon, is alſo ſmall; but furniſhed with teeth. Above the mouth are two little holes, which are perhaps its noſtrils. The back is orange-coloured, the belly white, the tail thin, and fleſhy like that of a turbot. The ſkin upon every part is very ſmooth, and entirely without ſcales. When the fiſh is opened the brain is plainly ſeen. The gall is large, the liver white, and very tender. But after all, this extraordinary fiſh does not weigh above a quarter of a pound.

It is a certain truth, that whoever touches this fiſh, whether with his hand or foot, or even with a ſtick, will immediately feel his limbs cramped and benumbed to ſuch a degree that he cannot move them, particularly the limb with which he touched the fiſh, or with which he extended the ſtick that touched it, which will appear totally and ſtrongly convulſed. But this general convulſion ſeldom laſts above half an hour: for it laſts a minute or two at the height; it then gradually abates, and in half an hour is quite gone. The Cape fiſhermen are extremely afraid of touching the torpedo; and whenever, on their dragging out a net, they perceive this fiſh, they turn the net aſide, and are content to loſe half their fiſh, nay their whole draught, rather than drag the torpedo aſhore, and by that means expoſe any one to the hazard of touching it.

The gold-fiſh, which is very different from that of China, is thus called from a circle of a gold colour about each eye, and a ſtreak of gold from the head along the ridge of the back to the tail. The Cape gold-fiſh is about a foot and a half long, and is of about a pound weight. The teeth are ſmall, but very ſharp, and do good execution upon muſcles and other fiſh that are its prey. Gold-fiſh are never ſeen near the Cape, but in the months of May, June, July, and Auguſt, when they

appear

appear in ſhoals, and great numbers of them are taken by the Cape Europeans. The colour of the meat is a mixture of white and red; it is of a delicate taſte, and is not only eſteemed very wholeſome, but a great cleanſer of the blood.

The Cape ſilver-fiſh reſembles a carp in its ſhape and taſte, and weighs about a pound. It is a very white fiſh, adorned with ſeveral ſtreaks of a bright ſilver colour, falling from the ridge of the back down both ſides, and the tail ſeems covered with ſilver. The jaws are furniſhed with ſmall ſharp teeth. Theſe ſilver-fiſh keep generally in the ſea, but at certain times come in ſhoals into the rivers, where they are caught in great numbers.

The bennet is a fiſh of which there is great plenty at the Cape, but how it came by that name is unknown. It is about the length and thickneſs of a man's arm, and weighs from ſix to eight pounds. It is a beautiful fiſh covered with large ſcales of a bright purple, intermixed with ſtreaks of gold. The eyes are red, the mouth ſmall and without teeth, and near the gills are two fins of a gold colour; but the other fins are of a light yellow. The tail is reddiſh, and has much the form of a pair of open ſciſſars. The ſcales appear tranſparent, as does likewiſe the ſkin; but, when the ſcales are off, the ſkin appears of a bright purple. The meat is of a crimſon colour, and is divided into ſeveral parts by a ſort of membranous ſubſtance interwoven with it. It loſes nothing in point of colour by boiling, but a little of its luſtre. It is a dry food, but agreeable to the palate, and eaſy of digeſtion.

In the Cape ſea are two kinds of braſſems, one ſomewhat rounder, broader, and ſhorter than the other. This is of a blackiſh colour on the back and ſides, with the head of a dark purple. The other is of a dark blue, and ſeems ſpeckled. A braſſem of this laſt ſort is about ſeven or eight inches long, and weighs about a pound. Both ſorts feed upon ſea-graſs, and upon dung and offals when they meet with them. They are ſeldom taken in the net, except in very ſtormy weather, when they come in ſhoals to the ſhore. Both the European fiſhermen and the Hottentots uſually take them with the line; and, when they are at this ſport, either whiſtle or make a hideous bawling noiſe, in both which the braſſems delight; and are thus allured in ſhoals about the baits. They are very wholeſome and well taſted, and three or four of them are bought at the Cape for about two-pence.

The ſea near the Cape alſo abounds with a fiſh called by the Cape Europeans the ſtone-braſſem. Theſe come in ſhoals with the tide into the rivers, where they are fond of feeding on the graſs which hangs in the ſtream, and go out again with the tide. This fiſh is ſhaped like a carp, but is a much finer fiſh, and not near ſo boney. On being boiled or fried, it ſplits into many flakes like the cod. Theſe fiſh are from a foot and a half to three feet long, and weigh from two to eight pounds. They are of different colours, but the backs of all of them are brown; ſome have ſeveral brown ſtreaks falling on both ſides from the back to the belly. Theſe add not a little beauty to the ſcales, which are large and white; and ſome have the belly of an aſh colour.

The red ſtone-braſſems at the Cape have the name of Jacob Everſſons; the ſkin and ſcales are red, ſpeckled with blue, and in the middle of the fiſh with gold colour. The belly is of a pale green; the eyes are large and red, with a ſilver circle about each. The mouth is ſmall, and as it were under the gullet, and is furniſhed with little ſharp teeth. This fiſh is of a delicate taſte, and is very wholeſome nouriſhing food. There is another ſort of red ſtone-braſſems, or Jacob Everſſons, which differs from the above in their being larger, in their having ſhorter mouths, and in having the out-parts of the gullet of a deep red. Both ſorts keep entirely in the ſea, and are ſeldom found in great depths of water.

Franciſci has given the reaſon of theſe fiſh being called at the Cape by the name of Jacob Everſſon; and as his account appears at the ſame time diverting, and is acknowledged to be ſtrictly agreeable to truth, we ſhall tranſcribe it. "There was many years ago, ſays he, a "maſter of a ſhip at the Cape, whoſe name was Jacob "Everſſon; he had a very red face, and was ſo deep "pitted with the ſmall-pox, that his beard, which was "black, could never be ſhaved ſo cloſe, but that ſeveral "hairs would remain in the pock-frets: ſo that his face, "when it was ſhaved, had the colour, and ſeemed to "have the ſpecks of the red ſtone-braſſem. This Jacob "being once a-fiſhing with his crew for red ſtone-braſſems, at Maurice iſland beyond the Cape, and the crew "dining that day very jovially upon this ſort of fiſh, "one of them took it in his head, in a fit of mirth, to "call it the Jacob Everſſon. The crew were ſtruck with "the brightneſs of the alluſion, and received it with the "higheſt agitations of mirth, and with thunders of ap-"plauſe: and when they got back to the Cape, they "immediately publiſhed this new name for the red ſtone-"braſſem. The ſettlers (among whom Jacob was very "well known) were as much ſtruck as the crew with the "juſtneſs of the name, and very merrily agreed to "call a red ſtone-braſſem a Jacob Everſſon ever after. "Every one that knew Jacob, being raviſhed with the "mirth in the alluſion, this new name for the red ſtone-"braſſem, together with the reaſon of its aſſignment, "ſoon after reached ſeveral ſettlements in the Indies; "and was ſo well received there, that red ſtone-braſſems "(of which the Indian ſeas furniſh plenty) have gone "there by the name of Jacob Everſſons ever ſince."

There are alſo in the Cape ſea porpoiſes, ſharks, pilot-fiſh, dolphins, and flying-fiſh, which we have already deſcribed in treating of the fiſh on the coaſt of Indoſtan. There are likewiſe ſea-lions and turtle, of which we ſhall defer the deſcription till we come to the coaſt of America. Beſides theſe there are many of the fiſh common in Europe, as pike, which are here only found in ſalt-water, and are of a dark yellow, but in every other reſpect reſemble thoſe of Europe; herrings, thornbacks, ſoles, barbels, carp, eels, and gudgeons.

Among the ſhell-fiſh at the Cape are lobſters, craw-fiſh, crabs, oyſters, muſcles, and perriwinkles, which differ but little from thoſe of Europe; but there are others unknown amongſt us.

At the Cape are two ſorts of water-ſnails, called by the Europeans there the porcupine-ſnail and the ſea porcupine-ſnail. The ſhell of the former is twiſted like that of a garden-ſnail, but more variouſly and beautifully coloured. The ſhell of the ſea porcupine-ſnail has alſo many beautiful colours, and is armed on almoſt every part with long prickles, which ſtand out much after the ſame manner as the raiſed quills of the porcupine. The ſhells of both ſorts retain their colours as long as the fiſh within them live; but when it dies, the colours on the ſhell fade away.

At the Cape are ſhell-fiſh called by the Europeans there ſea-ſuns and ſea-ſtars: both ſorts breed in the ſea, and are driven aſhore by the tide. The ſhells of both are multangular, and approach to a globular figure; but the ſea-ſun is ſmaller than the ſea-ſtar, and the ſhell more nearly reſembles a globe. The ſhells of both are alſo covered with a thick ſcaly ſkin, ſomething like that of a ſerpent, and have ſmall prickles upon them ſhooting out every way, like beams of light, whence they receive their names; but the prickles on the ſea-ſuns are longer than thoſe on the ſea-ſtars. In hot weather the fiſh in theſe ſhells are dried up on their remaining a few days out of the water, and the ſhells are left ſo bare, that there is no mark of their having been inhabited by any creature.

At the Cape is a ſhell-fiſh which the Cape Europeans call pagger, and is covered with dark brown ſcales, beautifully ſpotted with red and black; but on the back of it, near the head, is a ſort of horn, or prickle of a poiſonous nature, which is apt to wound the hand that touches it; in which caſe it cauſes a dreadful pain and inflammation, and if ſpeedy care be not taken the hand periſhes.

The ſhell-fiſh, called at the Cape the muſſel-crab, reſembles the lobſter, but is much ſmaller. Theſe, beſides the coat ſhell, have another, which ſerves them as an habitation, and they go in and out with great eaſe, though they never go ſo far out as to ſeparate themſelves quite from the ſhell.

There are ſeveral other ſhell-fiſh diſtinguiſhed by the beauty of their ſhells; but we ſhall only take notice of the nautilus, called at the Cape the pearl-ſnail. It is

no

Some aſſert, that there is a ſtone in the head of the hair-ſerpent, which is a never failing antidote both againſt the poiſon of this, and of every other ſerpent. But our author, after killing many hair-ſerpents at the Cape, and ſearching the heads of all of them very narrowly, in order to find this ſtone, could never diſcover any ſuch thing. The ſerpent ſtones in the poſſeſſion of the Cape Europeans, are all artificial ones brought from the Eaſt-Indies, where they are prepared by the Bramins, who are alone poſſeſſed of the ſecret of their compoſition Our author ſays, he ſaw one of them tried upon a child at the Cape, who had received a poiſonous bite in one of the arms; but it could not be diſcovered from what creature. When the ſtone was brought, the arm was prodigiouſly ſwelled and inflamed; the ſtone on its being applied to the wound ſtuck to it very cloſely, without any bandage or ſupport, drinking in the poiſon; till it could receive no more, when dropping off, it was laid in milk, that it might purge itſelf of the poiſon, and it did ſo, the poiſon turning the milk yellow. The ſtone was then applied again to the wound, and when it had drank in its doſe, was again laid in milk, and this was repeated till the ſtone had exhauſted all the poiſon; after which the arm was ſoon healed. The artificial ſerpent ſtone is ſhaped like a bean, the matter in the middle is whitiſh, and the reſt of a ſky blue.

There is a ſort of ſnakes at the Cape called houſe ſerpents, from their loving to be in the houſes. Theſe are from an inch and a quarter, to an inch and a half thick, and about an ell long. They are very fond of getting into people's beds, and lying with them all night. They will ſlip through the hands like eels, and when you drive them out of bed, if you uſe them in what manner you will, ſo that you don't diſable them, they will return, and get into bed again if they can. If they are offended, they bite; but their bite is not poiſonous, nor attended with any ill conſequence.

In ſhort, there are many other kinds of ſerpents in the Cape countries; one ſort is moſtly ſeen upon rocks, and another on flat ſandy ground. There is a ſort uſually ſeen about the roads, and a ſmall ſnake of a black colour that loves to harbour in ſtraw and reeds. Numbers of theſe laſt are in the thatch upon the houſes in the colonies, where they lay their eggs, and breed their young; a full grown ſnake of this laſt ſort is no longer than a man's middle finger, nor thicker than a gooſe quill.

Scorpions are ſo numerous at the Cape, where they generally harbour among ſtones, that the Cape Europeans are very cautious of putting their hands among them, for fear of being ſtung by thoſe creatures. The Cape ſcorpions are from two and a half to three inches long, and of a dark green ſpeckled with black. They reſemble the craw-fiſh in every part but the tail, which is longer and narrower. Their ſting cauſes intolerable pain, and frequently endangers life.

Among the ſpiders at the Cape, of which there are many ſorts, there is one no bigger than a white pea; but of which the Cape Europeans are very cautious. It is of a black colour, and very active. In houſes it faſtens on the walls, or ceiling, and in the fields fixes its web in the graſs; and its bite is ſo poiſonous, that it cauſes death, unleſs an antidote be uſed in time. Our author mentions a negroe who died of it, and an European boy who ſuffered the moſt tormenting pain from the bite of this inſect; but his life was ſaved by applying the ſerpent ſtone. This inſect frequently does damage to both the great and ſmall cattle.

There are here alſo a few of the centipedes, which are red and white, and about a finger long, but ſcarce half ſo thick: they are downy like Cape caterpillars, and provided with two horns; the bite of this inſect is as dangerous as that of a ſcorpion, but the ſerpent ſtone is an effectual remedy, as is alſo the application of roaſted onions applied to the wound.

There are various kinds of caterpillars at the Cape, different from thoſe in Europe: theſe quickly arrive at maturity, ſoon after which they fix themſelves to a plant, tree, or flower, and ſometimes to a wall, where they change their form in the manner of the ſilk-worm which we deſcribed in treating of China, and are covered with a cruſty matter or ſhell fourteen or fifteen days, when the ſhell opening, there iſſues from it a moſt beautiful butterfly, the wings of which are enamelled with gold and various other lively colours. There are indeed as many ſorts of butterflies as there are of caterpillars; and every butterfly at the Cape retains much of the colour of the caterpillar from which it was changed.

The ſea-flea is thus named from its leaping after the manner of a flea; it is nearly of the ſhape of a ſhrimp, and ſometimes continues under water. As it is provided with a ſting, it is a great plague to fiſh; for when it lights on them, it ſtings them ſo grievouſly, that they fling themſelves in a fury up and down, and then ſwim as quick as they can to a ſea-rock, or ſtony-ſhore, in order to rid themſelves of this enemy by rubbing themſelves againſt it.

The ſea-louſe reſembles a horſe-fly, but is broader, and covered with a hard ſhell. It has many legs, each of which ends in a hook. This inſect keeps generally under water, and when it gets upon fiſh clings faſt to it by its claws, and gives it great torture by ſucking it; and it is ſaid, that if the fiſh finds not ſome means to rub it off, this inſect will ſuck it to death.

SECT. VII.

Of the Sea and River Fiſh at the Cape of Good Hope.

AMONG the fiſhes at the Cape are the leſſer whale, called the grampus, which is frequently ſeen there; but we ſhall find another opportunity of deſcribing the whale when we come to thoſe countries on the coaſts of which theſe enormous fiſh are caught.

The blower, ſo called from a faculty it has of blowing itſelf up into a globular form, is frequently ſeen about the Cape. This fiſh is without ſcales, and very ſmooth; the mouth is ſmall, but furniſhed with four broad teeth; and it has a white belly. This fiſh is not food for man, it being very unwholeſome.

The torpedo cramp-fiſh is frequently taken at the Cape. It is of the cartilaginous kind, and roundiſh, being blown up as it were into that form. The head does not project from the body; but the mouth and eyes are fixed in it much in the ſame manner as you might carve them on a bowl. The eyes are very ſmall; and the inſides have a mixture of black and white. The mouth, which is ſhaped like a half-moon, is alſo ſmall; but furniſhed with teeth. Above the mouth are two little holes, which are perhaps its noſtrils. The back is orange-coloured, the belly white, the tail thin, and fleſhy like that of a turbot. The ſkin upon every part is very ſmooth, and entirely without ſcales. When the fiſh is opened the brain is plainly ſeen. The gall is large, the liver white, and very tender. But after all, this extraordinary fiſh does not weigh above a quarter of a pound.

It is a certain truth, that whoever touches this fiſh, whether with his hand or foot, or even with a ſtick, will immediately feel his limbs cramped and benumbed to ſuch a degree that he cannot move them, particularly the limb with which he touched the fiſh, or with which he extended the ſtick that touched it, which will appear totally and ſtrongly convulſed. But this general convulſion ſeldom laſts above half an hour: for it laſts a minute or two at the height; it then gradually abates, and in half an hour is quite gone. The Cape fiſhermen are extremely afraid of touching the torpedo; and whenever, on their dragging out a net, they perceive this fiſh, they turn the net aſide, and are content to loſe half their fiſh, nay their whole draught, rather than drag the torpedo aſhore, and by that means expoſe any one to the hazard of touching it.

The gold-fiſh, which is very different from that of China, is thus called from a circle of a gold colour about each eye, and a ſtreak of gold from the head along the ridge of the back to the tail. The Cape gold-fiſh is about a foot and a half long, and is of about a pound weight. The teeth are ſmall, but very ſharp, and do good execution upon muſcles and other fiſh that are its prey. Gold-fiſh are never ſeen near the Cape, but in the months of May, June, July, and Auguſt, when they appear

appear in ſhoals, and great numbers of them are taken by the Cape Europeans. The colour of the meat is a mixture of white and red; it is of a delicate taſte, and is not only eſteemed very wholeſome, but a great cleanſer of the blood.

The Cape ſilver-fiſh reſembles a carp in its ſhape and taſte, and weighs about a pound. It is a very white fiſh, adorned with ſeveral ſtreaks of a bright ſilver colour, falling from the ridge of the back down both ſides, and the tail ſeems covered with ſilver. The jaws are furniſhed with ſmall ſharp teeth. Theſe ſilver-fiſh keep generally in the ſea, but at certain times come in ſhoals into the rivers, where they are caught in great numbers.

The bennet is a fiſh of which there is great plenty at the Cape, but how it came by that name is unknown. It is about the length and thickneſs of a man's arm, and weighs from ſix to eight pounds. It is a beautiful fiſh covered with large ſcales of a bright purple, intermixed with ſtreaks of gold. The eyes are red, the mouth ſmall and without teeth, and near the gills are two fins of a gold colour; but the other fins are of a light yellow. The tail is reddiſh, and has much the form of a pair of open ſciſſars. The ſcales appear tranſparent, as does likewiſe the ſkin; but, when the ſcales are off, the ſkin appears of a bright purple. The meat is of a crimſon colour, and is divided into ſeveral parts by a ſort of membranous ſubſtance interwoven with it. It loſes nothing in point of colour by boiling, but a little of its luſtre. It is a dry food, but agreeable to the palate, and eaſy of digeſtion.

In the Cape ſea are two kinds of braſſems, one ſomewhat rounder, broader, and ſhorter than the other. This is of a blackiſh colour on the back and ſides, with the head of a dark purple. The other is of a dark blue, and ſeems ſpeckled. A braſſem of this laſt ſort is about ſeven or eight inches long, and weighs about a pound. Both ſorts feed upon ſea-graſs, and upon dung and offals when they meet with them. They are ſeldom taken in the net, except in very ſtormy weather, when they come in ſhoals to the ſhore. Both the European fiſhermen and the Hottentots uſually take them with the line; and, when they are at this ſport, either whiſtle or make a hideous bawling noiſe, in both which the braſſems delight; and are thus allured in ſhoals about the baits. They are very wholeſome and well taſted, and three or four of them are bought at the Cape for about two-pence.

The ſea near the Cape alſo abounds with a fiſh called by the Cape Europeans the ſtone-braſſem. Theſe come in ſhoals with the tide into the rivers, where they are fond of feeding on the graſs which hangs in the ſtream, and go out again with the tide. This fiſh is ſhaped like a carp, but is a much finer fiſh, and not near ſo boney. On being boiled or fried, it ſplits into many flakes like the cod. Theſe fiſh are from a foot and a half to three feet long, and weigh from two to eight pounds. They are of different colours, but the backs of all of them are brown; ſome have ſeveral brown ſtreaks falling on both ſides from the back to the belly. Theſe add not a little beauty to the ſcales, which are large and white; and ſome have the belly of an aſh colour.

The red ſtone-braſſems at the Cape have the name of Jacob Everſſons; the ſkin and ſcales are red, ſpeckled with blue, and in the middle of the fiſh with gold colour. The belly is of a pale green; the eyes are large and red, with a ſilver circle about each. The mouth is ſmall, and as it were under the gullet, and is furniſhed with little ſharp teeth. This fiſh is of a delicate taſte, and is very wholeſome nouriſhing food. There is another ſort of red ſtone-braſſems, or Jacob Everſſons, which differs from the above in their being larger, in their having ſhorter mouths, and in having the out-parts of the gullet of a deep red. Both ſorts keep entirely in the ſea, and are ſeldom found in great depths of water.

Franciſci has given the reaſon of theſe fiſh being called at the Cape by the name of Jacob Everſſon; and as his account appears at the ſame time diverting, and is acknowledged to be ſtrictly agreeable to truth, we ſhall tranſcribe it. "There was many years ago, ſays he, a "maſter of a ſhip at the Cape, whoſe name was Jacob "Everſſon; he had a very red face, and was ſo deep "pitted with the ſmall-pox, that his beard, which was "black, could never be ſhaved ſo cloſe, but that ſeveral "hairs would remain in the pock-frets: ſo that his face, "when it was ſhaved, had the colour, and ſeemed to "have the ſpecks of the red ſtone-braſſem. This Jacob "being once a-fiſhing with his crew for red ſtone-braſſems, at Maurice iſland beyond the Cape, and the crew "dining that day very jovially upon this ſort of fiſh, "one of them took it in his head, in a fit of mirth, to "call it the Jacob Everſſon. The crew were ſtruck with "the brightneſs of the alluſion, and received it with the "higheſt agitations of mirth, and with thunders of ap-"plauſe: and when they got back to the Cape, they "immediately publiſhed this new name for the red ſtone-"braſſem. The ſettlers (among whom Jacob was very "well known) were as much ſtruck as the crew with the "juſtneſs of the name, and very merrily agreed to "call a red ſtone-braſſem a Jacob Everſſon ever after. "Every one that knew Jacob, being raviſhed with the "mirth in the alluſion, this new name for the red ſtone-"braſſem, together with the reaſon of its aſſignment, "ſoon after reached ſeveral ſettlements in the Indies; "and was ſo well received there, that red ſtone-braſſems "(of which the Indian ſeas furniſh plenty) have gone "there by the name of Jacob Everſſons ever ſince."

There are alſo in the Cape ſea porpoiſes, ſharks, pilot-fiſh, dolphins, and flying-fiſh, which we have already deſcribed in treating of the fiſh on the coaſt of Indoſtan. There are likewiſe ſea-lions and turtle, of which we ſhall defer the deſcription till we come to the coaſt of America. Beſides theſe there are many of the fiſh common in Europe, as pike, which are here only found in ſalt-water, and are of a dark yellow, but in every other reſpect reſemble thoſe of Europe; herrings, thornbacks, ſoles, barbels, carp, eels, and gudgeons.

Among the ſhell-fiſh at the Cape are lobſters, craw-fiſh, crabs, oyſters, muſcles, and perriwinkles, which differ but little from thoſe of Europe; but there are others unknown amongſt us.

At the Cape are two ſorts of water-ſnails, called by the Europeans there the porcupine-ſnail and the ſea porcupine-ſnail. The ſhell of the former is twiſted like that of a garden-ſnail, but more variouſly and beautifully coloured. The ſhell of the ſea porcupine-ſnail has alſo many beautiful colours, and is armed on almoſt every part with long prickles, which ſtand out much after the ſame manner as the raiſed quills of the porcupine. The ſhells of both ſorts retain their colours as long as the fiſh within them live; but when it dies, the colours on the ſhell fade away.

At the Cape are ſhell-fiſh called by the Europeans there ſea-ſuns and ſea-ſtars: both ſorts breed in the ſea, and are driven aſhore by the tide. The ſhells of both are multangular, and approach to a globular figure; but the ſea-ſun is ſmaller than the ſea-ſtar, and the ſhell more nearly reſembles a globe. The ſhells of both are alſo covered with a thick ſcaly ſkin, ſomething like that of a ſerpent, and have ſmall prickles upon them ſhooting out every way, like beams of light, whence they receive their names; but the prickles on the ſea-ſuns are longer than thoſe on the ſea-ſtars. In hot weather the fiſh in theſe ſhells are dried up on their remaining a few days out of the water, and the ſhells are left ſo bare, that there is no mark of their having been inhabited by any creature.

At the Cape is a ſhell-fiſh which the Cape Europeans call pagger, and is covered with dark brown ſcales, beautifully ſpotted with red and black; but on the back of it, near the head, is a ſort of horn, or prickle of a poiſonous nature, which is apt to wound the hand that touches it; in which caſe it cauſes a dreadful pain and inflammation, and if ſpeedy care be not taken the hand periſhes.

The ſhell-fiſh, called at the Cape the muſſel-crab, reſembles the lobſter, but is much ſmaller. Theſe, beſides the coat ſhell, have another, which ſerves them as an habitation, and they go in and out with great eaſe, though they never go ſo far out as to ſeparate themſelves quite from the ſhell.

There are ſeveral other ſhell-fiſh diſtinguiſhed by the beauty of their ſhells; but we ſhall only take notice of the nautilus, called at the Cape the pearl-ſnail. It is

no

no ſmall pleaſure to obſerve theſe fiſh in calm weather on the ſurface of the water, when their ſhells ſerve them as boats. They erect their heads conſiderably above theſe natural veſſels, and, ſpreading out a kind of ſail with which nature has furniſhed them, move along in a manner very diverting to the ſpectators. If when they ſail they find they are in danger, they draw themſelves cloſe into their ſhells, and ſink out of ſight. Many of theſe ſhells will hold near a quart, and are uſed at the Cape as drinking-cups. The Cape Europeans put to them a foot of ſilver, ivory, or wood; and ſome are very curiouſly embelliſhed with ornaments engraved on the outſide.

SECT. VIII.

Of the Perſons, Dreſs, and Character of the Hottentots; particularly exhibited in the Life of an Hottentot, who had been employed by the Europeans.

THE Hottentots are neither ſo ſmall of ſtature, nor ſo deformed and wrinkled, as ſome authors have repreſented them; for moſt of the men are from five to ſix feet high; but the women are a great deal leſs. Both ſexes are very erect and well made, and are in the medium between fat and lean. There is not a crooked limb or any other deformity to be ſeen among them, which is the more remarkable, as they take much leſs care of their children than the European women. As their heads are generally large, their eyes are ſo in proportion; and their aſpect is ſo far from being wild and terrible, as ſome have repreſented it, that it is ſweet and compoſed, and even expreſſing the utmoſt benevolence and good-nature. The worſt features they have is their large flat noſes, and their thick lips, eſpecially the uppermoſt; but the flatneſs of the noſe is not natural, but cauſed by art. Their teeth are as white as ivory, and their cheeks have ſomething of the cherry; but, from their continual daubings, it is not eaſily diſcerned. The men have large broad feet, but thoſe of the women are ſmall; and neither ſex cut the nails either of their fingers or toes. But what is very extraordinary, and muſt appear incredible to thoſe who have not given attention to the variations obſervable in the human ſpecies, is, that all the Hottentot women are diſtinguiſhed by having a broad callous kind of flap growing to their bellies, which ſeems intended by nature to hide what civilized nations are taught moſt carefully to conceal; and ſome of them have it ſo large, that it can hardly be covered with the ſheep-ſkin they wear before them, it being often ſeen below it. This no Hottentot conſiders as a deformity, and for a little tobacco they will ſuffer any one to handle and examine it. Indeed Thevenot, in his Travels, ſays, the negro, Egyptian, and the women of ſome other nations, are ſubject to the like excreſcence, but ſtop the growth of it very early by ſearing: this may probably be done from their conſidering it as a deformity.

What chiefly renders the Hottentots a very naſty people, is a cuſtom obſerved by them from their infancy of ſmearing their bodies and apparel with mutton fat, marrow, or butter, mixed with the ſoot that gathers round their boiling-pots, in order to make them look black, they being naturally of a nut or olive colour. This cuſtom is repeated as often as the greaſe is dried up by the ſun or duſt, if they are able to procure butter or fat. The indigent part of the people are uſually obliged to make uſe of that which is rank; but the more wealthy always beſmear themſelves with the freſheſt and choiceſt that can be had. Every part of the body, from the crown of the head to the ſole of the foot, is covered with this filthy paint, and their ſkins are thoroughly daubed with it. The richer they are, the more fat and butter they uſe; for this is the grand mark of diſtinction between the rich and poor: but they have the extremeſt averſion to the fat of fiſh.

It is, however, worthy of obſervation, that this rubbing and greaſing has a natural tendency to promote the ſuppleneſs and activity of the body; and thence the Hottentots, though a lazy race, are, perhaps, the ſwifteſt of foot of any people upon earth; for they not only dart away from the ſwifteſt European, but ſome of them will out-run the fleeteſt horſe. Beſides, by their living almoſt naked where the ſun's heat is very great, and by their thus cloſing their pores with greaſe, they prevent that exceſſive perſpiration which would otherwiſe exhauſt their ſpirits and enervate their bodies. Indeed the ſame cuſtom is practiſed in a leſs degree by moſt ſavage nations.

What renders them ſtill more diſagreeable, is their ſuffering their woolly hair to be matted together with fat and dirt; their offenſive ſmell ariſing from theſe uncleanly cuſtoms and their abominable louſineſs.

With reſpect to their dreſs, the men, during the hot ſeaſon, have no other covering for their heads than this compoſition of fat, ſoot, and dirt; for they ſay the fat keeps their heads cool under the moſt raging ſun: but in the cold ſeaſon, and in wet weather, they wear caps made of cat or lamb-ſkins tied on with two ſtrings; however, the face and fore part of the neck are always uncovered. About the Hottentot's neck hangs a little greaſy bag, in which he carries his pipe and tobacco, with a little piece of wood of a finger's length, burnt at both ends, as an amulet againſt witchcraft.

The mantles they hang over their ſhoulders, which they call croſſas, are worn open or cloſe according to the ſeaſon. Thoſe of the moſt wealthy are of the ſkins of tygers or wild cats, and thoſe of the common people of ſheep-ſkins. Theſe they wear all the year round; in winter turning the hairy ſide inward, and in ſummer turning it outward. They lie upon them in the night, and when they die are tied up in them when put into their graves. As they generally wear theſe croſſas or mantles open, you ſee all the fore-part of their bodies naked to the bottom of the belly, where they are covered with a ſquare piece of the ſkin of a wild beaſt, generally of a wild cat, tied round the waiſt, with the hairy ſide outward. When they drive their herds to paſture, they put on a kind of leather ſtockings, to ſecure their legs from being ſcratched by the thorns and briars; and when they are to paſs over rocks and ſands, they wear a kind of ſandals, cut out of the raw hide of an elephant, or an ox, each conſiſting of one piece fitted to the ſole of the foot, and turning up about half an inch quite round it, the hairy ſide outward, and faſtened on with ſtrings paſſing through holes made in the turnings up of the toes and the heels.

Beſides theſe more eſſential parts of their dreſs, the men generally wear three rings of ivory upon the left arm. Theſe they form from the elephant's teeth they find in the woods, which they cut into rings, and finiſh with ſuch art and exactneſs, as would ſurprize the ableſt turner in Europe. Theſe rings, or bracelets, ſerve as guards when they fight an enemy; but when they travel they faſten to theſe rings a bag, in which they carry their proviſions, which they fix ſo cleverly that it is hardly any incumbrance.

The women in general wear caps all the year round, night and day, made of the ſkins of wild beaſts, pointing up ſpirally from the crown of the head. They generally wear two croſſas round their ſhoulders, which, like thoſe of the men, cover their backs, and ſometimes reach down to their hams. Between theſe croſſas they faſten a ſucking child, if they have one, with the head juſt peeping over their ſhoulders. The under croſſa ſerves to prevent their bodies being hurt by the children at their backs. They cover their poſteriors with another croſſa, which generally reaches to the calf of the leg; and have another before, which is always of ſheep-ſkin ſtripped of the wool or hair.

About their neck is tied a ſtring, to which is faſtened a leather bag, which they conſtantly wear from morning till night, both at home and abroad; it contains ſome kind of food, a pipe, tobacco, &c. The girls, from their infancy to twelve years of age, wear bulruſhes tied in rings round their legs from their knees down to their ancles. Theſe bulruſh rings are then laid aſide, and their place is ſupplied with rings of the thickneſs of a little finger made of ſlips of ſheep or calf-ſkins, from which the hair is ſinged; for the Hottentot ſheep have nothing like wool. Some of the women have above an hundred of theſe rings upon each leg, ſo curiouſly joined, and ſo nicely

Anna the Hottentot surrenders himself Prisoner to the Dutch Ensign.

BRITISH MUSEUM

nicely fitted to the leg, and to each other, that they ſeem like curious pieces of turnery. They are ſmooth and as hard as wood, and when they dance make a clattering noiſe. Theſe rings are kept from ſlipping over their heels by wrappers of leather or ruſhes about their ancles; and as the women are obliged every day to walk thro' buſhes and brambles to gather roots and other things for food, they preſerve their legs from being torn by the thorns and briars. Theſe rings are one great diſtinction of their ſex, and are conſidered as very ornamental; for the more rings they wear, the finer they are reckoned: but this is not all, they are proviſions againſt an hour of hunger and great ſcarcity; for when that arrives they pull them off, bruiſe them between two ſtones, and then eat them.

But the principal part of the finery of both ſexes conſiſts in the braſs buttons, and plates of the ſame metal, which they buy of the Dutch, and then poliſh to an amazing luſtre; theſe dangle in the men's hair. They are alſo extremely fond of fixing in their hair bits of looking-glaſs, which they alſo conſider as very ſplendid ornaments; nor are diamonds more admired by the Europeans than theſe trinkets by the Hottentots. They likewiſe wear ſmall ear-rings of braſs wire, which they always poliſh very neatly; and thoſe of the higheſt rank, or the greateſt wealth, hang in theſe ear-rings bits of mother of pearl, to which they have the art of giving a curious ſhape and poliſh. Of theſe ornaments they are extremely proud, as they imagine they procure them the admiration of every beholder.

To their commerce with the Dutch they likewiſe owe ſeveral other ornaments, as braſs and glaſs beads, of which they are extravagantly fond. There is hardly a Hottentot of either ſex who is not adorned with ſome of them: but the preference is univerſally given to braſs beads, on account of their not being ſo eaſily broken as thoſe of glaſs. They wear them in bracelets, necklaces, and girdles; of which every one has more or leſs according to his or her ability. For the neck and arms they chooſe the ſmalleſt beads they can meet with: the large ones they wear about their waiſt. Some wear half a dozen necklaces together, and others more, ſo large that they fall very gracefully to their navels. They alſo cover their arms with bracelets from their elbows to the wriſts, and wear half a dozen or more ſtrings of large beads of various colours about their waiſts. For theſe ornaments they freely exchange their cattle; and if they ſerve the Europeans, they always ſtipulate for ſome ear-rings, if they are not already provided; and whenever one of them works for an European, though it be but for a week, or even a day, he ſeldom fails in the agreement to article for beads.

It is alſo an invariable cuſtom among the men, who have diſtinguiſhed themſelves by their bravery, to wear the bladders of the wild beaſts they have ſlain, blown up and faſtened to their hair, where they hang as honourable trophies of their valour.

But with this finery the men do not think themſelves completely dreſſed, unleſs their hair be laviſhly powdered with a pulverized herb called buchu; and this being done, they are beaus and grandees, and appear in their utmoſt magnificence. As the hair of the women is conſtantly hid under their caps, they lay this powder as thick as they can upon their foreheads, where being rubbed into the greaſe, it ſticks very firmly. The women alſo paint their faces with a red earth, with which they make a ſpot over each eye, one upon the noſe, one upon each cheek, and one upon the chin. Theſe red ſpots they conſider as ſtriking beauties, and therefore this is their conſtant practice, when they are called to a mirthful aſſembly, or intend to make a conqueſt: but whatever attractions the men among the Hottentots may perceive in a woman thus painted, to an European they appear perfectly frightful.

The men have uſually in their hand, eſpecially when they go abroad, a ſmall ſtick about a foot long, at one end of which is faſtened the tail of a wild cat, fox, or other wild beaſt that has a buſhy tail; and this they uſe as an handkerchief to rub the ſweat off their faces, to wipe their noſes, and clear away the duſt and dirt that gather about their eyes. When this tail is covered with ſweat and filth, they plunge and toſs it about in water till all is waſhed off.

The Hottentots have been repreſented by ſome authors as being ſcarce above the level of the brutes, and as having neither underſtanding, nor any ſenſe of order or decency, and as ſcarce poſſeſſing the leaſt glimpſe of reaſon and humanity: but this is far from being true. "I have known "many of them, ſays the learned and judicious Mr. "Kolben, who underſtood Dutch, French, and Portu- "gueſe to a degree of perfection; and one I knew who "learnt Engliſh and Portugueſe in a very ſhort time, and "having conquered the habits of pronunciation con- "tracted from his native language, was ſaid, by good "judges, to underſtand and ſpeak them with ſurpriſing "readineſs and propriety."

They are eſteemed at the Cape the moſt faithful ſervants in the world, and the Europeans there are ſo pleaſed with them in that capacity, that they are loth to part with them. Though they are extremely fond of cutlery ware, wine, brandy, and tobacco, and will at any time part with the moſt valuable things they have to purchaſe them; yet they will neither diminiſh them themſelves, nor ſuffer any one elſe to diminiſh the leaſt drop or part of thoſe commodities, when they are committed to their truſt; and the care and fidelity with which they acquit themſelves on theſe occaſions is really ſurpriſing. They are even employed by the Dutch in affairs that require judgment and capacity.

Nothing can give us a juſter idea of a people, than ſeeing how they act on particular occaſions; ſince this more perfectly ſhews their capacities, tempers, and diſpoſitions, than the moſt elaborate diſquiſitions and explanations; with this view we give the reader the following little hiſtory.

An Hottentot named Claas was a man of ſuch integrity and diſcernment, that he was often, ſays Mr. Kolben, entruſted by Mr. Vander Stel, the late governor of the Cape, with large quantities of wine, brandy, rice, and other commodities, and directed to exchange them for cattle among the Hottentot nations at a great diſtance from the Cape, attended by a guard of two armed men belonging to the governor. Theſe commiſſions he executed with addreſs and reputation, and generally returned the governor more and finer cattle than the commodities he carried out could be judged to be worth. To theſe qualities he joined the greateſt humanity and good nature; and, notwithſtanding the ignorance in which he was bred, and in which, with reſpect to religion, he always lived, was a man of excellent morals, and had, perhaps, as much charity and benevolence as the beſt of us all. Many an European in diſtreſs has been relieved by this generous good-natured creature, who, by means of a handſome ſtock of cattle, in which the wealth of the Hottentots conſiſts, was well able to ſupply their wants.

This Claas was deſcended of a family rich in cattle, and the herd he had received from his father was, by his care and prudent management, conſiderably increaſed. He uſually reſided at a diſtance from the Cape, where he lived very happily with his wife, whom the Hottentots eſteemed a great beauty. She loved him tenderly; but her love awaked the envy of the king or captain of his nation, who reſolving to poſſeſs her, and being unable to ſhake her conſtancy, took her away by force. Claas being unable to obtain any relief againſt ſo powerful a raviſher, (the Dutch never intermeddling in the private quarrels of the natives) bore his misfortunes like a wiſe man, ſuppreſſed his grief, and troubled none with his complaints: but his wife gave full ſcope to her reſentment, and equally regardleſs of threats and flatteries, deafened the tyrant with her continual reproaches. He ſhut her up, and, after trying every art to quench her affection for her huſband, reſolved on his deſtruction.

Claas had cheriſhed the Dutch, and in a very extraordinary manner contributed to their eſtabliſhment at the Cape: but his zeal for their ſervice, which had even reached the city of Amſterdam, had procured him many enemies among his countrymen: but he had enemies ſtill more dangerous; theſe were the governor's people, who had before been entruſted to traffic with the Hottentot nations, and had embezzeled the goods delivered them to trade with. None of them returning with cattle that bore any proportion in number or value to his, the

governor had ſet them aſide, and committed the whole buſineſs to Claas, who had now managed it for a conſiderable time with the higheſt reputation. Theſe hateing the man whoſe integrity was a bar to their fortunes, had conſpired his deſtruction; and knowing how eagerly it was ſought by the Hottentot chief, who had already injured him in a tender part, they made him of the conſpiracy. It was reſolved, that the raviſher ſhould give information that Claas was endeavouring to raiſe an inſurrection againſt the Dutch, in order to drive them out of the country; and as his father, who was lately dead, had left him ſuch a number of cattle, that he was eſteemed one of the richeſt Hottentots in the country, it was farther reſolved, that the raviſher ſhould accuſe Claas to the governor of embezzling his excellency's commodities, and defrauding him of a great number of cattle, by which means he had acquired ſuch wealth.

Information was accordingly given, and the governor, who had a thouſand times declared his ſatisfaction at this worthy man's fidelity and affection for him and the ſettlement, either not ſuſpecting the trick, or longing for the great herds of cattle that would fall to him on his conviction, ordered the enſign of the garriſon, who was the arch-conſpirator, to march with a party of ſoldiers, in order to ſeize and bring Claas before him. The honeſt creature was then at the village where he uſually reſided, and the enſign and his party arriving there early in the morning, before any of the inhabitants were ſtirring, cauſed a volley of ſhot to be fired into the cottages. Claas ſallied out upon the alarm, and knowing the aſſailants, addreſſed himſelf in Dutch to the enſign, demanding the reaſon of ſuch an inſult on the village.

The enſign replied, they were come to ſeize and carry him before the governor, to anſwer to a charge of conſpiracy againſt the Dutch; and calling upon him to ſurrender, Claas returned, "I, Sir, conſpire againſt the "Dutch! I, who have given ſo many proofs of my zeal "and affection for them! I, who have ſerved them ſo "long and ſo faithfully!" The enſign replied, it was not his buſineſs to expoſtulate with him; and, if he did not inſtantly ſurrender, he would fire upon him. "Is it "true then, returned Claas, that there is ſuch a charge "againſt me?—But what then have theſe done? Sir? "(pointing to the men, women, and children of the "village, who were now aſſembled in a great fright) "what have theſe done, that their innocent lives ſhould "be expoſed to your fire? Are they too charged with "a conſpiracy againſt the Dutch? If I am only con-"cerned, Sir, it was ſurely great raſhneſs to attack them. "Beſides, was I upon my defence? Or, am I in a poſt "of defence? Did you, before your fire, ſend me no-"tice of your arrival? Did you ſummon me to ſurren-"der; and did I refuſe? There is hardly a man that I "would have ſooner choſen than yourſelf for a judge of "my fidelity to the Dutch, and of the warmth of my "heart for their ſervice. I have given ſo many proofs "of both, and ſo many of theſe have paſſed through "your own hands, that I can neither ſee how you, nor "any one elſe, can entertain a doubt about them."

The enſign commanding him ſilence, ſummoned him again to ſurrender, upon pain of immediate death. Claas then came forward, adding, that as he was innocent he feared no trial, and they might carry him where they pleaſed: upon which they bound him with ropes, the greateſt ignominy next to a ſhameful death, that can befal a Hottentot, and then led him away.

This worthy injured man being brought before the governor, denied every thing laid to his charge with ſerenity of temper; he refuted the allegations of the pretended witneſſes with the utmoſt ſtrength of reaſon, and rehearſed many recent inſtances of his fidelity and affection to the governor and the ſettlement; while his accuſers could only produce the ſuggeſtions of malice, without the leaſt air of proof. The people ſoon ſaw that all was a baſe conſpiracy to ruin him; but obſerving by the governor's behaviour that he would not ſee it, they did not think it ſafe to attempt publickly to detect the conſpirators. In ſhort, Claas was, upon the bare ſuggeſtions of his enemies, convicted before the governor of every charge brought againſt him: he was inſtantly baniſhed for life to Robben Iſland; his effects were confiſcated; and this unjuſt ſentence was immediately put in execution.

The infamous enſign was now appointed to ſucceed Claas in trading for the company with the Hottentot nations for cattle: but, by his perfidious management, the abilities and integrity of Claas daily became more illuſtrious. Being ſoon ſuſpected of breach of truſt, he was put under ſuch reſtrictions as took away all the honour of his employment; and at length, by his folly, arrogance, and knavery, the Hottentots raiſed their markets, and the price of cattle was ſo enhanced to the company, that the directors put a ſtop to all commerce with the Hottentots, and ordered that all ſupplies of proviſions for the uſe of the company ſhould be purchaſed of their own burghers at the Cape.

We have already mentioned the humanity of Claas: among others who had taſted of his hoſpitality, and felt and bleſſed his bountiful hand in the time of their misfortunes, was captain Theunis Gerbrantz Vander Schelling, who having loſt his ſhip in the bay of Algoa, on the eaſtern coaſt, was forced to go by land to the Cape, through ſeveral Hottentot nations, and to ſubſiſt on the charity of the people. In this diſtreſs he was met by Claas, who entertained and relieved him in ſo bountiful a manner, that, to the honour of the captain for his gratitude, as well as of the Hottentot for his hoſpitality, he delighted to tell the ſtory; and upon the repair of his broken fortune, which was not effected till after the death of Claas, would be ever expreſſing his ſorrow, that the generous creature was dead to whom he owed a thouſand returns of kindneſs. This gentleman was indeed at the Cape in the time of Claas's troubles; but was then unable to aſſiſt him. However, he ſaw how matters were carried againſt him, and upon his arrival in Holland made ſuch repreſentations to the directors in his favour, that by the firſt opportunity they diſpatched orders to the Cape for the recalling of Claas, and reſtoring all his effects. He was accordingly recalled; but as for his cattle, the wolves by whom they had been ſeized, could be brought to reſtore only a very ſmall part. He, however, repaired very contentedly with the trifles that were allowed him to his old ſeat; but was ſoon murdered by the Hottentot chief, who found the poſſeſſion of his wife extremely precarious while her huſband was living; and the Dutch never intermeddling between the Hottentots in affairs wherein they themſelves are not concerned, the ruffian was never called to an account.

To return to the character of the Hottentots in general: Notwithſtanding what has been ſaid of them, they ſeem to place all human happineſs in ſloth and indolence. They can think to purpoſe if they pleaſe; but they hate the trouble of thought, and look upon every degree of reaſoning as a diſagreeable agitation of mind: they therefore never exert their mental powers but in caſes of neceſſity; that is, when it is neceſſary to remove ſome preſſing want of their own or their friends. If the Hottentot be not rouzed by any preſent appetite or neceſſity, he is as deaf to thought and action as a log; but when thus urged, he is all activity. Yet when theſe are gratified, and his obligation to ſerve is at an end, he retires to enjoy again his beloved idleneſs.

SECT. IX.

Of their Food, their Manner of dreſſing it, and their Regulations in Relation to Things forbidden. Their fondneſs for Tobacco, Dacha, the Kanna Root, Wine, Brandy, and Arrac.

SOME authors pretend, that all the Hottentots devour the entrails of beaſts, uncleanſed of their filth and excrements, half broiled; and that whether ſound or rotten, they conſider them as the greateſt delicacies in the world: but this is not true. When they have entrails to eat, they turn and ſtrip them of their filth, and waſh them in clean water. They then boil them in the blood of the beaſt, if they have any; if not, they broil them on the coals. This, however, is done in ſo naſty a manner as to make an European loath their victuals. They have, indeed, been repreſented as the moſt filthy people with reſpect

reſpect to their food in the world; but this is not true, they being exceeded in naſtineſs by the Kamptſchadales, and even the inhabitants of St. Kilda, who are fond of putrid fiſh and rotten eggs. However, uncleanly as their manner of dreſſing their proviſions is, thoſe who keep to the diet of their country have few diſeaſes, are ſeldom ſick, and live to an extreme old age. But thoſe who drink wine, brandy, or other ſtrong liquors, ſuffer diſeaſes before unknown to them, and ſhorten their days: even the meat dreſſed and ſeaſoned after the European manner is very pernicious, with reſpect to them.

The proviſions of the Hottentots conſiſt not only of the fleſh and entrails of cattle, and of certain wild beaſts, but of fruit and roots. Except upon ſolemn occaſions, they ſeldom kill any cattle for their own eating; but readily feed upon thoſe that die naturally. The women furniſh them with fruit, roots, and milk; and when they are not contented with theſe, the men go a hunting, or, if they live near the ſea, a fiſhing. They boil the fleſh of their cattle in the ſame manner as the Europeans; but their roaſting is very different, and is performed in the following manner: a large flat ſtone being fixed on the ground in the manner of a hearth, a briſk fire is made upon it, which burns till the ſtone is thoroughly heated: the fire is then removed, the ſtone cleaned from the aſhes, and the meat placed upon it. It is then covered with a flat ſtone, as large as that upon which the meat lies. They then make a fire both round the meat and upon the ſtone which covers it, and thus it remains till it is roaſted, or rather baked.

They love to eat their meat very raw, and do it in ſuch a hurry, tearing it in pieces with their fingers, in a manner that makes them look extremely wild and ravenous. They uſe the lappets of their croſſas as plates, and their ſpoons are mother of pearl and other ſea-ſhells, but they put no handles to them.

They eat many ſorts of roots and fruit, in the choice of which they follow the hedge-hog and the bavian, a kind of ape, and will taſte of no ſort which thoſe creatures do not feed upon; for in the country are many fruits that appear very agreeable to the eye, and many roots which promiſe well for food, that are of a poiſonous nature.

They never paſs their milk through any kind of ſtrainer, but drink it ſettled or unſettled from the veſſel in which it was received from the cow. In this they boil the roots they eat, making of the whole a kind of pap.

Their manner of making butter is extremely filthy; inſtead of a churn they uſe the ſkin of a wild beaſt, made up into a ſort of ſack, with the hairy ſide inwards. Into this ſack they pour as much milk as will about half fill it, then tying up the ſack, two perſons of either ſex take hold, one at each end, and toſs the milk briſkly to and fro, till it becomes butter. They then put it in pots, either for anointing their bodies, or for ſale to the Europeans; for none of the Hottentots, except thoſe in the ſervice of the Europeans, ever eat any butter. This butter is extremely foul with the hair and other filth that ſticks to it, as well as with the greaſe and dirt that continually ſticks to tbe hands of the Hottentots; but though the ſight of it is enough to make any one ſick, yet there are Europeans at the Cape who buy it in large quantities; and having the art of purging it of its filth, make it look like the butter of Europe. The greateſt part of what they have ſo cleanſed they ſell to great advantage to maſters of ſhips and others, as butter of their own making, and the reſt they eat themſelves. Theſe Europeans, exceeding even the Hottentots in naſtineſs, give the dregs and refuſe of this filthy butter to their ſervants and ſlaves to eat: though the Dutch governor at the Cape publiſhes, from time to time, an expreſs order to the contrary, for fear the health of the people ſhould be injured by mingling ſuch foul unwholeſome butter in the ordinary diet of the ſervants. The butter-milk, foul and hairy as it comes from the ſack, the Hottentots give to their calves and lambs; and, though they never ſtrain it, they ſometimes drink it themſelves.

The Hottentots have no ſet times for their meals, but eat as humour or appetite invites, without any regard to the hour of the day or night. In fair and calm weather they eat in the open air, but when it is windy or rainy they eat within doors.

It is remarkable, that they have traditionary laws forbidding the eating of certain meats, which they accordingly abſtain from with great care. Swine's fleſh, and fiſh that have no ſcales, are forbidden to both ſexes. The eating of hares and rabbets is forbidden to the men, but not to the women. The blood of beaſts, and the fleſh of the mole, are forbidden to the women, but not to the men. But, notwithſtanding theſe diſtinctions, both the men and the women are ſo very filthy as to eat lice; and if they are aſked how they can eat ſuch deteſtable vermin, they cry they do it in revenge:" "They ſuck our blood, ſay they, "and do not ſpare us; why ſhould not we be even with "them? why ſhould we not make repriſals?"

It has been already intimated, that when pinched with hunger, they will devour the rings of leather which the women wear upon their legs. They will alſo, upon the ſame occaſion, eat the old caſt-off pieces of the hide of an ox or ſtag that have been worn for ſhoes, which they only dreſs by ſinging off the hair; then having ſoaked them a little in water, they broil them upon the fire till they begin to wrinkle and curl up, and then they devour them.

The Hottentots, when among themſelves, never eat ſalt, nor ſeaſon their proviſions with any kind of ſpice: yet they are not a little delighted with the high ſeaſoned food of the Europeans; but ſuch proviſions are very pernicious to them, they being often ſick at the ſtomach, and attacked by fevers, after ſuch a meal; and thoſe who eat for any length of time with Europeans, become ſubject to many diſeaſes they were in no danger of experiencing while they lived in their own manner, and never attain the great age to which the Hottentots uſually live.

It has been always cuſtomary with them, for the men to avoid joining with the women, not only at their meals, but in any entertainment whatever; and there is no exception to this rule, but the indulgence that is granted to a man on his wedding-day; for they apprehend, that ſome of the women may be in a ſtate of defilement, when it is criminal for them even to come near them.

The wealthy Hottentots, when they travel, generally carry with them ſome fleſh-meat, and being uſually provided with a flint and ſteel, and fuel being every where to be had, they can eaſily make a fire in order to dreſs it. Thoſe who are not provided with a flint and ſteel, light a fire by rubbing a dry twig upon a piece of iron-wood they carry with them. This twig they rub ſo quick and hard that it preſently ſmokes, and ſoon after flames; and then they light a fire by adding other fuel. If they are obliged to lie all night in the fields, they make a large fire in order to preſerve themſelves from the cold, and to frighten away the wild beaſts. Their tinder is a dry reed, which catches fire as quick as the tinder made of the fineſt rags.

Both the men and women are extravagantly fond of ſmoking tobacco. Their paſſion for this plant has no bounds, for when they are without it, they will part with any thing they have to procure more. They ſay that nothing they eat or drink is ſo exquiſite a regale, and that it comforts and refreſhes them beyond expreſſion. A Hottentot, who has no other means of procuring it, will perform a hard day's work for half an ounce; and when he gets it, will hug it in a tranſport of joy. The Europeans at the Cape think them much better judges of tobacco than themſelves; and, indeed, by ſmoking a pipe out of a parcel of tobacco they will diſcover its good or bad qualities to a wonderful nicety, and give a particular detail of them. For this talent they are in no little eſteem among the Europeans at the Cape, who ſeldom purchaſe a ſtock of tobacco till a Hottentot has ſmoked a pipe of it, and paſſed his judgment; and indeed they are very proud of this office.

A Hottentot will never enter into the ſervice of an European, except tobacco be made a part of his wages; and he muſt have a certain allowance of it every day, or it is in vain to treat with him: and if the quantity agreed upon be with-held but one day, he inſtantly becomes untractable; upon the like uſage the day after, he demands his other wages, and can hardly be perſuaded to ſtrike another ſtroke for ſuch a maſter.

The

The Hottentots are alſo extremely fond of dacha, which they ſay baniſhes care and anxiety like wine or brandy, and inſpires them with a thouſand delightful fancies, and with this they are often intoxicated to a degree of madneſs: they frequently ſmoke dacha mixed with tobacco.

There is likewiſe a root gathered in the Hottentot countries called kanna, which is ſo highly eſteemed for its great virtues, that they almoſt adore it; and what greatly inhances its value is its ſcarcity, for it is very ſeldom found. They conſider it as the greateſt chearer of the ſpirits, and the nobleſt reſtorative in the world. They will any of them run twenty miles upon an errand for a very ſmall bit of it; and if you give them the leaſt chip, they will run and ſerve you like a ſlave for ſo charming an obligation. Mr. Kolben ſays, he diſtributed a bit of this root not bigger than his finger, in ſmall chips, to ſeveral Hottentot families, near which he reſided, and ſo gained their hearts by theſe little preſents, that from that time till the time he left them, they ſought all opportunities to oblige him.

Several authors have ſuppoſed this to be the ginſeng of the Chineſe, and indeed it has ſurpriſing effects in raiſing their ſpirits, for they ſcarcely begin to chew it before their eyes brighten, their faces aſſume an air of gaiety, and their imaginations are greatly enlivened: but it is not certain that it has the medicinal virtues aſcribed to ginſeng.

The Hottentots are great lovers of wine, brandy, and arrac. For wine they never trouble themſelves about its qualities, if it has but the taſte of the grape. They are immoderately fond of brandy, becauſe it ſoon makes them merry; but apprehend that malt-ſpirits are not ſo wholeſome, and therefore they drink little of them: but as arrac is cheaper at the Cape than brandy, they frequently drink it to exceſs, and even boaſt of it the next day as an extraordinary honour.

However, the ordinary drink of the Hottentots is milk and water, for they have nothing better of their own, and cannot afford to make a large purchaſe of wine or brandy. When they are plentifully provided with milk, they often drink it without water; and when they have no milk, they are contented with water alone.

SECT. X.

Of their Huts and Furniture, with the Form of their Villages, and the Manner in which they are guarded by Dogs and fighting Oxen. Of their Management with reſpect to their Cattle, and their Dexterity at ſeveral Arts.

WE ſhall now deſcribe the manner of building their huts, and diſpoſing of their villages. The huts are all oval, about fourteen feet the longeſt way, and the ſhorteſt about ten; formed of ſticks, one end of which is fixed in the ground, and the other bent over the top, ſo as to form an arch, but they are ſeldom ſo high as to allow a man to ſtand upright within them. The arches being fixed and made ſteady by croſſing them with bent ſticks, tied with a kind of rope made of ruſhes, the whole is covered with mats made ſo faſt to each other, and to the ſticks, as not to be removed by the wind and rain. Thoſe of the wealthy Hottentots have alſo a covering of ſkins. Theſe huts have no other opening but at the entrance, which is alſo arched, and no more than about three feet high. On the top of this entrance is fixed a ſkin, which may be let down in order to keep out the wind, or taken up to admit the light; and this is alſo the only paſſage for their ſmoke.

Their furniture conſiſts of earthen pots for dreſſing their victuals, and ſeveral other veſſels for holding water, milk, and butter. Their bed is a ſkin ſpread in a hole ſunk a little below the ſurface of the ground, and their fire-place a hole made in the middle of the hut. The huts of the wealthy are frequently hung with beautiful ſkins, and a variety of trinkets. A village conſiſts of twenty or more of theſe huts placed near each other in a circle, leaving an area in the middle, each village containing from one to three or four hundred perſons. Though all the Hottentot huts are narrow, dark, and filthy, harmony, that heavenly charm, ſo ſeldom found in the palaces of Europe, continually reigns in almoſt all of them. When a difference ariſes between a man and his wife, it is ſoon accommodated; all their neighbours inſtantly interpoſe, and the quarrel is ſpeedily made up. The Hottentots run to the ſuppreſſion of ſtrife when it has ſeized a family, as we do to put out a fire that has ſeized a houſe, and allow themſelves no reſt till every matter of diſpute is adjuſted, and peace and tranquility reſtored.

There is hardly a hut that has not a dog or two belonging to it, and theſe are extremely cheriſhed by their maſters for their fidelity and good ſervices. Theſe dogs they allow to ſit about the fire with them, but turn them out every night to guard their cattle, who encompaſs the village on every ſide; and this office the dogs diſcharge with great watchfulneſs and courage.

A dog is the only domeſtic animal the Hottentots have, and he is ſo neceſſary, that they can by no means do without him; but though the dogs of the Hottentots have a thouſand good qualities, there is nothing in their appearance that indicates any one of them; for their mouths are pointed, their ears erect, and their tail, which is long and ſlender, they drag on the ground; their hair, which is thin, but long, points every way, and falls no where ſleek upon their bodies.

The Hottentots have alſo what they call backeleyers, or fighting oxen, which they uſe in their wars, as ſome other nations do elephants; and theſe, as well as their dogs, are of great uſe in the government of their herds at paſture, for upon a ſignal given they will fetch in ſtragglers. Every village has at leaſt half a dozen of theſe oxen; and when one of them dies, or grows ſo old as to be unfit for ſervice, the moſt ſtately young ox is choſen out of the herd, and taught to ſucceed him. The backeleyers know every inhabitant of the village; but if a ſtranger, and particularly an European, approaches the herd without having with him an Hottentot of the village to which they belong, they make at him full gallop, and if he is not within hearing of any of the Hottentots who keep the herds; if there is not a tree which he can immediately climb; or if he has not a light pair of heels, or a piece of fire-arms, he is certainly ſlain: but they no ſooner hear the whiſtling of the keepers thro' their fingers, or the report of a piſtol, than they return to the herds.

The Hottentots have likewiſe great numbers of oxen for carriage, which they break with ſuch art, that they render them as obedient to their drivers, as a taught dog in Europe is to the commands of his maſter. When the Hottentots remove their villages, they convey the materials of their huts, with their furniture, on the backs of theſe oxen.

It is neceſſary to obſerve, that all the cattle of a village run together, and the meaneſt inhabitant who has but a ſingle ſheep has the privilege of turning it into the flock, where as much care is taken of it as of the ſheep of the richeſt and moſt powerful of the village. They have no particular herdſmen or ſhepherds for driving their cattle to the paſture, and guarding them from wild beaſts. This is an office which they all take upon them by turns, three or four of them together, while the women milk the cows morning and evening. In the area of the village they lodge the calves and all the ſmall cattle, and on the outſide range their great cattle, tying two and two together by the feet. Theſe are in the night guarded by the dogs.

The Hottentots are extremely expert at ſeveral arts: they with ſurpriſing dexterity cut out the hide of a beaſt in an even ſtrap many yards in length: they make mats of great ſtrength of flags and bulruſhes, and form handſome earthen pots of the mould of ant-hills, in which the bruiſed eggs form a ſurpriſing cement. They make this earthen-ware on a ſmooth flat ſtone by hand, as our paſtry-cooks do a pye, in the form of a Roman urn: they let it dry in the ſun, and then burn it in a hole made in the earth by making a quick fire over it. Theſe pots are as black as jet, and of a ſurpriſing firmneſs.

The Hottentot ropes are made of flags, reeds, and bulruſhes dried in the ſun; and are as ſtrong, neat, and durable as the beſt European ropes made of hemp. The flags, &c. are twiſted ſeparately into ſmall ſtrings, and tied afterwards at the length of four yards: theſe lengths

are afterwards twiſted one round another to the thickneſs of an inch and a quarter. Though they make them only with their hands, frequent experiments have been made of the ſtrength of theſe ropes, which no pair of oxen could ever break.

The inſtruments they uſe for ſewing their ſkins are, the bone of a bird, for an awl; ſplit ſinews, or the veins of the back-bones of cattle dried in the ſun, for thread; and a knife for ſcraping the croſſas.

They dreſs their ſheep-ſkins, or thoſe of their wild beaſts, while warm, by repeatedly rubbing them only with fat, when they are to be ſold to an European; and with cow-dung and fat alternately, when they do it for themſelves. Their hides are tanned by rubbing wood-aſhes into the hair, which they afterwards ſprinkle with water, and lay them rolled up in the ſun. In two days time he opens the hide, and if he finds the hair looſened, plucks it off: if it ſticks faſt, he rubs it again with aſhes, and having ſprinkled it with water, rolls it up again, and lays it up for two days more in the ſun. A ſecond time never fails to looſen the hair, and that being taken off, he rubs as much fat as he can into the hide, labouring and currying it with all his might, till it has received a full dreſſing.

The ivory workers make ornamental rings for the arms: a knife is the only tool; and yet the rings, when finiſhed, are as round, ſmooth, and bright, as the moſt expert European can produce.

They point their weapons with iron, which they even draw from the ore; for this purpoſe they dig a hole in a raiſed piece of ground, and at about a foot and a half on the deſcent from it make another of leſs extent, to receive the melted iron, which is to run into it by a channel made from the bottom of the upper hole. In the firſt hole they kindle a fire, and when the earth about it is ſufficiently heated, put in the iron-ſtone, and make a large fire over it, which they ſupply with fuel till the iron runs into the receiver. When the iron is cold they take it out, heat it in other fires, and laying it upon one ſtone beat it with another, and thus form their weapons; after which they grind and poliſh them upon a flat ſtone ſo neatly, as to render it valuable both for its uſe and beauty. This ingenuity, which perhaps could not be equalled by an European ſmith with the ſame tools, is not wholly inconſiſtent with their habitual indolence; for a poor Hottentot having made a ſett of arms for his own uſe, and another for ſale to a rich one, by which means he procures two or three head of cattle, can hardly ever be induced to apply himſelf to the ſame labour again.

They are likewiſe very dexterous ſwimmers; but perform this in a manner different from other nations; for they beat the water with their feet, and raiſing themſelves erect, paddle along with their necks and arms above the ſurface. They thus not only croſs deep rivers, but proceed with great ſwiftneſs in the ſea, dancing forward without the leaſt apprehenſion of danger, in the manner which our ſwimmers call trading the water, riſing and falling with the waves, like ſo many corks.

They are alſo very expert at fiſhing both in the ſea and in the rivers; they are well acquainted with angling, and know the beſt baits for moſt ſorts of fiſh. Before they became acquainted with the Europeans, their hooks were made by themſelves; but now they are generally well provided with European fiſh-hooks. They are eſteemed by the Europeans extremely dexterous at drawing a net. They uſe the ſpear in creeks and rivers, and are alſo very expert at taking of fiſh by groping or tickling, which they do in brooks, and the creeks and baſons formed by nature among the rocks, in which are frequently found many fiſh upon the fall of the tide.

SECT. XI.

Of their offenſive weapons, and the amazing ſkill with which they uſe them. Of the Manner in which they hunt the Elephant, Rhinoceros, Lion, Tyger, &c. The Art with which they intrap Elephants, and their Method of making War.

THE dexterity of the Hottentots in diſcharging an arrow, and throwing what they term the haſſagaye and rackum-ſtick, is very amazing. A Hottentot arrow conſiſts of a ſmall tapering ſtick, or cane, about a foot and a half in length, pointed with a thin piece of iron barbed, and joined to the ſtick, or cane, by a barrel. Their bows are made of olive or iron wood, and the ſtrings of the ſinews or guts of beaſts faſtened to a ſtrong wooden or iron hook at each extremity of the bow. The quiver is a long narrow bag made of the ſkin of an elephant, ox, or elk, and ſlung over the ſhoulder by a ſtrap faſtened to it: on the upper end of the quiver is fixed a hook, on which the bow is hung when they go to war or to the chace. The haſſagaye uſed by them is a kind of half pike; the ſhaft is a taper ſtick of the length and thickneſs of a rake handle, armed at the thickeſt end with a ſmall thin iron plate, tapering to a point, and very ſharp on the edges. The rackum-ſtick is a kind of dart, little more than a foot long, made of hard wood.

In the uſe of theſe weapons the Hottentots ſhew ſuch quickneſs of eye, and ſureneſs of hand, as perhaps no people upon earth have beſides themſelves. If a Hottentot ſees a hare, wild goat, or deer, within thirty or forty yards of him, away flies the rackum-ſtick, and down falls the animal. They are equally expert in the uſe of the bow and arrow; for if there be no wind, they will hit a mark of the ſize of a ſilver penny at a conſiderable diſtance. They are no leſs perfect in throwing the haſſagaye and ſlinging a ſtone. In all theſe caſes they do not, like the Europeans, ſtand like ſtatues to take their aim; but while they gather it, which they are not long in doing, they ſkip from ſide to ſide, and brandiſh and whirl the weapon about in a manner that ſeems nothing more than idle flouriſh; but on a ſudden away it flies to the mark. In ſhort their amazing dexterity on theſe occaſions can ſcarcely be conceived, and is quite incredible.

When all the men of a village are out upon the chace, and diſcover a wild beaſt of a conſiderable ſize, they ſtrive to ſurround him, which they generally do very ſoon, even though the beaſt takes to his heels. If they thus encompaſs a rhinoceros, or an elephant, they attack him with haſſagayes; for theſe beaſts, by the thickneſs of their ſkins, are fortified againſt a ſhower of arrows. If they do not lay him dead upon the ſpot, and he is able to return the attack upon the Hottentots, they form as large a ring as they can, ſo as to reach him with their haſſagayes. The animal, on being wounded, runs with great noiſe and fury at the perſons who threw the weapons. Others inſtantly attack him in the rear. He turns about to be revenged on the laſt aſſailants, and is again attacked in the rear. Again he turns about, and is again attacked. The haſſagayes multiply upon his body. He roars, tears up the ground, and has ſometimes before he falls a foreſt, as it were, of haſſagayes upon his back.

When they thus encompaſs a lion, a leopard, or a tyger, they attack him both with their arrows and haſſagayes. With flaming eyes, and the moſt wild and furious rage, he flies at thoſe who diſcharge them. He is nimble, but they are ſtill nimbler, and avoid him with amazing ſwiftneſs and dexterity, till they are relieved by others. He ſprings towards one with ſuch rapidity, and you would think with ſo ſure a paw, that you ſhudder for the fellow, from the apparent certainty of his being inſtantly torn to pieces; but, in the twinkling of an eye, the man leaps away, and the beaſt ſpends all his rage upon the ground. He turns and ſprings at another, and another, and another; but ſtill in vain: they avoid him with the quickneſs of thought, and ſtill he only fights with the air. Mean while the haſſagayes and arrows are ſhowering upon him in the rear. He becomes mad with pain, and tumbling from time to time to break the arrows and haſſagayes faſtened in his back and ſides, he foams, yells, and roars in the moſt terrible manner. Nothing can equal the amazing activity and addreſs with which the Hottentots eſcape the paws of the beaſt, and the incredible ſpeed and reſolution with which they relieve one another. If the beaſt is not quickly ſlain, he is ſoon convinced that there is no dealing with ſo active and nimble an enemy, and then makes off with his utmoſt ſpeed; but having his back and ſides transfixed with a multitude of haſſagayes and arrows, ſome of which being generally poiſoned, he can ſeldom run far, but falls and dies.

The Hottentots, however, ſeldom engage a rhinoceros or elephant in this manner. The elephants always going to water in troops in a line, make a path from the places they frequent to the water ſide; and in this path the Hottentots, without either ſpade or pick-ax, for they have no ſuch tools, make a hole from ſix to eight feet deep; in the midſt of which they fix a ſtrong ſtake, which tapers up to a point almoſt to the top of the hole, and then cover the pit with ſmall boughs, leaves, mould, and graſs, ſo that no man living would ſuſpect the trap. The elephants keeping pretty cloſe to the path, one of other of them is ſure to fall in with his fore-feet, when his neck or breaſt being pierced by the ſtake on which his whole body reſts, the more he ſtruggles, the farther it penetrates. The other elephants inſtantly make off as faſt as poſſible. Mean while the Hottentots ſeeing the elephant thus caught, iſſue from their covert, get upon his neck, and either break his ſkull with heavy ſtones, or cut his large veins with their knives; then cutting the carcaſe in pieces, they carry it to the village, where all the inhabitants feaſt upon it. They alſo frequently take the rhinoceros and the elk in the ſame manner.

The Hottentots, like other nations, ſeek for redreſs in war upon invaſions of their right and national affronts. Upon theſe occaſions every Hottentot flies to arms, and aſſembles at the place of rendezvous; but before any acts of hoſtility are committed, deputies are diſpatched to remonſtrate againſt the injuries the others have committed, and to demand ſatisfaction. Upon the refuſal or delay of juſtice, the injured nation marches in ſearch of the enemy. The attack begins with the moſt frightful noiſe, ſhowers of arrows are inſtantly diſcharged, the Hottentots continuing the battle in alternate ſallies and retreats to the main body; for when one has diſcharged his arrow or haſſagaye, he retreats a little to make room for another behind him, who takes his place; and, by the time his ſucceſſor has diſcharged his weapon, has fitted to his bow another arrow, or to his hand another haſſagaye; and if a third obtains not the ground before him, ſallies forward and attacks again. Thus they continue ſallying out, and retiring into the crowd behind, till the fortune of the day is decided, which in a great meaſure depends on the conduct of the chief, to whoſe command the whole army pays a ſtrict and ready obedience. The conduct of the chief principally appears from his ordering when and where the backeleyers, or fighting oxen, ſhall ruſh upon the enemy; for if they but once penetrate the main body, they make incredible havock, goring, ſtamping, and kicking with incredible courage and activity; and when they are well ſeconded by the men, the enemy is ſoon routed.

Some Hottentot nations have peculiarities worthy of notice: thus the Chamtouers and Heykoms never ceaſe fighting while their chief plays on a kind of flageolet, though their loſs be ever ſo great; but the pipe no ſooner ceaſes than they retreat, and as ſoon as he plays again march back and renew the attack. Thus if the enemy runs, and the flageolet continues playing, they purſue; but if it ceaſes, they let the enemy go.

Some Hottentot nations fight as long as they can ſee their general, and when he is ſlain or diſappears, they betake themſelves to flight.

A Hottentot army once put to the rout, has little or no notion of rallying: but they have an honeſty in war peculiar to themſelves; they touch not the ſlain of the enemy, either to inſult or plunder them; for they ſeize neither the haſſagayes, arrows, croſſas, or any thing elſe belonging to them. Having carried off their own ſlain for interment, they leave the reſt to be taken from the field by the enemy, which is done as ſoon as the victors retire; but the priſoners taken in battle are inſtantly ſlain. They alſo put to death deſerters and ſpies wherever they are found.

It ought not to be omitted, that in time of battle they ward off the arrows, haſſagayes, and rackum-ſticks, that are thrown at them, with the kirri, or kirry-ſticks, which they only uſe as a defenſive weapon.

In time of peace the old men frequently exerciſe the people in mock fights, in which they only throw a haſſagaye now and then; theſe diſputes being chiefly maintained by rackum-ſticks, kirri-ſticks, and ſtones. Nothing can be more amazing than the dexterity with which the Hottentots ward off haſſagayes, rackum-ſticks, and ſtones, with the kirri ſtick only; for a Hottentot no ſooner ſees himſelf in danger from a haſſagaye, a rackum-ſtick, or a ſtone, than he ſtands ſtock ſtill, under the guard of the kirri-ſtick, and with that turns it aſide.

SECT. XII.

Of the Marriages of the Hottentots; their Laws relating to Divorces; their regard to Decency; their Delivery of the Women; Treatment of their new-born Children, and their Education before the Boys are made Men.

IF a perſon is diſpoſed to marry, he diſcovers his views to his father; and if he be dead, to the next in authority of kindred; who, if he conſents, attends him to the relations of the woman, whom they regale with a pipe or two of tobacco or dacha, which they all ſmoke. The lover's father then opens the affair to the father of the woman, who on hearing it uſually retires to conſult his wife; but ſoon returns with a final anſwer, which is generally favourable. If the lover's father receives a denial, which ſeldom happens, nothing more is ſaid about it, and the lover at once tears the object of his affections from his heart, and looks out for another. But if it be complied with, he chooſes two or three fat oxen from his own herd, or his father's, and drives them to the houſe from whence he is to take his deſtined bride, accompanied by all his relations of both ſexes who live near him. They are received with careſſes by the woman's kindred, and the oxen being immediately ſlain, the whole company beſmear their bodies with the fat; after which they powder themſelves all over with buchu, and the women ſpot their faces, as already mentioned, with a kind of red chalk. The men then ſquat on the ground in a circle, the bridegroom ſquatting in the center. The women aſſemble at ſome diſtance, and likewiſe ſquat in a circle round the bride. At length the prieſt who lives at the village where the bride reſides, enters the circle of the men, and coming up to the bridegroom piſſes a little upon him; the bridegroom receiving the ſtream with eagerneſs, rubs it all over his body, and makes furrows in the greaſe with his long nails, that the urine may penetrate the farther. The prieſt, who has for ſome time reſerved his urine for this purpoſe, then goes to the other circle, and evacuates a little upon the bride, who rubs it in with the ſame eagerneſs as the bridegroom. The prieſt then returns to him, and having ſtreamed a little more, goes again to the bride and ſcatters his water upon her: thus proceeding from one to the other till he has exhauſted his whole ſtock, uttering from time to time to each, the following wiſhes, till he has pronounced the whole upon both: "May your life together be long and happy. "May you have a ſon before the end of the year. May "this ſon be your comfort in your old age. May he "prove a man of courage, and a good huntſman."

The nuptial ceremony being thus ended, the oxen are cut in many pieces, ſome of which are boiled and the reſt roaſted in the manner already deſcribed. Dinner being over, what is left is ſet by, and they go to ſmoking, each company having only one tobacco pipe. The perſon who fills it, after taking two or three whiffs, gives it to his or her neighbour, and thus it goes round, the beſt part of the night being ſpent in ſmoking and meriment, till the bridegroom retiring to the arms of his bride, the company ſeparate. The next day they again aſſemble, and feaſt and ſmoke as before; and this is continued every day till the proviſions dreſſed on the day of marriage are conſumed. Upon theſe occaſions they have neither muſic nor dancing, though they are fond of both, and have only their ordinary drink, which is milk and water.

A Hottentot never has a hut of his own till after his marriage, and then his wife aſſiſts him not only in erecting it, but in providing the materials, which are all new, and in making the furniture; after which he leaves to her the care and fatigue of ſeeking and dreſſing proviſions for the family, except when he goes a hunting or fiſhing: ſhe alſo bears a part in attending the cattle.

The Hottentots allow of polygamy; but the richeſt have ſeldom more than three wives. They do not allow of

of marriages between firſt and ſecond couſins, and if theſe either marry, or commit fornication, they are immediately, upon conviction, cudgelled to death.

The men in their marriages have no view to the fortune of the bride, who has ſeldom any portion, but regulate their choice by the wit, beauty, or agreeableneſs of the woman; ſo that the daughter of the pooreſt Hottentot is ſometimes married to the captain of a kraal or village, or to the chief of a nation.

A man may be divorced from his wife, and a woman from her huſband, upon ſhewing ſuch cauſe as ſhall be ſatisfactory to the men of the village where they live; for, upon ſuing to them for a divorce, they immediately aſſemble to hear and determine the affair. But though a man divorced from his wife may marry again when he pleaſes, yet a woman divorced from her huſband cannot marry again while he lives. There is alſo a very ſingular cuſtom, probably intended to prevent the women's engaging in a ſecond marriage, which is, that for every huſband ſhe marries after her firſt, ſhe is obliged on the nuptial-day to cut off the joint of a finger, and preſent it to the bridegroom, beginning at one of the little fingers.

The huſband and wife have ſeparate beds, and he never enters her's but by ſtealth. Before company they behave with the utmoſt reſerve, and you would imagine there was no ſuch thing as love or a conjugal relation between them.

Their modeſty and regard to decency appears in ſome other inſtances; they are never ſeen to eaſe nature, and if an European takes the liberty to fart before them, they make no ſcruple of telling him he ought to be aſhamed.

In every kraal, or village, there is a midwife choſen by the women of the village from among themſelves, and ſhe holds her office for life. When a woman is near her time, ſhe is generally joined by two or three of her female relations or acquaintance; and when the midwife arrives, ſhe lays her on a croſſa, or mantle, on the ground. If her huſband be at home he goes out, and cannot put his head into the hut till ſhe is delivered, without being eſteemed unclean, and forfeiting as a purification a ſheep, and in ſome places two, to the men of the village, who eat the meat, and ſend the broth to their wives.

When the child is born, they firſt rub it gently over with cow-dung, and then lay it on a mantle either by the fire, in the ſun-ſhine, or the wind, till it is ſo dry that it may be eaſily rubbed off. While this is doing ſome women go into the fields to gather the ſtalks of what they call Hottentot figs; and bruiſing them between two ſtones, obtain the juice, with which they waſh the child all over, in order to promote the ſtrength and activity of the body. The child is then laid as before to dry; and the moiſture being ſoaked up, or evaporated, it is beſmeared with ſheep's fat, or butter; and when that has ſoaked well into the pores, they powder it from head to foot with buchu, which they imagine has very ſalutary effects. But firſt the child's navel-ſtring is tied with a ſheep's ſinew ſo long that it hangs down a conſiderable length below the knot; and there it is to remain till it rots off. The belly-band is a narrow piece of ſheep-ſkin. The mantle on which the woman was laid, and the placenta, are buried together in ſome ſecret place.

The child is ſoon after named by the father or the mother, when, like the antient Troglodytes, whoſe manners they ſeem to imitate on many occaſions, they give the infant the name of ſome favourite beaſt, as Hacqua, or Horſe, Gamman, or Lion.

The men are not only obliged to retire out of the ſight of their wives when in labour, but while they have the menſes; and upon theſe occaſions lodge and eat with their neighbours. When the woman is fit for the company of her huſband, ſhe rubs herſelf all over with cow-dung, by way of purification. This being rubbed off when dry, ſhe ſmears herſelf all over with fat, and then powdering herſelf with buchu, waits within to receive him. The huſband having alſo ſmeared himſelf with fat, and duſted himſelf all over with buchu, enters the houſe, and ſitting down puts many endearing queſtions to his ſpouſe concerning her welfare, and the manner in which ſhe has paſſed her time in his abſence; makes freſh profeſſions of conjugal love, and entertains her with all the pleaſing ſprightly things he is able to utter.

At the birth of the firſt child the parents have a ſolemn feſtival, of which all the inhabitants of the village partake; and theſe rejoicings, if it be a ſon, are far ſuperior to thoſe attending the birth of their other children. The parents are then very liberal in providing cattle for the entertainment of the whole village, and every one congratulates them on their obtaining an heir. If a woman has at any time twins, and they are both boys, they kill two fat bullocks, and all their neighbours, men, women, and children, rejoice at their birth, as an extraordinary bleſſing. The mother alone is excluded from the entertainment, and has only ſome fat ſent her to anoint herſelf and her infants. But if the twins are girls, there is little or no rejoicing, and they at moſt ſacrifice only a couple of ſheep.

On theſe occaſions they frequently practiſe a moſt cruel cuſtom; if the parents are poor, or the mother pretends that ſhe has not milk ſufficient to allow her to ſuckle them both, the worſt-featured of the two is either buried alive at a diſtance from the village, caſt among the buſhes, or tied on its back to the under bough of a tree, where it is left to ſtarve, or to be devoured by the birds or beaſts of prey. Barbarous as theſe cuſtoms are, they were allowed among the politeſt heathen nations. The ancient Greeks and Romans frequently expoſed their children in the woods and highways, as the Chineſe who pride themſelves in being the moſt civilized people in the world do at preſent, and nothing but the light of the goſpel has been able to aboliſh theſe cuſtoms ſo oppoſite to natural affection and humanity.

A female infant thus expoſed is ſometimes found by an European; when if it be dead he generally ſtays to bury it; but if it be alive he always carries it home; and if he is unwilling to take care of it, he eaſily finds thoſe who will take it off his hands. Theſe children always receive a good education, and extraordinary care is taken to inſtruct them in the knowledge of the Chriſtian religion, to prevent their falling off to the idolatry and naſtineſs of the Hottentots; but theſe generous labours have never, it is ſaid, been attended by any laſting effect. It has never been found that the mind of a Hottentot is to be deprived of its native bias; for theſe females thus educated no ſooner come to years of maturity, than flying to their own people, they conſtantly renounce the Chriſtian religion, with the European manners and apparel, embrace the religion and cuſtoms of their anceſtors, and ever after remain with the Hottentots.

The care and education of the children, till the boys are made men, and the girls are married, is committed to the wife. In a little time after her delivery ſhe takes the infant and wraps it in a piece of an old croſſa, with the head juſt peeping out, and tying it on her back, carries it about, both at home and abroad, till it is able to crawl. She even ſuckles it on her back; for her breaſts, like thoſe of the women in ſome other parts of Africa, are ſo long, that ſhe can toſs them upon her ſhoulder, and the child catching hold of the nipple, ſucks till it is filled. While ſhe has the child on her back, ſhe is generally ſmoking dacha, and the wind often carries ſuch a cloud of ſmoke in the child's face, as one would think ſufficient to ſtifle it. It is very diverting to ſee the infant, when it is a little uſed to it, enveloped in a cloud of ſmoke. It ſhakes its head, and fights it very briſkly while it is paſſing; and, when it is gone, ſmiles, ſneezes, and ſtares very pleaſantly. When the child is about ſix months old, ſhe weans it, and then frequently putting her pipe, when almoſt out, into the child's mouth, holds it there from time to time, till its palate is ſeaſoned to the ſmoke, and it catches a fondneſs for the pipe which it never loſes.

The children of both ſexes, as ſoon as they can walk, run after their mother wherever ſhe goes, except prevented by the weather. The daughters when grown up, aſſiſt their mother in gathering of roots for food, and bringing home fuel. It is in the nurſery, and by the women, that the children are taught the traditions and cuſtoms of the Hottentots. The inſtitutions and opinions of their anceſtors, of which the women are the grand repoſitories, are there faſtened upon their memories, and there recommended to all their veneration, and to all their care.

SECT. XIII.

Of the Cuſtom of depriving the males of the left Teſticle; the Ceremony of receiving them into the Society of the Men; the Honours paid to a Man who has ſingly killed a wild Beaſt; and the Ceremonies of their public Rejoicings: their removing their Villages; their Funerals; and their cruel Treatment of the Superanuated.

ONE of the moſt extraordinary cuſtoms obſerved by theſe people, is depriving all the males of the left teſticle, which is generally performed at eight or nine years of age; but the poverty of the parent ſometimes occaſions its being deferred till the youth is eighteen years old, for it is attended with ſome expence.

This cruel ceremony is performed in the following manner. The patient, being firſt ſmeared all over with the fat of the entrails of a ſheep newly killed, lies on the ground upon his back; his hands are tied together, as are his feet; on each leg and arm kneels a friend, and on his breaſt lies another. Being thus deprived of all motion, the operator, with a common knife well ſharpened, makes an orifice in the ſcrotum an inch and a half in length, and ſqueezing out the teſticle, ſpeedily cuts and ties up the veſſels. Then taking a little ball of the ſize of the teſticle of ſheep's fat, mixed with the powders of ſalutary herbs, particularly of buchu, he puts it into the ſcrotum, and ſews up the wound with a fine ſlip of a ſheep's ſinew and the bone of a fiſh, ſhaped like an awl. The wound being thus ſown up, the friends of the patient planted on his legs, arms, and breaſt, riſe, and his bands are looſened. But before he offers to crawl away, the operator anoints him all over with the ſtill warm and ſmoking fat of the kidneys and entrails of the ſheep killed on this occaſion; after which he adminiſters the cuſtomary ceremony of ſcattering his water all over him with a plentiful ſtream, reſerved for the occaſion. The ceremony being now over, the patient is left lying on the ground, and is abandoned by every one; but near the place is a little hut, previouſly erected as a ſort of infirmary; into this he crawls as ſoon as he can, and there remains about two days without any kind of refreſhment; in which time the wound, without any freſh application, is finely healed, and his vigour returning, he ſallies out with the ſpeed of the wind over the neighbouring plains, in teſtimony of his recovery. Thoſe who have never been under the knife are not permitted to ſee the operation.

When the operator and aſſiſtants abandon the patient, they repair to the houſe of his parents, where all the men of the village immediately aſſemble to congratulate them, and feaſt on the ſheep that was killed on this occaſion. They boil and eat the meat, and ſend the broth to their wives. The remainder of the day, and all the next night, are ſpent in ſmoking, ſinging, and dancing. The next morning they anoint their bodies with the remaining fat of the ſheep, duſt their heads with buchu, and return home, the operator receiving a preſent of a calf or lamb for his trouble.

This operation is ſuppoſed to contribute to the agility of the Hottentots. They have alſo a prevailing opinion, that a man with two teſticles conſtantly begets two children, and, beſides, think it ſo extremely indecent and wicked for a man or youth to cohabit with a woman before the performance of this operation, that was any man to do it, both he and the woman would lie at the mercy of the rulers, and the woman would perhaps be torn to pieces by her own ſex.

But before they marry there is alſo a ſecond act of legitimation, which is the receiving them with much ceremony into the ſociety of the men. Till they are about eighteen years of age they are confined to the tuition of their mothers, and conſtantly live and ramble about with them. During this time they are not even to converſe with their own fathers, or any other men; but, by this act they are freed from the tuition of their mothers, baniſhed from their ſociety, and from thenceforward are to converſe with men. When a father, or the generality of the men of a village, reſolve to call a young man into their ſociety, all the inhabitants aſſemble in the midſt of the village, and ſquat down in a circle. The young fellow to be admitted ſtands without the circle, and is ordered to ſquat upon his hams, and then the oldeſt man of the village riſes, and aſks, if the youth ſhall be admitted into their ſociety, and made a man. To this all anſwering, Yes, yes; he leaves the circle, and ſtepping up to the youth, tells him that the men having eſteemed him worthy of being admitted into their ſociety, he is now to take an eternal farewel of his mother, and all his puerile amuſements. That if he is but once ſeen talking to his mother, and does not carefully avoid her company, he will be conſidered as a child, and unworthy of the converſation of the men, from which he will be baniſhed; that therefore all his thoughts, words, and actions, muſt now be manly. This he repeats, till he judges that he has fixed theſe admonitions in his mind. The youth having before well daubed himſelf with fat and ſoot, the old man diſcharges a ſtream of urine all over him, which the youth receives with eagerneſs and joy, making furrows with his long nails in the fat upon his body, he rubs in the briny fluid with the quickeſt motion. The old man having given him the laſt drop, utters aloud the following benedictions, "Good fortune attend thee. May'ſt "thou live till old age. May thy beard ſpeedily grow, "and thou increaſe and multiply."

The youth is then ſolemnly proclaimed a man, and all the men feaſt upon a ſheep provided by his friends, part of which is boiled, and part roaſted; but the youth himſelf is not permitted to join the company, till near the end of the entertainment. If after this he is ever ſeen eating and drinking with the women, he is treated with the utmoſt contempt; he then becomes the jeſt and deriſion of the whole village, and is excluded from the converſation of the men, till the ceremony is performed over again.

A young Hottentot thus freed from his mother's care, may be ſo brutiſh and unnatural as to cudgel her, merely to ſhew his independence. It is even common for a young fellow, on his being admitted into the ſociety of the men, to go and abuſe his mother; and as a proof of the ſincerity of his intentions to follow the admonitions he has received, to inſult and triumph over her, on his being thus diſcharged from her authority.

The father having his ſon now immediately under his care, he compleats his education, by initiating him into all the manly exerciſes practiſed by the Hottentots; he inſtructs him in the uſe of their weapons, trains him up to war and to the chace; and if he is maſter of any handicraft, he teaches it him.

It has been already obſerved, that ſome of the Hottentots have a kind of honourable diſtinction in being allowed to wear bladders tied to their hair, as trophies of their valour; theſe are the perſons who having ſingly encountered an elephant, rhinoceros, lion, tyger, leopard, or elk, are conſidered as heroes. Such a man, on his return home, ſquats down, but is ſoon viſited by an old man, deputed by the reſt of the village, to thank and congratulate him upon his having performed ſo beneficial an exploit, and to acquaint him, that the men of the village expect him, that they may confer on him the honours that are his due.

The hero inſtantly riſes, and attends the meſſenger to the middle of the village, where all the men wait for him, and ſquatting down upon a mat ſpread for that purpoſe, all the men ſquat round him, while the hero's face is flushed with joy. The deputy then marches up to this diſtinguiſhed perſon, and pours a plentiful ſtream of his own water all over him from head to foot, pronouncing over him certain terms, the meaning of which is not known. The brave man, as in other caſes, rubs in the ſmoking ſtream upon his face, and every other part, with the extremeſt eagerneſs. The deputy then lights his pipe, and having taken two or three whiffs, gives it to whoſoever he pleaſes in the circle; who having taken the ſame ſolace, gives it to another, and thus it goes round till only the aſhes remain, which the deputy ſhakes upon the hero, who rubs them into the fat on his body with an eager motion, as if he would not loſe a ſingle particle.

The circle then riſes, he follows their example, and every one congratulates him on the high honour he has received, and thanks him for the ſervice he has done his country. The hero now conſiders himſelf as raiſed to the ſummit of human glory; and by the bladder of the beaſt he has killed, which he wears faſtened to his hair, and the majeſtic port he ever after aſſumes, demands the homage and reſpect which the cuſtom of the Hottentots aſſigns to his high dignity, and which he conſtantly receives from all his countrymen. The death of no wild beaſt gives ſuch joy to the Hottentots as that of a tyger.

They have alſo ſome ceremonies of a general concern, as upon the overthrow of an enemy; on a conſiderable ſlaughter being made of the wild beaſts that devour their cattle; on the removal of a village when the paſture becomes too barren to ſupport their flocks and herds; to propitiate the deity when a diſeaſe prevails among their ſheep, and when an inhabitant dies either by a violent or natural death.

When they intend to make a public entertainment, they erect in the center of the village a kind of booth, or arbour, ſufficient to entertain in a commodious manner all the men, and this is made of new materials, alluding to their deſign of beginning on ſuch occaſions to lead a new life. On the morning of the day appointed for the ſolemnity, the women and children go into the valleys in ſearch of the moſt beautiful and odoriferous herbs, flowers, and boughs of trees, and with theſe adorn the booth. The men kill the fatteſt bullock, part of which is roaſted, and the other boiled. The men eat it in the booth, and the women are obliged to be ſatisfied with the broth alone. They then begin to ſmoke and dance, while a band of muſic compoſed of a kind of flutes formed of reeds, and a ſort of drums, ſtrike up at proper intervals. Some ſing, others crack their jokes, and mirth triumphs in peals of laughter; but notwithſtanding their being exceſſively fond of ſtrong liquors, yet little or none of any ſort is ſeen in theſe ſolemnities, which uſually continue the remainder of the day, and the greateſt part of the night.

When they are determined to remove a kraal, or village, on account of the barrenneſs of the paſture, they kill a fat ſheep: part they roaſt, and part they boil, ſending to the women the uſual regale of broth. The feaſt is conducted with a great deal of mirth and good humour; and is conſidered as a thank-offering for the bounties of nature enjoyed in that place. When they have done, they demoliſh their cots, pack up their furniture, and remove at once, the men in one body, and the children in another, to the place appointed for a new ſettlement, where being arrived, in about two hours time they erect their circular village, and diſpoſe of their furniture. A ſheep is then killed by the women, and dreſſed as before; but they now eat the fleſh themſelves, and ſend their huſbands the broth. Having anointed their croſſas or mantles with the fat, they powder their hair with buchu, and go to ſeveral diverſions among themſelves, which they continue the reſt of the day, and till pretty late at night. The ſheep is here ſaid to be conſidered as a ſacrifice, and the unctions and powderings, as religious formalities, neceſſary to procure the proſperity of the village.

We ſhall now give thoſe ceremonies that attend a perſon's departure out of life. When a man, woman, or child, is in the agonies of death, the friends and relations ſet up a terrible howling, and the breath is no ſooner out of the body, than they form ſo dreadful a chorus of ſcreaming, yelling, roaring, and clapping of hands, that it is impoſſible for an European to ſtay with ſafety to his brains, in the village.

The corpſe is inſtantly wrapped up, neck and heels, much like the poſture of a child in the womb, in the croſſa of the deceaſed, ſo cloſe, that no part of it is to be ſeen. The grave is generally either a cleft in the rock, or a hole made by a wild beaſt; for the Hottentots never dig one, when either of theſe is to be found at a convenient diſtance.

The burial is performed about ſix hours after the perſon's death, and the corpſe being ready to be brought out, all the men and women of the village, except thoſe who are employed about the corpſe, aſſemble before the entrance of the hut, and ſquatting in two circles, the men forming one, and the women the other, they clap their hands, crying in moſt doleful accents, Bo, bo, bo, or Father, father, father. The covering of the hut being removed, the corpſe is brought out from the back part of it; for it muſt not be taken out at the door. The bearers being firſt named by the captain of the village, or by the relations of the deceaſed, carry the body in their arms. When it is brought out of the hut, the circles before the door riſe, and follow it to the grave, the men and women in ſeparate bodies, all the way wringing their hands, howling out, Bo, bo, bo, and putting themſelves in poſtures that appear ſo ridiculous, that it is difficult for an European who is preſent to forbear laughing. Having put the corpſe into the hole, they fill it up with the mould of ant-hills, that it may be the ſooner conſumed, and cram ſtones and pieces of wood into the grave, to prevent its being devoured by wild beaſts.

All the people then return to the village, and ſquatting again in two circles before the door, continue their lamentations for about an hour longer, till the word being given for ſilence, two old men, the relations or friends of the deceaſed, enter each circle, and ſparingly diſpenſe their ſtreams upon each perſon, that all may have ſome, every one receiving their water with eagerneſs and veneration. Then each ſteps into the hut, and taking up a handful of aſhes from the hearth, comes out by the paſſage made for the corpſe, and ſtrews the aſhes by little and little upon the whole company. This they ſay is done to humble their pride, to baniſh all notions of diſtinction, and to ſhew that old and young, rich and poor, the weak and the ſtrong, the beautiful and the diſagreeable, will all be equally reduced to duſt and aſhes.

If the deceaſed left any cattle, the heir now kills a ſheep, and ſome of his neareſt relations, if they are able, do the ſame for the entertainment of the village. The caul of the ſheep killed by the heir is well powdered with buchu, and put about his neck, and he is obliged to wear it till it drops off. The other relations likewiſe wear about their necks the cauls of the ſheep they kill upon this occaſion; theſe cauls being the mourning worn by the rich Hottentots. But if the relations be ſo poor that they cannot afford to kill any cattle for the entertainment of the village, they ſhave their heads in narrow ſtripes, leaving alternately a ſtripe of hair and another ſhaved.

The Hottentots, notwithſtanding the many inſtances in which they ſhew that they are fully ſenſible of all the tender feelings of humanity, and of filial and parental affection, have a moſt horrid cuſtom with regard to thoſe of both ſexes who are grown ſuperannuated. While the old men or women are able to fetch in a ſtick a day, or can perform any office of kindneſs, care is taken to render their lives as eaſy and comfortable as poſſible; but when they can be of no manner of ſervice, they are, by the conſent of the village, placed in a ſolitary hut at a conſiderable diſtance, with a ſmall ſtock of proviſions within their reach, where they are left without any one to aſſiſt them, to die of hunger, or to be devoured by the wild beaſts. Cruel as this cuſtom is, they conſider it as an act of mercy, and are filled with amazement at hearing the Europeans ſpeak of it with horror.

SECT. XIV.

Of the Government of the Hottentots; their Laws and the Manner in which they are executed.

EACH of the Hottentot nations has a chief, whoſe office is to command the army, and who has the power of making peace or war. His poſt is hereditary; but he is not allowed to enter upon it till he has ſolemnly engaged in a national aſſembly not to attempt the ſubverſion of the antient form of government. He was formerly diſtinguiſhed only by the beauty of the ſkins he wore; but the Dutch, ſoon after their eſtabliſhment at the Cape, made a preſent of a braſs crown to the chief of every nation in alliance with them, which they wear upon

upon ſolemn occaſions: however, in time of peace the chief has little more to do than to govern the village in which he reſides.

The captain of a village adminiſters juſtice and preſerves the peace, and in time of war has under the chief of the nation the command of the troops furniſhed by his village. His office is likewiſe hereditary, though he cannot execute it till he has entered into a ſolemn engagement before the people, not to alter or deviate from the antient laws and cuſtoms of the kraal or village. Theſe village-captains were alſo antiently diſtinguiſhed only by the fineneſs of the ſkins they wore, which were thoſe of tygers, or of wild cats; but at preſent they have all a cane with a braſs head given them by the Dutch, which deſcends along with the office. But neither the chiefs of the nation nor theſe captains have any revenue from the public, or any perquiſite attending the execution of their office.

The captain of a village decides all diſputes relating to property, and tries and puniſhes perſons for murder, theft, adultery, and other crimes committed within his juriſdiction, he being aſſiſted by all the men of the village, and from his ſentence there lies no appeal; but ſtate criminals are tried by a chief, aſſiſted by all the captains of villages.

Whenever a diſpute ariſes in relation to property, the captain ſummons all the men of the village into the open field, where they ſquat down in a circle. The plaintiff and defendant plead their own cauſes, and the witneſſes on both ſides are heard. The depoſitions being finiſhed, the captain, after ſome debate, collects the voices, and immediately pronounces the decree according to the majority; upon which a full and quiet poſſeſſion is inſtantly ſecured to the party in whoſe favour the decree is paſſed.

The criminal matters which employ the village-courts are adultery, robbery, and murder; for adultery is puniſhed with death. When a Hottentot is known or ſuſpected to have committed any of theſe crimes, notice is given to all the men of the village to which he belongs, who, conſidering themſelves as officers of juſtice, watch with the utmoſt care in order to ſeize the ſuſpected perſon; and it is in vain for him to think of finding ſanctuary in any other Hottentot nation, for he would be taken up as a fugitive or ſpy. The criminal being apprehended, is ſecured till the men of the village can aſſemble, which is done the very day in which he is brought back.

The court being ſeated on their hams in a circle, the priſoner is placed in the middle, becauſe the Hottentots juſtly obſerve, that in an affair in which a man's life is concerned, he ought to be allowed the beſt ſituation for hearing and being heard. The charge againſt him is then pronounced by the proſecutor, and his witneſſes give their evidence. The priſoner then makes his defence, calling his own witneſſes, who are heard with the utmoſt indulgence. At length the captain of the village, after ſome debates on the evidence, collects the voices, a majority of which acquits or condemns the priſoner. If he be acquitted, damages are aſſigned him out of the proſecutor's cattle: but if he be convicted, and judged worthy of death, ſentence is immediately pronounced: the court riſes, while the priſoner ſtands ſtill without ſtirring a limb: for a minute or two all is ſilent, till the captain flies at the priſoner, and with one blow on the head, with his kirri-ſtick, lays him on the ground. All the reſt following his example, ruſh forwards, and ſtriking him with all their ſtrength, he in a moment expires.

Juſtice being thus executed, they bend the corpſe neck and heels, wrap it up in his croſſa, and bury it with every thing found about it, except the ear-rings and other ornaments, which are given to his family, or to his heir, who ſuffers nothing, either in his name, privileges, or property; for his family, relations, and friends, are treated with the ſame reſpect as before, and every thing proceeds as if no ſuch misfortune had ever happened. Even the memory of the criminal is ſo far from being inſulted, that his corpſe is interred with the ſame ceremonies, and with as much pomp, as is ſhewn at the funeral of the richeſt and moſt virtuous among them.

All the wealth of the Hottentots deſcends to the eldeſt ſon, or, when a ſon is wanting, to the next male relation; and the younger ſons, who are at home and unprovided for at the death of their father, are at the courteſy of the eldeſt, both with reſpect to their fortune and their liberty; for if a Hottentot has ſeveral ſons, he can, on his death-bed, leave nothing to the younger, without the conſent of the eldeſt. If he makes any proviſion out of his herd or flock, he muſt do it while he is in his vigour. As all the Hottentots have an ardent love of liberty, an elder brother's detaining the younger in ſervitude muſt be very painful; but ſuch regard do the younger brothers pay to cuſtom, that they conſtantly ſubmit to it without murmuring, till the elder will give them their liberty. The elder brother, after his father's death, has the ſame power over his ſiſters: they cannot marry or leave him without his conſent. He gives to each, when they marry, juſt what he pleaſes; and is not obliged to give them any thing at all. In ſhort, the eldeſt ſon, or whoever inherits an Hottentot's cattle, is obliged to take care of the wife or wives of the deceaſed, till their death, or till they are married again.

Such is the government, and ſuch the laws of the Hottentots. But it is here neceſſary to add, that the Dutch governor of the Cape is the arbiter of all the differences of a public nature that ariſe among the Hottentots; and by this means frequently prevents a war breaking out between the different nations. The chiefs often wait upon him for the renewal of their agreements with preſents of cattle, and are always entertained in a very friendly manner; and receive in return for their preſents of cattle, tobacco, brandy, coral, beads, and ſuch other things as are known to be acceptable to them.

Notwithſtanding what has been ſaid of the government and laws, to which the Hottentots in general ſubmit, there is a ſort of banditti that infeſt all the nations about the Cape. Theſe are troops of abandoned wretches, who, finding the laws and cuſtoms of their countries too great a reſtraint upon their inclinations, repair to the mountains, where ſecuring themſelves in almoſt inacceſſible faſtneſſes, they ſally out from time to time, in order to ſteal cattle for their ſubſiſtence: but theſe are ſo abhorred by all the Hottentot nations, that when any one of them is taken, though he be the eldeſt ſon of the chief of the territory, he is inſtantly put to death, none daring to interpoſe in his favour. The ſeveral nations of the Hottentots frequently ſend out large parties in queſt of theſe robbers, and in this the Heycoms are more active than the reſt. As theſe villains know that their is no mercy to be expected for them, ſhould they be taken, they fight with the utmoſt fury and deſpiration, and a party of them ſeldom give way, but fight till they have either routed the enemy, or are all ſlain.

SECT. XV.

Of the Religion of the Hottentots.

THE great ſecrecy with which the Hottentots conceal their religious opinions and ceremonies from the Europeans, long rendered their faith uncertain; but it is now known that they acknowledge, and firmly believe, that there is a Supreme Being, whom they call Gounja Gounja, or Gounja Tiquoa, or the God of Gods, the Governor of the world, endued with unſearchable attributes and perfections, who made the heavens and the earth, the ſun, and every thing in them; who dwelling far above the moon, cauſes ſunſhine and rain; provides food for bodily ſuſtenance, and ſkins of beaſts for apparel.

But notwithſtanding this belief, and their celebrating every event of life with offerings and ſolemnities, there is no feſtival or inſtitution of worſhip amongſt them that has an immediate regard to the true God. Their adorations are ſolely paid to thoſe whom they eſteem inferior deities dependant on the Supreme; for the moſt ſenſible Hottentots, when they are in a humour for anſwering the queſtions aſked them on this ſubject, ſay, their firſt parents ſo grievouſly offended the God of Gods, that he curſed them with hardneſs of heart, on which account

they know little of him, and have ſtill leſs inclination to obey him.

They eſteem the moon an inferior viſible God, whom they call Gounja, or God, and maintain that he is the ſubject and repreſentative of the Moſt High and Inviſible. They aſſemble for the celebration of his worſhip at the change and full, let the inclemency of the weather be ever ſo great. They then throw themſelves into a thouſand different attitudes, ſcream, proſtrate themſelves on the ground, ſuddenly leap up, ſtamp and cry aloud, "I ſalute thee: thou art welcome. Grant us fodder for "our cattle, and milk in abundance." They repeat theſe and other addreſſes to the moon, ſeveral times ſinging, Ho, ho, ho, with a variation of notes, accompanied with clapping of hands. Thus in ſhouting, ſinging, ſcreaming, jumping, ſtamping, dancing, and proſtration, they paſs the whole night in worſhipping this planet, which they conſider as preſiding over the weather.

They alſo adore as a benevolent deity a certain inſect, ſaid to be peculiar to the Hottentot countries. It is of the ſize of a child's little finger: on its head are two horns; it has two wings; the back is green, and the belly ſpeckled with red and white. Whenever this inſect appears in ſight, they pay it the higheſt tokens of veneration; and if it honours a village with a viſit, the inhabitants aſſemble round it with tranſports of devotion, ſinging and dancing troop after troop in the higheſt raptures, throwing to it the powder of buchu, with which they cover the circular area of the village and the tops of the cottages. They alſo kill two fat ſheep as a thank-offering for this high honour, and imagine that all their paſt offences are buried in oblivion. If this inſect ever alights upon a Hottentot, he is from thence-forward conſidered as a man without guilt, and ever after revered as a ſaint. The fatteſt ox is inſtantly killed for a thank-offering, and eaten in honour of the deity and the ſaint, who feaſts alone on the tripe, which is boiled; while the men devour the meat dreſſed in the ſame manner, and the women are only regaled with the broth. He is obliged to be very careful of the fat, and while any of it remains muſt anoint his body and apparel with that alone. The caul of the beaſt, well powdered with buchu, and twiſted like a rope, is put round his neck, and he is obliged to wear it day and night till it rots off, or till the inſect at another viſit lights upon another inhabitant of the village. The caſe is the ſame if the inſect ſettles upon a woman; ſhe inſtantly commences a ſaint, and the ſame ceremonies are performed; only here the women feaſt upon the meat, while the men are regaled with the broth.

The Hottentots will expoſe themſelves to the greateſt dangers to preſerve this little animal from being injured. Mr. Kolben mentions a German, who had a country-ſeat about ſix miles from the fort, and having given ſome Hottentots leave to turn their cattle for a while into his lands, they removed thither with their village. A ſon of this German was amuſing himſelf there, when the deified inſect appeared: the Hottentots ran in a tumultuous manner to adore it, while the young gentleman reſolved if poſſible to catch it, in order to ſee the effects his having it would produce. He ſeized it in the midſt of them; but how great was the general cry and agony when they ſaw it in his hand! With looks of diſtraction they ſtared at him, and at each other. "See, ſee! cried they, what "is he going to do? will he kill it? will he kill it? in the mean while every limb ſhook with terror. He aſked why they were in ſuch agonies for that paltry inſect. "Ah, Sir, they returned with the utmoſt con-"cern, it is a divinity! It is come from heaven; it is "come on a good deſign. Ah! do not hurt it, do not "offend it, we ſhall be the moſt miſerable wretches up-"on earth if you do. This ground will lie under a curſe, "and the crime will never be forgiven." He ſeemed unmoved by their petitions, and appeared reſolved to maim or deſtroy it; on which they ſtaired and ran about like people frantic, exclaiming, where was his conſcience, and how he dared to think of perpetrating a crime that would bring upon his head all the curſes and thunders of heaven? But this not prevailing, they all fell proſtrate to the earth, and with ſtreaming eyes and the loudeſt cries beſought him to ſpare the creature, and reſtore its liberty. The young man now yielded, and let the inſect fly; on which they capered and ſhouted in a tranſport of joy, and running after it, rendered it the cuſtomary honours.

The Hottentots alſo pay a religious veneration to their deceaſed ſaints and famous men, whom they honour not with tombs, ſtatues, and inſcriptions; but conſecrate mountains, woods, fields, and rivers to their memory. On paſſing by any of theſe places, they ſtop to contemplate the virtues of the perſon to whoſe memory it was dedicated, and to implore his protection for them and their cattle.

The Hottentots alſo worſhip an evil deity, whom they imagine the father of miſchief, the ſource of all their afflictions, and the inſtructor of the wicked Hottentots in the vile arts of witchcraft, by which they imagine that innumerable miſchiefs are done to the perſons and cattle of thoſe who are good. They call him Touquoa, and ſay he is a little, crabbed, inferior captain, whoſe malice will ſeldom let him reſt, and therefore they worſhip him, in order to avert the effects of his reſentment, and wheedle him by offering him an ox or a ſheep.

It is evident that the Hottentots believe that the ſoul ſurvives the body, by their offering up petitions to their deceaſed ſaints, and by the cuſtom which prevails amongſt them of removing their villages upon the death of any man, woman, or child: for they believe that the dead never haunt any place but that in which they died, except any thing belonging to them be carried out of it, and then they apprehend that the departed ſpirit will follow a village, and be very troubleſome. They therefore leave the hut in which a perſon died ſtanding, without removing any of the utenſils belonging to the deceaſed.

The Hottentots ſay, that their firſt parents came into their country through a door, and that the name of the man was Noh, and of the woman Hingnoh; that they were ſent into the country by God himſelf, and taught their deſcendants to keep cattle, and do many other uſeful things. This tradition, which is carefully preſerved among all the Hottentot nations, ſeems like a fragment of the ſtory of Noah, who ſurvived the flood, and deſcended from the ark by a door. They reſemble the Jews in their offerings; in the regulation of their chief feſtivals by the new and full moon; in their legal defilements; their abſtaining from certain ſorts of food, particularly ſwine's fleſh, and fiſh without ſcales; and their depriving the males of a teſticle, may be a corruption of circumciſion: but they have no tradition in relation to the children of Iſrael, to Moſes and the law. In their religion and manners they alſo reſemble the Troglodytes, the deſcendants of Abraham, by his wife Keturah, who obſerved all, or moſt of the cuſtoms in which the Hottentots agree with the Jews; with ſeveral others, as giving their children the name of favourite beaſts: in their funeral ceremonies, and in leaving their old people in a hut to expire by themſelves.

In every village is a prieſt, or rather maſter of the religious ceremonies; for he never offers up to Heaven the prayers of the people; nor inſtructs them in religion, his office being only to preſide at their offerings, and to conduct their ceremonies. He performs the marriage and funeral rites; he deprives the male of one teſticle, and heals the wound. But he has no revenue or certain perquiſites; indeed he is ſometimes preſented with a calf or lamb, and out of reſpect, is invited to feaſts and merry-makings, and theſe are all the emoluments of his office.

We have here given the ſtrange and abſurd ſyſtem of the Hottentot religion, of which they are ſo fond, that it is not certain any one of them ever died a Chriſtian. The Dutch indeed have ſent miſſionaries among them, who have undergone numberleſs fatigues, and taken the utmoſt pains to make proſelytes; but it was without effect, and they were compelled with ſorrow to abandon ſo good a deſign, without having made the leaſt impreſſion on the minds of the Hottentots. In confirmation of this, Mr. Kolben gives the following remarkable incident.

Mr. Vander Stel, governor of the Cape, took an infant Hottentot, whom he educated in the knowledge of the

the Chriſtian religion, and after the genteel manners of the Europeans, allowing him little or no intercourſe or converſation with the Hottentots. He became well verſed in the myſteries of religion, and in ſeveral languages; he was alſo richly dreſſed, and his manners were formed after the beſt European models at the Cape. The governor, finding him thus qualified, entertained great hopes of him, and ſent him with a commiſſary general to the Indies, where he remained employed in the commiſſary's affairs, till that gentleman's death, and then returned to the Cape. A few days after, at a viſit among his relations, he pulled off his European apparel, and equipped himſelf in the manner of his country. This done, he packed up his cloaths, ran with them to the governor, and preſenting himſelf before his patron, laid the bundle at his feet, and addreſſed his excellency to the following purpoſe. "Be pleaſed, Sir, to "take notice, that I for ever renounce this apparel. I "likewiſe for ever renounce the Chriſtian religion. It "is my deſign to live and die in the religion, manners, "and cuſtoms of my anceſtors. I ſhall only beg you "will grant me, and I am perſuaded I ſhall not beg in "vain, for leave to keep the collar and hanger I wear, "and I will keep them for your ſake." Here he ſtopped, and turning his back, fled ſwiftly away, and was never more ſeen in that quarter. This man, ſays the above author, I frequently converſed with up in the country, and found, to my great aſtoniſhment, that he had a ſurpriſing ſtock of Chriſtian knowledge. But though I made uſe of the moſt perſuaſive and endearing language, to call him back into the fold of Chriſt, he continued deaf to all my reaſoning and remonſtrances.

However, with reſpect to morality, an eſſential part of Chriſtianity, and thoſe virtues which dignify and adorn human nature, the Hottentots in general excel; for in munificence and hoſpitality, they exceed all other nations. They take a pleaſure in relieving one another, which they perform with ſuch a noble ſimplicity and openneſs of heart, as is no where elſe to be found. A Hottentot can hardly enjoy himſelf, except one or more of his countrymen partake with him. If he has a good meal provided for him at home, he will rarely ſit down to it without the company of two or three more of his neighbours. Has he a dram of brandy or arrack in his hand, his countryman who comes by, whether an acquaintance or a ſtranger, generally receives part of it. Is he ſmoking, he calls to his countrymen to ſtay and take half a dozen whiffs with him; for a Hottentot expreſſes as much joy at having regaled a number of his countrymen with his own pipe, as we uſually do upon ſome valuable acquiſition. They are all kindneſs and good-will to one another, and are charmed with opportunities of obliging. If a Hottentot's aſſiſtance is required by one of his countrymen, notwithſtanding his natural indolence, he runs to give it; and if his countryman be in want, he relieves him according to his ability, with the utmoſt readineſs. In ſhort, the hoſpitality they ſhew to ſtrangers who behave inoffenſively, does not in general fall ſhort of the ſurpriſing bounty and benevolence they ſhew to each other; they are generally moved at the ſight of diſtreſs in perſons of every complexion, and eagerly adminiſter what relief they can, without any ſtipulation for a reward.

In ſhort, they have a ſtrict regard to truth, and are eſteemed the moſt religious obſerves of national faith. They excel all or moſt nations in chaſtity; a moſt beautiful ſimplicity of manners runs through all the Hottentot nations: and many of them told our author, that the vices they ſaw prevail among Chriſtians, their avarice, their envy, and hatred to each other; their reſtleſs diſcontented tempers, their laſciviouſneſs and injuſtice, were what principally kept them from liſtening to the doctrines of Chriſtianity.

SECT. XVI.

Of their Skill in Phyſic, Surgery, Muſic, and Dancing.

THOUGH many idle whims and ſuperſtitions enter into the Hottentot practice of phyſic and ſurgery, yet their doctors often ſucceed, and ſometimes perform great cures. The Hottentots, who apply to the ſtudy of medicine, are generally well ſkilled in the virtues of a multitude of herbs and roots produced in the Hottentot countries, and often apply them in very difficult and dangerous caſes with wonderful ſucceſs.

The two profeſſions of phyſic and ſurgery are here united; for every phyſician is alſo a ſurgeon. They bleed, cup, reſtore a diſlocation, and perform all the manual operations in their practice with ſurpriſing dexterity; and yet there are no other inſtruments uſed by the Hottentot ſurgeons than a common knife, a horn, and a bird's bone. They have ſalves, poultices, and many internal remedies, though they fall vaſtly ſhort, in point of number, to thoſe uſed in the European practice of phyſic and ſurgery.

In cholics and pains of the ſtomach they firſt ſeek relief by cupping, which is thus performed. The cup is an ox's horn, the rim of which is made very ſmooth. The patient lying on his back, the doctor applies his mouth to the part where the pain lies, and ſucks; then clapping on the horn, lets it remain till he ſuppoſes the part under it is become inſenſible; then tearing off the horn, he makes two or three inciſions about half an inch long, and afterwards claps it on again and lets it remain till it falls off, which it does when it is full of blood; and it is generally filled in two hours, and then they ſuffer the patient to reſt. If the pain removes to another part, they rub that part well with hot fat; and if that does not eaſe the patient, they cup him again where the pain ſettles; and if this does not produce a cure, they proceed to inward remedies, giving him either infuſions or powders of certain roots or herbs.

In plethories they let blood in the following manner: the operator binds with a ſtrap the vein he would open, and then cuts it with his knife well ſharpened. Having got as much blood as he judges neceſſary, he looſens the ſtrap, cloſes the orifice with ſweet mutton fat, and ties over it a leaf of ſome ſalutary herb. If bleeding does not ſet the patient to rights, they apply as before inward remedies.

Their method of reſtoring a diſlocated joint is firſt to rub it with fat, and then to move the limb briſkly up and down, preſſing upon the joint, till it ſlips into its proper place: this rude method they complain is attended with dreadful pain.

In head-achs the Hottentots often ſhave the head; which they alſo perform with a common knife well ſharpened. The fat continually on the Hottentot's hair, which is ſhort and woolly, ſerves the purpoſe of ſoap; but they never ſhave off all the hair, but only make furrows in it, generally leaving as much on as they take off.

For a foul ſtomach the Hottentots take the juice of aloe-leaves, putting a few drops in a little warm broth. This is a good cathartic, and at the ſame time an excellent ſtomachic. If the firſt doſe does not anſwer the purpoſe, three or four days after they take another, of ſometimes twice the quantity of the firſt, and this ſeldom fails to produce the deſired effect; for moſt other inward ailments they take powders and infuſions of wild ſage, wild figs, fig-leaves, buchu, fennel, garlic, and ſome other herbs.

The Hottentot amputations are only of the joints of the fingers of women, which they perform with ſuch art, that nothing is ever hurt or diſfigured beyond the amputation. Their method of performing this operation is by binding very tightly, with a dry ſinew, the head of the joint next below that to be cut off, and then making the amputation with a common knife. They then ſtop the blood by applying to the end of the mutulated finger the juice of the leaves of the myrrh-tree, and wrap up the finger in the leaves of ſalutiferous herbs.

There is a phyſician in every kraal or village, and in the large ones are two; theſe are choſen out of the ſages of each village, and appointed to watch over the health of the inhabitants; and the honour of the employment being judged a ſufficient recompenſe for their trouble, they adminiſter their medicines and perform their operations in ſurgery without fee or reward. All their ſalves, ointments, powders, and poultices, they pretend are of their own invention, and therefore keep the preparations very ſecret. But if a patient dies under their hands, they always

Engravid for the second Edition of the New System of Geography.

The Attachment of an Hottentot to the Manners of his Country,
shewn by the Conduct of one of them bred from his Infancy among Europeans.

always aſſert, that their remedies were rendered ineffectual by witchcraft, and in this they are ſure to be believed.

There are alſo ſeveral old women in every village, who pretend to great ſkill in the virtue of roots and herbs, and readily give their advice to their neighbours; but theſe are held in great contempt by the doctors.

It ought not to be omitted, that all ſickneſſes that baffle the art of the phyſicians, all ſudden inward pain, and croſs accidents, and every artificial performance that is above their comprehenſion, the Hottentots aſcribe to witchcraft. If one of them be ſeized with a pain, which he imagines ariſes from this cauſe, he ſends for the phyſician of the village, who, on his arrival, orders a ſound fat ſheep to be inſtantly killed, then taking the caul, carefully views it all over, and having powdered it with buchu, twiſts it in the manner of a rope, and hangs it about the patient's neck, generally ſaying, "You will "ſoon be better; the witchcraft is not ſtrong upon "you." The patient is obliged to wear this caul while a bit of it will hang about his neck. If the patient be a man, the men of the village feaſt upon the ſheep; if a woman, the women; and if a child, the carcaſe is ſerved up to the children alone, and none elſe taſte a bit of it.

If the patient grows no better, the doctor gives phyſic; and if the patient dies, he boldly affirms it was occaſioned by witchcraft; and that the charms of the witch, or wizard, were too ſtrong for him or any one elſe to break; and for this he always finds ſufficient credit.

Indeed, as we have already intimated, every thing above their comprehenſion obtains the name of witchcraft. "I "have often, ſays Mr. Kolben, been looked upon by the "Hottentots as a wizard myſelf. My magic lanthorn, "burning-glaſs, and other inſtruments, producing effects "which aſtoniſhed them, were eſteemed pieces of witch-"craft. Once being ſurrounded by a good number of "them, I poured a little brandy into a cup and fired it, "and then aſked if they would drink of it. They were "aſtoniſhed at the propoſal; and when they ſaw me "drink it myſelf, betook themſelves to their heels in a "fright, and ever after dreaded me as a great and dan-"gerous conjurer. They have vaniſhed out of my ſight "in an inſtant, upon my holding up a ſtick, and threat-"ning to bewitch them with it."

However, it does not appear that the Hottentots have any notion of their wizards or witches entering into a compact with the evil ſpirit, whom they call Touquoa, or that their ſouls go to him at death; for they imagine, that the malice of this being is confined to this world, and that he cannot act beyond it.

This ſimplicity of the Hottentots, with reſpect to witchcraft, is not however very extraordinary, if we conſider that it has prevailed among polite nations, enlightened by a Divine religion; among whom it muſt appear much leſs excuſable, than among theſe untutored people.

We ſhall now give an account of their muſic and dancing; but ſhall firſt take notice of their language, which is ſo far from being harmonious, that it is conſidered as a monſter among languages, the pronunciation depending upon ſuch colliſions or claſhings of the tongue againſt the palate, and upon ſuch ſtrange vibrations and inflections of that member, as a ſtranger can neither imitate nor deſcribe. Hence they are conſidered as whole nations of ſtammerers.

Their muſic, however, is much more tolerable than their language; for though it has but few charms for an European ear, and is but poorly provided with either inſtruments or tunes, it ſhews a genius and ſenſibility in the Hottentots, which entirely deſtroys the credit of thoſe accounts which repreſent them as monſters of ſtupidity.

One of their muſical inſtruments is called the gom-gom, and is common in ſeveral other nations: it conſiſts of a bow of iron or olive wood, ſtrung with twiſted ſheep-guts or ſinews. On one end of the ſtring they fix, when they play, the barrel of a quill ſlit, by putting the ſtring into the ſlit, ſo as to run quite through the barrel. This quill they apply, when they play, to their mouths, much in the ſame manner as is done in playing on the Jew's harp, and the various notes are owing to the different modulations of the breath. This is the leſſer gom-gom.

The great gom-gom is made by putting on the ſtring, before they fix it to the bow, a cocoa-nut ſhell, about a third part ſawed off; ſo that it hangs like a cup, with the mouth upwards, the ſtring running through two holes near the brim. This ſhell is cleared and made very neat and ſmooth. When they play on this inſtrument, they hold the bow with one hand, and apply the quill on the ſtring to their mouths; while with the other they move the ſhell nearer or farther from the quill, according as they would vary the ſound, which riſes or falls according to the motions of the ſhell. When three or four of theſe gom-goms are played upon in concert, by ſkilful hands, they make a very agreeable harmony, eſpecially when it runs in the low notes, for there is a ſoftneſs in the muſic that is extremely pleaſing.

They have alſo a kind of flutes and flageolets, made of reeds, with which they make a tolerable harmony.

Another inſtrument of muſic is an earthen pot, which, like the common ones of the Hottentots, reſembles a Roman urn; but is covered at the top with a ſmooth-dreſſed ſheep-ſkin, and braced on with ſinews and ſheep-guts, like the ſkin on a kettle drum. This inſtrument is only uſed by the women, who play upon it with their fingers; but upon this inſtrument they perform only one tune, and that conſiſts of but few notes.

The vocal muſic of the Hottentots conſiſts of the monoſyllable ho, which is ſung by both ſexes in their ceremonies of worſhip, in a ſmall round of notes; and they have alſo a few ſongs. In this conſiſts the whole of the Hottentot harmony, which, notwithſtanding their often hearing European muſic at the Cape, they aſſert excels not only that, but all the muſic in the world.

We ſhall now take notice of the dancing of the Hottentots, in which both ſexes take great delight. This is chiefly practiſed when a peace is concluded with a nation with whom they have been at war; when a member of a village has ſlain a wild beaſt, or eſcapes ſome imminent danger; or when ſome happy event has happened in favour of ſome particular perſon or family of the village. On theſe and the like occaſions the whole kraal teſtify their joy in dancing, ſometimes whole nights, without any manner of refreſhment. In theſe public rejoicings the men of the village ſquat down in a circle, which is enlarged by their being joined by the women, for the better convenience of the dancers who perform within it, and that they may aſſiſt in the common, ho, ho, ho, and add their pot-drums to the muſic of the gom-goms. No ſooner are the latter heard, than the women begin to play on the drums: thoſe who have their mouths at liberty ſing, and others clap their hands. Several couples then preſent themſelves to dance, but no more than two couples dance at a time. When a woman ſtarts up and ſhakes the rings upon her legs, it is to intimate that ſhe wants a male partner, and ſhe has one immediately. Two couple, that is two men and two women, having entered the ring, dance each man with his partner, the men uſing great activity with their legs, leaping a great height. When they begin, they are at the diſtance of about ten paces from each other, and they dance near a quarter of an hour before they meet; and ſometimes, inſtead of meeting, they turn about, and dance back to back; but they never take hold of each other by the hands. When the women ſtamp in dancing, the rings on their legs make a noiſe reſembling that of the harneſs upon the back of a coach-horſe, when he ſhakes himſelf.

We ſhall conclude this account of the Hottentots with a hiſtory of the country; a conciſe view of the Cape-town, and the government of the Dutch.

SECT. XVII.

A conciſe Hiſtory of the Cape of Good Hope, from its Diſcovery by the Portugueſe, including an Account of the Manner in which it was ſettled by the Dutch.

THOUGH the Cape of Good Hope was diſcovered by the Portugueſe ſo early as the year 1493, none

of them landed there till 1498, when Rio d'Infanta, the Portugueſe admiral, in his voyage to India, went aſhore; and, on his return, gave ſuch an agreeable account of the advantages of the place to king Emanuel of Portugal, that it was reſolved to form a ſettlement there; but this was, however, neglected. At length Franciſco d'Almedei, viceroy of Brazil, returning from thence with a fleet from Portugal, took his courſe by the Cape, and caſting anchor, ſent a party aſhore to purchaſe cattle; but they were repulſed by the natives, who drove them back to their ſhips. The viceroy was, however, perſuaded to land them again, with a conſiderable reinforcement, and, for the encouragement of the men, to put himſelf, with eleven captains of the fleet, at their head. His excellency conſented with reluctance, and ſeemed to foreſee the unhappy iſſue; for, on his entering the long-boat, he cried with a dejected look, "Ah! whither do you carry ſeventy years?" alluding to his own age. On their being landed, one of the men refuſing to give a pair of braſs buckles he had in his ſhoes to a Hottentot, who much admired them, his refuſal was taken as an affront, and a ſufficient proof of their being enemies: and thus this trifle became the foundation of a quarrel. The Hottentots who were preſent, exaſperated at this behaviour, attacked the Portugueſe with ſuch ſpirit, that ſeventy-five of them were ſlain, among whom was the viceroy himſelf, and the reſt eſcaped by flying in confuſion to their ſhips.

The Portugueſe, vexed and mortified at this diſgrace, vowed revenge. But after ſmothering their reſentment for two or three years, a fleet, in their way to the Indies, landed again at the Cape; and the Portugueſe, knowing the high value the natives ſet on braſs, landed a large braſs cannon, charged with ſeveral heavy balls, and faſtened to the mouth two ropes of great length. The Hottentots, in a tranſport of joy at receiving ſo large a piece of their admired metal, took hold of the two ropes in great numbers, as they were directed, in order to draw it along. Thus a conſiderable body of them extended in two files the whole length of the ropes full in the range of the ſhot; when the Portugueſe ſuddenly diſcharging the cannon, a moſt dreadful ſlaughter was made, and thoſe who eſcaped the ſhot fled in the wildeſt conſternation up into the country. After this baſe and cowardly exploit, the Portugueſe re-embarked at their leiſure, and it ſeems that the Hottentots have ever ſince had an extraordinary dread of fire-arms.

We do not find that any Europeans landed afterwards at the Cape, till the year 1600, when it began to be viſited by the Engliſh, French, and Dutch, in their voyages to and from the Eaſt Indies. However, in the year 1650, a Dutch fleet anchoring before it, Mr. Van Riebeck, a ſurgeon on board, obſerving that the ſoil of the country was rich and well ſtocked with cattle, the harbour commodious, and the people tractable; on his return to Holland laid an account of his obſervations before the directors of the Eaſt India company there, who, after a grand conſultation, reſolved to attempt a ſettlement without loſs of time. Immediately four ſhips were ordered out on that deſign, with all the materials, inſtruments, artificers, and other perſons neceſſary for ſuch an expedition; and the ſurgeon was rewarded by being appointed governor and commander in chief of the intended ſettlement, with power to treat with the Hottentots in ſuch a manner as he ſhould think would be moſt advantageous to the company.

With theſe ſhips Van Riebeck arrived ſafe at the Cape, when he ſo charmed the natives by his addreſs and good humour, and by the preſents he brought them of braſs toys, beads, tobacco, brandy, and other liquors, that a treaty was immediately concluded; and he giving them commodities and toys to the value of fifty thouſand guilders, they gave the Dutch full liberty to ſettle there, reſigned to them a part of the country, and a trade was eſtabliſhed with them on a good and ſolid foundation.

Upon theſe wiſe regulations, in which ſo juſt and equitable a regard was paid to the natural rights of the natives, Mr. Van Riebeck raiſed a ſquare fort, and built within the walls, dwelling-houſes, warehouſes, and an hoſpital for the reception of the ſick: to this fort he added proper out-works, to ſecure himſelf againſt being attacked by any of the European powers. He then ſet the ſeeds he had brought from Europe on a piece of land two leagues up the country, part on a hill, and part in a vale, dividing the ground into a vineyard, a fruit, flower, and kitchen garden.

As every thing proſpered in a ſurpriſing manner, the company offered ſixty acres of land to every man who would ſettle at the Cape, provided he would engage not only to maintain himſelf upon it within three years, but alſo contribute at a certain rate to the ſupport of the garriſon; leaving every one at liberty, when that time was expired, to ſell or make over his land, and to leave the ſettlement.

Encouraged by theſe propoſals, and by the aſſiſtance given to thoſe who were unable to provide utenſils, tools, and inſtruments of agriculture, a great number of people went to the Cape, and the ſettlement ſoon began to make a very conſiderable figure. But all this while there was a growing evil, againſt which no proviſion had yet been made: European women were very ſcarce, and thoſe they had were wives who had ſettled there with their huſbands; while the plantations ſwarmed with young fellows, each of whom was ſettled upon his farm, and in a way of thriving; but wanted wives as much for the ſake of iſſue and domeſtic help, as for ſenſual gratification; and yet had no inclination at all to marry the Hottentot women. However, an account of this grievance being diſpatched to Amſterdam, a fine troop of young women were raiſed, who, on their arrival at the Cape, were beſtowed by the governor on thoſe who wanted wives, with all the indulgence that could be ſhewn upon ſuch an occaſion to their ſeveral fancies and inclinations.

The ſettlement being thus firmly eſtabliſhed, was now increaſed, by the addition of other ſettlers, to ſuch a degree, that the Dutch in a few years extended themſelves in new colonies along the coaſt.

They now form four principal ſettlements: the firſt, and moſt conſiderable, is at the Cape, where are the grand forts and the capital city, alſo named the Cape; the ſecond is the Stellenboſh; the third the Drakenſtein; and the fourth the Waveriſh colony.

The company have alſo provided for a future increaſe of people, by purchaſing all the tract of land called Terra du Natal, which lies between Moſambique and the Cape; for which they paid in commodities, utenſils, and toys, to the value of thirty thouſand guilders: ſo that this part of the dominions of the Dutch Eaſt India company is of very great extent.

SECT. XVIII.

A Deſcription of the City of the Cape, and of the Dutch Government.

WE ſhall now give the reader an account of the Cape town and its principal buildings. The town extends from the ſea-ſhore to the valley, and is large and regularly built, containing ſeveral ſpacious ſtreets, with handſome houſes, many of which have large courts in the front, and beautiful gardens behind them. The ſtreets, the court-yards, the houſes, and every thing in them are, according to the cuſtom of the Dutch, extremely clean and neat. The houſes are of ſtone; but moſt of them only one ſtory high, and none more than two, on account of the violence of the eaſterly winds which ſometimes ſhake and damage the houſes, notwithſtanding their being ſo low, and for the ſame reaſon moſt of them are only thatched.

The Dutch company give great encouragement to building at the Cape. A man who is willing to erect a houſe, whether contiguous to the town or in the country, has ground allotted him gratis, of ſufficient extent to have a court-yard, out-houſes, and a garden, if he chooſes to have them. The government receives no advantage from theſe houſes till they are ſold, and then, if the houſe be new, it becomes charged with a ground-rent, of the tenth

or twentieth penny of the rent it is ſuppoſed it would let for annually; but if it be old, there is only paid the fortieth penny of the rent.

The caſtle is a very ſtrong and noble edifice, of great extent, provided with all manner of accommodations for the garriſon, which conſiſts of about two hundred ſoldiers. It covers the harbour, is an admirable defence towards the country, and is, in ſhort, an excellent fortreſs. The ſuperior officers of the company have here very ſpacious and beautiful lodgings, and within are the company's ſtorehouſes, which are large, commodious, and handſome.

The church is a plain, neat, and ſpacious edifice, built of ſtone; but both the body and ſteeple are thatched. They are, however, white-waſhed on the out-ſide, which gives this edifice an agreeable appearance from the ſea, eſpecially in fine weather.

The hoſpital for the ſick is both an honour and an ornament to the town. It is ſituated near the company's garden, and ſo large as to accommodate ſeveral hundred patients. This is of extraordinary uſe, as few ſhips ever arrive at the Cape, either from Europe or the Indies, without having a conſiderable number of ſick on board. A ſhip is no ſooner at anchor than theſe are conveyed to the hoſpital, where they are very decently lodged, and ſupplied with freſh proviſions and medicines. Thoſe who are able to walk about have the liberty of the company's garden, which enjoys a fine air, and furniſhes the hoſpital with roots and herbs. This hoſpital fronts the church, and is a very handſome regular ſtructure.

The above garden is perhaps the moſt extraordinary in the world, it containing, as hath been already intimated, almoſt all the rich fruits, beautiful flowers, and valuable plants that are produced in Aſia, Africa, and America. Nature has indeed little or nothing to ſet her off there beſides her own charms and the hand of the gardener; but thus adorned, ſhe is ſufficiently lovely. Thouſands of various flowers ſtrike the eye at once, vying with each other for ſuperior beauty. Here and there are fine groves of trees of a vaſt variety of kinds unknown in Europe, beautiful ſummer-houſes, and ſhady walks. The garden is very ſpacious, and from moſt parts of it you have a delightful view of the country.

There are alſo many large and beautiful gardens about the town, which belong to the inhabitants: theſe, as well as that belonging to the company, are kept in fine order. It is very delightful to viſit them, and they form a lovely appearance in ſeveral views of the town; while the millions of flowers in them all fill the air with the moſt delicious perfumes.

To return to the buildings, there is a large edifice called the lodge, for the uſe of the company's ſlaves, who are chiefly brought from Madagaſcar. It is divided into two wards, one for the lodging of each ſex, and is provided with convenient ſtore-rooms, with a very ſpacious room, where the ſlaves receive and eat their allowance, and a ſtrong priſon wherein the drunken and diſobedient are confined and puniſhed. It has likewiſe decent apartments for the officers ſet over the ſlaves, and a ſchool for the negro girls.

The company have alſo a very handſome range of ſtables, capable of containing ſeveral hundred horſes; and a great number of fine Perſian horſes are kept there for the ſervice of the company and the uſe of the governor, who lives in great ſtate, and has a maſter of the horſe, an under-maſter, a ſadler, coachman, and grooms. The governor's body-coachman is eſteemed at the Cape a very conſiderable perſon.

The government is conducted by the eight following councils. Firſt, the grand council, or, as it is ſometimes called, the college of policy, conſiſts of the governor, who is preſident, and eight others, who are generally the next principal officers in the company's ſervice at the Cape. This council is the company's repreſentative; it has the care of trade and navigation, makes peace or declares war with the Hottentots, and has the management of every thing relating to the ſafety and intereſt of the ſettlement. This council not only correſponds with the court of directors in Holland, but with the Dutch government at Batavia and Ceylon. When the members enter or leave the fort, the garriſon pays them the martial ſalute, an honour paid to no other at the Cape.

The next is the college of juſtice, which generally conſiſts of the ſame members that compoſe the grand council. This court hears and determines in all civil and criminal caſes of moment that happen among the Europeans at the Cape. But if an European, who is not in the ſervice of the company, is either plaintiff or defendant, the three regent burgo-maſters, who are magiſtrates annually choſen out of ſuch as are not in the company's ſervice, aſſiſt at the trial, to ſee that no partial judgment be given on the ſide of the company's ſervant. Appeals lie from the decrees of this court to the ſupreme courts of juſtice at Batavia, which is compoſed of perſons eminent for their learning in the civil laws, and alſo to the ſupreme court of juſtice in Holland.

There is a petty court dependant on the laſt for puniſhing breaches of the peace, and determining treſpaſſes and ſmall debts. It conſiſts of a member of the grand council, who ſits as preſident, three of the burghers, and four of the company's immediate ſervants. One of the burghers is vice-preſident. No action is to be brought in this court for more than a hundred crowns. Copies of all the proceedings, both in this court and the college of juſtice, are, from time to time, tranſmitted to Holland.

The fourth is the court of marriages, which takes care that all contracts of marriage among the Europeans at the Cape are allowed by the parents or guardians of both parties, and that neither party is under any engagement or promiſe of marriage to another. It conſiſts of the ſame members as the petty court for puniſhing breaches of the peace, and is held every Saturday evening.

This court, upon receiving ſatisfaction in the matters of its enquiry from the parties, their parents, or guardians, grants a warrant, authorizing the paſtor of the pariſh where the parties live to publiſh the banns of matrimony from his pulpit on the three following Sundays; and then, if no perſon appears to forbid the banns, to join the parties in marriage.

It is cuſtomary for perſons of diſtinction, who are upon the point of marriage, to invite all the officers of the court to make the inquiries at their houſes, which is ſeldom refuſed, as they are ſure of a ſplendid entertainment, and a preſent of ten or twenty crowns; and the clerk on theſe occaſions has two crowns for his trouble: but at the caſtle, where the court is uſually held, he has but one, and the court no gratuity.

The fifth is the chamber of orphans, which conſiſts of the vice-preſident of the grand council, three of the company's ſervants, and three burghers. Orphans of fortune cannot marry at the Cape without the conſent of this chamber, till they are twenty-five years of age.

The ſixth is the eccleſiaſtical college for the reformed churches at the Cape, which are three in number, and for the proper application of the money given for the uſe of the poor. It conſiſts of the three paſtors, the two elders of each church, and twelve overſeers of the poor, each pariſh having four.

This council is ſo careful in the application of the charitable collections, that there is not a beggar to be ſeen in all the ſettlement. The ſurplus of theſe collections is either put out to intereſt, or applied to the repairs of the churches, or the maintenance of the ſchools at the Cape.

In each of the colonies at the Cape is a court of common council, conſiſting of a certain number of the burghers. In the Cape town this council propoſes matters in favour of the burghers to the grand council, and collects the taxes. In the colonies they hear and determine all cauſes relating to debts and treſpaſſes not exceeding a hundred and fifty florins, and alſo try and puniſh moſt crimes committed within their juriſdiction, and all crimes committed by the ſlaves.

The eighth are the boards of militia, one of which is for the Cape towns, and the other for the colonies.

The company's immediate ſervants at the Cape are about ſix hundred in number; but they are not all lodged in

in the caſtle; many petty officers and a great number of the common ſervants living in ſeveral buildings belonging to the company in the town.

The company's ſervants at the Cape are divided into two claſſes, called the qualified and the unqualified. The qualified are all the officers in the adminiſtration, and the clerks under them: the unqualified are the ſoldiers, artificers, and common ſervants. We ſhall here give a particular account of the ſalaries of the former.

The governor is allowed by the company three thouſand two hundred and fifty-five florins a year in ſalary, and board wages; beſides which he is allowed monthly one thouſand five hundred pounds of rice, thirty buſhels of puſh, or fine white rice, three hundred and ſixty pounds of fine barley-flour, twenty pounds of European ſalt beef and pork, as much mutton as he pleaſes, one aum of African wine, two gallons of brandy, four of Canary, twenty-three of ſtrong ſhip-beer, or Brunſwick mum, twenty-five pounds of freſh butter, fifteen pounds of white wax candles, ten pounds of tallow candles, ſix pounds of ſpices, a gallon of ſallad oil, and whatever he pleaſes for the uſe of his houſhold, which the company's ſtores can furniſh, twenty-five per cent. cheaper than any body elſe. He has likewiſe a yearly allowance of five hundred florins for entertaining the commanders and other officers of the Dutch India ſhips with a grand dinner in their return to Europe; and yet he provides for them entirely out of the company's cattle, ſtores, and gardens.

The chief merchant, the fiſcal intendant, the captain of the garriſon, the three paſtors of the colonies, and the ſtore-keeper, have each one thouſand ſix hundred and twenty-ſeven florins per annum in ſalary and board-wages.

The lieutenant of the garriſon has a thouſand and five florins per annum in ſalary and board-wages.

The enſign of the garriſon, and twelve perſons called under-merchants, have ſeven hundred and eight florins per annum each.

The book-keepers, and officers who attend the ſick, thirteen perſons, each five hundred and thirteen florins a ar.

Twenty aſſiſtant clerks have three hundred and fifty-four florins a year each.

We have now given a very full and circumſtantial account of the Cape of Good Hope, and of the Hottentots, and ſhall conclude with the character given of this fine ſettlement by the ingenious author of Lord Anſon's Voyage round the world, which may ſerve both as a ſummary and confirmation of what has been already ſaid of that delightful country. "The Cape of Good Hope, "ſays he, is ſituated in a temperate climate, where the "exceſſes of heat and cold are rarely known; and the "Dutch inhabitants, who are numerous, and who here "retain their native induſtry, have ſtocked it with pro-"digious plenty of all ſorts of fruits and proviſions; moſt "of which, either from the equality of the ſeaſons, or "the peculiarity of the ſoil, are more delicious in their "kind than can be met with elſewhere: ſo that by theſe, "and by the excellent water which abounds there, this "ſettlement is the beſt provided of any in the known "world, for the refreſhment of ſeamen after long voyages, "and by its extraordinary accommodations, the healthi-"neſs of its air, and the pictureſque appearance of the "country, the whole enlivened too by the addition of a "civilized colony, was not diſgraced on a compariſon "with the vallies of Juan Fernandes, and the lawns of "Tinian."

SECT. XIX.

Of Caffraria Proper, and particularly that Part of it called Terra de Natal, containing a conciſe Account of the Country and of its inhabitants the Caffres.

THE northern part of Caffraria, diſtinguiſhed by the name of Caffraria Proper, is in a manner entirely unknown; no European traveller has proceeded through it, and deſcribed its bounds, its produce, its natural curioſities, and the manners of its inhabitants. The little we know of it is confined to the eaſtern part, which has obtained the name of Terra de Natal.

The country of Natal, which was thus called from its being diſcovered by the Portugueſe on the day of our Saviour's nativity, is ſituated between the thirtieth and thirty-third degrees of north latitude, and is inhabited by the Caffres, who are a very different people from the Hottentots. This country extends to the Indian ſea on the eaſt, but how far it runs to the weſtward is yet unknown.

That part of the country which lies towards the ſea is plain and woody; but within land it is diverſified with many hills, intermixed with pleaſant vallies, and large plains chequered with natural groves and meadows. There is no want of water, for every hill affords little brooks, which gliding down, ſome of them, after ſeveral turnings and windings, meet by degrees, and form the river Natal, which diſcharges itſelf into the eaſtern ocean in about the thirtieth degree of ſouth latitude. This is the principal river of the country; though there are other ſtreams which bend their courſes northerly.

The woods are compoſed of ſeveral ſorts of trees, many of which are tall and large; theſe are very good timber fit for any uſe. The meadows are covered with graſs, and a variety of herbs and flowers.

The land-animals of this country are elephants, which feed together in great troops, a thouſand or fifteen hundred being ſometimes ſeen in the mornings and evenings in the meadows; but in the heat of the day they retire into the woods.

Here are alſo buffaloes, cows, deer, hogs, rabbets, lions, and tygers.

Here are fowls of various ſorts, as ducks and teal, both tame and wild, plenty of cocks and hens, a large wild fowl as big as a peacock, adorned with many beautiful feathers, and abundance of wild birds, of which we have no other account, than that they are wholly unknown to us.

The ſea and rivers abound with many ſorts of fiſh, yet the natives ſeldom endeavour to catch them; but frequently take turtle when they come aſhore at night to lay their eggs. They are ſaid alſo to uſe a very odd way of catching turtle in the ſea, by taking a living remora, or ſucking-fiſh, and faſtening a ſtring to the head and another to the tail; they then let it down into the water among the half-grown or young turtle; and when they find that it has faſtened itſelf to the back of them, which it will ſoon do, they draw him and the turtle up together.

The natives, who are of a middle ſtature, are well proportioned; their ſkins are black, and their hair woolly; their noſes are neither flat nor high, but well proportioned; their teeth are white; their aſpect is in general graceful, and, like the Hottentots, they are ſwift of foot.

The natives commonly wear only a ſquare piece of cloth, made of ſilk graſs, in the form of a ſhort apron; at the upper end it has two ſtraps to tie round their waiſt, and the lower end is fringed, and hangs down to their knees. They are ſaid to have caps made of tallow about nine or ten inches high. Theſe they are a great while in making; for the tallow muſt be very pure before it is fit for this uſe; beſides, they lay on but a little at a time, mixing it among the hair, ſo that it never afterwards comes off their heads.

When they go a hunting, which is but ſeldom, they pare off three or four inches from the top of their caps; but the day after their return begin to build it up again, and this they daily practiſe till it is of the faſhionable height. It would be a moſt ridiculous thing for a man here to be ſeen without this cap of tallow; but boys are not ſuffered to wear any before they arrive at maturity. The men make themſelves very fine with feathers ſtuck thick into theſe caps; for this purpoſe they uſe only the long feathers of a cock's tail. They alſo wear a piece of a cow's hide made like a tail, reaching down from the waiſt to the ground. This piece of hide is about ſix inches broad, and each ſide of it adorned with little iron rings of their own making. The women have only ſhort petticoats, which reach from the waiſt to the knee; but when

when it rains they cover their bodies with a cow's hide, thrown over their ſhoulders like a blanket.

Their chief employment is huſbandry. They have many cows, which they carefully look after, and every man knows his own, though they all run promiſcuouſly in the meadows. They have alſo Guinea corn, of which they make their bread, and a ſmall ſort of grain no bigger than muſtard-ſeed, of which they make ſtrong drink; and they fence in their fields to keep out their cattle. The people alſo drink milk, but generally prefer it when ſour. Their common ſubſiſtence conſiſts of beef, ducks, and hens eggs.

No arts or ſeparate trades are profeſſed among them, but every one makes for himſelf whatever he wants. The men build their own houſes, cultivate the land, and look after their cattle; while the women milk the cows, dreſs the proviſions, and manage every thing within doors. Their houſes are neither large nor well furniſhed; but are made ſo cloſe, and are ſo well thatched, as to keep out the wind and rain.

They live together in ſmall villages, in which the oldeſt man governs the reſt. They are extraordinary juſt and civil to ſtrangers, and have a king who governs the country.

Every man may have as many wives as he can purchaſe or maintain; and, as they have no money in the country, they buy them of the woman's father, brother, or neareſt male relation, by giving cattle in exchange for wives.

The Caffres traffic with the rovers of the Red Sea, who bring them manufactures of ſilk for elephants teeth. Theſe manufactures the Caffres exchange for European commodities, particularly for tar, anchors, and cordage, which they exchange again with the rovers of the Red Sea; and ſuch ſilks as they do not ſell to the Europeans who touch at Natal, they diſpoſe of to the inhabitants of Monomotapa.

Captain Vander Schelling, whom we have already mentioned in treating of the Hottentots, found an Engliſhman at Terra de Natal, who had deſerted his ſhip, and ſettled among the Caffres, where he married two Caffre wives, by whom he had ſeveral children; he was dreſſed like a Caffre, and lived like them. He ſhewed the captain ſeveral piles of elephants teeth and ſome rooms of ſilk manufactures, intending to take the opportunity of embarking with thoſe commodities for the Cape, and of abandoning his ſettlement, wives, and children: but the king of the country having notice of his deſign, ſent for him, and reproached him with his intended treachery and ingratitude to a people who had received and cheriſhed him after ſo generous a manner, repreſenting the miſerable condition to which his family would be reduced if he abandoned it, ſince he would take no care of it; and, in ſhort, admoniſhed him with ſuch warmth on the affection and tenderneſs he owed to his wives and children, and the cruelty of deſerting them, that being unable to reſiſt the eloquence of this royal Caffre, he fell at the king's feet, and gave up his deſign. This he himſelf related to the captain, one of whoſe men he afterwards prevailed upon to deſert the ſhip, and ſettle with him among the Caffres.

CHAP. VIII.

Of the inland Empires of MONOMOTAPA, and MONOMUGI.

SECT. I.

The Situation, Extent, Climate, and Produce of Monomotapa; with the Perſons, Dreſs, and Food of the Natives.

THE inland country of Monomotapa is bounded by the maritime kingdom of Sofala on the eaſt; the river Spiritu Sancto on the ſouth; the mountains of Caffraria on the weſt; and the river Cuama on the north, which parts it from Monomugi. It is ſituated between the forty-firſt and fifty-ſixth degree of eaſt longitude, and between the fourteenth and twenty-fifth degree of ſouth latitude; and is ſix hundred and ſeventy miles from north to ſouth, and ſix hundred and fifteen from eaſt to weſt.

The climate of Monomotapa is ſaid to be temperate, though the far greater part of it lies within the ſouthern tropic. The air is clear and healthy, the ſoil fertile, and ſo well watered by ſeveral fine rivers as to abound with paſture grounds, on which are bred a prodigious multitude of cattle, eſpecially of the larger ſort, on which the inhabitants ſet a higher value than on their gold. Their ground produces plenty of rice, millet, and other grain; but no wheat. They have a variety of excellent fruit-trees, and plenty of ſugar-canes, which grow here without any culture. Their foreſts ſwarm with wild beaſts, and various kinds of game; and their rivers, of which they have a great number, abound not only with fiſh, but with gold waſhed down from the mountains. They have neither horſes nor any other beaſts of burthen, except vaſt herds of elephants, which are moſtly wild, and ſeveral thouſands of them are annually deſtroyed for the ſake of their teeth, which the natives ſell to the Portugueſe. They have a kind of ſtag of an extraordinary ſize and ſwiftneſs, and oſtriches that are extremely large.

The natives are black, with woolly hair; but are well ſhaped, robuſt, ſwift of foot, and healthy. They delight much in war, which they prefer to traffic; and the people of the lower claſs are extremely expert at diving, their chief buſineſs being to fetch ſand or mud from the bottom of rivers, ponds, and lakes, in order to obtain the gold that is mixed with it, and which they exchange with the Portugueſe for cotton and other cloths, and a variety of other merchandizes and trinkets.

The Monomotapas go naked almoſt as low as the waiſt; but from thence downwards are covered with a piece of cloth of various colours, and dreſs more or leſs richly, according to their rank and circumſtances: the cloth worn by the common people is dyed cotton; but perſons of quality uſually wear India ſilks, or cotton embroidered with gold, over which they have generally the ſkin of a lion, or ſome other wild beaſt, with a tail hanging behind, and trailing on the ground.

Their chief food is the fleſh of oxen and elephants, ſalted and dried fiſh, and a great variety of fruits. Among the laſt is one called caſaema, which is ſhaped like an apple, is very ſweet, and of a bright violet colour; but is ſo pernicious in its effects, when eaten in too great a quantity, that it never fails of cauſing a violent dyſentery and bloody-flux. Their bread is made of rice or millet baked in thin cakes, and their drink ſour-milk or water; but the rich have palm-wine, and ſeveral kinds of fruit. Perſons of wealth have their liquors commonly mixed with manna, ambergriſe, muſk, and other perfumes, of which they are extremely fond, and uſe them both in their meat and drink and in their apartments. All the flambeaux burnt before the emperor are ſaid to be perfumed in the ſame manner.

The men are allowed to marry as many wives as they pleaſe, or as they can maintain; but the firſt is always conſidered as the chief and miſtreſs, and her children as the father's heirs; while the reſt are only deemed as ſervants.

SECT. II.

Of the Splendor in which the Emperor appears, and his Retinue when he goes abroad. The manner in which he treats the Princes who are his Vaſſals. Of his chief Wives, and their Employments.

THE emperor of Monomotapa is ſaid to live in great ſtate, and to have a conſiderable number of princes ſubject or tributary to him. Authors obſerve, that he neither allows himſelf nor any of his wives to wear any clothes that are manufactured out of his own dominions, for fear they ſhould have ſome poiſon or charm concealed in them. His uſual dreſs is a kind of long veſt, which falls down to his knees, then croſſing between his legs, is tucked up under his girdle. He alſo wears a brocaded mantle on his ſhoulders; his neck is adorned with a magnificent collar that falls below his breaſt, and is enriched with diamonds, rubies, emeralds, and other precious ſtones. Of the ſame rich materials is a band which encompaſſes his turban, and on his legs are buſkins richly wrought and embroidered with gold and pearls.

Whenever he goes abroad he is either carried in a palanquin, or mounted on an elephant. His palanquin is borne by four perſons of quality, and over it is a magnificent canopy richly embroidered and beſpangled with pearls and precious ſtones. If the weather happens to be cloudy, or miſty, four perfumed wax lights are carried before him. On theſe occaſions, beſides his other regalia, he affects to wear hanging at his ſide a ſmall ſpade with an ivory handle, and an arrow in each hand. Theſe he calls the enſigns of his royalty. The ſpade is ſaid to be the emblem of induſtry, intimating that his ſubjects ought to apply themſelves to the cultivation of their lands, leſt by neglecting it they ſhould be reduced to indigence, and thereby pilfer and ſteal; on which account one of the arrows in his hand ſhews his power to puniſh crimes, and by the other he declares himſelf the protector and defender of his people.

On his going abroad in this public manner, whether to war or for diverſion, or to viſit his dominions, his ſubjects, who pay him the moſt profound homage and reſpect, never fail of appearing in crowds to wiſh him all imaginable ſucceſs, and at proper diſtances on the road through which he paſſes, ſacrifice a deer or ſome other victim. Over this he rides, and his augurs, who always aſſiſt on ſuch occaſions, carefully obſerve the motions of the liver, heart, &c. of the dying creature; and from thence proclaim his enterprize or journey ſucceſsful or otherwiſe. If the former, the people fill the air with ſhouts and acclamations; and if the latter, with doleful ſounds: but theſe monarchs will ſeldom proceed farther on their journey or deſign when thoſe ſoothſayers predict its being unſucceſsful.

The emperor is ſerved at table upon the knee. He is commonly attended at ſuch times by a great number of officers, who keep a moſt profound ſilence. The plates, diſhes, and bowls belonging to his table, are ſaid to be a kind of porcelain curiouſly wrought with ſprigs of gold.

As theſe ſovereigns conſtantly keep a numerous ſtanding army, they are the leſs liable to be diſturbed either by the revolt of the many tributary princes, or by an invaſion of the neighbouring nations. The emperor, as a farther ſecurity, alſo obliges his vaſſals and tributaries to ſend their ſons in order to be educated in his court, where they are taught to acknowledge his authority, and are kept as hoſtages of the fidelity of their parents. To this double policy he adds a third, which is once a year ſending ambaſſadors to all the grandees, who are vaſſals to the crown, to give them what is ſtiled the new fire. No ſooner do theſe ambaſſadors arrive at the court of a vaſſal, than they order him, in the emperor's name, to put out his fire, on pain of being declared a rebel; which being complied with, he comes and lights it afreſh at the fire brought by the ambaſſadors for that purpoſe: and ſhould any vaſſal or tributary refuſe to conform to this order, war would be immediately declared againſt him.

As the emperors of Monomotapa are thus careful to keep all their vaſſals within due obedience, ſo they are ſaid to be no leſs ſolicitous to preſerve the affections of their ſubjects by acts of benignity. The only tribute they exact from them is a ſmall and inconſiderable free gift, when they apply to them for juſtice, or ſome other favour; this being eſteemed a mark of reſpect due from an inferior whenever he approaches a ſuperior. This cuſtom is alſo obſerved by the merchants, who at their fairs, or other places of ſale, commonly make the ſovereign upon the throne a preſent of ſome of their wares, not by compulſion, but of their own accord; and if any neglect paying him this ſmall homage, their only puniſhment is their not being permitted to appear before him, which is eſteemed a great mortification and mark of contempt.

The emperor is ſaid to have a thouſand wives, and all of them the daughters of ſome of his vaſſal princes; but the firſt alone enjoys the title and honours of an empreſs or queen. Among theſe nine immediately take place after the empreſs, and enjoy ſome conſiderable employment at court. The firſt of them is ſtiled mazarira, or mother of the Portugueſe, ſhe being their advocate with his majeſty. The next is the inahanda, who performs the ſame office in favour of the Moors. The other ſeven have likewiſe their reſpective titles and employments, and all of them their ſeveral revenues, which enable them to live in great ſtate; and as ſoon as one of them dies, ſhe in the next rank ſucceeds to her title, poſt, and income.

The empreſs, and as many of his other wives as the emperor invites, accompany him into the country to aſſiſt at the gathering in his harveſt; and if he be hindered by war, or otherwiſe, the empreſs takes the whole care of it upon herſelf, and aſſigns to the other wives their ſeveral taſks. Theſe are to overlook a certain number of the ſoldiers, or other ſubjects employed in that work, who are obliged to pay the emperor the ſervice of ſeven days in thirty, and to bring their own proviſions with them; though when he is preſent he commonly ſupplies them with oxen, ſheep, and other eatables.

The emperor is always accompanied by a numerous band of muſicians, jeſters, and buffoons, each under their own captain or maſter of the revels. During the evening, and even for the whole night, he is ſometimes entertained with vocal and inſtrumental muſic, or with the jeſts and buffooneries of thoſe who endeavour to divert him.

SECT. III.

Of the principal Officers of the Emperor's Court: the Manner in which Juſtice is adminiſtered: the Religion of the People; and a conciſe Deſcription of the Metropolis of Monomotapa.

THE principal officers in his court are the ningameſha, or governor of the kingdom, who is a kind of prime-miniſter; the mokomaſha, or captain-general; the ambuya, or lord high-ſteward, who, among other privileges, has that of naming a new empreſs when the old one dies; but ſhe muſt be either one of the ſiſters, or near relations of the emperor; the inhantore, or captain of the band of muſicians, who has a great number of them under him, and is himſelf a great lord; the nurakao, or captain of the van-guard; and the bukurumo, which ſignifies the king's right hand. All theſe are ſtiled lords, as are alſo the two chief cooks belonging to his majeſty, who are generally his relations; and the under cooks are likewiſe men of quality; but none of theſe muſt be above twenty years old; for when they have arrived at that age they are preferred to greater poſts.

All law-ſuits may be brought before the emperor by appeal, and the former judgments be either confirmed or annulled by his authority. He has no priſoners in his dominions, becauſe every trial is ſummarily determined according to the evidence given by the witneſſes, and every crime is puniſhed immediately after conviction. If the complaint be of ſuch a nature that it cannot be immediately proved, and there be any danger of the perſon accuſed

accuſed making his eſcape, he is ordered to be tied to a tree, and a guard is ſet over him till he is either acquitted or condemned; and if the latter, the ſentence is immediately executed in the open fields.

Moſt of the inhabitants are idolaters. They call the Supreme Being Maziri, or Atuo, and believe him to be the creator of the world. Their principal feſtivals are on the firſt day of the new moon, and the anniverſary of their emperor's birth. They pay great honours to a virgin they call Peru, and have a convent in which they ſhut up a number of young women.

The metropolis of the empire is called Benematapa, or Banematapa, and by others Medrogan. The houſes are built with timber, or earth, neatly white-waſhed both within and without, and the roofs are large and in the form of a bell. Theſe are more or leſs lofty according to the rank of the owners.

The greateſt ornament of the city is the imperial palace, which is a large and ſpacious wooden ſtructure with four great porticos, where the emperor's guards ſtand century in their turn. The out-parts are fortified with towers, and the inſide is divided into ſeveral ſpacious rooms hung with cotton hangings of very lively colours. Some pretend that the cielings, beams, and rafters are gilt or covered with plates of gold; that the apartments are furniſhed with chairs, which are painted, gilt, and enamelled; and that candleſticks of ivory hang by ſilver chains.

It ought not to be omitted, that the Portugueſe have ſeveral forts in the country, which one of the emperors allowed them to build out of gratitude for the ſervice they had done him in aſſiſting him to reduce ſome revolted vaſſals to obedience. They have likewiſe in moſt towns churches and monaſteries of the Dominican order. In ſhort, they not only exchange cloth, glaſs, beads, and other trifles for gold, ivory, and valuable furs, but have ſome of the moſt valuable mines of gold in the empire.

SECT. IV.

A conciſe Account of the Empire of Monomugi.

MONOMUGI, of which very little is known, is another inland country ſaid to be ſituated near the equator, and is bounded by Monomotapa on the ſouth, and on the weſt by Congo; but it is ſo little frequented, and ſo unknown to the Europeans, that it is impoſſible to aſcertain its extent. There are ſeveral petty princes on all ſides, who are either tributary or ſubject to this crown.

The climate is very unhealthy, and the air extremely hot; but the country abounds in gold, ſilver, copper, and ivory. The natives clothe themſelves in ſilks and cottons, which they buy of ſtrangers, and wear necklaces of tranſparent amber beads, brought them from Cambaya. Their monarch conſtantly endeavours to be at peace with the neighbouring princes, in order to keep an open trade with Mombaza, Melinda, and Quiloa, on the eaſt, and with Congo on the weſt; from all which countries the black merchants reſort thither for gold. The Portugueſe merchants aſſert, that on the eaſt ſide of Monumugi is a great lake, in which are many little iſlands inhabited by negroes, and abounding with all ſorts of cattle and fowl. The country affords great quantities of palm-wine and oil, and ſuch plenty of honey that above half of it is loſt, the blacks not being able to conſume it. The religion of the country is idolatry, and it does not appear that either Chriſtianity or Mahometaniſm have got any footing there.

Neither the accounts of travellers nor the maps agree in the names of the kingdoms and towns of this country; nor are there any particulars known relating to theſe kingdoms and towns.

We ſhall therefore now proceed up the weſtern coaſt of Africa; but here, particularly on the ſouthern part, we find the ſame uncertainty; and we no ſooner proceed to the north of the country of the Hottentots, than we meet with confuſed, ridiculous, and abſurd accounts. The Portugueſe writers, who about a hundred and fifty years ago deſcribed thoſe countries, have all of them an air of romance that is extremely ill placed when treating of regions unknown; and the reader, who with impartial eye ſearches for truth, is ſurfeited with fictions, and amuſed with an account of nations of Amazons, and cannibals perpetually at war, whoſe ſhambles are filled with the limbs of their captives expoſed publickly to ſale; who, though extremely numerous, bury all their children alive, recruiting their armies with thoſe taken in war. Theſe are the only writers who have deſcribed Monomugi and Mataman, or Matapan, which laſt is repreſented as a deſart waſte, inhabited by theſe barbarians; at leaſt no European nations have found it worth their while to ſettle colonies or even factories there.

CHAP. IX.

Of CONGO, including the Kingdoms of BENGUELA, ANGOLA, CONGO PROPER, and LOANGO.

SECT. I.

Of BENGUELA.

Its Situation, Extent, and Rivers; with a conciſe Account of Old Benguela.

LEAVING the deſart coaſt of Mataman, or Matapan, and proceeding to the north, four kingdoms extend along the weſt coaſt, which are frequently included by geographers under the general name of Congo, ſtretching from ſixteen degrees ſouth to four degrees and a half north latitude; that is, above twelve hundred miles in length, from north to ſouth; but they in no part reach two hundred miles from the ſea within the land. This extenſive country is bounded by the kingdom of Benin and Negritia on the north, by the inland unknown countries of Africa on the eaſt, and by the Atlantic ocean on the weſt.

But as theſe kingdoms are not ſubject to Congo, we ſhall give the ſituation and ſome of the moſt remarkable particulars of each ſeparately; and, as they agree in their natural hiſtory and in the manners of the people, we ſhall, to avoid repetition, give theſe under Congo Proper.

The kingdoms we are now to deſcribe are thoſe of Benguela, Angola, Congo Proper, and Loango. We ſhall begin with the firſt. Benguela is bounded on the north by Angola, by the kingdom of Matapan on the ſouth, and by the ocean on the weſt; the coaſt of this kingdom begins at Cape Ledo in the north, and extends to Cape Negro on the ſouth; that is from nine degrees twenty minutes to ſixteen degrees thirty minutes ſouth latitude, which is about four hundred and thirty miles.

Its chief rivers, beginning at the north, are the Longo, or Moreno, the Nica, the Catonbella, the Gubororo, or St. Franciſco, which runs through the middle of it, the Farſa, the Cutembo, and the great river Cuneni, all which run from eaſt to weſt.

The climate is extremely bad, for ſtrangers and the Europeans ſettled there are ſaid to look as if taken out of their graves.

The

The men wear ſkins round their waiſt and beads about their neck, and are armed with darts headed with iron, and with bows and arrows.

The women wear about their necks a heavy collar of copper, and have little copper bracelets round their arms reaching to their elbows; about their waiſt they have a kind of cloth made of the bark of the inſandie tree, and on their legs they have copper rings.

The capital of the kingdom, named Old Benguela, is ſituated in ten degrees thirty minutes ſouth latitude, and gives its name to a province that extends thirty miles along the coaſt. In this city the Portugueſe have built a fort, encompaſſed with paliſadoes and a ditch: the whole is ſurrounded with houſes, and ſhaded with orange, lemon, bannana, and other trees. The bay of Benguela lies to the ſouth of the town, and is about two leagues broad at the entrance; but before the town lies a ſand-bank, which makes it neceſſary for ſhips to caſt anchor at the diſtance of about a league from it.

About fifteen leagues to the ſouth of Old Benguela is the town of Manikicongo, which is large, and ſituated at the foot of a hill; it is very populous, and is well ſupplied with oxen, hogs, and other beaſts for food. The Portugueſe have a warehouſe there.

SECT. II.

Of ANGOLA.

Its Situation, Rivers, and ſome Circumſtances relating to the Manners of the People, particularly with reſpect to their Language, Trade, and Method of making War: with a conciſe Deſcription of Loando, its Capital.

THOUGH this country is called by the Europeans Angola, among the natives it has the name of Dombo. This kingdom is bounded on the north by Congo Proper, on the eaſt by Malemba, or Majemba, on the ſouth by Benguela, and on the weſt by the ocean. The country is watered by ſeveral rivers, the moſt conſiderable of which is the Dande and the Coanza. The ſoil is fertile; it produces Indian corn, beans, oranges, lemons, and ſeveral other fruits; and is rich in mines of ſilver, copper, and other metals.

The inhabitants reſemble thoſe of Congo, which we ſhall particularly deſcribe. They are, however, in general very lazy; and, though they have plenty of proviſions, are fonder of dog's fleſh than of any other meat, and therefore fatten them and ſell their fleſh in the ſhambles.

The people are divided into four claſſes, the firſt of which are noblemen; the ſecond are ſtiled children of the dominion, theſe are natives, and for the moſt part artificers and huſbandmen; the third are the ſlaves of the ſeveral lords, who are conſidered as a part of their property; and the fourth are the ſlaves taken in war.

They manure their ground by caſting up the earth into a ridge, leaving a furrow on either ſide, into which, when the rivers are ſwelled by the rain which flows from the mountains, they cut their banks and let in the water, which having remained there for ſome time; they let it out into their canals, cloſe up the banks, and ſoon after the earth becomes proper for receiving their ſeed, which ſoon grows up, and is fit to be reaped in three months time.

Polygamy prevails here, and the firſt wife is ſuperior to the reſt. While a child has no teeth, the woman keeps from her huſband; but as ſoon as theſe appear, all the friends and acquaintance of both ſexes carry the infant in their arms from houſe to houſe, playing and ſinging, to procure ſome gift for it, and are ſeldom or never put off with a denial. The huſbands ſtay at home, and employ themſelves in ſpinning and weaving cotton; while the women buy, ſell, and perform the buſineſs which is generally done by men in other countries, and they are ſo jealous of their huſbands, that if they obſerve them ſpeak to any other woman, they are preſently in a flame, and make the place ring with their clamour.

When any perſon dies, they waſh the corpſe, and winding it up, comb out the hair, and put on new cloaths: they then carry it to the grave, which is made like a vault, where it is ſet upon a ſeat made of earth, with many glaſs beads, and trifles about it. The wealthy ſprinkle blood upon the earth, and pour out wine, which is ſaid to be done in remembrance of the deceaſed.

The language of Angola differs from that of Congo only in the pronunciation; but they are not acquainted with the uſe of characters for writing.

The trade of the Portugueſe and other Europeans in Angola, conſiſts in purchaſing ſlaves. Theſe are bought above an hundred and fifty, or two hundred miles up the country, and from thence ſent down to the coaſt. All ſorts of commodities are imported thither, particularly cloth, kerſies, ticking, Sileſia and other linen, gold and ſilver lace, ſeamen's knives, linſeed oil, all ſorts of ſpices, brandy, white ſugar, Turky carpets, coloured yarn, ſewing ſilk, needles, pins, beads, large fiſh hooks, Canary wine, and horſe tails, which are much eſteemed in Angola.

The king of Angola acknowledges no kind of ſubjection to the king of Congo, though the country was formerly ſubject to him; for about the middle of the ſixteenth century, one of the nobles named Angola, by the aſſiſtance of the Portugueſe, made war upon the reſt of the nobility, and ſubdued them, till they all became his tributaries.

The military diſcipline of the people of Angola and Congo is nearly the ſame; for both of them uſually fight on foot, and divide their army into ſeveral troops, forming themſelves according to the ground, and diſplaying their enſigns and banners. The motions of their troops are regulated by the captain-general, who placing himſelf in the center of the army, by the ſound of inſtruments gives his orders whether to advance or retire, turn to the right, or left, join battle, or perform any other warlike action.

They chiefly make uſe of three ſorts of martial muſic. The firſt is a kind of drum, on which they beat with ivory ſticks. The ſecond is ſhaped like a bell reverſed, and made of thin plates of iron; upon theſe they ſtrike with wooden ſticks. The third ſort are elephants teeth hollowed, and blown at a hole made in the ſide, the ſound reſembling that of a horn. Theſe ſeveral inſtruments are of different ſizes, the larger are for the uſe of the captain-general, and the ſmaller for the inferior officers; ſo that when they hear the general's drum, horn, or bell, they anſwer in the ſame note, to ſignify that they underſtand his pleaſure.

The commanders, on their march, wear ſquare hats or bonnets, adorned with the feathers of oſtriches, peacocks, &c. The upper part of their bodies is naked, only they hang over their ſhoulders iron chains, with very large links. They have linnen drawers, and a cloth which hangs down to their heels; but they occaſionally tuck it up under their girdle, to which is faſtened ſeveral bells, and on their legs they wear buſkins.

Their arms are the bow and arrow, ſword, dagger, and ſhield. The common ſoldiers, who go naked from the waiſt upwards, uſe bows and daggers, with hafts like knives; thoſe they ſtick in their girdle. Their bows are three feet long, with ſtrings made of the bark of trees; the arrows, which are of the ſame length, are not ſo thick as a man's finger, and have iron heads; they alſo uſe broad ſwords, muſquets, and piſtols, which they buy of the Portugueſe.

They advance to war with beat of drum, and the ſound of horns, and having diſcharged a flight of arrows, dexterouſly wheel about, and leap from place to place to avoid the arrows of the enemy. There are commonly ſome ſturdy youths in the van, who with the ringing of the bells that hang at their girdles encourage the reſt. After the firſt bodies have fought till they are weary, upon the ſound of a horn they retreat, and others ſupply their places, till one ſide proves victorious.

The people fly as ſoon as their general is ſlain, and are never to be rallied. The king never goes to war in perſon; the ſtrength of his army conſiſts entirely in the infantry, he having few or no horſes, and therefore the commanders are frequently carried on the ſhoulders of their ſlaves.

The chief town of Angola, and one of the moſt conſiderable belonging to the Portugueſe ſettlements on this ſide of Africa, is named St. Paul de Loando; it is ſituated

ated on the iſle of Loando, which is twelve miles in length, and three quarters of a mile in breadth, and ſtands in eight degrees forty-five minutes ſouth latitude. The town is large and handſome, conſidering the country, and contains about three thouſand houſes built of ſtone, and covered with tiles; beſides a vaſt number of the huts of the negroes made of ſtraw and earth. It has a good harbour, defended by a fort, and is a biſhop's ſee. The jeſuits have a college here, and there are ſeveral other religious houſes; but they have no freſh water.

The Portugueſe, however, do not ſeem to be ſo much maſters of the coaſt of Angola as they are of Congo Proper; for both the Engliſh and Dutch trade thither with the natives, and annually purchaſe a great number of ſlaves, which they carry to America.

SECT. III.

Of CONGO PROPER.

Its Situation, Climate, Mountains and Minerals, Marbles, and Precious Stones. Of their Harveſts, Agriculture, different Sorts of Grain and Pulſe; and of the Mandioca, or Maniac Root, with the Manner in which it is ground into Meal.

THIS kingdom is bounded on the north by the river Zaira; on the eaſt by a ridge of mountains, and the kingdom of Matemba; on the ſouth by Angola, from which it is parted by the river Dande, and on the weſt, by the Atlantic Ocean. It extends along the ſea coaſt from cape Dande, to the mouth of Zaira, which is about ſixty leagues; but is ſaid to extend to a greater length to the eaſtward, though its limits on that ſide are not determined.

The climate of Congo is ſaid to be extreamly temperate, conſidering its being ſituated very near the equator. The winter begins in March, when the ſun enters the northern ſigns, and ſummer in September, when the ſun enters the ſouthern ſigns, and in this ſeaſon it never rains; but during five months of their winter, that is, April, May, June, July, and Auguſt, they have but few fair days; the rain pouring down with prodigous force, the rivers overflow their banks, and lay all the low lands under water.

The winds in winter through all theſe regions blow from north to weſt, and from north to north-eaſt, driving the clouds towards the mountains with great violence, where being gathered and compreſſed, they are ſeen on the tops of theſe eminencies, and ſoon after diſcharge themſelves in ſhowers. During their ſummer, the winds blow from the ſouth to the ſouth-eaſt, and as they clear the ſouthern ſkies, drive the rain into the northern regions. Theſe winds cool the air, the heat of which would otherwiſe be inſupportable. No ſnow falls in theſe countries, nor is any to be ſeen on the tops of the mountains, except towards the Cape of Good Hope, and ſome other hills, called by the Portugueſe, the Snowy Mountains.

Copper is found in many parts of Congo, eſpecially near the city of Pemba, where that metal has ſo deep a tincture of yellow, that it has been miſtaken for gold. There are alſo mines of ſilver and iron.

The mountains of Congo in many places have quarries of excellent ſtone of various kinds, from whence whole columns, with their capitals and baſes, may be dug of a prodigious ſize. There are even ſaid to be whole mountains of porphyry, jaſper, and marble of various colours, reſembling thoſe which at Rome are called marbles of Numidia, Africa, and Ethiopia. There is alſo a ſtone ſpeckled with grains, or ſtreaks, ſome of which contain beautiful hyacinths; for the ſtreaks which are diſperſed like veins through the body of the ſtone may be plucked out, like the kernels of a pomegranate, when they fall into grains and little pieces of perfect hyacinth. Beautiful columns may be formed of the whole maſs, which is very ſparkling. There are other ſtones, which ſeem inlaid with copper and other metals; theſe are very beautiful, and take a fine poliſh.

There are every year two harveſts in the kingdom of Congo; for they begin to ſow in January, and reap in April: the ſecond ſeed-time is in September, and they reap what is then ſowed, in December. In cultivating the earth, they make uſe of neither plough nor ſpade. The clouds no ſooner begin to afford the leaſt moiſture, than the women ſet fire to the herbs and roots, and after the firſt heavy ſhower has fallen, proceed to turn up the ground with a ſlight hoe, which is fixed to a handle about two ſpans long; with this they cut into the earth with one hand, and with the other ſcatter the ſeed, which they carry in a bag by their ſides. While they are employed in this exerciſe, they are generally obliged to carry their children upon their backs in ſwathing rolls, to prevent their being hurt by the number of inſects that upon this occaſion come out of the earth. They even do the ſame when they carry burthens.

As to their grain, here is a ſort which the inhabitants call luco, that nearly reſembles muſtard-ſeed; but it is ſomewhat bigger. It is ground with hand-mills, yields a very white meal, and makes fine, well taſted bread, not at all inferior to that made of wheat. There is alſo a kind of millet, called the corn of Congo, and another ſort called Portugueſe corn. They have likewiſe maize; but they give it to their hogs, and they are not fond of rice, of which they have great plenty.

They have various ſorts of pulſe for the moſt part unknown in Europe, among which is a ſort not unlike rice; it grows upon a ſhrub, and will laſt two or three years, yielding fruit every ſix months in great abundance.

The oluvo may be preſerved many years; it has a triangular ear, and its grain, which reſembles millet, is red and wholeſome.

Among many other ſorts of pulſe are the mandois, which grow three or four together like vetches; but under ground, and are about the thickneſs of an ordinary olive; from theſe they extract milk like that drawn from almonds. There is another ſort of ground pulſe, called incumbe, which is of the ſize and ſhape of a muſquet ball, and is very wholeſome and well taſted.

According to Dapper, they make bread of the root of what the natives call mandioca, or maniac root, reduced to meal; this plant is of various ſorts, which differ in the roots, colour, and quality. The leaves reſemble thoſe of the oak, and are of a deep green, with many veins and prickles. The ſtem ſhoots upright ten or twelve feet high, ſpreading into many branches; but the wood is weak, like that of the willow, the bloſſom ſmall, and the ſeed like Palma Chriſti, but of no value. When they cultivate this plant, they dig up the earth, beat it ſmall, and throw it up into heaps, then lopping off twigs, or taking ſlips about a foot long, and an inch thick, ſet two or three in each heap, with the ends ſticking out four or five inches above the earth. Theſe inſtantly take root, and in about a twelve month's time, ſhoot up to the height of above twelve feet, with many branches, and a body as thick as a man's thigh. To make the root grow large, they keep the ground clean by weeding it, and when it is come to its perfect maturity, cut the ſtem cloſe to the earth. The root being afterwards dug up, and the outſide taken off, they reduce it to flour, by grinding it in a mill made like the wheel of a waggon. The fellies of the wheel are a ſpan broad, and the bottom covered with copper, ſet with ſharp points in the manner of a grater, and underneath is a trough, into which the meal falls. He who holds the root to the wheel, is attended by ſeveral little boys, who bring him the roots, and there are ſlaves to take the ground meal out of the trough, and dry it in copper pans over the fire. Many houſes are built for this work, that are above a hundred feet long, and thirty or forty broad, with ten furnaces on each ſide. Every huſbandman may make as much meal as he thinks fit, and if he has a houſe with twenty furnaces, he commonly employs fifty or ſixty ſlaves in weeding, hoeing, grinding and drying.

Garden plants and roots grow here with little labour, particularly cabbages; but theſe are more open than with us, colliflowers, ſpinage, purſlain, ſage, hyſſop, thyme, ſweet-marjoram, coriander-ſeed, turnips, potatoes,

toes, carrots, radiſhes, and many others, beſides ſeveral unknown in Europe.

SECT. IV.

Of the Timber and Fruit Trees of Congo, and the neighbouring Countries, particularly the Enſado, and Mirrone-Tree, the Moſuma Cotton-tree, the Maginette, and the Mignamigna. Of the Beaſts, with a particular Deſcription of the Dante, and the Nſnoſſi. Of the Birds, Reptiles, and Fiſhes.

THERE are trees here of an amazing ſize, the chief of which is called by the natives enſada, and commonly ſpring up with one thick body to a great height. At the top they ſhoot forth many branches, from which deſcend ſmall ſtrings of a yelloviſh colour, which on their reaching the ground, take root, and ſpring up again like new plants, and in a little time encreaſe to a large bulk, from whence fall new pendulums, which taking root again, ſpring up as before; ſo that ſometimes a ſingle tree will extend its boughs above a thouſand paces, forming a wood large enough for ſeveral thouſand men to ſhelter themſelves under the branches, which grow ſo very cloſe, that the ſun-beams cannot penetrate them. The leaves of the young boughs reſemble thoſe of the quince-tree, they being of a whitiſh green, and woolly. The fruit, which is red both within and without, grows between the leaves of the young branches, like a common fig. Under its outermoſt bark, they find ſomething like a thread or yarn, which being beaten, cleanſed, and drawn out in length, the common people make into a kind of cloth. This and the following are evidently ſpecies of the Banyan-tree already deſcribed, in treating of Indoſtan.

The mirrone nearly reſembles the former; for the boughs alſo ſend down abundance of roots to the ground; the leaves are like thoſe of the orange-tree, and it is generally planted near the dwellings of the inhabitants, who pay to it a kind of religious veneration.

By the river Zaira grows the moſuma-tree, of which the natives make canoes. The wood is ſo extremely light, that it will not ſink tho' it be full of water. On theſe trees grow ſilk-cotton, which by ſea-faring people is uſed inſtead of feathers. Cotton alſo grows wild.

Their fruits growing on ſhrubs are ananas, anones, bananas, aroſdſes, pompions, melons, cucumbers, &c.

Among the fruit trees are citrons, lemons, and oranges. There is here a fruit tree which bears the name of the count; the fruit reſembles the giant-pear, its ſeed is like a bean, and its juice is exceeding pleaſant.

The cola fruit is as big as a pine apple, and incloſes other fruit like cheſnuts within its huſk. This fruit, beſides its other qualities, is eſteemed a ſovereign remedy in all diſeaſes of the liver.

The guajavas have ſome reſemblance to pears; they have ſhort ſtalks, are yellow without, and of a carnation colour within; they have a delicious taſte; but are of ſo cold a nature as to be unwholeſome.

The granate plum reſembles the guajava; but is ſmaller, has a pleaſing ſharp taſte, and is very wholeſome.

The maginette is a grain reſembling pepper, but is larger, and grows in bunches; within theſe grains are ſeeds, like thoſe of a pomegranate, which, on being taken out, appear of a purple colour; but, on being dried in the ſun, become black, and have a biting taſte like pepper. There alſo grows a tree three or four feet high, with ſmall and narrow leaves, the fruit of which reſembles the coriander; it firſt appearing in green knots, afterwards in bloſſoms, and laſtly in a kind of ſmall grain. Theſe berries, when grown ripe and dried in the ſun, turn black and hard, and differ but little in taſte from Eaſt India pepper, only they are not ſo hot.

There are here alſo ſeveral kinds of palm, date, and cocoa trees; there are likewiſe many trees that have medicinal virtues; but the moſt ſurpriſing of them all is the mignamigna, which is ſaid to produce poiſon in one part, and its antidote in another; for if any perſon be poiſoned, either by the wood or by the fruit, which reſembles a ſmall lemon, he will then be cured by the leaves; and if he is poiſoned by the leaves, he muſt then have recourſe either to the fruit or the wood.

Among the animals the dante ſeems peculiar to this country. It is ſhaped and coloured much like an ox, though not ſo large; its horns are like thoſe of a he-goat, but are blackiſh, very bright and ſhining, and the natives form them into a great variety of very pretty baubles. They make uſe of the raw hide dried to cover their ſhields, it being ſo tough that no arrow or dart can go through it. It is exceeding ſwift of foot, and when wounded will follow the ſcent or ſmoke of the gun-powder with ſuch fury, that the hunters have no other way to avoid it, than by climbing a tree with all poſſible ſpeed; and upon ſuch occaſions they always carry rope-ladders with them, which they faſten to ſome branch before they venture to fire. The wounded dante, finding his enemies out of his reach, ſtays at the foot of the tree for them, and ſtirs not from it till a ſecond, or perhaps a third ſhot has laid him dead. Their fleſh is eſteemed delicate food, and both the natives and the wild beaſts make continual war upon them; but nature has taught them to guard againſt the latter; they commonly go in large droves of ſeldom leſs than a hundred, which, on their being attacked, diſpoſe themſelves into a ring, with their horns outward, with which they defend themſelves with ſurpriſing vigour and agility. They are of different colours like our cows, ſome black, others grey, and others brown.

The nſoſſi is of the bigneſs of a cat; it is of an aſh colour, and has two ſmall horns on its head. This is ſaid to be the moſt fearful creature that lives, it being ever in motion, and ſtarting or running at the leaſt noiſe or breath of air. Even when it is drinking, it ſwallows a ſingle gulp, then runs away, as if purſued, and with the ſame fear returns, till it has quenched its thirſt. It does the ſame when browzing on the graſs, at every blade it crops. Its fleſh has an exquiſite taſte, and the natives prefer its ſkin to that of any other creature, to make ſtrings for their bows.

There are here alſo the elephant and the rhinoceros, with red buffaloes, zebras, elks, lions, tygers, leopards, bears, wild boars, wolves, foxes, very large wild cats, catamountains, civet cats, apes, baboons, and the orang outang, which is of a middle ſpecies between the human and the baboon. Theſe are alſo found in the Eaſt Indies, where we have given a particular account of them.

There are alſo here cows, ſheep, goats of ſeveral kinds, hogs, fallow deer, roe-bucks, hares, and rabbits.

Theſe and the neighbouring kingdoms afford a vaſt variety of both land and ſea fowl. Among the former are plenty of oſtriches of a ſurpriſing ſize. Their feathers, mixed with thoſe of the peacock, which are here no leſs numerous, and exceeding beautiful, are uſed as enſigns and ſtandards, and made into very ſplendid umbrellas. The king of Angola, we are told, keeps vaſt numbers of peacocks in a wood ſurrounded with high walls, and ſuffers none in his dominions to breed or have any of them, becauſe he uſes their feathers in his royal enſigns.

Turkiſh geeſe, hens, and ducks, both wild and tame, are alſo here in vaſt plenty; and pheaſants are ſo numerous and familiar, that boys take them alive in their traps. The ſame may be ſaid of the prodigious quantity of woodcocks, pigeons, doves, and other ſmaller birds, which are common in all theſe countries.

They have a great variety of parrots, diſtinguiſhed by their different ſizes and colours, particularly a ſmall ſort not much bigger than a ſparrow, but of a fine ſhape and the moſt delightful colours.

But the moſt eſteemed are thoſe diſtinguiſhed by the name of birds of muſic. Theſe are ſomething larger than the Canary bird, and of different colours, ſome being all over red, others green, with only the feet and bill black; ſome are all white, others grey, dun, or black; theſe laſt have the ſweeteſt note, and ſeem to talk in their ſinging.

In ſome places the pools are covered with white herons. There is alſo a ſort of fowl like a crane, with the bill and feet red, and its feathers for the moſt part red and white; but ſome are of a dark grey. Birds of prey, as eagles,

eagles, vultures, falcons of various ſorts, ſparrow hawks, and others of the like nature, are here likewiſe very numerous.

With reſpect to reptiles, the country is infeſted with a variety of ſerpents, ſome of which the Portugueſe prieſts have repreſented as of ſo incredible a ſize, as to ſwallow a ſheep whole, or even a ſtag with its horns. There are rattle-ſnakes, vipers, tree-ſerpents, and many reptiles of other kinds; and the houſes are infeſted with ſcorpions.

Fiſh, as in other maritime countries, are here alſo in great plenty and variety, both in the ſea and the rivers.

SECT. V.

Of their Perſons, Dreſs, Manners, and Cuſtoms. Their Entertainments, Muſic, and Dancing.

THE complexion of the original natives is generally black, though not in the ſame degree, ſome being of a deeper die than others; and ſince their intermixed marriages with the Portugueſe, they have varied from their native hue, ſome to a dark brown, ſome to an olive, and others to a blackiſh red. Their hair is black and woolly, and their eyes of a fine lively black; but they have neither flat noſes, nor thick lips. Their ſtature is moſtly of the middle ſize; and, excepting their black complexion, they much reſemble the Portugueſe, though ſome of them are more fat and fleſhy than they.

In general they behave in a friendly manner towards ſtrangers, and are of a mild, courteous, and affable diſpoſition, eaſy to be overcome by reaſon; yet inclined to drink to exceſs, eſpecially when they can get Spaniſh wine and brandy. In converſation they diſcover great quickneſs of parts and underſtanding, and expreſs themſelves with ſuch good ſenſe and humour, that perſons of the greateſt learning take delight in hearing them. But they are, on the other hand, proud, revengeful, and much addicted to poiſoning one another on the ſmalleſt provocation; but if the offender be detected, he dies without mercy; and the enquiry is ſo ſtrict, that it is very difficult to eſcape.

Lopez obſerves, that the king of Congo and his courtiers were formerly cloathed from the waiſt downwards with palm-tree cloth, faſtened with girdles of the ſame ſtuff. They alſo hung before them, by way of ornament, the ſkins of ſmall tygers, civet cats, ſables, martens, and other animals, in the manner of an apron; and on their heads a cap reſembling a hood. Next their ſkins they wore a kind of ſurplice which reached to their knees, and was made of very fine palm-tree cloth, and fringed round the ſkirts. Theſe ſurplices were turned up again, and tucked upon the right ſhoulder. They wore yellow and red caps, ſo ſmall that they ſcarce covered their heads. Moſt of them went unſhod; but the king and ſome of the great lords wore ſandals, like thoſe of the antient Romans, made of palm-tree wood. The common people were dreſſed from the middle downwards in the ſame manner, only the cloth was coarſer; but the reſt of their body was naked.

The women uſed three kinds of aprons of different lengths, one of which reached to their heels, and was fringed round. They had alſo a ſort of jacket, open before, that reached from their breaſts to their girdle, and over their ſhoulders a cloak made of palm-tree cloth. Their faces were uncovered, and they had a ſmall cap on their heads like thoſe worn by the men. Women of inferior rank were dreſſed in the ſame manner, only their cloth was coarſer; but the maid-ſervants, and the women of the loweſt rank, had only a cloth round their waiſt, and all the reſt of the body naked.

This was the dreſs of Congo before the arrival of the Portugueſe; but after their converſion to the Romiſh faith, the great lords of the court began to follow their faſhion in wearing cloaks, Spaniſh hats, wide jackets of ſcarlet ſilk, and leather or velvet ſlippers. But the common people, both men and women, retain the old habit through neceſſity. Women of figure alſo dreſs like the Portugueſe, except their wearing no clokes: they cover their head with a veil, over which they have a velvet cap adorned with jewels, and gold chains round their necks.

The natives chiefly live upon fruit, roots, grain, and pulſe: their common drink is water, and they regale themſelves with palm wine. They are fond of entertainments, and commonly celebrate their feaſts in the evening, when they ſeat themſelves in a ring upon the graſs, and a large, thick, wooden platter is placed in the midſt of them. The eldeſt perſon preſent gives to every one his ſhare with great exactneſs, both as to quality and quantity, ſo that none have reaſon to complain. If any perſon whatſoever happens to be paſſing by where the gueſts are eating, he or ſhe thruſts into the ring without ceremony, and has an equal ſhare with the reſt, even though he ſhould come after the ſhares are allotted: in which caſe the carver takes ſome from every perſon's meſs to make up that for the ſtranger. It is the ſame if the chance-comers are numerous; they may eat and drink as freely as if invited; and when they perceive the platter empty, they riſe up and go away, without taking leave or returning thanks: nor do the people ever aſk theſe intruders whence they come, or whither they are going.

Theſe feaſts are kept on ſeveral occaſions, as on a marriage, the birth of a child, their advancement to ſome dignity, or the like, when every one makes his lord a preſent ſuitable to his ability, and alſo aſſiſts at the ſolemnity.

At theſe entertainments they ſing love ſongs, and play upon an inſtrument of a very extraordinary ſhape; the body and neck reſemble thoſe of a lute, but the belly-part is not made of wood, but of a ſkin as thin as a bladder. The ſtrings are hairs of the elephant's tail, or threads of palm-tree, reaching from the bottom of the inſtrument to the top of the neck, and tied to ſeveral rings placed ſome higher and others lower. At theſe rings hang thin plates of iron and ſilver, of different ſizes and tones. When the ſtrings are ſtruck the rings ſhake, which moving the plates, the latter yield a confuſed kind of gingle. Thoſe who play on this inſtrument tune the ſtrings and ſtrike them with their fingers like a harp, very ſkilfully, ſo that they make a ſound agreeable enough.

Of the ſame kind is an inſtrument like a guitar, but without a head; inſtead of which are five ſmall iron bows, which, when the inſtrument is to be tuned, are let more or leſs into the body of it. The ſtrings are of palm-tree thread, and are played upon with the thumbs of each hand, while the inſtrument reſts upon the performer's breaſt. Though the ſound is very low, yet it is not diſagreeable.

The moſt ingenious of their inſtruments, as well as that moſt in uſe, is thus deſcribed by Carli. They take a ſtick which they bend like a bow, and tying it, bind to it fifteen long, dry, and empty gourds, or calabaſhes, of different ſizes to ſound different notes, with each a hole at the top, and a ſmaller hole three fingers lower. This laſt hole they ſtop up half way, and cover that at the top with a little thin bit of board at ſome diſtance above it. They then take a cord, made of the bark of a tree, and faſtening it to both ends of the inſtrument, hang it about their neck. To play upon it, they uſe two ſticks, with the ends covered with a bit of rag, and ſtriking upon the little boards, make the gourds gather wind; which being driven out of the half ſtopped hole, give ſounds reſembling thoſe of an organ, and make an agreeable harmony, eſpecially when three or four of them are played together.

They have alſo flutes and pipes, which the court muſicians play upon very ſkilfully; the common people alſo uſe pipes with little rattles, and other inſtruments that form a very rude ſound.

They make their drums in the following manner; they cut the trunk of a tree three quarters of an ell long or more, for when they hang them about their necks they reach almoſt to the ground. Theſe they hollow within, and cover the top and bottom with the ſkin of a tyger, or ſome other beaſt, which makes a hideous noiſe when they beat it, after their manner, with the open hand.

Beſides theſe great drums, which are uſed in the army, there is a ſmaller ſort, made either of the fruit of the aliconda tree, or of a ſmaller piece of the trunk of a tree made hollow, with a ſkin over one end only: theſe they beat upon only with one hand.

When

When the people dance they keep good time with the muſic, clapping the palms of their hands together; but at court they generally move their feet in a kind of Moreſco meaſure, with great gravity.

The chief paſtimes of the Congo blacks are dancing and ſinging. They alſo play at cards, ſtaking ſmall ſhells, which are their money. In the evening, when the women are returned with their children from the fields, they light a fire in the middle of their cottages, and ſitting round it on the ground, eat what they have brought; then talk till they fall backwards with ſleep, and thus ſpend the night.

SECT. VI.

Of their Marriages; the ſeparate Employments of the Huſband and Wife; the Treatment of their Children; their Funerals and Mourning.

THE people of Congo who have embraced the religion of the Portugueſe, marry after their manner; but will not be reſtrained from keeping as many miſtreſſes as they can maintain. When a young man expreſſes his deſire to marry, his parents ſend a preſent to the relations of the young woman on whom he fixes his choice, requeſting their daughter as a wife for their ſon. With this preſent an earthen pot of palm wine is alſo ſent, and before the preſent is received, all the wine is to be drank by the girl's parents and friends, the father and mother drinking firſt. After this is done the father returns an anſwer, and his receiving the preſent is conſidered as a proof of his compliance. The young man upon this goes immediately with his friends and relations to the houſe of his miſtreſſes's father, and, having received her of her parents, conducts her home, where he lives with her in order to be ſatisfied whether ſhe will have children; whether ſhe will be deligent in her daily labour, and prove very obedient: and if, in two or three years time, he finds her faulty in any of theſe points, he ſends her back to her parents, and has the preſent reſtored; but when the fault is on his ſide, he can recover nothing. The woman, however, is not conſidered in a worſe light on this account, but generally undergoes another trial ſoon after.

If after a man's enjoying, during two or three years, all the privileges and endearments of the nuptial commerce, he at laſt ventures to tie the nuptial knot, he ſends to all his and his bride's relations, who never fail to come on the day appointed, dreſſed in the moſt coſtly ornaments they can either purchaſe or borrow. Every one breaks out into congratulations and good-wiſhes. The prieſt, if any can be had, (for in ſome parts of the kingdom they are ſometimes whole years without ſeeing a prieſt) comes in and performs the ceremony; then follows the dowry, and ſome mutual preſents, ſuitable to their rank.

The marriage-ceremony is quickly ſucceeded by a ſumptuous banquet, and upon theſe occaſions they exert all their abilities. The repaſt commonly laſts till after ſun-ſet, or rather as long as there are any victuals or liquor left.

No ſooner are all the proviſions eaten than every one diverts himſelf his own way, ſome by ſinging or dancing, others by drinking, ſmoaking, or ſleeping, which generally crowns the feaſt; and the next riſing ſun ſends them all home.

In caſe of adultery the man is obliged to give the value of a ſlave to the huſband, and the woman to aſk pardon; and if this be not done, the huſband may eaſily obtain a divorce from the Portugueſe prieſt.

The huſband is obliged to procure an habitation, to clothe his wife and children in a manner agreeable to his rank, to prune the trees, to grub up roots, and to carry home the palm wine as often as the veſſel fills. On the other hand, the woman is to find proviſions for her huſband and children: ſhe accordingly works in the fields till noon, and at her return prepares the dinner. If any thing is wanted, ſhe muſt either buy it out of her own money, or barter cloaths for it. The man ſits alone at table, while the wife and children wait to ſupply him with what he wants. When he has dined the remainder comes to them; and though they may ſit down to eat it if they pleaſe, yet they generally ſtand from the opinion that they ought to pay this mark of reſpect to him whom they are born to ſerve and obey.

The mothers of thoſe who have not embraced the Romiſh religion preſent their infants as ſoon as they are born to their own prieſts, in order to know their good or ill fortune. The falſe prophet, then taking the child in his arms, makes his obſervations on the muſcles and other parts of his body, and then tells the parents what he thinks proper. The ſame is done to ſick perſons, in order to know the cauſe of their diſtemper, and whether they will recover; and if they gueſs wrong, they never want an excuſe.

It is cuſtomary for the parents, or the pagan prieſt, to order the young people to abſtain from eating either the fleſh of ſome particular wild beaſt, ſome ſorts of poultry, or a particular fruit or root; and theſe orders are as inviolably kept, as they are ſtrictly enjoined; for they would ſooner faſt for ſeveral days than taſte the leaſt bit of what has been forbidden.

When a perſon dies, they wrap up the corpſe in a piece of cotton cloth; but the poor make uſe of ſtraw mats, then bury the body in the fields, and diſtinguiſh the grave by placing a heap of raiſed earth upon it: others place upon this heap the horn of ſome uncommon beaſt; and others plant trees, and form arbours around it.

Both rich and poor obſerve a kind of mourning for their near relations, which begins with a cloſe confinement and abſtinence from all refreſhment during three days: after which thoſe of the common rank ſhave their heads, and anoint themſelves all over with oil; upon which they rub ſuch a quantity of earth, duſt, and dry leaves of various ſorts, as gives them a moſt frightful appearance. Thoſe of higher rank content themſelves with ſhaving the upper part of the head, binding about it a liſt of cloth, linen, or leather, and confining themſelves in their houſes eight days; after which they gradually return to their former way of life.

The widows are obliged to ſubmit to a much longer retirement, eſpecially at court, and in the populous cities, where it would be thought ſcandalous to be ſeen abroad in leſs than a year after the death of a huſband; but in more remote places they are allowed to go about their own affairs much ſooner. Upon their firſt appearance they are uſually in black, with a cap on their head, which falls back upon their ſhoulders: their upper garment, which is generally woollen, is open on the ſides, and reaches as low as the knee both before and behind. That of the women of quality is of the ſame ſtuff and colour, but fuller, and plaited about the neck. The widow ſlaves of St. Salvadore, Loango, and other places, are diſtinguiſhed by a ſharp pointed cap, about thirty inches high, which makes a ſtrange appearance.

We ſhall conclude this ſection with a very barbarous cuſtom which prevails at Congo. The people believe that the dying are juſt upon paſſing from a wretched and troubleſome life into a ſtate of eaſe and happineſs; and from thence infer, that the moſt charitable office they can do them is to haſten their deliverance; and therefore, when a perſon is at the point of death, they ſtrive who ſhall diſpatch him ſooneſt, by ſtopping his mouth and noſe, and ſtriking him upon the breaſt with their fiſts or knees, which they imagine an inſtance of kindneſs, as it ſhortens his laſt ſtruggles and agonies, and ſpeedily ſends him into a ſtate of reſt and bliſs.

SECT. VII.

Their Ignorance of the Sciences, and their Skill in ſeveral Arts, particularly in working Iron, and Weaving: their Carpenters, Joiners, and Potters: and their method of travelling.

THE inhabitants of Congo cultivate no ſciences: they keep no hiſtories of their antient kings, nor any records of paſt ages; for they have not the art of writing.

They

They reckon the year by winter ſeaſons, which they begin upon the fifteenth of May, and end on the fifteenth of November: they alſo reckon the months by the full moon, but do not divide the days into hours and minutes.

Working of iron is much eſteemed amongſt them, not only on account of its extraordinary uſe, but from a tradition that its firſt inventor became afterwards king of Congo; and yet it has received ſo little improvement, that a ſtranger who ſaw them working at the forge, would find all the appearance of its being ſtill in its infancy. The workman ſits on the ground, or at beſt upon a ſtone; for they have no notion of ſtanding to work, with an ill ſhaped hammer in one hand, a piece of iron in the other, and, inſtead of an anvil, a hard ſtone between his legs, upon which he beats and ſhapes one iron, while his foot is moving a wretched pair of bellows to heat another.

They do not dig the ore out of the mines, but content themſelves with ſuch a quantity as the heavy rains and torrents bring down in a kind of duſt or dirt into the valleys and highways; and for receiving it dig holes and trenches. When it is ſettled at the bottom, and the water taken off or dried up, they cover the whole with charcoal; and by blowing it, when lighted, purge the metal from its droſs, and melt it into a lump, which they afterwards fabricate in the above manner, performing the whole with ſo little art that the points of their lances, darts, and arrows, their ſcymetars, cutlaſſes, and other weapons, are clumſy and ill ſhaped.

Their method of weaving is ſtill more rude and imperfect: and yet one would be aſtoniſhed at ſeeing the curious works performed by ſuch ſimple means. They have neither loom, ſhuttle, nor other inſtruments in uſe among them; but only faſten their threads at both ends to pieces of wood laid upon the ground at no conſiderable diſtance; for they never weave a piece of any greater length than will ſerve for one ſingle dreſs. Having braced the threads of the woof as tight as they can, they conduct the croſs-web between them with aſtoniſhing patience, as if they were rather darning then weaving; and yet ſome of them adorn their web with various works in checkers, diamonds, flowers, and net-work in different colours, with ſurpriſing neatneſs, conſidering the manner in which the whole is performed: but among us a weaver is able to do as much work in one day as they in twenty.

With reſpect to their joiners and carpenters, who at Congo are of one trade, their tools conſiſt of a miſhapen ax, the back of which ſerves for a hammer; at one end is alſo a kind of chiſſel, the other is ſharp-pointed like a puncheon, and both are faſtened to a wooden handle. The work they produce is clumſy and without art, and being performed with ſuch aukward tools, is ſix times as long ere it is finiſhed, as a better hand, with better tools, would be in making a more perfect work.

The potters for want of a wheel, ſhape their clay by the help of a piece of a gourd, which ſerves them as a mould; and, inſtead of an oven or a kiln, burn a quantity of ſtraw over and about it.

In many caſes, as in the making of their ordinary huts, boats, nets, and the like, every one works for himſelf.

Their artiſts have ſhewn but little ſkill in contriving vehicles for carriage. They have neither coaches, carts, beaſts of burthen, or even ſaddle horſes, mules, or aſſes; but the people are carried on the ſhoulders of their ſlaves, be it ever ſo far, or the roads ever ſo bad. The rich commonly travel in a kind of hammocs, with a covering over them to ſhelter them from the ſun; and perhaps a ſlave runs with an umbrella to ſhade his maſter on the ſunny ſide, and ſometimes only for grandeur. The hammocs, ſome of which are made of net-work, and others of ſtrong ſtuffs, are faſtened at both ends to a pole, which is carried upon the ſhoulders or the heads of two ſtout ſlaves, who are relieved at proper intervals by two others, or more if their maſter can afford it; while he lies lolling at his eaſe, ſmoaking, ſleeping, or looking about him, with all the indolence that makes a part of African as well as Aſiatic luxury.

Some of theſe carriages are borne by four ſlaves, and reſemble the palanquins of India; they having an eaſy couch and a pillow, and above a canopy and curtains to ſhield the perſon, indolently reclined within, from the ſun, the rain, or the wind. Theſe are more convenient than the other, and require a great number of ſlaves; on which account they are only fit for perſons of high rank, and are therefore commonly embroidered with gold, ſilver, and ſilk.

On the other hand, thoſe of the lower rank are contented with being carried ſitting in a kind of open chair, or even a broad leather ſtrap, hanging to a pole carried on men's ſhoulders, and holding an umbrella in their hand.

All theſe methods of travelling require, beſides the ordinary relay of ſlaves, another ſet to carry proviſions, tents, and other conveniencies for the journey; and thoſe who have not a ſufficient number of them may hire them of thoſe who have.

Indeed, their beſt method of travelling is chargeable, inconvenient, and tedious; for even thoſe who have the beſt opportunities for expedition, muſt let their porters and carriers reſt ſo often, either upon real or pretended occaſions, that they ſeldom make half the ſpeed that might be expected. While the badneſs and difficulty of the roads, and the want of them in moſt parts of the kingdom, where they are obliged to cut their way thro' woods and thro' thickets of thorns and brambles; to croſs pathleſs deſarts and burning ſands; to travel over high and almoſt impaſſable rocks and mountains, expoſed to danger from wild beaſts and venomous reptiles, muſt render the moſt delightful conveniencies for travelling diſagreeable, when attended with delay. Add to this, their being frequently obliged to croſs large and rapid rivers, ſometimes only by means of a rope thrown over and faſtened to a tree; and, at beſt, in ſome old boat, made of the bark, or cut out of the ſtump of a tree.

SECT. VIII.

Of the Buildings and Furniture of the Congoeſe; with a Deſcription of St. Salvadore, the Metropolis of the Kingdom.

THEIR houſes are generally no better than round huts, low and ill built with wood and mud, without any floor beſides the naked ground, or any cieling; they are commonly ill contrived, and poorly thatched with ſtraw or fern; but this is ſufficient to defend them from the ſun, rain, and wind. They have no windows, nor any light but from the doors, which are uſually ſo low, that the ſhorteſt man muſt ſtoop to enter them, and the talleſt can hardly ſtand upright within the little building. Theſe tents are more or leſs ſpacious according to the largeneſs of the family, who live promiſcouſly in them, and at night light a fire in the center, the ſmoke of which makes its way through the thatch, while they lie round it with their heads towards the wall. The houſes of the city of St. Salvadore, and ſome other of their towns, are however ſomewhat higher, better thatched, and white-waſhed both within and without: theſe are divided into apartments, the chief of which have their floors matted. Thoſe which belong to perſons of rank are ſtill more capacious, and have a kind of hall to receive their viſitors; beſides diſtinct apartments for their wives, ſervants, and ſlaves, which ſtand like ſo many houſes either adjoining to each other, or incloſed within the ſame cincture.

Thoſe of the Portugueſe muſt be excepted, they being commonly built of brick and mortar after the European manner, and for the moſt part pretty well furniſhed; but theſe have not been able to raiſe the emulation of the Congoeſe to endeavour to imitate them.

The furniture of the natives is much of a piece with their houſes, it chiefly conſiſting of a few ill contrived inſtruments of agriculture; a hatchet to fell timber; a cutlaſs, which they uſually carry about them when they are travelling, or going to war; a few calabaſhes, in which they ſtore their proviſions, as their roots, pulſe, grain, and the like; and their kitchen furniture, which conſiſts of a pot, a kettle, a ladle, a few earthen platters, a hand-mill to grind their corn, and ſome ſmall calabaſhes, out of which they eat and drink. Their beſt bedding is a large coarſe ſackcloth filled with ſtraw, leaves, or the like, with a ſlight covering, and perhaps a ſtump of wood for a pillow. If the meaner ſort have any thing better than

than the bare ground to lie upon, it is only ſome ſtraw, fern, ruſhes, or leaves; and as they are all obliged to kindle a fire at night, on account of the violent dews, it frequently communicates itſelf to their bedding, and in a few moments ſets the whole houſe in a flame, even ſometimes before they can have time to eſcape out of it; and it is not unuſual for the flames to ſpread over a whole town or hamlet. Tables, chairs, and ſtools, with many other pieces of furniture eſteemed neceſſary in Europe, are never uſed by the common people.

Indeed their princes and great lords, ſince the coming of the Portugueſe, have endeavoured to imitate, in ſome degree, the richneſs of their furniture. But all their finery conſiſts in having their floors neatly matted, or covered with a fine carpet, and their mud walls hung with tapeſtry: they have alſo a few large cheſts, in which they lay up their proviſions, ranged about their apartments, and over them hang their arms and apparel in an irregular manner. Indeed in the palaces of ſome of the chief princes and viceroys the rooms are adorned with large and ſplended umbrellas, and many pieces of furniture purchaſed of the Portugueſe merchants, as pictures, looking-glaſſes, ſtately couches, eaſy-chairs, cuſhions, cabinets, caſkets, drinking-glaſſes, China-ware, wardrobes filled with rich cloaths, and other coſtly houſhold furniture. Thoſe of the nobility who are unable to purchaſe theſe expenſive pieces of furniture, content themſelves with either imitating ſomething like them in a leſs degree, or, which is more common, with deſpiſing them with a philoſophic pride, as things unworthy the regard of a great mind.

After giving this account of the buildings and furniture of the natives, we ſhall add a deſcription of the capital of the kingdom, antiently called Banza Congo; but it is now known by the name of St. Salvadore, which was given it by the Portugueſe. This city is ſituated in the fourteenth degree twenty-five minutes eaſt longitude, and in the fifth degree of ſouth latitude, upon a very high hill moſtly of ſolid rock, about two leagues in compaſs, and about a hundred and fifty miles to the eaſt of the ſea. It is ſhaded by a variety of fruit-trees, as the palm, lemon, and orange tree, and yields a delightful proſpect all round it; as it commands the neighbouring country on every ſide as far as the ſight can reach, without being obſtructed by woods or mountains. The river Zaira runs on the ſouth-eaſt ſide, where the deſcent is very ſteep. The monarchs of Congo choſe this city for their reſidence, on account of its being almoſt inacceſſible to an enemy, and conſequently not eaſy to be ſurprized or attacked. The common high way that leads up to it is broad, but winding, and the aſcent about five miles in length.

It is ſeated almoſt in the center of the kingdom; and on the top of the mountain is a large plain, well watered and covered with farms; and there are alſo a great number of cattle, by which means the place may be eaſily ſupplied with proviſions. The mountain has alſo ſome iron mines of ſingular uſe to the inhabitants, who there work that metal into weapons and inſtruments of agriculture.

St. Salvadore ſtands on an angle of the mountain facing the ſouth-eaſt; it enjoys a ſerene and healthy air, and, being ſtrongly fortified by nature, has no walls, except on the ſouth ſide. The houſes ſtand pretty near to each other; moſt of them belong to perſons of quality, who join ſuch a number of little ſtructures within one incloſure, that they appear like ſmall towns. Thoſe which belong to the inferior people run in a ſtraight line, and form very handſome ſtreets; theſe are moſtly ſpacious, but their walls are all of ſtraw, except ſome which the Portugueſe have cauſed to be built of brick, and covered with ſtubble.

The royal palace is a ſpacious building, encompaſſed with a ſquare wall, and has the appearance of a ſmall city; but the wall that faces the Portugueſe quarter is the only one that is built of ſtone and mortar, the other three ſides being only of ſtraw, though neatly enough diſpoſed. The walls of the inner apartments are of the ſame materials, but covered with hangings or mats curiouſly wrought. The inner-court contains gardens and orchards, adorned with alleys, arbours, and pavilions that make a handſome appearance. Here are ten or twelve churches, of which the cathedral and ſeven others are within the town, and three within the palace. The jeſuits had ſome years ago a college, wherein four of them were conſtantly employed in teaching the Latin and Portugueſe tongues, and in catechiſing the children. The town is ſupplied with plenty of freſh water by two fountains, one in the ſtreet called St. Jago, and the other in the palace; and, beſides, there is on the eaſt ſide, near the foot of the hill, a ſpring of excellent water, which ſerves to refreſh the adjacent lands. They have here but few ſheep and oxen, but great plenty of goats and hogs; and have a large market in a piazza before the great church well furniſhed with proviſions. The reſt of that ſquare is encompaſſed by ſpacious houſes moſtly inhabited by noblemen, as are alſo many others in the ſuburbs of the city and the adjacent country. That part which is encloſed, and called the Portugueſe city, is reckoned about a mile in compaſs, and the king's palace is nearly the ſame. The walls about each of them are very thick, but their gates are neither ſhut nor guarded.

SECT. IX.

Of the Government of Congo; the abſolute Authority of the King, who poſſeſſes all the Lands; in what Manner the Kingdom is elective; and how the Election is performed. The Ceremony of the King's bleſſing the People, and that of his granting Inveſtitures; the Grandeur of his Court; the Splendor with which the King goes abroad, and hears Maſs. In what Manner the Affairs of Government are tranſacted. The King's Seraglio; his Forces; and the Manner in which the Laws are executed.

THE government of Congo is monarchical, and as deſpotic as any in Aſia or Africa. The king is the ſole proprietor of all the lands within his dominions, which he beſtows upon whom he pleaſes, on condition of being paid a certain tribute out of them; and turns the people out of it upon failure of paying it, or even at his own pleaſure. The princes of the blood are ſubject to the ſame law; ſo that there is no perſon, let his rank or quality be what it will, that can bequeath a foot of land to his heirs or ſucceſſors; and when theſe owners under the crown die, they immediately devolve to it again.

The Portugueſe, however, ſince their becoming maſters of the country, have prevailed on the monarchs to permit the heirs and ſucceſſors of the tenants to continue in the poſſeſſion of ſuch lands, and have obliged the tenants to pay their tribute more readily and exactly than they did formerly. The tribute affixed to the grant of lands to the governors of provinces, and to ſeveral marquiſes, counts, and other nobles, is expreſsly ordered to be brought to court once in three years at fartheſt; which, joined to the ambition and avarice of thoſe lords, makes them oppreſs the people in a cruel manner, and not only ſtrip them of all they have, but even ſell, without the leaſt mercy, their tenants, with their wives and children, for ſlaves.

The kingdom is partly hereditary, and partly elective. No perſon can be choſen who is not of the royal blood; but whether he be of a nearer or farther branch, whether by the male or female ſide, or whether born of the wife or one of the king's concubines, is not material, a baſtard being eſteemed as capable of ſucceeding to the throne as one born in wedlock; and therefore, upon the deceaſe of a monarch, there ſeldom fails of being a great number of competitors, though the choice commonly falls on him who brings the greateſt number of friends and forces with him to the field of election, provided he be of the church of Rome; for none elſe are permitted to ſtand as candidates for the crown.

As ſoon as they have agreed upon a ſucceſſor, all the grandees of the realm are ſummoned to appear on a plain near St. Salvadore, whence they proceed in pomp to the cathedral, once a noble ſtructure built by the Portugueſe, but ſince run to decay; but on theſe occaſions an altar is richly adorned, and near it is a ſplendid throne, on which the biſhop or his vicar is ſeated; and near the other end of the altar is a chair of ſtate, on which is ſeated an officer, who is to declare the perſon elected: he is ſur-

rounded

rounded by the candidates, who yet know not who they have pitched upon, and now wait with impatience to hear him declared; but, before he makes his proclamation, he riſes from his chair, and kneeling before the altar makes a prayer, and then returning to his ſeat, pronounces a long ſpeech on the duties of a monarch, and the many cares and difficulties with which it is attended; after which he declares to the aſſembly, that he and the other electors, having impartially weighed the merit of the candidates, have choſen ſuch a one to enjoy the dignity of ſovereign.

He then ſteps forward, takes the new ſovereign by the hand, and bringing him to the biſhop, they both kneel before him. While the king continues on his knees, the prelate gives him a ſhort admonition, in which, among other things, he exhorts him to ſhew himſelf a zealous protector of the Chriſtian religion, and an obedient ſon of the church.

The uſual oaths are then adminiſtered to him, and he pronounces them with a loud voice; after which the biſhop leads him by the hand to the throne erected for him, puts the royal ſtandard into his hand, and a crown upon his head; upon which the whole aſſembly fall proſtrate before him, acknowledging him for their king with loud acclamations; to which are added, the ſound of martial inſtruments, and ſoon after the firing of artillery. The ceremony being over, the new king takes the name of one of the kings of Portugal, as all his predeceſſors have done ever ſince the reign of the firſt Chriſtian king.

There are two remarkable ceremonies which follow that of the king's coronation; the moſt conſiderable of which is that of the new monarch's publickly bleſſing the people; the other is that of his granting the inveſtiture of the principal poſts and fiefs in his dominions.

The days fixed for each are proclaimed with extraordinary pomp and ceremony throughout the kingdom, and in St. Salvadore, by the firing of the artillery and the ſound of muſical inſtruments. The firſt of theſe ceremonies brings a prodigious concourſe of people from all parts, for they eſteem his bleſſing of ſuch value, that they would think it a dreadful thing to be deprived of it.

The monarch appears on the day appointed in the utmoſt ſplendor, ſurrounded by his guards and a numerous court, with all the governors and nobles of his kingdom, magnificently dreſſed and attended. The ceremony is performed on a ſpacious plain, ſufficient to contain the innumerable multitudes that flock to it, and on an eminence is raiſed a ſplendid throne covered with a canopy, from which he can ſee and be ſeen, and plainly diſtinguiſh his nobles and miniſters, who are ſituated nearer or farther from him according to their rank. If there are any aſſembled who have incurred his diſpleaſure, he caſts his firſt looks upon them, and cauſes them to be driven from his preſence, as wretches unworthy of his bleſſing; when the populace, emulous to expreſs their zeal for their prince, lay violent hands on theſe obnoxious perſons, and drag them away, treating them with ſuch indignities, that many loſe their lives before they can get out of the numerous crowd. By this means the king often gets rid of ſuch bad miniſters with the greateſt eaſe, whom he could not have attempted to puniſh without imminent danger.

Theſe obnoxious perſons are no ſooner removed, than the king, addreſſing himſelf to the reſt of the aſſembly, exhorts them to preſerve their loyalty to him, and promiſes them in return his favour and protection. Then riſing from his throne, they proſtrate themſelves on the ground before him, and he gives them his bleſſing, not in words, but by a peculiar ſpreading of his arms over them, and geſticulation of his fingers; for which they, on their part, expreſs their joy and gratitude by loud acclamations and clapping their hands. The whole ceremony concludes with the ſound of various inſtruments, and the diſcharge of the artillery. From that time all who have ſurvived the diſgrace of being denied a ſhare in the bleſſing, are regarded with horror and contempt, except they can, by means of their friends, by rich preſents, and a ſubmiſſive behaviour, regain the royal favour; which if they do, they are admitted to his preſence, and his bleſſing wipes away all their former diſgrace.

The ceremony of granting inveſtitures is performed with much the ſame ſplendor. On the day prefixed the king appears with the utmoſt magnificence on his throne, while all who are candidates for a new poſt, fief, or inveſtiture, lie proſtrate before him, encompaſſed by vaſt crowds of ſpectators, in the ſame poſture. At the third diſcharge of the artillery the candidates are regularly introduced to the foot of the throne, accompanied by all their relations and friends in the richeſt attire; there kneeling at the lowermoſt ſtep of the throne, the grant is brought them by a chief miniſter; which having received with the deepeſt ſubmiſſion, the king informs them, in a ſet ſpeech, of the greatneſs of the favour he beſtows on them, the conditions upon which it is granted, and the duties he expects from them; to all which they take a ſolemn oath to conform themſelves: after which the inſignia of their dignity are delivered to them, which are a white bonnet, more or leſs rich, according to the dignity granted, a flag of honour, a chair of ſtate, a ſcymetar, and a carpet. The whole concludes with proſtrations, clapping of hands, and thankful acclamations, extolling the royal favour; though it is commonly ſaddled with ſuch tribute, and other hard conditions, as are impoſſible to be performed but by the oppreſſion of thoſe who are under them.

The whole buſineſs being thus diſpatched, the king riſes, and the ceremony is cloſed, as it began, with the loud huzzas of the people, and the noiſe of the artillery and muſical inſtruments; in the midſt of which he is conducted to his palace.

As the court is fond of imitating the Portugueſe, the nobility not only wear ſhort cloaks, ſcarlet jackets, and long ſpados; but ſtrive to outvie each other in their ſilks and velvets, gold and ſilver tiſſue, lace, fringe, and other finery; and, indeed, the whole court, with the retinue of the king, his table-furniture and attendants, his throne and ceremonials, are regulated after the Portugueſe model. His table is covered with variety of the moſt exquiſite meats, his ſide-board with the moſt delicate wines and other liquors, and he has taſters to examine every thing he eats and drinks. He has rich veſſels of gold and ſilver, ſolely for his own uſe, and always eats alone; for he never ſuffers any perſon, though of the higheſt rank, to ſit with him: their greateſt privilege is to ſtand about him. The throne of ſtate, on which he gives public audience twice or three times a week, has an aſcent of three ſteps covered with Indian tapeſtry; and the chair of ſtate on which he ſits, as well as the table which ſtands before him, are covered with crimſon velvet, adorned with boſſes and nails of gold.

When the king goes abroad, he is attended by a numerous guard, ſome of which are armed with muſquets, and others with lances, bows, and arrows; but they march before him without any regularity. Theſe are followed by crowds of muſicians, who may be heard at a great diſtance, and ſerve to give notice of his approach. Next to theſe are the officers of the houſhold, followed by the knights of the Holy Croſs, an order inſtituted by the firſt Chriſtian king of Congo. The king appears next, preceded by two young pages of the nobleſt families in the kingdom; one bearing a royal ſhield, covered with a tyger's ſkin, and the ſword of ſtate adorned with precious ſtones; the other holds a ſtaff which has a large knob of ſilver at each end, and is covered with red velvet. On each ſide of the king ride two officers, who keep fanning him with horſes tails; and behind them is a third, who holds over his head a large umbrella of red damaſk, richly fringed and embroidered. The three laſt muſt alſo be of the moſt illuſtrious families of the kingdom.

He proceeds to maſs with much the ſame pomp; and, upon his alighting at the church, is led by two maſters of ceremonies to a chair, (in which he may ſit when he thinks fit) and ſeveral velvet or damaſk cuſhions to kneel upon. As ſoon as he is placed, a lighted taper is put into his hand, which he gives to his next page, who holds it till the Goſpel is read, when he takes it from him, and holds it up till that is ended, and then the prieſt brings him the Goſpel for him to kiſs it. At the offertory he walks towards the altar, where the prieſt gives him the patten to kiſs; after which he makes his offering and retires to his place. At the elevation of the hoſt he takes the

the lighted taper again, and continues upon his knees during moſt of the remainder of the maſs; all which time the muſic continues playing, and the proper anthems are ſung. The ſervice being ended, the king ſits down and receives the compliments of his court; and having given them his bleſſing, and his hand to kiſs, returns to the palace in the ſame pomp and order.

The king's court conſiſts not only of the officers of his houſhold, but of all the governors of his kingdom, who, on their coming to pay their homage and tribute, appear with a large and ſplendid retinue; to which may be added, his generals and other military officers, who are obliged to come and give an account of the ſucceſs of their arms and the ſtate of his forces. He has alſo his auditors, judges of different tribunals, counſellors, and ſecretaries, whoſe buſineſs, however important and difficult, is ſoon diſpatched, becauſe every thing is tranſacted in a verbal and ſummary manner, without any writings: yet the multiplicity of affairs obliges them to appear frequently before him, and, as few of them can read, his deciſions and orders can only be received by word of mouth, and be conveyed by them to their diſtant clients, by perſons of known character, intruſted with ſome undoubted token that what they bring is the reſult of the royal will. However, if the diſtance of the place, or the nature of the meſſage, requires a fuller diſcuſſion, the king's orders are ſent in writing to the governor or officer concerned to ſee them executed; but then he is obliged to get ſome miſſionary or prieſt to read it to him, and to write an anſwer to it; which he muſt ſend by the ſame courier, to let his majeſty know how punctually his orders have been obeyed; the leaſt failure in which being reckoned ſuch an offence as to cauſe him to be deprived of his office, or even of all he is worth. Thus theſe great officers, notwithſtanding their vaſt authority and outward grandeur, are in fact as great ſlaves as thoſe over whom they tyranize, and live in continual dread of ſome ſignal token of his diffidence and reſentment, either of which is ſufficient to procure their deſtruction.

Though the king's palace, which was built by the Portugueſe, is vaſtly ſpacious, grand, and commodious, yet the ſeraglio may properly be termed a priſon. He is allowed but one wife, yet may have as many concubines as he pleaſes; and theſe, on entering the palace, are confined during the remainder of their life. Their apartments are ſurrounded either with ſtrong high walls, or quickſet hedges, of ſuch a height and thickneſs, that no mortal can go over or through them. The government of this encloſure is uſually committed to ſome favourite nobleman.

The lady who is married to the king is ſtiled miſtreſs of the women, on account of her being ſet over all the reſt of his ſeraglio. Before his marriage a tribute is levied throughout his kingdom, for a dowry for the young princeſs: but this is not the only tax paid on this occaſion; for, on his wedding-day, proper officers are ordered to meaſure the length and breadth of every bed, and the owner is taxed ſo much for every ſpan. The marriage-ceremony is no ſooner over, than ſhe is conducted to her apartment in the royal palace, with all the young ladies that are to be her conſtant attendants, where moſt of their time is ſpent in diverſions. The king has not only free acceſs to her when he pleaſes; but makes no ſcruple of taking the ſame freedom with any of thoſe young ladies, as he does with his other concubines, notwithſtanding all the remonſtrances of his father confeſſor, or of the moſt zealous miſſionaries.

His ſtanding forces are neither numerous nor well diſciplined, and are ſtill worſe armed and cloathed; but they are all obliged to appear at their ſtated muſters, where they are uſually exerciſed and taught particularly how to uſe their defenſive weapons, and cover their bodies, which are naked from the waiſt upwards, with their ſhields made of thick ſkins, with ſuch dexterity, as to avoid the miſſive weapons of the enemy. They are alſo inſtructed how to fall on the foe with a deſperate kind of bravery, which they generally do upon all occaſions.

These muſters are conſtantly made on St. James's day, when the vaſſal princes and the governors bring their offerings to the king; and he not only feaſts them, but gives them his bleſſing, in the manner already deſcribed.

The army thus aſſembled, is divided into ſeveral bodies, before which the king marches, attended by his court, and taking a full view of them, commends or diſcommends, puniſhes or rewards them, as he ſees occaſion; after which theſe bodies engage in a ſham fight, with as much ſeeming fury, as if they were attacking an enemy.

The ceremony of the fight being over, the king generally treats the combatants with a plentiful ſupper on the field of battle, which is greedily devoured by his hungry gueſts, though the duſt they have raiſed is ſo thick that a ſtranger can hardly breathe or ſee through it. After they have conſumed all the proviſions ſet before them, the feaſt uſually concludes with muſic, dancing, and other diverſions: during which they drink till, overcome by the liquor, and the fatigue of the day, they all lie down upon the bare ground, and ſleep till the next morning.

Theſe troops are under the command of the governors of the provinces, and march under them in every expedition and incurſion into an enemy's country; but when the king goes in perſon, they are obliged to repair to the royal ſtandard, under their reſpective officers, with their arms and proviſions; which laſt are but juſt ſufficient to keep them alive two or three days: but in theſe excurſions they ſeize on all that come in their way, without regard to friend or foe, as corn, fruit, cattle, beaſts wild or tame, and even ſerpents, inſects, and the bark and root of trees, leaving nothing behind them but the moſt dreadful devaſtation and miſery, which appears where-ever they paſs; for the poor inhabitants of the villages, at the firſt alarm of their approach, retire into the woods, mountains, or other places of ſafety, with their families, cattle, and what other effects they are able to carry off with them; and leave their houſes and the reſt of their goods to their mercy. But notwithſtanding theſe dreadful ravages, vaſt numbers periſh in their march through hunger, ſickneſs, and many other accidents, ſo that the king frequently loſes more than half his army before he comes in ſight of the enemy; and is ſometimes obliged to return, by the unfitneſs of the ſeaſon, with leſs than one-third part of it, without having ſtruck a ſtroke, or injured any but his own ſubjects.

They always endeavour, if poſſible, to engage the enemy in a ſpacious plain, and begin the attack with greater fury than regularity; for the commander's authority ceaſes to have any check upon them, from the moment the onſet is begun. The fight continues with the ſame obſtinancy, till one ſide begins to give way, which is no ſooner perceived, than the reſt take to their heels without paying any regard to the officers who endeavour to ſtop them. The flight of one army encourages the other to purſue, and the ſlaughter is continued without intermiſſion; no quarter being given by either ſide, till the vanquiſhed are out of their reach. They then return, plunder the enemy's camp, ſeize all the men, women, and children they find there, with all the ſtragglers that fall into their hands, and brand them as ſlaves, conſidering them as the moſt valuable part of the ſpoil, and gladly ſend them, the firſt opportunity, to be ſold to the Europeans. As for the wounded, few, if any, ſurvive the defeat; for their weapons being poiſoned, wherever they draw blood the perſon ſpeedily dies, unleſs provided with ſome extraordinary antidote, which is the caſe of few beſides thoſe of high rank.

A victory is generally followed by a peace; but it being concluded upon the victor's terms, it ſeldom proves of longer duration than till the vanquiſhed have recovered ſufficient ſtrength ro renew the war.

The Congoeſe have no written laws, but every province has what they term a royal judge, and has the power of deciding all cauſes in civil and criminal affairs; an appeal, however, may be made from his deciſion to the king, who preſides twice a week at the ſupreme court, and determines all affairs by his abſolute authority. The royal

royal judge has inferior ones under him in every town and community, from whoſe ſentence the parties may appeal to him; but this is ſeldom done, except in matters of great moment.

Every judge chooſes a number of aſſiſtants, which commonly conſiſts of twelve; and, when the cauſe is brought before him, hears and examines the parties, and their evidence.

The plaintiff and defendant are the only pleaders; the former begins and endeavours to lay open his cauſe as well as he can, and the other anſwers him. If any think themſelves incapable of pleading their own cauſe, they are allowed to nominate a friend to do it for them, who muſt be inſtructed in every thing before he appears in court. When both ſides have been heard, ſometimes once, and ſometimes oftener, the judge recapitulates the whole evidence to his aſſiſtants, and aſks their opinion; when, if any difference or diſpute ariſes between them, he endeavours to bring them over to his ſide: but whether he does or not, he immediately pronounces ſentence, and diſmiſſes the parties; ſo that a law-ſuit is generally begun and ended in two or three hours time.

They uſe nearly the ſame method in criminal caſes, in which only three offences are deemed capital; theſe are treaſon, murder, and ſorcery. In the former the offender's puniſhment chiefly depends on the will of the prince, who generally condemns him to loſe both his head and eſtate; the latter of which is confiſcated into the treaſury. The man convicted of murder is immediately beheaded, unleſs ſome aggravating circumſtances require a more ſevere death, or the relations of the deceaſed petition for his being puniſhed with greater ſeverity; in which caſe he is uſually delivered up to them, that they may puniſh him in what manner they think proper; and this is generally done immediately after the ſentence is pronounced. The pretended crime of magic, or ſorcery, is ſaid by the Portugueſe prieſts to be very common in the unconverted provinces, and is on that account puniſhed more ſeverely; the perſon whom they pretend to have convicted of it being immediately burned alive. Other puniſhments for ſmaller crimes are the baſtinado, whipping, fines, and impriſonments; the two former generally falling to the lot of the poor, and the two laſt to that of the wealthy.

As for the Portugueſe, they are allowed a judge of their own nation to determine not only all law-ſuits among themſelves, but between them and the natives, who decides all controverſies according to the laws of Portugal, a circumſtance which muſt be conſidered as extremely unjuſt.

SECT. X.

Of the Religion of the Natives of Congo.

THE religion of Congo, before the arrival of the Portugueſe, was idolatry, which is ſtill preſerved in a great part of the country, where they acknowledge a Supreme Being, whom they call Nzambiam-pongu, and believe to be omnipotent. They aſcribe to him the creation of their country; but imagine that he committed all ſublunary things to the care and government of a multitude of ſubordinate deities, ſome of whom preſide over the air, others over the fire, earth, and ſea, the lakes and rivers, winds, ſtorms, rain, lightning, and drought; men and beaſts, fowls and fiſhes, trees, fruits; and, in ſhort, on all the bleſſings and curſes to which this world and its inhabitants are ſubject. Hence aroſe an immenſe multitude of falſe ſubordinate deities, who had their idols and a prodigious variety of gangas, or prieſts, and ſuperſtitious rites, which are ſtill uſed in thoſe parts of the kingdom that have not yet received the Portugueſe religion, eſpecially towards the Eaſt; and indeed many of theſe ſuperſtitious rites are ſtill practiſed among thoſe who make an open profeſſion of Chriſtianity.

But though the ignorant people were taught to acknowledge ſuch a variety of inferior deities, they were left entirely at liberty to chooſe which of them they pleaſed as the object of their worſhip and confidence, and to repreſent them in what ſhape they thought fit, whether of lions, tygers, crocodiles, goats, or ſerpents; or of trees and plants of different kinds; or the ſtatues or pictures of men, unſkilfully carved or painted, ſome of which they worſhipped in their houſes, and others in mean temples erected to their honour. Their worſhip conſiſted in kneeling, proſtrations, fumigations, and other rites: but what was moſt inſiſted upon by the gangas, as indiſpenſibly neceſſary, was offering to them ſome of their moſt valuable effects, whether for food or apparel, or other uſeful purpoſes. In this the principal revenues of the gangas conſiſted, they ſelling them the favour of the deities at an exorbitant price.

Theſe prieſts ſtill perſuade the people, that no public calamity, as earthquakes, inundations, peſtilence, famine, and the like, happen but through the diſpleaſure of their gods, between whom and them they pretend to be the ſole mediators, and to know what ſacrifices and oblations are neceſſary to diſarm their anger; and when the calamities are removed, they demand new offerings by way of thankſgiving. If a perſon be ſick, he muſt appeaſe the offended deities by ſuch ſacrifices as the ganga preſcribes.

As theſe idolaters are very numerous, and extend themſelves towards the eaſtern parts of the kingdom, ſo they are divided into a multitude of ſects, each of which have their peculiar gods, manner of worſhip, and different kinds of gangas; and every ganga has his particular office. Some are applied to for procuring bleſſings, others to avert judgments, to cure diſeaſes, or to remove witchcrafts and inchantments; others are conſulted about making war; on the ſucceſs of their excurſions, and on the proper time for ſowing and reaping; in all which caſes the people muſt never come empty-handed. They are generally ſo ſcrupulous, that they will not even venture to build a hut, without conſulting a ganga, and putting the building under the protection of a deity; nor does the owner dare to enter into the poſſeſſion of it, without having previouſly employed the ganga to make the proper ſacrifices, fumigations, and other ceremonies, in order to ſecure that protection.

Except at their new moons they have no ſtated times of worſhip, but what the preſident of the gangas appoints, or as occaſion is ſuppoſed to require, as after a victory, a good harveſt, or any other public bleſſing. He alone has the privilege of appointing the ſacrifices and other rites proper for the ſolemnity; and he likewiſe preſcribes the ceremonies, feaſting, muſic, and dancing with which they are to be crowned.

But the higheſt in power and dignity of the prieſtly order is a perſon ſtiled Shalome, whom they reverence as a kind of pope, and to him they offer the firſt produce of the land. No perſon of any rank is allowed to enter his houſe under the ſevereſt penalties, unleſs it be by his permiſſion, or on ſome urgent occaſions; for he there keeps his ſovereign tribunal, not only for religious, but for civil affairs; for the diſpatch of which he appoints a number of ſubſtitutes, over whom he preſides in chief. Such is the regard paid by the people to this chief prieſt, that they are ſaid to think it a capital and unpardonable crime to have any conjugal commerce with their own wives or concubines while he is abſent from his uſual place of reſidence, either upon public or private affairs, of which he always takes care to give them previous notice, as well as of his return. And this the natives though naturally libidinous, are generally careful to abſtain from, for fear of putting themſelves into the power of thoſe females; for it ſometimes happens that a woman, weary of her huſband, will accuſe him of incontinence at this time, merely to get rid of him and marry another.

Among the high notions which the people entertain of this chief prieſt is one that is not ſo advantageous, nor in all probability ſo agreeable to him; that is, that by the dignity of his office he is exempt from dying a natural death; and that ſhould it ever happen otherwiſe to any of them, the world would ſoon be at an end. To prevent this fatal calamity, his life is no ſooner perceived to be in danger, either through ſickneſs or old age, than his ſucceſſor is impowered to go and diſpatch him with his own hand, either by knocking him on the head with a green cudgel, or by ſtrangling him with a rope; immediately after which he is inſtalled into his office.

The mokiſſos, or images, are for the moſt part formed of wood in the ſhape of a goat, with the head of a tortoiſe; and in theſe images ſome ſpirit to whom the Almighty has committed the government of a particular part of nature, is ſuppoſed to reſide. Hence the prieſts dance around them, and aſk them queſtions in relation to paſt and future events. Such regard do the pagans of theſe countries pay to theſe mokiſſos, which are made in various forms, that if a man, wearied with his burthen, throw it down in the highway, and leave a knot of twiſted graſs upon it, to ſhew that he has left it under the care of his mokiſſo, no pagan will venture to meddle with it.

In ſhort, theſe pagan prieſts not only ſearch into futurity, and offer up their prayers and praiſes to the ſpirits which they ſuppoſe reſide in the idols, but alſo ſerve as phyſicians and ſurgeons, generally making uſe of ſimples; and if theſe fail, they pretend that a certain ominous bird flew over the head of the patient, and prevented the operation of the medicine; or its effect was deſtroyed by means of witchcraft.

Here, as well as in India, they have ordeal-trials, ſome of which are by fire, others by boiling water, others by a poiſoned draught, which is to kill the perſon if guilty, or to prove harmleſs if he be innocent; but as the gangas have the whole management, they are ſaid by the Portugueſe to manage it ſo, that the guilty, if they bribe them high, ſhall eſcape unhurt; while the innocent, for want of that caution, ſhall be adjudged guilty.

The Portugueſe pretend, that by their means Chriſtianity is become the eſtabliſhed religion of all the converted provinces of the kingdom: this indeed is ſaying a great deal; but it appears from the generality of writers, that the Congoes have only changed their ſuperſtitions, and become more corrupt in their morals. Inſtead of receiving the Goſpel, which breathes piety, meekneſs, and humanity, and which never was put into their hands, they have had before their eyes cruel and revengeful bigots, who have drawn the ſword of perſecution, and taught them cruelty, treachery, diſſimulation, and thoſe other vices which Chriſtianity, much more than paganiſm, condemns.

Indeed, if we may believe the generality of writers, the greateſt part of theſe extenſive regions have little elſe but the bare name of Chriſtian. Though popery has got a footing there, we find nothing of that pomp and religious pageantry practiſed in other Romiſh countries; no ſtately cathedrals, no cardinals, patriarchs, archbiſhoprics, rich abbeys, or well-endowed monaſtries or convents. We hear nothing of their grand feſtivals and ſolemnities, except ſuch as are rather of a ſecular nature; and on which the court and nobles of the kingdom repair to the church in great ſtate, and ſumptuous apparel, to hear maſs. Some of the natives are repreſented as arrant hypocrites, who embraced the Romiſh religion only to ingratiate themſelves with the Portugueſe, while they retain all their old heatheniſh ſuperſtitions; and privately worſhip their idols. Others who have perhaps received more inſtruction from their living nearer the churches, and under the eyes of the Portugueſe, will expreſs a contempt for ſuch ſenſeleſs ſuperſtitions; and, in compliance with the church, will conform ſo far to the laws as to go regularly to maſs and confeſſion, and will conſent to have but one wife; but could never be perſuaded of the unlawfulneſs of having as many concubines as they can maintain. As to other immoralities, ſuch as cruelty, fraud, oppreſſion, exceſſive pride, and ſloth, they ſee them more or leſs practiſed by moſt of the European Chriſtians who live among them.

SECT. XI.

Of the Trade of Congo, and the barbarous Manner in which the Slaves are tranſported by the Portugueſe from Congo and the neighbouring Kingdoms to America.

THE chief commodities brought by the Portugueſe into Congo are either the produce of Braſil, or the manufactures of Europe. The former chiefly conſiſts in grain, fruit, plants, and other proviſions; and the latter of Turky carpets, Engliſh cloths, and light ſtuffs made of cotton, linen, and woollen for cloathing; copper and braſs veſſels; blue earthen ware; rings and ornaments of gold and ſilver; braſs and baſer metals; coral, glaſs beads, bugles, and other trinkets; a great variety of tools and utenſils; tobacco, wine, brandy, and other ſpirituous liquors.

In return for theſe articles they carry off ſuch a prodigious number of ſlaves for their plantations in America, that ſome make the yearly amount from this kingdom, and ſome other ſettlements on the ſame coaſt, to be near fifteen or ſixteen thouſand. Many of theſe indeed die in their paſſage, which is not at all ſurpriſing, if we conſider the inhuman manner in which thoſe poor unfortunate wretches are ſhipped off and conveyed from one country to another. Seven or eight hundred men and women are promiſcuouſly ſqueezed like herrings into the hold of one ſhip, where they can lie only on one ſide upon the bare boards, and are often forced to lie double during the whole voyage, with no other proviſions than horſe-beans and water, ſuffocated for want of air, and with their own ſtench; ſome dead, others dying, and moſt of them labouring under ſome grievous diſorder, if not under a complication of diſtempers; without any refreſhment, except perhaps a little freſh air to breathe in once a day, if they are able to come upon deck; and without any better proſpect, than that of ending their lives in the moſt miſerable ſlavery.

This indeed is far from being the moſt melancholy ſide of the view that preſents itſelf to the minds of theſe unhappy wretches; for there is a ſtrange and dreadful notion, that all who are ſold for ſlaves in America are immediately to be butchered on their landing, in ſome dreadful manner, in order to have their bones burned and calcined to make gun-powder with; and their fleſh, fat, and marrow to be preſſed into an oil, which they believe is the only ſort the Europeans bring to Africa; and what confirms them in this opinion is, its being brought in ſkins, which they imagine to be thoſe of the poor ſlaves from whoſe fleſh the oil is extracted.

Theſe notions are ſo firmly believed through all thoſe parts, that the very threatening of the moſt obſtinate and ſtubborn ſlave to ſell him into America, is ſufficient to terrify him into the moſt obſequious ſuppleneſs and obedience: the thoughts of being burnt into gun-powder, and melted into oil, being more dreadful to them than the moſt cruel puniſhment.

From theſe inhuman hardſhips, and theſe dreadful fears, one might wonder that ſo many ſhould out-live the paſſage; but it appears ſtill more amazing, that any creatures of the human form, and eſpecially ſuch as call themſelves Chriſtians, ſhould be ſo hardened as to treat their poor fellow-creatures after ſo barbarous a manner, merely for the ſake of reaping a little more profit by each voyage; for as one of them is bought in Congo, or Angola, for three or four pounds, and ſeldom ſells for leſs in America than twenty-five or thirty, one would be apt to imagine, that, ſetting aſide religion and humanity, the great profit obtained by them might procure thoſe miſerable objects a more compaſſionate treatment.

Beſides the ſlaves continually brought from other parts into Congo and Angola, to be ſhipped off for America, there remains a ſufficient number in the kingdom to do all the laborious works, as building of houſes, felling and ſawing of timber, carrying men and other burthens, and working at ſeveral buſineſſes, as butchers, cooks, huntſmen, fiſhermen, and performing all the lower offices of families. Indeed, if we except a few moveables and cattle, ſlaves are reckoned the greateſt riches which thoſe of the inferior and even middle rank have to boaſt of, or to bequeath to their children and relations.

The Portugueſe ſettled in this kingdom have taught the natives the uſe of weights and meaſures, of which they had not, till then, the leaſt notion; nor have the majority of the people any great uſe for them, conſidering their poverty and way of life.

SECT.

SECT. XII.

Of the firſt Diſcovery of Congo by the Portugueſe, and by what Means they changed the Religion of the Country.

THE Portugueſe had been for ſome years making diſcoveries along the coaſt of Africa, in order to find a paſſage to the Indies, when, in the year 1484, king John II. of Portugal, ſent Diego Cam, one of the moſt expert Sailors in his ſervice, and a gentleman of an enterpriſing genius, to make diſcoveries ſtill farther to the ſouth than any of his former navigators had been. Cam ſet ſail with this view, and endeavouring to double the Cape of Catalina, fell inſenſibly into the rapid ſtream of the river Zaira, when its great breadth and depth ſoon determined him to ſail nearer, and to caſt anchor at its mouth, not doubting that it had inhabitants on each ſide. He had not rowed far up the river before he ſaw a number of the natives, whoſe ſhape, complexion, and hair greatly reſembled thoſe of the other negroes whom he had already ſeen; nor were they in the leaſt alarmed at the appearance of theſe ſtrangers; but coming up to them in the gentleſt manner, preſented them ſome of their fruits and other refreſhments, which Cam gratefully accepted, and, in return, made them ſome equivalent preſents. The misfortune was, that they had no other method of underſtanding each other but by ſigns; ſo that it was not without ſome difficulty that he was at laſt informed, that they were ſubject to a very powerful prince, who reſided a few days journey up into the country.

Cam was extreamly delighted with their account and behaviour, and no leſs deſirous of being informed who this powerful prince was, and if poſſible of entering into an alliance with him; he therefore prevailed upon four or five of the natives, by means of his preſents, to conduct an equal number of his officers to St. Salvadore. Theſe were entruſted with conſiderable preſents for the king and court, and allowed a certain time for their return: but the rapidity of the river, contrary winds, and other obſtacles, added to the length of the journey, prevented his ſeeing them at the time expected; ſo that after having ſtayed double the time that had been fixed, he reſolved to leave them behind, and to ſail back to Portugal; but took with him four of the natives who were in the ſhip, who proved to be men of noble birth and excellent underſtanding, as hoſtages for his own countrymen. Some ſay they willingly offered to accompany him into Portugal: however, it is certain he took great care of them during the voyage; and, by the time of their arrival at the Portugueſe court, they had made ſuch a ſurpriſing progreſs in learning that language, that they could inform his majeſty of ſeveral important matters which he enquired of them; with which king John was ſo highly delighted, that, having made them very conſiderable preſents, he ordered Cam to ſail with them back to Congo, and ſent by him very valuable preſents of European rarities to their king and his court, charging them to exhort their monarch, in his name, to become a convert to the worſhip of the only true God, and to permit the Chriſtian religion to be propagated throughout his dominions.

Cam returning to Congo the following year, was highly pleaſed to find his men in good health, and perfectly ſatisfied with the kind reception they had met with at court, and from the natives in general. It was not long before he ſent a formal embaſſy to the king, accompanied with the rich preſents he had brought from Portugal. On the other hand, the four young natives, no leſs charmed with all they had ſeen, and the noble treatment they had received in that country, blazed abroad, both at their own court, and wherever they came, the magnificence of the Portugueſe court and nation. In ſhort, a firm alliance was ſoon concluded between the two crowns, which ſtill ſubſiſts, though it has been ſuſpended by ſome intervening wars.

While this alliance was tranſacting at the court of Congo, Cam ſet ſail, and diſcovered the coaſt as far as the twenty-ſecond degree ſouth latitude; and then, returning back to Congo, went in great ſtate to pay a viſit to the king, in order to thank him for the favours conferred on him and his nation, and was received with all poſſible magnificence. At his deſire, he gave him a full account of the grandeur of his king's dominions; of the government, laws, cuſtoms, and more particularly of the religion of the Portugueſe, in ſuch terms as not only made that prince conceive the higheſt eſteem and regard for that people, but expreſs his earneſt deſire to become a member of that church; and, at Cam's departure, the king appointed Zachut, one of the young nobles whom he had before taken to Portugal, to go now as his ambaſſador at that court, with orders to entreat his Portugueſe majeſty to ſend ſome holy men to inſtruct him and his ſubjects in the Chriſtian faith. He alſo ſent ſome other young Congoeſe with him, that they might learn the new religion; together with a large quantity of elephants teeth, carpets, and cloths made of the palm-tree, as preſents to his Portugueſe majeſty.

Cam ſoon after weighed anchor and departed. At his arrival at Liſbon he preſented the Congoeſe ambaſſador and the other young nobles to the king, who was greatly pleaſed at the ſucceſs of the expedition, and gave all theſe ſtrangers a moſt gracious reception. They ſtaid in Portugal near three years, during which great care was taken to inſtruct them, not only in the principles of religion, but in all the polite exerciſes ſuitable to their rank; and at length they were baptized at Beja, where the court then reſided. The ceremony was performed with the utmoſt ſplendor and magnificence, the king himſelf ſtanding godfather to the ambaſſador Zachut, to whom he gave his own name. Soon after this ſolemnity he ſent them back into their own country in three ſhips, the command of which was given to Gonſalez de Souza, with whom he alſo ſent ſeveral prieſts, with mitres, chalices, fonts, and other church veſſels and ornaments of great value; but Gonſalez, dying in the paſſage, was ſucceeded by Roderigo Souza, his near relation.

This ſquadron arrived at the city of Sogno, which is ſituated on the river Zaira, in Auguſt following, and they were all joyfully received by the governor of the province, who ſoon after their arrival was baptized by the name of Emanuel, which was that of the king of Portugal's brother. This ceremony was performed in the open country, in the preſence of the Portugueſe admiral, who had cauſed a magnificent altar to be erected for that purpoſe, where, after maſs was ended, this nobleman, with one of his ſons, and ſome of his officers, were received into the church before a vaſt concourſe of the natives, who flocked thither on that occaſion.

Admiral Souza, now taking leave of his noble converts, haſtened to the court, and there gave the king an account of his uncle's converſion and baptiſm; with which he was ſo pleaſed, that he enlarged his dominions, and gave him power to deſtroy all the heathen temples and other monuments of idolatry within his government. His majeſty was alſo highly delighted with receiving the ſacred veſſels and ornaments brought from Portugal, which he examined with great attention, and liſtened to the explication the prieſts gave him of their uſe; the reſult of which was, that he reſolved to build immediately a ſumptuous church in his capital for the reception of the Portugueſe prieſts and utenſils. This ſtructure was ſoon completed; after which it was conſecrated under the name of the Church of the Holy Croſs.

Soon after the king and queen, with ſeveral of the nobility, were publicly baptiſed in his new church. The ceremony was performed with extraordinary magnificence: The king took the name of John, and the queen that of Eleanora, in compliment to the king and queen of Portugal, whoſe ambaſſador, as their repreſentative, aſſiſted at the ceremony. Their example was followed by many thouſands of their ſubjects: the king the more zealouſly promoting it, as he was going to ſuppreſs a rebellion which broke out in one of the provinces of his kingdom. Upon this occaſion Souza, the Portugueſe ambaſſador, preſented him a royal ſtandard, on which a croſs was embroidered; and, in his maſter's name, exhorted him to put his whole confidence in the divine Saviour whoſe religion he had now embraced, and to rely ſolely on his aſſiſtance for the ſucceſs of that expedition, to which he himſelf would accompany him with an

hundred armed Portugueſe. The king gained a compleat victory over the rebels, and was upon the point of entering their territories, in order to chaſtiſe them with the utmoſt ſeverity, according to the cuſtom of the country, when Souza diverted him from it, and by his timely meditation prevented that province being laid waſte by fire and ſword.

At Souza's departure, great civilities paſſed between him and the king, with whom he left a great number of Dominicans to carry on the affairs of religion, and particularly to preach to the people. About the ſame time, the king's eldeſt ſon returning from an expedition againſt ſome rebels in the ſouthern provinces, over whom he had obtained a victory, was baptiſed by the name of Alphonſo, and continued a zealous proſelyte during his whole life; but his younger brother, named Panzo Aquitima, fond of the heathen ſuperſtitions in which he had been educated, became an irreconcileable enemy both to the Portugueſe and their religion, and made uſe of ſuch artifices to exaſperate his father againſt thoſe ſtrangers, that he prevailed upon him, not only to apoſtitize, but to perſecute all the Chriſtian converts who refuſed to follow his example. Among theſe, prince Alphonſo reſiſted all his careſſes and menaces, and endeavoured, to the utmoſt of his power, to defeat all his brother's cabals; but in return was accuſed of treaſonable practices, and being baniſhed to a remote province, his younger brother was appointed his father's ſucceſſor.

The king, however, ſoon after diſcovered the treachery that had been uſed againſt Alphonſo, and not only recalled him from baniſhment, but gave him the government of one of the chief provinces of the kingdom. Alphonſo, with his uſual zeal, began his government by prohibiting the worſhip of idols, under the ſevereſt penalties; which not only drove a vaſt number of his own ſubjects to his brother, the declared patron of idolatry, but induced his father to order him to come to court, unleſs he immediately repealed the law he had made againſt worſhipping the gods of his country. Alphonſo excuſed himſelf from complying, and at the ſame time ſent the king word, that the multitude of buſineſs he had upon his hands would not permit him to leave his government.

In the year 1492, the king being worn out with age and infirmities, was viſibly haſtening to his end, upon which Alphonſo was adviſed by his friends to march againſt his brother, and to ſeize upon the capital, which he declined, till he had certain intelligence of his father's death, and then entered it in the night. The next morning he appeared upon the green before the royal palace, at the head of his friends and Chriſtian forces, and, in a ſhort ſpeech, informed them of the king's death, and of his being the next heir to the crown; upon which he was proclaimed king, with the uſual formalities.

Panzo, being then at the head of a numerous army, no ſooner received the news of his brother's being ſeated on the throne, than dividing his forces into two columns, he marched directly againſt him. Alphonſo, who had only a handful of Chriſtian ſoldiers, and about forty Portugueſe, expected him with undaunted courage, and both by his words and example inſpired his men with ſuch intrepidity, that they gained a complete victory, and drove the diſconſolate Panzo, accompanied only by an old experienced officer, into a wood, where, in their flight, they both fell into a large trap deſigned to catch wild beaſts. The prince died about two days after, partly by the hurt he received in his fall, and partly of grief and deſpair. Upon which the old officer ſent a ſubmiſſive meſſage to the king, to let him know that it was indifferent to him whether he obtained his pardon, or an order for his execution; but begged, if his majeſty choſe the latter, he would permit him firſt to be received into the Chriſtian church by baptiſm; adding, that as he could not help looking upon the late victory over ſo ſuperior an enemy as altogether miraculous, he earneſtly requeſted, that he might die a worſhipper of the great God from whom he had obtained it.

Whether his behaviour was ſincere, or merely an artifice, the king was ſo highly pleaſed with it, that he freely pardoned and promoted him; and having cauſed him to be inſtructed, he was received into the Chriſtian church. The reſt of Panzo's army readily offered to ſubmit; but he refuſed to ſuffer them to take the oaths of fidelity to him, except thoſe who were idolaters conſented to change their religion.

Many of the Congoeſe now made a profeſſion of embracing Chriſtianity; and if any credit is to be given to the Portugueſe writers, this king was a moſt excellent preacher, and frequently made long diſcourſes upon the truth and excellency of the Chriſtian religion, the certainty of future rewards and puniſhments, and on other ſubjects of the higheſt moment. But what greatly contributed to the promotion of the Chriſtian religion, was the great regard he ſhewed to all the Portugueſe in general, and eſpecially to the Dominican monks who had been ſent to convert his ſubjects. To the former he granted the privilege of ſettling in what part of his dominions they liked beſt, gave them conſiderable lands and immunities, and enacted ſevere penalties againſt ſuch of his ſubjects as ſhould dare to moleſt them. He took the Dominican friars under his immediate protection, built them ſeveral new monaſteries and churches in ſeveral parts of his kingdom, and omitted nothing that could render them reſpected. He even ſtudied the Portugueſe tongue, in order to interpret to his people the ſermons of thoſe preachers, and afterwards ſtrove to inculcate them the deeper by ſome remarks of his own.

Some time after Alphonſo, at the deſire of Emanuel king of Portugal, ſent his ſon and a number of young noblemen to Liſbon, where Emanuel ſpared neither pains nor expence to procure them the ableſt teachers.

The ſame year his Portugueſe majeſty ſent a ſplendid embaſſy to Congo, accompanied with magnificent preſents, particularly a noble ſtandard, with a coat of arms, which the king and his ſucceſſors were afterwards to bear, richly embroidered upon it in their proper colours. This conſiſted of a croſs argent, upon a ground gules, cantoned with four other eſcutcheons of the ſame, charged with five torteaux ſables, ſaulterwiſe: and theſe arms the kings of Congo have borne ever ſince.

This prince died in the year 1525, and was ſucceeded by his ſon Don Pedro, who alſo diſtinguiſhed himſelf by his zeal for the Portugueſe and their religion; and dying without iſſue in 1530, left the crown to his brother Franciſco, who was alſo a friend to the Portugueſe; but dying, after a reign of only two years, he left the crown to his firſt couſin, named Diego; who alſo dying without children, the Portugueſe were become ſo numerous, and ſo opulent from the great privileges that had been granted them under the three former reigns, that they reſolved to fill the throne with a perſon of their own chooſing: but the princes of the blood, the governors of the principal provinces, and the reſt of the Congoeſe nobility, conſidered this as an open and avowed attempt to ſubvert their conſtitution and government, and to reduce the whole nation to ſlavery; and riſing up in arms, the Portugueſe were too weak to withſtand their fury, and all who engaged in this conſpiracy were cut off, except the clergy and miſſionaries, who were ſpared, from a regard to religion.

This bloody execution reſtored to the natives the freedom of electing their own monarchs; a new king was choſen, and an embaſſy ſent to Sebaſtian king of Portugal, who boldly complained of this attempt to overturn their conſtitution and government; and repreſented to his majeſty, how odious his ſubjects had made themſelves to the natives, by their intolerable pride and avarice, and the tyranny with which they treated them in all the parts of the kingdom where they were ſettled. In ſhort, he gave ſo many inſtances of their miſbehaviour, and backed them with ſuch irrefragable evidence, that Don Sebaſtian, who was preparing to ſend a powerful army to revenge the ſlaughter of his ſubjects, was eaſily perſuaded to liſten to more amicable terms, and to live in peace and friendſhip with the new king and his ſubjects.

Mean while, king Sebaſtian, being informed that there were ſeveral rich mines of gold, ſilver, and other metals in that kingdom, ſent ſome ſkilful men thither to ſearch for them: but king Alvarez, who was then on the throne of Congo, being diſſuaded by his honeſt confeſſor Franciſco Barbuto, a Portugueſe, from ſuffering thoſe mines

to be diſcovered, leſt it ſhould tempt that monarch to make himſelf maſter of them, and by degrees of his whole kingdom, inſtead of telling thoſe artiſts where they lay, ſent them into other provinces where there were none to be found. Upon this king Sebaſtian and his Portugueſe ſubjects, being diſappointed of their high expectations, ſoon altered their behaviour towards him: the wealthy Portugueſe merchants abandoned his dominions, his ſplendid embaſſies at the court of Liſbon were received with a formal coldneſs, and his moſt earneſt intreaties for a freſh ſupply of miſſionaries were anſwered by affected delays. But it is not our deſign to give a particular hiſtory of the progreſs of the Chriſtian religion in Congo. It is ſufficient to add, that it was a long time after theſe events, before the Portugueſe clergy obtained the power of chuſing the king, and in a manner new modelling the government, in the method already deſcribed. From that time we do not find that any great efforts have been made to convert the natives; for tho' many ſtill make a profeſſion of Chriſtianity, ignorance and vice, as hath been already intimated, prevail, and all their religion conſiſts in a few forms and ceremonies.

SECT. XIII.

Of the Kingdom of LOANGO.

Its Situation, Extent, Provinces, Climate, Fertility, Plants, and Animals.

THE kingdom of Loango, or, as others write it, Loanga, extends along the African coaſt, from the Cape of St. Catharine, under the ſecond degree of ſouth latitude, to the ſmall river of Lovanda in the fifth degree, and is ſituated between twenty-eight degrees thirty minutes, and forty degrees ten minutes of eaſt longitude: it is therefore a hundred and eighty miles from north to ſouth; but it is ſaid to extend near three hundred miles from eaſt to weſt. This country, as well as Angola, was formerly a part of the kingdom of Congo, but has been long diſmembered from it. It is watered by many ſmall rivers, and divided into four principal provinces, named Lovangiri, Lovango-mango, Chilongo, and Piri; in all which are abundance of towns and villages: but we know little more of them than their names, and indeed they appear to have but little worth our notice, either with reſpect to their populouſneſs, manufactures, commerce, or elegance of building.

Though Loango is ſituated almoſt in the midſt of the torrid zone, the climate is healthy and pleaſant, and the ſoil fertile and capable of improvement: but the natives, like all the others along this coaſt, are naturally lazy, and too averſe to the fatigues of agriculture to plant or ſow more than will barely ſuffice the current wants of each year: whence it frequently happens, that a bad ſeaſon is followed by a famine, for want of their laying up a proper ſtore againſt times of ſcarcity. They are commonly contented with bread, fiſh, and ſuch fruits, greens, and pulſe, as the earth naturally produces; and which being the ſame as grow in Congo, and other of the neighbouring countries, need not here be repeated. We ſhall only obſerve, that they have ſeveral ſorts of peaſe and beans, with large and ſmall millet, of all which the ground annually yields three crops. Their palm, banana, and other trees, produce excellent fruit, of which they make different ſorts of wine, which they prefer to that which comes from Europe. The cotton and pimento trees grow wild, as well as the grain of paradiſe, though the laſt is in ſmaller quantities. The enzanda, alicandi, and metamba afford them plenty of materials both for building and covering their houſes, for making their ſhips and ſmaller veſſels, for cloathing, and other uſes. Sugar-canes, caſſia, and tobacco, grow here plentifully; but there are few oranges, cocoas, and lemons, which are not much regarded by the natives. They make bread of a variety of fruits, herbs, grain, and roots, which, with a little more induſtry, might be produced in ſuch abundance as to prevent their ever ſuffering by famine.

They have very few cattle of any ſort, except goats and hogs; but poultry is ſaid to be ſo extremely cheap, that ſixpennyworth of beads will purchaſe thirty good chickens. Pheaſants, partridges, and other wild fowl, are ſtill more numerous, and hardly bear any price. They have a land bird bigger than a ſwan, which in ſhape reſembles a heron; its feathers are black and white, and it has a bare place on the breaſt: this is probably the pelican. Among the wild beaſts they have the zebra and a multitude of elephants, whoſe teeth they exchange with the Europeans for iron, of which they make warlike inſtruments and tools.

They catch on the coaſt great quantities of fiſh; and for this purpoſe, it is ſaid they daily watch a large fiſh of the ſize of a grampus, which conſtantly comes to feed along the ſhore, driving whole ſhoals of the ſmaller kind before him, which are then eaſily caught. If one of theſe large fiſhes runs himſelf a ſhore, the natives immediately endeavour to free him again, which is as much as four or five ſtrong men can do. Theſe they call ſea-dogs, and will not ſuffer any man to hurt them. In the bays, rivers, and in ſhallow water, they catch fiſh with mats made of ruſhes, ſome of which are three hundred yards long. Theſe are ſet afloat on the ſurface, with pendant ruſhes on the ſides, which frighten the fiſh, and make them leap upon the mat, where they are eaſily caught.

SECT. XIV.

The Perſons, Manners, and Dreſs of the Inhabitants.

THE natives, who are called Bramas, are tall, well-ſhaped, ſtrong, and very civil. They uſe circumciſion, without knowing why, and trade chiefly among themſelves. They are induſtrious and vigilant where gain is to be got, and are at the ſame time friendly and generous to one another; are extremely fond of palm wine, yet deſpiſe that of the grape. They are libidinous to a high degree, and very jealous of their wives. They carry on a variety of trades, and have among them weavers, ſmiths, carpenters, potters, canoe-makers, fiſhermen, and merchants; but theſe handicraftſmen are ſo fond of their old ways, and ill contrived tools, that, like thoſe of Congo, they take ten times more time and pains in performing an imperfect piece of work, than they would take in finiſhing one with better tools.

They commonly dreſs in cloth of their own manufacture, made either of the leaves of the palm or ſome other tree; but the better ſort are all made of the former: for this purpoſe the young palm ſhoots are lopped off, dried, then ſoaked in palm wine, and well rubbed with the hand, by which means they obtain a kind of flax, which, being ſpun and wove, is made into ſuits for thoſe in eaſy circumſtances, and hang round the body from the girdle down to the feet. They have four ſorts of this cloth. The richeſt, which is flowered with different colours, is worn only by the king and thoſe whom he permits to wear it. The ſecond ſort is not half ſo finely ſpun, yet at a ſmall diſtance appears almoſt as beautiful, it being figured much in the ſame manner, and it will require a nice eye to diſtinguiſh them, except they are examined on the wrong ſide, where the difference is more viſible. The two other ſorts, which are wove plain, are ſtill coarſer, and only worn by the common people and ſlaves. Theſe, like the former, reach down from the girdle to the ancles; but thoſe of the ſlaves only to the knee. The reſt of the body, from the girdle to the head, is naked; yet they wear bracelets, according to their rank, which are of gold, ſilver, braſs, or coarſer metals, in the form of chains; others are of ivory, glaſs-beads of ſeveral colours, and the like.

The men are alſo obliged to wear the ſkin of a wild or tame cat; and the wealthy have them of marten, beaver, and other valuable furs: ſome of them, called enkinies, are beautifully ſpotted; but theſe are only worn by the king and thoſe of his court to whom he grants that privilege. Both he and they frequently wear five or ſix ſorts of them neatly ſewed together, and ſtuck with the feathers of parrots and other birds of various colours, diſperſed in the form of a roſe, and hanging juſt before. The ſkirts of the furs are hemmed with elephants hair, to which they hang a number of little bells, which, at

every motion of the body, and at every ſtep they take, make a tinkling. Theſe garments are tied round the waiſt with a rich girdle that encompaſſes it ſeveral times. Thoſe of ſuperior rank wear two of theſe girdles, one above the other, richly adorned and variegated. They wear round their necks, wriſts, and legs, ſeveral circles of beads of coral and ivory, round ſhells of beautiful colours, chains of copper, tin, or iron, of a triangular form, and brought from Europe. Over their ſhoulders they have a kind of ſack knotted about three quarters of a yard long, with a hole juſt big enough to put their hand in; and this ſerves to hold their calabaſh, proviſions, pipes, and tobacco. Their heads are covered with a knit cap, which ſits cloſe to it; and, as they never go without arms, they commonly hold in their hand a cutlaſs, ſword, or bow.

The women dreſs in much the ſame manner, only they wear no girdle, and their petticoats are much ſhorter; but the rich will throw over them a piece of ſome fine European ſtuff or linen. The head and upper parts of the body, as well as the legs, are naked, except their wearing collars, bracelets of coral, and other trinkets about their necks, arms, and legs. Both ſexes wear rings of richer or baſer metal, according to their rank, which they conſider as amulets and preſervatives, and both colour their bodies all over with a red wood, called takeel, ground upon a ſtone.

SECT. XV.

Of their Marriages, and the Slavery of the Women. An Account of a People called White Moors. Of the Religion of the Natives, and their Funeral Rites.

THEY allow of polygamy, and authors ſay, that the rich have ten, twelve, or more wives; and thoſe in inferior circumſtances ſeldom leſs than two or three: but, if this be the caſe, they muſt have abundantly more females than males born among them, or elſe the poor can have no chance of being married. The conſent of the parents, and paying the price agreed on for the wife, is all the formality and courtſhip uſed in their marriages.

Some are ſo curious as to buy them, when ſix or ſeven years old, and breed them up to their hand; but the wiſer ſort of parents will not part with them till they are become marriageable, at which time they ſet a mark upon them that ſeldom fails of bringing a number of young gallants, eſpecially if they are handſome. This mark is ſhaving their heads, and leaving only a circle of hair.

The young females have, however, little encouragement to enter the matrimonial ſtate, which, beſides their being obliged to have many rivals in it, and the extreme jealouſy of the huſband, reduces them to the moſt melancholy ſervitude. They alone till and manure the ground, gather in the harveſt, grind the millet and other grain, make the bread, dreſs the proviſions, make wines and other liquors, and take care of all the other houſhold affairs. They muſt ſtand at a due diſtance while their huſbands eat, and take their leavings when they are gone. They muſt approach him when he comes, in words and geſtures expreſſive of their joy and reſpect, and ſpeak to him and receive his commands upon their bended knees. They are liable to be turned out of doors upon the leaſt ſuſpicion of infidelity; and, if proved guilty, undergo a ſevere puniſhment, though the man with whom they have tranſgreſſed commonly eſcapes with only ſome pecuniary fine; and whoever takes her in after her huſband has turned her away is obliged to pay the like fine, or another woman in exchange for her. But though this is the ſlaviſh ſtate of the wives of this country, there is a particular law by which the children follow the condition of their mothers; that is, they muſt continue ſlaves if the wife be ſuch, though the father be free; and are free born if the mother be ſo, though the huſband be a ſlave.

The children of the natives are born white, but in two days time become as black as their parents. This often deceived the Portugueſe at their firſt ſettling in theſe parts; for, having had a commerce with the negro women, they vainly imagined the child to be theirs.

But, what is much more extraordinary, here are a white people, who have grey eyes, red or yellow hair, and a complexion that reſembles chalk. Their eyes, inſtead of a lively ſparkling, ſeem fixed in their ſockets; and they appear to have hardly any ſight, except in the duſk of the evening, or by moon-light. Though the negroes look upon theſe as monſters, and have the utmoſt hatred and averſion to them, they are well received by the king, who cauſes ſome of their children to be educated as ſoothſayers, and is never without ſome of them about his perſon and his court. They are called Dondos by the negroes, and Albinos, or White Moors, by the Portugueſe. There is a kind of continual war between the negroes and them, in which the former always attack them in the daytime, when their ſight is the moſt imperfect; and theſe take their advantage of them in the night, when it is at the beſt.

Theſe white people not only make a part of the king's council, but are the chief perſons employed in all religious affairs and ſuperſtitious ceremonies: yet neither they nor any of the Loangoeſe have any tolerable ideas of a Supreme Being; and though they ſeem to acknowledge his exiſtence, under the name of Sambian Pongu, they neither pay any adoration to him, nor ſeem to have any notion of his nature or attributes. All their worſhip and invocations are, like thoſe of the Congoeſe, directed to ſubordinate ſpirits, who, they imagine, preſide over the different parts and powers of nature. Theſe pretended deities they repreſent in the form of men, women, or other living creatures; ſome coarſely carved, and others modelled in clay. Some images of a ſmall ſort are worn in little wooden boxes pendant about their necks; but the larger they ſet up in their houſes, and adorn their heads with the feathers of pheaſants, parrots, and other birds, painting them all over of various colours, and hanging little bits of cloth, ſmall ſhells, pieces of iron, and other baubles on their bodies. Theſe are placed in an earthen veſſel, ſomewhat like a ſtone mortar, in which the figure ſtands half in and half out.

The perſons conſecrated to the ſervice of theſe imaginary deities, are uſually advanced in years, and choſen by the enganga mokiſſo, or chief of the magicians, with many ridiculous ceremonies before a numerous aſſembly; and it is ſaid, as ſoon as theſe are ended, the candidate begins to look wild, to diſtort his face, and put his body into ſeveral indecent attitudes, uttering loud and terrible ſhrieks. Authors tell us, that he then takes fire in his hand, and bites it without burning himſelf; and that ſome of them run with prodigious ſwiftneſs into ſome deſart place, whither they muſt be ſought out by beat of drum, and when one of them is found, he appears with his body covered with leaves, and is brought home by his relations, who dance around him, while he acts the part of a perſon poſſeſſed by ſome demon. At his return, he is aſked to what demon, law, and particular obſervation he intends to bind himſelf; and as ſoon as he has named one, a buckle or ring is faſtened round his arm, which he muſt always wear, to remind him of his promiſe; and afterwards he never ſwears by any thing but the ring, or the demon, to which he hath dedicated himſelf.

The common people have likewiſe one or more ſmall idols, which thoſe of high rank wear in great numbers.

The inhabitants of Loango entertain various notions of the nature of the human ſoul. The royal family are perſuaded, that the ſouls of their deceaſed relations tranſmigrate to the bodies of thoſe who are afterwards born in the family. Others imagine, that the departed ſouls become heroes, houſhold Gods, and guardian ſpirits, and from that opinion make little niches under the roof of the houſe, where they place their idols, which are generally a ſpan long, and offer them a ſhare of their meat and drink, before they venture to taſte it themſelves. Others aſſign the ſoul a reſidence under the earth, where they ſuppoſe it enjoys a new kind of life in a higher or lower rank, according to the degree of merit it poſſeſſed while on earth. Another ſort think, that ſouls die with their bodies, unleſs they are kept alive by the witchcraft of an enemy, in order to render them ſerviceable to his avarice and intereſt. They are all perſuaded, that their mokiſſos, or as the Portugueſe call them fetiſſos, that is the ſpirit to whom they have been dedicated at their birth, has power to inflict puniſhments, or even death, on thoſe who neglect or break any of the obſervances to which they have bound themſelves. Hence when a perſon enjoys perfect health, and worldly proſperity, he flatters himſelf, that his God is well ſatisfied with his behaviour; but when matters go other-

otherwiſe, he thinks it high time to look about him, in order to find what has diſpleaſed his mokiſſo, and what is the propereſt method of regaining his favour.

In this kingdom they have many temples, in which their idols are placed; the moſt conſiderable of which is that of Therico, a large village, where the temple is very ſpacious, and the pillars, as well as the mokiſſo, have the figure of a man. The enganga or prieſt, who is lord of the village, performs the ſervice every morning, by ſtriking a fleece of wool with his ſtaff, and muttering ſome words, to which a youth who aſſiſts him, makes regular reſponſes; after which he addreſſes his petitions to the mokiſſo, recommending to his care the health and proſperity of the king, the welfare of the country, the fertility of the land, and the good ſucceſs of their traffic and fiſhery.

When a common perſon dies, they expreſs little concern till his breath is out of his body, and then every one begins to howl and cry, to crowd about the corpſe, bring it out of the houſe, and aſk it the cauſe of his death, whether want of food or other neceſſaries, or any inchantments. This tumult commonly laſts two or three hours, during which ſome of the relations are buſily employed in waſhing, combing, ſhaving, and ſtaining the corpſe with red wood, particularly his nails, and getting ready ſuch of his goods as are to be thrown into his grave; while others are employed in digging it of a ſufficient ſize to contain both him and them. When every thing is ready, they ſuddenly ſnatch up the corpſe, and run away with it, with all poſſible ſpeed, the company following with the ſame haſte; and when they come to the place, throw the body and goods into the grave. Theſe goods are generally ſome of the deceaſed's cloaths, weapons, and tools; and when theſe are too many for the grave to contain, they hang them upon ſhort poſts ſtuck into the ground, after having firſt torn, or otherwiſe injured them, to prevent their being ſtolen. The mourning laſts ſix weeks, during which the deceaſed's relations meet at the grave morning and evening, to bewail his death.

A perſon of rank no ſooner falls ſick, than the ſtricteſt enquiries are made, whether his diſeaſe be not cauſed by enchantment. Upon this the engangas are conſulted, and if they pronounce him bewitched, countercharms are uſed for his cure. If none of theſe avail, and the patient dies, much the ſame ceremonies are uſed as at the death of a perſon of meaner rank, only they extend the corpſe on the floor of ſome large chamber, and not in the ſtreet, and inſtead of three hours ſpend three days in lamenting his death, and preparing for his interment. All this while his male relations utter their lamentations about his corpſe, while the females are dancing in another room, and ſinging his panygerics, expatiating on the nobility of his lineage, the greatneſs of his eſtate, the grandeur in which he lived, and the number of his friends and enemies. The mention of his enemies by name ſeldom fails to create a ſuſpicion that ſome of them have cauſed his death by witchcraft, eſpecially if the engangas have intimated any thing to that purpoſe. Upon this ſtricter enquiries are made, and if no certainty can be obtained, they unanimouſly reſolve to conſult one of the mokiſſos, and every one contributes ſomething to defray the expence of the enquiry. On the third day, the corpſe with the goods are hurried away with precipitation to the burying-place, and there they throw the body and other utenſils, as an earthen pot, an arrow, a lance, a wooden ſhovel, a calabaſh, a drinking cup, a pipe, a tobacco box, a ſtaff, and other thinks of the like nature; and, as hath been obſerved before, what is not thrown into the grave, is ſuſpended on poſts ſet round it; after which the mourning laſts two or three months, during which the friends and relations make their morning and evening lamentations at the grave, and the enquiry after the cauſe of the perſon's death is carried on by the relations.

No ſtrangers are ſuffered to be buried in this kingdom; for when they die they are conveyed in a boat two miles from the ſhore, and thrown into the ſea. This, they pretend, was occaſioned by the following incident. A Portugueſe gentleman dying, and being buried there, had not lain in the ground above four months, before a famine, occaſioned by want of rain, induced the inhabitants to conſult the mokiſſos in relation to the cauſe; and were anſwered, that a Chriſtian had been buried among them, and muſt be taken up and thrown into the ſea before they would obtain any rain. The people obeyed, and a plentiful rain happening to fall three days after, they have never ſince permitted any Chriſtian to be buried there.

SECT. XVI.

Of the Government of Loango, the Power and State of the King; the Ceremonies obſerved at Court; the Funerals of the Kings of Loango; the Order of the Succeſſion; and a conciſe Account of the Laws.

LOANGO was anciently a part of the kingdom of Congo, as hath been already intimated; but the governors of its ſeveral provinces revolted from it, and raiſed themſelves to the dignity of independent princes, till one of them grew ſo rich and powerful, as to ſubdue all the reſt, and not only aſſumed the royal title and dignity, but took ſeveral other provinces from the king of Congo; by which means he rendered himſelf ſo abſolute, as to be worſhipped in ſome meaſure as a deity.

The king of Loango is ſtill reckoned very powerful, and capable of bringing great armies into the field; for all his ſubjects that are able to bear arms, are obliged to appear at the uſual muſters, in order to perform their exerciſes before him, and to follow him or his general to the wars, wherever he commands them. His troops are armed with darts, which have large heads of iron, and have a handle about the middle of the ſtaff, by which they throw them with great force and juſtneſs. They have alſo a kind of dagger, which in ſome meaſure reſembles the head of their darts. Their targets are ſo large as to cover almoſt the whole body, and ſo ſtrong, as to repel an arrow or dart, they being made of hard and thick hides.

It is here reckoned a capital and unpardonable offence to ſee the king eat or drink. He generally contents himſelf with two meals a day, and is ſaid to have two houſes appropriated to that purpoſe, the one for eating, and the other for drinking; to the firſt he uſually repairs about ten o'clock, which is his dinner-time, and there finds his victuals ready, brought in a kind of baſkets, a ſervant going before with a little bell, to give notice that the king's table is going to be covered. The high ſteward has no ſooner placed the meat before him but he retires, and locks the door after him, leaving neither man nor beaſt to ſee him eat, his numerous court waiting all the time in an antichamber, in order to follow him to his drinking-houſe, to which he generally adjourns immediately after dinner.

This is the nobleſt appartment in the whole palace, and is encompaſſed by a ſpacious court incloſed with paliſadoes of palm trees: this is alſo the place where he adminiſters juſtice to his ſubjects. The room is hung with rich tapeſtry, about eight feet high, and at the farther end of it is the royal throne, which is formed of fine palmetto pillars white and black, curiouſly wrought in the manner of baſket work. The front of the apartment is open to let in the freſh air; and about twenty feet beyond it, a ſcreen or partition runs quite acroſs to keep the palm wine which he drinks concealed. On each ſide of the throne are two large baſkets of black and red palmetto, in which the natives ſay, the king keeps the images of the familiar ſpirits who guard his perſon. On each ſide of him ſtands one of his two cup-bearers, and when he wants to drink, he beckons for the cup, upon which one of them reaches it to him, and the other, who holds two iron rods, reſembling drum-ſticks, ſtrikes them together to give notice that he is going to drink, and then all the nobles, both in the hall and out of it, fall with their faces to the ground; but the cup-bearer who preſents the wine turns his back. In this poſture all continue, till notice is given, by the ceaſing of the ſignal, that he has drank, upon which they immediately riſe and expreſs their joy and good wiſhes by clapping their hands.

No one is permitted to drink out of his cup, or to eat of the proviſions which he leaves, after having dined or ſupped; but all that is left is carefully put together, and buried in the earth. It is a mark of reſpect, when any perſon is allowed to drink in his preſence, for that perſon to turn his back to him.

As cauſes are heard, and affairs of the greateſt importance are diſcuſſed in this hall, he often ſtays in it till about an hour after ſun-ſet, or, in other words, till about ſeven o'clock; but, if there be nothing of that nature, he commonly retires to his ſeraglio, and paſſes the reſt of the afternoon with ſome of his wives. About ſeven o'clock, or ſoon after, he repairs to his eating-houſe, where he ſups with the ſame ceremonies uſed at dinner, and then adjourns to the drinking-hall, where he uſually ſtays till bed-time, which is at about nine or ten in the evening, and then retires to reſt.

This prince ſeldom or never ſtirs out of his palace, except on ſome grand feſtival, or ſome ſolemn occaſion; as receiving an embaſſy, or hunting ſome miſchievous leopard that lurks about his capital; quelling ſome revolt, or ſeeing his people begin to plough and ſow his lands; and when his vaſſals come to pay him their uſual homage and annual tribute.

Upon theſe occaſions he publicly repairs to a ſpacious green that faces his palace, in the center of the city, where is erected a throne of white and black palm-tree wickers, artfully interwoven, and adorned with curious embelliſhments. On the back of the throne is ſpread a kind of eſcutcheon, or ſhield, hanging to a pole, and on each ſide of the throne are ſet about eight umbrellas, neatly wrought with the fineſt of their country thread, and fixed at the end of poles, which run through the center of each. Theſe umbrellas are of the form of an hemiſphere, and about two yards in diameter. The ſtff to which they are fixed is about as thick as a man's arm, and two or three yards in length, with a large taſſel or buſhy tuft above, and ſeveral others under the concave. Theſe, and ſeveral other penſile ornaments of different materials, being whirled about horizontally with great vehemence, by proper perſons appointed for that purpoſe, raiſe an artificial breeze that is very refreſhing and delightful to all within its reach.

Before the throne the ground is covered with a large carpet, or cloth, of quilted leaves, about forty yards long, and twenty broad, on which none but the king or his children may ſet their foot, but round it there is room ſufficient for two or three perſons to paſs; and beyond that the nobles and officers of the houſhold are ſeated croſs-legged, ſome on the ground, and others on carpets or cuſhions, each holding in his hand a buffaloe's tail, and waving it about. A great number of ſervants ſurround their maſters on the outſide, all ſeated in the ſame poſture; and at proper diſtances are placed the muſicians, who have three ſorts of inſtruments, one made of ivory like our hunting-horns, but of different ſizes and bores; theſe joined together yield a loud, yet pleaſant ſound. The ſecond ſort is the drum, which is of various ſizes, and is made and beat after much the ſame manner as thoſe of Congo and Angola. The third reſembles a tabor, ſhaped like our large ſieves, with a drum-ſkin inſtead of a piece of lawn or wires. The hoop about it has holes, in which are faſtened flat pieces of tin or braſs, which make a kind of gingle whenever the tabor is moved or beat with the hand.

Before the above carpet a number of dwarfs ſit with their backs towards the throne; theſe are choſen for their deformity, and eſpecially for the diſproportionate largeneſs of their heads. Their cloathing is ſuited to their appearance, it being only the ſkins of beaſts tied about their waiſts. Theſe the king cauſes to be intermixed by way of contraſt with a number of White Moors, and both together in their motions and antic geſtures make a very groteſque appearance.

The king is no ſooner ſeated on his throne, than the muſic plays, and a ſet of officers, or gentlemen, begin a dance, called kilomba, round the royal carpet, in which they toſs about their arms, and ſhew all poſſible activity with their bodies; and when any of them has been ſo happy as to pleaſe his majeſty by his performance, he lets him know it by opening his arms; on which the dancer draws nearer the throne, and, after rolling himſelf ſeveral times in the ſand, to expreſs his gratitude and ſubjection, is ſometimes allowed to clap his hands upon the king's knees, and his head in his boſom. The nobles have the privilege of ſaluting the king in this manner: when approaching his perſon they take ſeveral large ſteps or bounds in the air backwards and forwards; and as theſe have their ſeparate ſeats on each ſide of the throne, they cauſe their own vaſſals who attend them on theſe occaſions to perform the ceremony to them: this is called the leaping ſalute, and is always uſed upon grand occaſions, particularly when the king's vaſſals come to pay him their homage and tribute.

The next grand ſolemnity is termed the ſeeding-time, and is kept on the fourth of January, when the men and their wives appear before the king, in order to till and ſow his lands. The men appear in arms, while the women are buſied in breaking up the ground, which is a ſervice to which they muſt all ſubmit, and from which none can abſent themſelves without incurring a penalty; and the king himſelf repairs in perſon at about three in the afternoon to encourage them, and ſee that this work be well done. In the evening they are all invited to ſup at his expence; and this is eſteemed a grand feſtival. Every vaſſal is in like manner obliged to ſend his wives to till the lands of his lord, and when they have performed this ſervice, they are at liberty to work for themſelves on what waſte piece of ground they like beſt, for all the reſt of the lands are held in common; but when any one has begun to cultivate one ſpot, it is not lawful for another to interfere with him in it.

The king alſo ſhews himſelf in public on the hunting of a leopard within the neighbourhood of his capital. Theſe animals being numerous, the nobles are allowed to ſummon all their vaſſals to hunt and deſtroy them; and when any has killed a leopard, he gives notice of it to the king, by bringing its tail to Loango, and hanging it on a palmetto pole before the royal palace.

But if any of them are diſcovered within the neighbourhood of that capital, the king, upon the firſt notice of it, orders all the inhabitants, by ſound of trumpet and beat of drum, to appear in arms and accompany him to the place where it is lodged. If it be too far for him to walk, he is carried in a wicker chair, borne upon four men's ſhoulders. When they come to the leopard's den, or to the wood in which he lurks, ſome of the people beſet the avenues, armed with their bows and javelins; while others lay their traps, or ſpread their nets, to catch him alive. A third ſort beat the buſhes, ſound their trumpets, and make a hideous noiſe to frighten the beaſt; who, in order to break his way through the vollies of darts and arrows diſcharged at him on every ſide, is forced into the trap, where every one ſtrives to diſpatch him in the preſence of the prince.

This is no ſooner done than he orders him to be flayed by one of his officers; after which the ſkin is carried in triumph by the huntſman to the palace, where the ceremony is cloſed with ſinging, dancing, and variety of other paſtimes.

The king's funeral is performed with great pomp; but, inſtead of the inhuman cuſtom practiſed in ſome of the neighbouring parts of Africa of interring the king's wives, relations, domeſticks, and ſlaves alive with him, they ſurround the funeral-ſeat, on which the corpſe is placed with little images of clay, wood, or wax; yet ſome ſlaves are ſaid to be ſlaughtered upon theſe occaſions, and buried in the ſame or ſome adjoining vault. Theſe vaults are made ſo large as to contain not only the corpſe of the king, which is always dreſſed in the moſt pompous manner, but a great number of utenſils, as pots, kettles, pans, pitchers, cups, linen, and cloaths. The above ſlaves are ſaid to be buried with their maſters, not only to attend them in the next life, but to bear witneſs when they come before the God of the other world how they have lived and behaved in this.

With reſpect to the ſucceſſion of the crown, it deſcends not to the king's children, but to thoſe of his ſiſter. Some care is neceſſary to prevent confuſion and diſputes about it; therefore thoſe who claim a right to aſcend the throne have particular towns or villages aſſigned for their

reſidence nearer or farther from Loango, according to their being nearer or farther from the ſucceſſion: they have likewiſe their titles from thoſe towns; thus the next heir to the crown is called Manikay, from the town of that name, about five or ſix miles north-weſt of the capital. The next to him is called Mani-bocke, and lives at that town, which is between fifteen and ſixteen miles farther up the country. Mani-ſallaga, or Salag, the third in rank, lives at Salag, thirty miles from Loango. Mani-kat, the fourth, lives at Kat, a village about fifty miles diſtant: and Mani-inyami, the fifth and laſt, reſides at a hamlet on the ſouthern borders of the kingdom. Hence, when the king on the throne dies, Mani-kay, who ſucceeds him, removes to Loango, and the other four remove one ſtage nearer to it, according to their rank, and a new one is nominated to ſucceed Mani-inyami.

Their laws are much more gentle than in other neighbouring ſtates, except in crimes committed againſt the king's perſon, dignity, or honour. Thus they never condemn a man to ſuffer death for theft, but content themſelves with obliging the offender to reſtore what he has ſtolen, or its value, and with expoſing him with his hands tied behind him to a tree or poſt, to the ſport and deriſion of the ſpectators.

It is ſaid that adultery is only puniſhed with a fine; but this indulgence is ſo far from extending to the king's wives and concubines, that if any of them be debauched, or ſuſpected to be ſo, both ſhe and her paramour are burnt alive without mercy, in ſight of each other. The number of his wives is indeed prodigious, becauſe he is obliged to keep thoſe of his predeceſſors, as well as his own, ſo that they ſometimes amount to a very great number. All theſe he keeps confined in his ſeraglio, and ſingling out ſome of them for his pleaſure, obliges the reſt to employ themſelves in ſome uſeful work; but ſhould any of theſe be found pregnant, ſhe would be put to the torture to make her confeſs her partner; but theſe women ſometimes cauſe an innocent perſon to ſhare their dreadful fate, in order to ſave the man they love.

SECT. XVII.

A Deſcription of Loango, the Capital of the Kingdom, and the Trade carried on by the Natives.

THOUGH the bay of Loango is eſteemed a pretty good one, it has a bank on the north ſide of its mouth, or entrance, that runs about half a league along the coaſt, and has not above two fathoms and a half water; but having got over it, you come into five fathoms and a half, which continues till within a ſmall cannon-ſhot of the land, where the veſſels commonly anchor in three fathoms, on a reddiſh bottom. The bay is eaſily known by the high reddiſh mountains on the ſea-ſide, that are different from all the others on that coaſt. The many large rivers that come down from the continent cauſe the currents to be ſo ſtrong and rapid towards the north, that it is difficult to weather them and gain a ſouthern courſe: but this may be done with greater eaſe and ſafety in the months of January, February, March, and April; during all the reſt of the year the currents flow ſo ſtrong, that even the coaſters are obliged to keep at leaſt ten or twelve leagues off the land. The port, or landing-place, is at the ſmall village of Kanga.

The city of Loango is ſituated in the province of Loango-mongo, in four degrees and a half ſouth latitude, and about five or ſix miles from the ſea-coaſt. The houſes are for the moſt part oblong, and covered in ſuch a manner, as that the middle part of the top is flat, and the reſt of the covering comes down with a ſlope. The whole is ſupported by ſtrong wooden pillars and croſs beams; thoſe that ſupport the higheſt part being ten or twelve feet higher than the ſide ones, and the laſt of a height proportioned to the ſize of the building; for the houſes are higher or lower according to their length or breadth. They have uſually three or four rooms; but have none above the ground-floor. The houſes are fenced round with a hedge of palm twigs, canes, or the like materials; and ſome of theſe hedges encloſe ſeven, eight, or more buildings. The families within them commonly live together in a peaceable and friendly manner, and are ready upon all occaſions to aſſiſt each other, except when they ſuſpect any one of magic.

Their chief furniture conſiſts in a variety of pots and kettles, baſkets, calibaſhes, mats, and benches, on which they lay their cloaths, weapons, and other utenſils.

The ſtreets are wide and kept very clean, and before each ſide is a row of palms, bananas, or bacavas, which agreeably ſhade the fronts of the houſes; and moſt of thoſe which belong to perſons of ſuperior rank have the ſame behind, or even quite round.

In the center of the city is a ſquare of a prodigious ſize, on one ſide of which is the royal palace, which is a mile and a half in compaſs, and ſurrounded by ſtately palms. It conſiſts of a vaſt number of detached buildings, or houſes, among which are thoſe of the king's women. The houſes of the king, his halls of audience, and other offices are on the weſt ſide, and face the above ſquare, in which he holds his councils of war; he there alſo feaſts his prime officers, and ſometimes his whole army. From this ſquare there likewiſe runs a wide ſtreet, ſome muſquet-ſhots from the palace, where a conſiderable market is kept every day, in which are ſold great quantities of palm cloths; as alſo corn, meal, poultry, fiſh, wine, and oil; and there were formerly ſold in the ſame place elephants teeth, but theſe are now removed to the port of Kanga. In this market is alſo a famous temple and idol, called Mokiſſo a Loango, which has been held in great veneration both by the king and people.

The trade of this country chiefly conſiſts in ſlaves, which are eſteemed the greateſt riches of the inhabitants; and this trade is carried on much in the ſame manner as at Congo. The natives alſo ſell conſiderable quantities of ivory, tin, lead, iron, and copper, brought from the mines of Sundi, which are ſituated far to the eaſt. The ſmiths and artiſts in mines ſet out from Loango in September for the kingdom of Sundi, and being arrived at the mountains where the copper-mines are, ſet their ſlaves to work in them. They melt the ore on the ſpot; but as they have not the art of purifying it from other metals, their copper is neither ſo pure nor ſo valuable as it might be. At that work they are employed till the month of May following, at which time they bring elephants teeth and tails; but the former are only of a ſmall ſize, and the latter the Portugueſe carry to Loango, where the negroes of that town have the art of weaving the hair into girdles, bracelets, collars, and other ornaments that are exceeding neat and beautiful. Theſe two laſt articles the Loangoeſe purchaſe of one of the inland nations, in exchange for ſalt, palm oil, Sileſia ticking, cutlaſſes, looking-glaſſes, beads, and other things, which they obtain from the Europeans.

The Portugueſe alſo export from Loango ſeveral ſorts of cloths, the manufacture of the country, ſome of which paſs for money both there and in other neighbouring kingdoms.

Thoſe European merchants who are deſirous of trading at Loango, are obliged to obtain a licence for it from the king, which can only be done by preſents made, not only to him, but to his mother, the queen, and ſome of his miniſters, which renders it chargeable and difficult. Beſides, as the inhabitants underſtand no language but their own, it is neceſſary to hire ſome of their fiſhermen, who have commonly a ſmattering of Portugueſe, to ſerve for interpreters and brokers.

CHAP. X.

Of the Kingdom of BENIN.

SECT. I.

Its Situation, Extent, Face of the Country, and Climate; Vegetables, Beaſts, and Birds.

THE kingdom of Benin is of conſiderable extent, but its limits are very imperfectly aſcertained; it is, however, bounded by Loango on the ſouth, by the gulph of Guinea and the Slave coaſt on the weſt, by part of Gago and Biafara on the north, and by Mujac and Makoko on the eaſt. It begins in the firſt degree of ſouth latitude; but how far it extends from ſouth to north, and from eaſt to weſt, cannot be well aſcertained.

The firſt diſcovery of this kingdom is generally attributed to Juan Alphonſo de Aveiro, who gave the name of Formoſa to the river Benin, from the verdure and beauty of its banks. For ſeveral leagues up the country the land is low and marſhy; but its banks are every where adorned with tall, ſtraight, and ſpreading trees: the adjacent country affords a delightful proſpect, the land being even, without hills, yet riſing by gentle degrees; and the trees are diſpoſed by nature in ſuch regular order, that they ſeem as if planted by deſign.

But, notwithſtanding the apparent ſatisfaction the country affords from the pleaſing landſcapes preſented to the eye, the air is noxious and peſtilential, which is owing to the groſs vapours exhaled by the heat of the ſun from its marſhes; and there are ſuch quantities of moſquitos as render life intolerable, from the ſharpneſs of their bite, and its ſeeming poiſonous effects, producing violent heat and inflammations, with convulſions, vomitings, and other dangerous ſymptoms.

The ſoil at a ſmall diſtance from the river Benin is extraordinary fertile, and whatever is planted or ſowed there grows well, and yields a rich crop. Among the fruits of the earth is the large ſort of millet; but as the natives are not fond of it, little is ſowed; it grows very luxuriant, and yields a prodigious quantity of grain. They ſometimes employ the Andra women to brew beer with it.

There is little or no rice cultivated at Benin, though the moraſſes near the river ſeem proper for it.

There are not many potatoes; but there is great plenty of yams, which they eat with their other food inſtead of bread, and are careful to plant them in their proper ſeaſon.

Among the fruit-trees are two ſorts of cocoas, bananas, wild figs, and ſome others.

With reſpect to tame animals, here is no want of horſes, cows, ſheep, dogs, and cats. The cattle, though ſmall, are good and cheap; and the negroes prefer the fleſh of the dogs and cats to that of any other beaſt. The natives alſo ſometimes kill wild ſwine and harts with their javelins; but this is very ſeldom. The country alſo contains a vaſt number of elephants, and a few lions and tygers; with many jackalls, baboons, and all ſorts of apes.

Among the feathered kind, they have great plenty of poultry, which are equally good and cheap; pheaſants, green and blue partridges, turtle and ring-doves, crooked-bills, ſnipes, divers, water-hens, and a ſort of crown birds.

SECT. II.

Of the Dreſs, Manners, and Cuſtoms of the Natives; their Food, Marriages, Treatment of their Wives, Puniſhment of Adultery, and Regard to Decency. The Circumciſion of their Children. Twins reputed happy Omens; but at Arebo are put to Death. The Treatment of their Sick, and the Burial of the Dead.

THE dreſs of the natives of Benin is neat, and greatly exceeds that of the negroes of the Gold coaſt. The rich wear firſt a white calico or cotton petticoat, about a yard in length, and half a yard in breadth. This they cover with another fine piece of calico of ſixteen or twenty yards in length, which they plait in a becoming manner, wearing over it a ſcarf a yard long and a foot wide, the ends of which are adorned with a handſome lace or fringe. The upper part of the body is moſtly naked. This is the dreſs in which they appear in public; but at home their cloathing is more ſimple, and leſs expenſive, it only conſiſting of a coarſe cloth worn round their waiſt, covered with a large painted cloth of the manufacture of the country, and worn in the manner of a cloak.

The women of rank wear fine calico beautifully checked with various colours, faſtened round the waiſt. The dreſs is long and open, either on one ſide or behind, juſt as fancy directs. The face and upper part of the body is covered with a thin veil, which they remove among their friends and intimates of either ſex. They adorn the neck with ſtrings, and chains of coral agreeably wrought and diſpoſed. Upon their arms and legs they wear bright copper or iron bracelets of a mean workmanſhip, and all their fingers are crowded with rings of the ſame metal. Upon the whole, their perſons are not diſagreeable, after cuſtom has rendered them familiar to the eye; and, except their rings and bracelets, the dreſs does not appear unbecoming.

The meaner degrees, both of the women and the men, differ from thoſe of high rank only in the quality of their cloaths, the form being the ſame. The men neither curl nor adorn their hair, but ſuffer it to fall naturally, except in two or three parts, which they buckle in order to ſuſpend a bunch of coral to each lock. The women, on the other hand, uſe great art in dreſſing their hair, which they reduce into a variety of different forms, great and ſmall curls, high and low fore-tops, ſometimes plaited up behind, at others flowing in wanton ringlets down the neck, but generally divided on the crown of the head, by which means the curls are brought into exact form and order. Some anoint the hair with a kind of oil, which they expreſs or roaſt out of oil-nuts; and this oil, it is ſaid, at length gives it a beautiful green or yellow, of which they are fond.

The natives of Benin are, in general, a good-natured, civil, and gentle people, from whom, by kind uſage, any thing may be obtained. If they receive preſents, they return double the value; and they will even ſteal to enable them to ſhew their gratitude. If a ſtranger asks a favour of them, he is ſeldom refuſed, however inconvenient it may be for them to grant his requeſt: but though they are eaſily wrought upon by ſoft means, they are inflexible to all kinds of ſeverity and rough uſage; for by courteſy their pride is flattered, their ſelf-importance raiſed, and therefore a perſon of an obliging behaviour will ſucceed in points which a bluſterer would in vain try to effect. To think of forcing any thing from them, ſays Mr. Boſman, is to diſpute with the moon.

They are quick and alert in buſineſs, greatly attached to their antient cuſtoms, in which, if we comply with them, they are very eaſy to deal with, and will not be wanting in any thing on their part requiſite to a good agreement. They are however very tedious in their dealing, for it frequently happens that a bargain for elephants teeth will take up ſome weeks before it is concluded; but this is managed with ſo many ceremonious civilities, that it is impoſſible to be angry with them; yet with each other, where they repoſe a confidence, no people make greater diſpatch. Mr. Boſman complains of another inconvenience, which is, that on the arrival of the Europeans, they are obliged to truſt them with goods to make paans or cloth of; for the payment of which they frequently ſtay ſo long, that from the advancement of the

ſeaſon,

ſeaſon, the conſumption of proviſions, and the ſickneſs or mortality of the men, they are obliged to depart without their money. However, upon their return, they are honeſtly paid the whole.

Thoſe of the natives who can afford it feed well. Their common food is beef, mutton, or fowls, with yams for bread, which, after boiling, they beat into a ſort of cake. They frequently make entertainments for each other, and what is left is conſtantly diſtributed among the poor. People of mean rank content themſelves with ſmoked or dried fiſh, which they eat with a kind of bread made of yams, bananas, and beans, mixed and beat up together. For their drink they uſe water, or water mixed with a bad wine called pardon; but the rich drink at their meals water and European brandy.

They are well ſkilled in making ſeveral ſorts of dyes, as red, yellow, green, blue and black. The blue they prepare from indigo, great quantities of which grow here; but the other colours they extract from certain trees. They ſpin cotton, and weave cotton cloths, with which they not only ſupply all the inhabitants, but export a great deal. They make ſoap, which is better than any made in Guinea. Their other workmen are chiefly ſmiths, carpenters and leather-dreſſers; but their workmanſhip is very clumſy.

The men marry as many women as their circumſtances will permit, the laws limiting them to no determinate number. If a man loves a virgin, he diſcovers his paſſion to the moſt conſiderable perſon among his relations, who goes to the houſe where ſhe lives, demands her of her friends, and, if ſhe be not already engaged, ſeldom meets with a refuſal. As ſoon as the conſent of the parents is obtained, the match goes on, the bridegroom preſenting his future bride with a ſuit of cloaths, bracelets, rings, and necklaces proportioned to the degree of his wealth. After having treated the relations on both ſides with a handſome collation, the marriage is ended without any other ceremony.

The natives are jealous of each other to a degree of madneſs, but never take offence at any liberties taken with their wives by Europeans, thinking it impoſſible that the taſte of the women ſhould be ſo depraved as to allow them to grant unbecoming favours to a white man. Among people of rank, the women live after the manner of the Eaſtern nations, cooped up from all converſation with the males of their own complexion and features; but are otherwiſe treated with great tenderneſs, in order to alleviate the misfortune of the loſs of liberty. If the maſter of the houſe receives a viſit from any of his acquaintance, his wife immediately retires, unleſs the ſtranger prove an European, in which caſe ſhe is deſired to remain in her ſeat. The women uſe every female artifice to engage their huſband's affections, from their being fully ſenſible, that all their happineſs depends upon his love.

Adultery is puniſhed three different ways; if among the lower claſs a huſband ſuſpects his wife's fidelity, he tries every method to ſurprize her in the fact, without which he can inflict no other puniſhment than ill uſage. If he ſucceeds in detecting her, he immediately becomes poſſeſſed of the real and perſonal eſtate of the gallant, which he may from that inſtant ſeize and enjoy as his own. The offending wife is diſciplined with a cudgel, driven out of the houſe, and left to ſeek her fortune, which is commonly very unhappy; for few perſons will chooſe to receive her into their houſes, and fewer ſtill will marry a woman who has ſo groſsly violated her faith. They therefore uſually retire into a country where they are not known, where they either paſs for widows, and watch for a ſecond opportunity of marrying, or elſe ſubſiſt by their labour, or by engaging in trade.

Among perſons of rank the crime is atoned for by a ſum of money advanced by the wife's relations to prevent the ſcandal annexed to adultery. After this ſhe paſſes with her huſband and all her acquaintance for a woman of virtue, proportioned to the money received by the huſband.

The governors and arés-de-roes, or ſtreet-kings, puniſh this crime with the utmoſt ſeverity; for if the woman and gallant are taken in the fact, they are, without any form of law, immediately put to death, and their bodies thrown out as a prey to the birds of the air and the beaſts of the field. From the ſeverity of theſe puniſhments the violation of the marriage-bed is leſs known in Benin than in any other country.

In general the negroes of this country are libidinous, which is indeed the caſe of the inhabitants in almoſt all warm climates. Their converſation is, however, free from all obſcenity; the rites of love are held as ſacred, and to be only ſpoken of in places deſtined for that purpoſe; and their converſation is enlivened with well contrived fables and chaſte ſimilies.

The pregnant wife is forbid the careſſes of her huſband till after delivery. If the infant proves a male, it is preſented to the king, as properly and of right belonging to him, but the females are the property of the father, and are entirely under his power till marriage.

About eight or fourteen days after the birth of their children, both the males and females are circumciſed: the latter by the loſs of a ſmall part of the clitoris. The infants have beſides ſeveral inciſions made all over their bodies, in a regular manner expreſſive of certain figures: but the females are more tortured with theſe unnatural ornaments than the males. But before this, when the infant is only ſeven days old, the parents imagining that it has eſcaped the greateſt danger, give an entertainment; and, to prevent the evil ſpirits, doing them an injury, ſtrew the roads with proviſions.

When a woman bears two children at a birth, it is eſteemed a happyomen, the king is made acquainted with it, and public rejoicings are ordered to be kept, in which they make uſe of a variety of wretched muſic, vocal and inſtrumental. As it is eſteemed too difficult a taſk for the mother to ſuckle both children, the father is obliged by the laws to look out for a nurſe who has loſt her own child; and, that no advantages may be taken of him, her price is ſettled by authority.

Yet at Arebo, a town a conſiderable diſtance up the river, twin-births are deemed a bad omen, and attended with great grief to the unhappy parents; for they ſacrifice both the mother and her children to a certain demon, which, they imagine, haunts the village. Though the huſband happens to be ever ſo fond of his wife, he can no otherwiſe purchaſe her life than by ſacrificing a female ſlave in her ſtead; but there is no poſſible means of redemption for the poor innocent children. Hence the circumſtances of having twins is ſo much dreaded, that thoſe whoſe abilities are able to ſupport the expence, uſually ſend their wives to be delivered in another country.

A wood ſuppoſed to be frequented by this evil ſpirit is held ſo ſacred, that no foreign negroe of either ſex is permitted to enter it. If a native of Arebo accidentally falls into any path leading to this wood, he is obliged, however preſſing his buſineſs may be, to proceed forwards to the end of it, without looking back, the violation of which cuſtom, or of the cruel one of murdering their wives and children, they imagine would be attended with a plague, famine, or ſome other public calamity. Nyendael informs us, that notwithſtanding this riveted ſuperſtition, he frequently went a ſhooting there, and to ridicule their ſtupid credulity, often turned back before he had proceeded half way in the track leading to the wood. At firſt they imagined he would inſtantly fall down dead, or be ſeized with ſome violent diſorder; but perceiving that his boldneſs was attended with no ill conſequences, their faith was ſomewhat ſtaggered. Their artful prieſts, however, deſtroyed all his endeavours to undeceive them, by their ſubterfuges, affirming, that no inference could be drawn from the practice of a white man, their God having no concern with him; but if a negroe was to attempt it, the conſequence would certainly be fatal.

The females of this country are extremely prolific; a barren woman is very uncommon, and eſteemed contemptible, while a fruitful woman is much admired.

The inhabitants of Benin appear leſs terrified at the approach of death, than the other people of the ſame coaſt. They aſcribe the duration of life to the determination of the Gods, and yet uſe the proper means to prolong it. Upon their being ſeized with any diſorder, they have recourſe to the prieſt, who here, as in ſeveral other countries on this coaſt, performs the office

of

of phyſician. He firſt applies ſome green herbs, and if theſe prove ineffectual, he has recourſe to ſacrifices, and appeaſing their Gods.

The reputation of the prieſt is greatly augmented by the recovery of the patient; but if, after all his endeavours, the perſon dies, the prieſt is never at a loſs to defend his practice. But, notwithſtanding the great confidence they place in their prieſts, they are generally rich only in fame; for the patient's gratitude continues no longer than the diſeaſe, and the ſacrifice, which is offered at the prieſt's expence, frequently amounts to more than his fee.

When any perſon dies, the body is carefully waſhed; but when the natives of Benin breathe their laſt, they are with the utmoſt caution brought to the place of their birth; the body being firſt dried over a ſlow fire, then put into a cloſe coffin, and ſweetened with aromatics. As it frequently happens that no conveyance can be obtained for ſeveral years, the body remains all this while unburied, nor can the funeral rites be performed with propriety in any other but their native ſoil.

The neareſt relations of the deceaſed expreſs their grief in various ways; ſome ſhave their hair, others their beards, and others but half of either. The public mourning is uſually limited to the term of fourteen or fifteen days. Their complaints and lamentations are accommodated to the ſounds of certain muſical inſtruments with long intermediate ſtops, during which they drink plentifully. When the laſt obſequies are performed, every man retires to his own houſe, and the neareſt relations, who continue in mourning in the above manner, bewail the deceaſed at ſtated periods, during the time limited by cuſtom. Huſbands and parents uſually prolong this mourning to three or four months.

The funeral of a king is performed with ſeveral very extraordinary ceremonies. A well is dug before the palace ſo deep, that the workmen are ſometimes ſuffocated in the pit themſelves have made, and yet it is ſo narrow at the top, that a ſtone five feet in length, and three in breadth, will conveniently cover it; but its dimenſions at the bottom are conſiderable. Here the king's body is firſt laid in the preſence of a prodigious concourſe of people of both ſexes, all of whom contend for the honour of being buried with him. Such as are choſen for this high dignity are put in with him, and the grave cloſed by a ſtone. The next morning the nobles return, and removing the ſtone, dip their heads into the water with which the pit is generally filled, and aſk the perſons buried with the king, Whether they have met with their royal maſter? and on their making no reply, conclude that they are attending him in his flight to the other world; upon which the ſolemnity is cloſed. Barbot adds, that the firſt miniſter immediately goes to the king's ſucceſſor, who then coming to the grave, orders the tomb-ſtone to be laid, and upon it a banquet of the moſt delicate wines and ſweet-meats. Every one eats and drinks till night, when the mob, intoxicated with liquor, run about the ſtreets committing the wildeſt exceſſes and riots, putting every one to death that obſtructs them, whether men, women, children, or brute animals, and cutting off their heads, carry them to the royal ſepulchre, and throw them in as offerings to the deceaſed king, together with all the cloaths and effects of thoſe perſons they have ſacrificed to his manes.

SECT. III.

Of the Religion of the Natives of Benin.

AS to the religion of the country, it is fraught with a ſtrange mixture of good ſenſe and abſurdity. The fetiche, or mokiſſo, is worſhipped here, as in all the other countries on the weſtern coaſt of Africa; but the deities, which they ſuppoſe inhabit theſe idols, they conſider as ſubordinate, and acting as mediators between men and the great God, of whom their ideas are leſs groſs and unworthy. To the Supreme they aſcribe the attributes of omniſcience, omnipreſence, omnipotence, and inviſibility, believing that he actuates every thing, and governs the world by his providence. As he is inviſible, they think it would be abſurd to repreſent him under a corporeal form, and thus to make an image of what we never ſaw, and cannot comprehend. To every evil, they give the name of wicked ſpirit, imagining that an evil diſpoſed and malicious being preſides over all that is bad; and this being they worſhip out of fear, and to prevent his injuring them.

Dapper obſerves, that they have very juſt notions of the ſupreme goodneſs, majeſty, power, and wiſdom of the great God, who created both heaven and earth, and continues to govern them. This being they call Oviſſa, and think it unneceſſary to pay their adorations to him; becauſe his nature is good and benevolent, while the evil ſpirit requires conſtant worſhip, in order to check the malignity of his diſpoſition. Nyendael however aſſerts, that both are worſhipped by ſacrifices and offerings.

The negroes of Benin firmly believe in apparitions, and that the ghoſts of their deceaſed anceſtors walk the earth unſeen; but chiefly appear to them in their ſleep, in order to warn them of ſome danger which they are to obviate by ſacrifices; and the day no ſooner returns, than they comply with the ſuppoſed ſuggeſtions of the ſpirit. They make offerings, and if they are very poor, will even borrow to enable them to perform them. Theſe are, however, of no great value, they only conſiſting of yams mixed with oil, which they place before the idol. Sometimes they ſacrifice a cock; in which caſe the blood is ſpilt for the fetiche, while they keep the fowl for their own uſe.

They have annual ſacrifices, which are performed by the great with all imaginable pomp, and in theſe they ſlaughter a great number of bulls, cows, ſheep, and all other kinds of cattle. All their friends are invited to the feſtival, which generally continues for ſeveral days, and ends in diſtributing valuable preſents to the gueſts.

Theſe people place the ſeat of their future felicity or miſery in the ſea. They conſider the ſhadow of a man as a real exiſtence, which will one day give teſtimony of their good and evil actions. They call this appearance paſſadoor, and bribe it by ſacrifices and offerings, as by its evidence they may be raiſed after death to the higheſt dignity and pleaſures of paradiſe, or ſunk into the loweſt abyſs of wretchedneſs, where they muſt periſh through poverty and hunger.

Though their houſes are ſo filled with idols, that it is difficult to find a vacant ſpot, they have particular huts or little temples appropriated to the reſidence of the Gods, where they receive the offerings of their votaries. Their prieſts pretend to be acquainted with the evil ſpirit, and with the art of penetrating into futurity, by means of a pot pierced at the bottom in three different places. Nothing is however undertaken without conſulting the prieſt; but if he meddles with politics, and utters oracles that affect the ſtate, he is puniſhed with death; and the prieſts of the provinces are prohibited under ſevere penalties from entering the capital.

The high prieſt of Loebo, a town ſituated at the mouth of the river Formoſa, is particularly famous for his profound ſkill in magic. All the natives, the king not excepted, believe that his power extends over the air and ſea; that he can foreſee and prevent the arrival of ſhips, ſhipwrecks, and innumerable other important events. His majeſty of Benin, ſtruck with the miracles one of theſe prieſts is ſaid to have performed, complimented him with the town of Loebo, and all its dependencies. He is conſidered as the head of the prieſthood, and is ſo revered, that no one approaches him without trembling; nay, the royal ambaſſadors dare not preſume to touch his hand without leave, and without ſhewing tokens of the greateſt awe and veneration.

Among their other ſuperſtitions, the people are ſaid to ſtand in profound dread of a certain black bird, which they worſhip, and are prohibited to kill, under pain of death. Theſe birds have prieſts appointed to attend, feed, and worſhip them in the mountains conſecrated to their uſe.

The

The Benians divide the time into years, months, weeks, and days, and each diviſion is diſtinguiſhed by its proper appellation. The year is compoſed of four months, and the ſabbath or day of repoſe, which returns every fifth day, is celebrated as a feſtival, with ſacrifices, offerings, and entertainments. They have alſo many other days conſecrated to the purpoſes of religion, particularly an annual feaſt in memory of their anceſtors. But the greateſt feſtival is called the Coral feaſt, at which the king appears in all his grandeur, marching at the head of his women, who ſometimes exceed ſix hundred, and are the moſt beautiful that can be found. He proceeds to the ſecond area of the palace, where his throne is placed under a rich canopy. About him are ranged his women and officers in their richeſt attire. The king leaves his throne to ſacrifice in the open air to the gods, which is accompanied by the loud ſhouts and acclamations of the people. Having paid his devotions, he returns to his throne, and ſtays there till all his people have performed theirs. After which he retires to his chamber, and the remainder of the day is ſpent in mirth and feaſting.

SECT. IV.

A Deſcription of the City of Benin, and of the King's Palace; with the Manner in which that City was reduced to a ruinous State.

THE palace of the king is ſituated in Benin, the capital of the kingdom, which ſtands in the ſeventh degree thirty minutes north latitude, and in the fifth degree four minutes eaſt longitude from London. The ſtreets are extremely long and broad, in which are variety of ſhops filled with European merchandize, as well as the commodities of the country; and markets are kept in them for cows, cotton, and elephants teeth. It was formerly very cloſe built, and extremely populous, as appears from the ruins of the houſes; but at preſent they ſtand widely diſtant from each other. They are all built with clay walls, and covered with reeds, ſtraw, or leaves, there being no ſtone in the country. The city is divided into diſtricts, each governed by its reſpective officer, called King of the Street; and is encloſed on one ſide by a double fence of large trunks of trees, ten feet high, ſet cloſe in the ground like a palliſado, and faſtened together by ſpars fixed acroſs, and the ſpace between the two rows is filled up with red clay; which at a diſtance looks like a good thick wall, very even and ſmooth: but the other ſide of the city is defended by a large ditch and hedge of brambles; which are ten feet high and five broad, are made of one piece of wood, and hang, or rather turn, on a pin in the middle. Each has a guard of ſoldiers, and opens to the country through a ſuburb. The women keep the ſtreets neat and clean, in which reſpect the inhabitants of Benin are not exceeded by the Dutch; for here, as in Holland, every woman cleans her own door.

A principal part of this city is taken up by the royal palace, which is of prodigious dimenſions; but neither elegant nor commodious. There firſt appears a long gallery, ſuſtained by fifty-eight ſquare pillars, rough and unpoliſhed, each above twelve feet high, and three in circumference. On paſſing this gallery you come to a high mud wall, which has three gates; that in the center is embelliſhed at the top with a wooden turret of a ſpiral form ſeventy feet high, and upon the extremity of this turret is fixt a large copper ſnake, well caſt, and bearing marks of a proficiency in the arts. Within the gate is an area of fine turf, a quarter of a mile in length and near as broad; at the farther end of which is another gallery, in the ſame taſte as the former, only ſupported by pilaſters, ornamented with human figures, and many of them cut out in that form, but in a very aukward manner. Behind a canvas curtain are ſhewn four heads caſt in braſs, neither reſembling the human nor brutal form, and each ſupported by a large elephant's tooth.

On paſſing through this gallery and another gate, you have the king's dwelling in front, which is far from dazzling the eye by its pomp and magnificence. Over the porch is another ſnake, probably done by the ſame artiſt who made that on the turret. In the firſt apartment is the king's audience-chamber, where, in the preſence of the chief nobility, or officers of the court, he receives foreign miniſters and ambaſſadors. His throne is of ivory, and over it is a canopy of rich ſilk. This chamber of audience has alſo the appearance of being his majeſty's warehouſe; for the king is engaged in trade as well as his ſubjects, and it is filled with loads of elephants teeth, and other commodities, lying in a confuſion that plainly ſhews they are not intended for ornament. The room is, however, hung with fine tapeſtry, and the floor covered with mats and carpets of an indifferent manufacture.

The decay of the city was occaſioned by the tyranny of one of the kings of Benin, who being jealous of obtaining the wealth of two petty princes of the ſtreet, ordered them to be ſeized and put to death, under the pretence that they had conſpired againſt his life, and then confiſcated their effects to his own uſe. They gave the cleareſt proofs of their innocence; but nothing is ſo deaf to the cries of pity as avarice.

Soon after, another perſon's wealth made the king meditate his deſtruction; but this nobleman, being appriſed of his majeſty's intention, quitted the city, and with him went three-fourths of the inhabitants. His majeſty immediately aſſembled an army, and purſued them; but was ſo warmly received by the fugitives, that he was forced to retreat with loſs and diſappointment. After this, he made a ſecond attempt to force them to return; but was defeated and purſued by the nobleman, who entering the city ſword in hand, plundered the whole, except the palace; and for ten years he continued with his fugitive band to harraſs, plunder, and moleſt the inhabitants of Benin, till at length, by the mediation of the Portugueſe, a peace was concluded, by which he was granted a free and full pardon, and even requeſted to return to his habitation; but as he did not chooſe to put himſelf into the power of a prince whoſe diſpoſition he was but too well acquainted with, he fixed his reſidence at a place three days journey from the capital, where he kept a court that greatly eclipſed that of the king. In vain were all endeavours uſed to bring his adherents back to the city; they preferred poverty with freedom to wealth and dignity with ſervitude, whence Benin has ever ſince remained in a manner depopulated.

SECT. V.

Of the Government of Benin; the Succeſſion of the Crown; the Revenues and Forces of the King; with the Arms of his Troops. The People divided into ſeveral Claſſes; with a conciſe Account of the Laws of Benin, with reſpect to Inheritances, and the Puniſhment of Crimes.

AS to the government of Benin, it is perfectly deſpotic. The empire is divided into an infinite number of petty royalties, all of them ſubject to the king of Benin; but though the people boaſt of their being born free, nothing can be more ſervile than the blind obedience they pay to the king's authority; for they are proud of being conſidered as his ſlaves, and this title they eſteem a diſtinguiſhed honour.

The ſucceſſion to the crown is regulated after the following manner: When the monarch on the throne perceives his end approaching, he calls one of the onegwas, or great lords, and lets him know which of his ſons he nominates to fill the throne, with an injunction not to reveal the ſecret upon pain of death, till after his deceaſe.

As ſoon as his breath has left his body, the onegwa takes into his cuſtody all the royal jewels, treaſure, and effects; and the young princes, who are in the utmoſt uncertainty as to their fate, come and do homage to this miniſter, as the ruler of their deſtiny. When the time limited by law for declaring a ſucceſſor draws near, the miniſter ſends for the high marſhal, and lets him know the laſt will of the king, which the other, to pre-

vent miſtake, repeats ſix times, and then returns to his own houſe with a ſolemnity adequate to the importance of the ſecret in his poſſeſſion. The next day the miniſter orders that prince to be called for whom the crown is intended, and deſires him to intreat the marſhal to nominate a ſucceſſor. The prince obeys, and with a ſupplicating air ſolicits his requeſt. Six days elapſe, during which the miniſter and high marſhal concert the neceſſary meaſures for proclaiming the king, and then the people being aſſembled, the high marſhal takes the prince by the hand, names him ſix times, and pauſing after every repetition, aſks the miniſter if he has made any miſtake. At length, the other princes are called, who kneeling down, are informed of the laſt will of their father. The young king having returned thanks to the miniſter and marſhal, for the i[illegible]rity with which they have diſcharged their office, is immediately inveſted with the badges of royalty, and receives the homage of the great officers and nobles.

The ceremony being thus ended, the new king retires to Oſcebo, a town ſome miles diſtant from Benin, in order to be inſtructed in the art of government, and the duties of a king. During this interval, the queen mother, the miniſter intruſted with the king's laſt will, and the grand marſhal, hold the reins of the government, and their decrees are not to be revoked by the ſucceſſor, without their conſent.

The young monarch, having finiſhed his ſtudies, takes poſſeſſion of the palace at Benin, where his firſt care is to ſecure his tranquillity, by the murder of his brothers, whoſe bodies are, however, interred with all imaginable pomp; this cruel and bloody act being conſidered as a neceſſary ſacrifice for the public good.

The revenues of the crown of Benin are pretty conſiderable, every governor being accountable to the king for a certain number of bags of bougies, or blackmoor's teeth, which are eſteemed as much as gold and ſilver, and anſwer the purpoſes of money. The inferior officers pay their taxes in cattle, fowls, cloth, and other commodities. Thus the court is continually ſupplied with all kinds of neceſſaries, the overplus is ſold, and the money put into the royal coffers. Certain duties are alſo laid upon foreign trade, beſides annual taxes paid to the governor for the privilege of commerce, which amounts to a great ſum; but only a ſixth part of this tax goes to the king. However, notwithſtanding theſe incumbrances on trade, the Europeans are treated with great reſpect.

Some authors repreſent the king of Benin as ſo powerful, that in a day's time he can aſſemble twenty thouſand men, and in a few days more a hundred thouſand, on which account he is greatly feared and reſpected by his neighbours. While his general is in the field his pay and dignity are very conſiderable; but he has no ſhare in the booty taken from the enemy, which ſolely belongs to the king. Such ſtrict diſcipline is maintained among the troops, that a man's quitting his place for a minute, without leave, is ſaid to be puniſhed with death; yet Nyendael obſerves, that they are unacquainted with the art of war, and their want of courage and conduct frequently expoſes the kingdom to the incurſions of pirates and robbers.

The arms uſed by the natives of Benin are ſwords, poniards, javelins, bows, and poiſoned arrows. Every ſoldier has a buckler compoſed of reeds, which can afford but a ſlender defence. The nobles wear in the field a ſcarlet robe to diſtinguiſh their quality: others have a ſuit of armour formed of the elephant's hide, adorned with the teeth and claws of a leopard, and the head covered with a kind of helmet of the ſame materials, adorned with a ſcarlet fringe and binding, to which is ſuſpended a tail that reaches down to the waiſt. The military ſtandards and colours are made of fine ſilk, generally red, and are carried in the front and center of each diviſion of the army. The ſoldiers alſo wear ſaſhes of ſilk, to which they hang their bucklers, which are their only defence againſt the poiſoned arrows of their enemies.

The ſtate of Benin is divided into three claſſes of men, beſides the king, whoſe will is a law. Next to him are three great lords, who are always about his perſon, and to whom all muſt addreſs themſelves who want to apply to his majeſty; but as they inform him of only what they think proper, the whole adminiſtration of the government may be ſaid to be lodged in them.

Next to theſe are the ares-de-roes, or ſtreet kings; ſome of whom preſide over the commonalty, others over the ſlaves; ſome over military affairs, and others over the affairs relating to cattle and the fruits of the earth. From this claſs of men are choſen the viceroys and governors of the provinces ſubject to the king, who are recommended by the three great lords, to whom they are reſponſable; and out of this claſs a particular ſuperviſor is alſo choſen over every branch of trade, manufacture, farming, and every thing relative to the civil or military government. The king, as an enſign of the dignity of all theſe officers, preſents each of them a ſtring of beads, on their being raiſed to their poſts; and this ſtring is equivalent to any order of knighthood in Europe. This they are perpetually to wear about their necks, without ever daring to put it off on any account whatſoever; and if they are ſo unhappy as to loſe it, or to ſuffer it to be ſtolen, they are condemned to ſuffer death, without the poſſibility of being reprieved by the king. Theſe badges of honour are kept by the king in his own poſſeſſion, and the counterfeiting or having any of them without his grant is puniſhed with death. They are made of a ſort of pale red earth, and are ſo well glazed, that they look like marble ſpeckled with a variety of beautiful colours.

The third order of ſtate conſiſts of the fiadores, who likewiſe wear the ſtring of beads, but with ſome diſtinction of ſubordination and inferiority to the ares-de-roes. Beſides the fiadores, under the ſame claſs are ranked the mercadores, or merchants, the pleaders, and the elders; all of them diſtinguiſhed by their different method of wearing the ſtring of beads.

The king, great lords, and every viceroy and governor, ſupport, according to their ability, a certain number of poor. The blind, the lame, and infirm are the objects of their charity; but as to the lazy, if they refuſe to ſupply their own wants, they are ſuffered to ſtarve. By this excellent police, there is not a beggar or vagrant to be ſeen; for the public officers keep the idle conſtantly employed, to prevent thoſe diſeaſes which are the conſequence of poverty from increaſing the tax upon themſelves; and by this means, in ſpite of the natural indolence of the people, there are but few indigent. Liberality and generoſity are the diſtinguiſhing qualities of the natives of Benin; but they frequently accompany their donations with an oſtentation that deſtroys the grace and beauty of the action.

With reſpect to their laws, the right of inheritance devolves in the following manner: When a perſon of rank dies, the eldeſt ſon ſucceeds as ſole heir; but preſents a ſlave by way of tribute to the king, and another to the three great lords, with a petition that he may ſucceed to his father's eſtate. The king grants his requeſt, and the fortunes of the younger children depend entirely on his pleaſure; but the widow is allowed by the laws a jointure proportioned to the eſtate and her rank and quality. The ſon takes home his father's other wives, and, if he pleaſes, uſes them as his own; but thoſe by whoſe charms he is not affected he ſets to work, that they may ſupport themſelves with credit, and as little expence to himſelf as poſſible; but, on the failure of male heirs, the king inherits.

If a thief be taken in the fact, he is obliged to make reſtitution, and if he happens to be rich is fined; but if poor is beaten. If a public officer be robbed, the offender is puniſhed with death. However, the crimes of burglary and robbery are ſeldom practiſed in this country: murder is ſtill leſs frequent; but whoever kills a man is puniſhed with death; yet if the murderer be the king's ſon, or ſome other conſiderable perſon, he is only baniſhed under a ſtrong guard to the extremity of the kingdom, and none of theſe being ever heard of afterwards, the people conclude that the guard has conveyed them to the manſions of the dead.

If a perſon dies by an accidental blow, his death is not eſteemed violent when no blood appears, and the offence is atoned for by burying the dead with decency, and ſacrificing a ſlave to appeaſe his ghoſt. This ſlave the offender touches with his forehead upon his bended knees, in

in which poſture he remains till the ſlave is dead, and the ſacrifice is duly performed. Afterwards he pays a ſum, in proportion to his circumſtances, to the three great lords; upon which he retains his freedom, and the friends of the deceaſed remain ſatisfied with his having fulfilled the law.

All other crimes, except adultery, of which we have already treated, may be atoned for with money; and, where that is wanting, the deficiency muſt be ſupplied by corporal puniſhment.

When the accuſation is not clearly proved, and the crime remains doubtful, there are five different methods of purgation, four of which are admitted in civil cauſes and trivial offences, and the fifth in capital caſes. In the firſt method of purgation, the accuſed is carried before a prieſt, who pierces his tongue with a cock's feather well greaſed; when if it paſſes eaſily through, the perſon is eſtemed innocent, and it is thought the wound will cloſe up and heal without pain; but ſhould he prove guilty, they ſuppoſe the quill will remain fixed in his tongue, and the wound canker.

In the ſecond method of trial the prieſt takes an oblong piece of turf, and ſticks in it ſeven or eight ſmall quills, which the accuſed draws out one by one, when if they come out freely he is acquitted; otherwiſe he is found guilty of the crime and ſubject to the penalty.

The third method is injecting the juice of certain green herbs into the eye of the ſuſpected perſon, when if it becomes red and inflamed, he is pronounced guilty, otherwiſe he is imagined innocent.

The fourth trial conſiſts in the prieſt's ſtroking the perſon's tongue with a hot copper bracelet, when its eſcaping without a bliſter is a certain criterion that he is not guilty of the crime laid to his charge.

The fifth kind of trial, which is taken by none but perſons of rank, ſeldom happens. The accuſed is carried by the king's order to a river, whoſe waters are ſuppoſed to have the extraordinary quality of gently wafting the innocent plunged into them to land; while the guilty, they ſay, never fail to ſink, whatever ſkill they have in ſwimming. It is indeed amazing that, among nations endowed with common underſtanding, trials ſo ridiculous and abſurd ſhould be deemed proofs of innocence or guilt; yet we find they have prevailed in all nations, as if folly had dictated thoſe laws which are moſt eſſential to ſociety, to the happineſs of mankind, and the dignity of human nature.

The fines charged on theſe crimes are thus divided: the perſon injured by theft or robbery has reſtitution made him, either by returning the goods ſtolen, or out of the criminal's effects. The governor has next a certain proportion, and the remainder of the fine goes to the three great lords. The king has no ſhare, though the great lords always make uſe of his name; and if they are diſſatisfied with what they receive, ſend to acquaint the governor with the king's indignation at the ſmall proportion of the fine allowed him. This has its effect, and never fails of doubling the ſum.

SECT. VI.

The principal trading Towns of Benin to which the Europeans reſort; with the cruel Maſſacre of the Natives of Meiburg.

ON the banks of the river Benin, or Formoſa, are ſome towns where the Europeans, and particularly the Dutch, have ſettlements: theſe are Boededo, Arebo, and Agatton.

Boededo, the firſt of theſe villages, conſiſts of about fifty houſes, or cottages, built with reeds and leaves. It is governed by a viceroy, aſſiſted by ſome grandees, who, under the king, govern the diſtrict under its juriſdiction; but their authority extends only to things of ſmall importance, as civil cauſes, and collecting the revenues: but if any thing conſiderable happens, or any capital crime be committed, they are not permitted to decide it, but muſt ſend to court, and wait for orders from thence.

Arebo, which is now the center of the commerce of Benin, is ſituated ſixty leagues up the river, and, notwithſtanding that river branches out into innumerable ſtreams, ſhips of burthen can ſail a great way higher, and anchor in fine large creeks and ſandy bays. Arebo is a large and populous city, of an oblong form; the houſes are much larger than thoſe of Boededo, though built in the ſame manner. The Engliſh and Dutch had a ſettlement, agents, and factors here, but the former have abandoned it.

Agatton, or Gatton, has alſo been conſiderable for its extent, and commerce, and the number of its inhabitants; but the ravages of war have almoſt ruined it. It is ſituated on a ſmall hill, about thirty miles to the north of Benin, the capital of the empire.

The laſt of the commercial towns we ſhall mention was Meiberg, a name given to it by the Dutch, who once carried on a great trade, and maintained a conſiderable ſettlement there, and rendered it famous by a very tragical event. Beeldſyder, a Dutch factor, having a violent paſſion for one of the women belonging to the negro governor, carried her away. The governor, tranſported with rage, attacked the Dutch ſettlement with a body of troops, and forced the factor to retreat on board a veſſel that lay in the road, after his having received a wound, of which he died ſoon after. Upon this the Dutch director-general, being ill informed of the circumſtances, reſolved to revenge the death of the factor, and fitting out a brigantine for that purpoſe, ſurprized the blacks at Meiberg, and killed or took priſoners every perſon of the village that could not eſcape by flight. The news of this event ſoon reaching the court at Benin, his majeſty demanded an explication of the cauſes of this bloody maſſacre; and, after being informed, inſtead of turning his reſentment againſt the Dutch, who had broke through all the laws of juſtice, hoſpitality, and humanity, he ſided with them, from views of policy, and with the moſt horrible circumſtances of barbarity, ordered the innocent governor, and his whole race, to be extirpated. This was done; their dead bodies were caſt out as a prey to the wild beaſts, and their houſes razed to the ground, with ſtrict orders that they ſhould never be rebuilt.

It is remarkable, that all the male ſlaves of this country are foreigners; for the natives cannot be ſold for ſlaves, but are all free, and alone bear the name of the king's ſlaves. Mr. Nyendael even aſſerts, that it is not allowed to export any male ſlaves ſold in this country, for they muſt remain there; but they may do what they pleaſe with the females.

CHAP. XI.

Of GUINEA.

SECT. I.

The Situation, Extent, Climate, and Diviſions of Guinea in general; with a conciſe Account of that Part of the Slave Coaſt which includes the Kingdoms of Coto, and Great and Little Popo.

THE coaſt of Africa, from the Cape of Good Hope to Guinea, extends from north to ſouth; but here it runs out to the weſt, extending from the fifteenth degree of eaſt to the fifteenth of weſt longitude from London, or one thouſand eight hundred miles from eaſt to weſt, and between the fourth and tenth degree of north latitude; it is therefore no more than three hundred and ſixty miles in breadth from ſouth to north. This extenſive country is bounded on the north by Nigritia, or Negroland, on the eaſt by the unknown parts of Africa, and on the ſouth and weſt by the Atlantic ocean.

This country probably derived its name from a town called Ginhy, which the Portugueſe touched at on their firſt viſiting this part of Africa.

As all this country lies within the tropic of Cancer, the air is extremely hot; and the flat country being overflowed a great part of the year by the periodical rains, it is eſteemed very unhealthful: the ſhips frequently loſt half their crews by fevers; but ſince Dr. James's powders have been carried thither, this voyage has been as ſafe to the Engliſh as thoſe to any other hot countries; and the effects of a climate which uſed to fill people with terror have been found to be eaſily removed.

The winds of this coaſt ſit directly contrary to the trade winds, and blow from weſt to eaſt; except in the rainy ſeaſon, between the vernal and autumnal equinox, when they have violent hurricanes, attended with thunder and lightning: and theſe ſtorms blowing from the ſouth, the ſhips on the coaſt are in danger of being wrecked on the ſhore, on which a ſurf conſtantly beats, in the calmeſt weather, that renders landing not only very difficult but dangerous.

This whole coaſt is much frequented by the Europeans; by whom it is uſually divided into the Slave, the Gold, the Ivory, and Grain Coaſt.

The Slave Coaſt is bounded by the kingdom of Benin on the eaſt, by the Gold Coaſt on the weſt, and by the Atlantic Ocean on the ſouth, comprehending the kingdoms of Coto, Popo, Whidah, and Ardrah; but authors are not agreed about the limits of theſe kingdoms. According to Boſman, the Coto coaſt is frequently called by the natives the Land of Lampi.

The country is flat, ſandy, dry, barren, and without wood or trees, except the palm, great numbers of which grow there. It is, however, pretty well provided with cattle, of which it has as many as will abundantly ſupply the inhabitants. There is no want of river fiſh; but they can get none from the ſea, on account of the prodigious ſurf on the coaſt.

The natives are good-natured, civil, and obliging; in politics, religion, and œconomy, they nearly reſemble the inhabitants of the Gold Coaſt, whoſe manners we ſhall ſoon deſcribe, but differ from them in the number of idols kept at Coto; for in the multiplicity of theſe their wealth conſiſts. A negro who is not poſſeſſed of at leaſt a dozen idols is reputed poor, and his riches are thought to increaſe in proportion to the number of his gods; indeed the houſes, roads, and bye-paths are filled with idols.

Their language reſembles that ſpoken by the negroes of Acra. Their trade is ſmall, and they are very poor. Their moſt advantageous employment is a very iniquitous one: this is making excurſions up into the inland countries, and ſtealing men, women, and children, which they ſell to the Europeans; but the profits they draw from the ſale of theſe ſlaves is ſaid not to diminiſh their natural poverty, from their laying out what it produces in the purchaſe of idols, or materials for making them.

The kingdom of Popo, or Papa, extends from Cape Monte to the borders of the kingdom of Whidah, which is about ten leagues, and is divided into two provinces, Great and Little Popo. According to Boſman, a barren tract, ten miles broad, lies between Coto and Little Popo, in which the country is flat, without hills or trees, and covered with ſand, in which an incredible number of rats burrow like rabbits.

The town of Little Popo ſtands on a beach four leagues to the weſt of the town of Great Popo, in full view of the ſea. The natives live on plunder, and on the ſlave trade. In the former they are more ſucceſsful than the inhabitants of Coto, from their being more active, bold, and reſolute. Their ſlave trade is not, however, very conſiderable, it frequently requiring a reſidence of ſome months to complete a cargo. The natives are uncommonly artful and fraudulent, it being the uſual practice to draw the merchant or factor on ſhore, under the pretence of viewing a number of ſlaves they have ready for ſale, and then to detain him, till they have actually procured the number he wants, which they oblige him to take at the price they think proper to fix upon them.

At the diſtance of four miles from Little Popo are the boundaries of Great Popo. In the inland country are found plenty of beaſts, birds, fruits, and roots: but the ſea-coaſt is marſhy, and almoſt inacceſſible, the ſea beating with ſuch violence againſt the ſhore, that, during the greateſt part of the year, neither boats nor canoes dare approach it.

The harbour of Little Popo is five leagues diſtant from that of Great Popo. In ſailing eaſtward the latter of theſe ports is viſible at a conſiderable diſtance, particularly two flags upon two points formed by the banks of the river Torri, or Tarri; the Dutch factory ſtands behind the eaſt flag, and at the mouth of the river is the town of Great Popo, built in an iſland formed by a creek and marſhes, that give the country the appearance of a ſpacious lake; hence it is called by the Portugueſe, Terra Annegada, or the Drowned Land.

The mouth of the river is blocked up by a kind of bar, which canoes, however, can eaſily paſs. The town is divided into three parts; but the houſes, or rather huts, are ſmall: yet this is the only place in the dominions of Great Popo that merits the name of a town, all the reſt being only little hamlets of two or three houſes each.

The royal palace is a large court compoſed of an infinite number of ſmall huts or cabins, the principal apartment being ſeated in the middle. The king's houſe is adorned with a large ſaloon, reſerved for public audiences and the entertainment of ſtrangers. As he always eats alone, foreigners are entertained by the lords and principal officers of the court. His majeſty keeps a great number of women, two of whom always attend his perſon, to cool and refreſh him with fans neatly made of reeds and feathers. His conſtant amuſement and ſole employment conſiſts in ſmoking tobacco, toying with his women, and converſing with his officers upon the moſt trifling ſubjects. All the women honoured with the royal affection, are entertained in the palace with a great variety of dainties.

All the country, except this iſland, is thinly inhabited, owing chiefly to the perpetual incurſions of the negroes of Whidah: hence the land is uncultivated, proviſions often ſcarce, and the people in danger of being famiſhed; but they obtain ſupplies from their moſt bitter enemies, who run the hazard of an illicit trade for the ſake of the great profits they obtain.

The natives of Great Popo trade in ſlaves, and if no foreign ſhips arrive on their coaſt, diſpoſe of their ſtock

to

A New & CORRECT MAP of NEGROLAND and GUINEA By G. Rollos, Geog.r

to the ſovereign of Little Popo, who exchanges ſome of his European commodities for them. But the greateſt trade of the kingdom ariſes from the fiſh caught on their coaſt, which they prepare and ſell both to the people of the neighbouring kingdoms and to foreigners.

The inhabitants of Popo, like all the other negroes on the coaſt, have a blind confidence in their prieſts, whom they call Domines, a Latin term which they doubtleſs borrowed from ſome European nation. Theſe prieſts are generally cloathed in long white robes, and always carry in their hands a kind of croſier. All the ſhips that trade there pay them a ſort of duty, under the name of a preſent, in order to encourage the negroes, by theſe marks of reſpect to their prieſts, to exert their diligence in compleating their cargoes. Theſe weak and ſuperſtitious creatures, perſuaded that nothing but the interceſſion of their prieſts can procure them the favour of the Deity, obey all their commands; and the prieſts, finding it their intereſt to oblige the Europeans, leave no means untried to render them honeſt and induſtrious. While theſe are aſſiſting the Europeans in loading or unloading the ſhips, a prieſt ſtands on the ſhore, and pours on their heads a handful of conſecrated gravel, which they eſteem an infallible ſecurity for their canoes in paſſing the dangerous bar at the mouth of the river; and if after this any man has the misfortune to be loſt, it is attributed to the mixture of ſome profane particles of ſand with thoſe that are conſecrated.

SECT. II.

Of the Kingdom of WHIDAH.

Its Name, Situation, Extent, and Rivers; the Inconvenience of its Coaſts, and the Beauty of the Country: its amazing Fertility and Populouſneſs; the Diviſion of the Country, and the great Market carried on at Sabi.

THIS kingdom is called by the natives, the Engliſh, and Portugueſe, Whidah; while the French call it Juda, and the Dutch Fida. It is bounded on the weſt by the river Solta; on the ſouth by the Gulph of Guinea; on the eaſt by the kingdom of Ardrah; and on the north by the country of Dahomay. It extends about ten leagues along the ſhore, and its center reaches ſeven miles within land; after which it branches into two arms, each of which is in ſome places ten or twelve leagues broad, but in others much narrower.

This country is watered by two rivers, which likewiſe run through the kingdom of Ardrah. The moſt ſouthern is called the Jakin, and is only navigable by canoes: its waters, which are of a yellowiſh caſt, are generally about three feet deep, and in many places much ſhallower. The other, which is called the Euphrates, waſhes with its ſtream the city of Ardrah, and then paſſes within a mile of Sabi, the capital of Whidah. It is deeper and wider than the Jakin, and were not the paſſage blocked up by ſome banks of ſand, would be navigable for large ſhips. From time immemorial the kings of Whidah have exacted a ſort of cuſtom of two bougies paid to officers ſtationed at the fords, without which none are permitted to croſs the river. At its mouth is the port where ſhips load and unload, but, like the reſt of this coaſt, it is incommodious and dangerous, on account of the high ſurfs and a ſwelling ſea, particularly in the months of April, May, June, and July, when accidents frequently happen, boats being overturned, goods ſunk, the men loſt, and the ſhips themſelves are in danger of being driven from their moorings upon the ſhore. The natives are indeed ſo expert in ſwimming, that few of them are loſt.

Beſides this high ſea, a ſtrong tide runs eaſt and weſt, with ſuch ſtrength that no boat or ſhallop can ſtem it by rowing; they therefore puſh them forward with long poles, which is a method ſo ſlow and tedious that the ſhips are detained twice as long as the trade would otherwiſe require.

But having once got on ſhore, the ſcene is changed from a dreadful ſwelling ſurf to moſt beautiful meadows and fields, enamelled all the year with the fineſt verdure; and riſing by an eaſy and equal aſcent towards the interior parts, affords the moſt delightful landſcapes. The height of the aſcent is bounded by a chain of mountains that defends the country from its neighbours to the north-eaſt. All the Europeans, who have been in Whidah, ſpeak with raptures of the country, which they extol as the moſt beautiful in the world. The trees are ſtraight, tall, and ſeem diſperſed in the moſt regular order, repreſenting to the eye fine groves and extenſive avenues, clear of all bruſh-woods and weeds. The meadows enamelled with flowers, the richneſs of the fields covered with three different kinds of corn, and with beans, roots, and fruit, add to the agreeableneſs of the place. Every inch of ground is converted to ſome uſe, except the parts deſtined by nature for pleaſure, where the woods ſpring up ſpontaneouſly in the moſt exquiſite rural ſimplicity.

Here ſpring and autumn ſwiftly ſucceed each other; for no ſooner has the huſbandman cut his corn, than he again plows and ſows the ground; yet it is ſo far from being worn out, that the next crop ſprings up with the ſame vigour as the former. With all theſe advantges Whidah is ſo populous, that one ſingle village contains as many inhabitants as ſeveral intire kingdoms on the coaſt of Guinea; and yet theſe villages ſtand ſo cloſe, that it is almoſt inconceivable that the moſt fertile land on earth can produce food ſufficient for the great number of people contained in ſo ſmall a compaſs. The whole kingdom may be compared to a great city, divided, inſtead of ſtreets, by gardens, lawns, and groves; for there is not a village which has not another within the diſtance of a muſket-ſhot. Some belong to the king, ſome to the viceroy, and others are built and peopled by particular private families. The former are the largeſt and beſt built, but the latter beſt cultivated. In ſhort, it is impoſſible to enumerate all the perfections of this delightful country, without raiſing ſome ſuſpicion in the reader, that we indulge a warm imagination at the expence of ſtrict hiſtorical truth.

This kingdom, notwithſtanding its ſmall extent, is divided into twenty-ſix provinces, which take their names from their capital towns, and are diſtributed among the chief lords of the kingdom, who are their hereditary governors. The king of Whidah, who has the ſupreme authority, preſides particularly in the province of Sabi, or Xavier, which is the principal province in the kingdom, as the city of the ſame name is the capital of the whole.

In the city of Sabi, a great market is held every fourth day; but the principal are on Wedneſdays and Saturdays, when, to prevent confuſion and diſturbance, the market is removed to the diſtance of a mile from the walls, and is in a fine large plain, ſeveral parts of which are adorned with groves, that afford a refreſhing ſhade to the people half ſtifled in the crowd, and ſcorched under the burning heat of the ſun; and here the king's women attend to ſell their cloths, and other manufactures. A judge, attended by four armed officers, is appointed by the king as inſpector of all goods, with power to hear and determine grievances, complaints, and diſputes.

The market-place is ſurrounded with places of refreſhment, in which are ſold certain ſorts of meat, as beef, pork, goats, and dogs fleſh. Other huts are kept by women, who ſell bread made of maize, millet, rice, and other corn. There are ſhops, in which they ſell pito, a kind of pleaſant, wholeſome, and refreſhing beer; palm wine, and ſpirits purchaſed of the Europeans, are kept in other ſhops, with reſtrictions on the ſale, to prevent drunkenneſs and riots. Here ſlaves of both ſexes are bought and ſold, alſo oxen, ſheep, hogs, dogs, birds and fiſh of various kinds. Silks, woollen cloths, linen, calicoes of European and Indian manufacture are here in great abundance; likewiſe china-ware, and glaſs of all ſorts, gold in duſt and ingots, iron bars, hard-ware, ſheet lead, and a variety of European, Aſiatic, and African productions, may be purchaſed at theſe markets at a reaſonable price. The chief commodities of the country-manufacture are cloths, umbrellas, baſkets, pitchers, plates and diſhes of wood, boards finely ornamented, white and blue paper, alſo palm oil, pepper, ſalt, &c.

The ſlave trade is conducted by the men; but all other things are ſold by the women, and all of them are extremely expert in the art of ſelling and reckoning.

The money uſed in all bargains is gold duſt, the value of which they compute very readily: bougies paſs for ſmall money; for in the kingdoms of Whidah, Ardrah, and many other places on this coaſt, theſe ſerve equally for ornament and ſpecie. They pierce each ſhell with an iron made for that purpoſe, and ſtring forty of them upon a thread, and by theſe ſtrings the exchange of gold duſt is rated, and the price of ſlaves determined.

SECT. III.

Of the Fruit, Beaſts and Birds of Whidah; with an Account of a Bird remarkable for changing its Colour whenever it moults. The Perſons, Dreſs, and Manners of the Natives, who in their Ceremonies, Induſtry, and other Particulars, greatly reſemble the Chineſe. Their Ignorance of Chronology, and Skill in Arithmetic and Muſic.

HERE are all the fruits produced on the Gold Coaſt, beſides which are abundance of citrons, tamarinds, and ſome others. European ſeeds grow up to great perfection, and the fineſt ſallad gardens in the world might be planted here.

Their cattle are cows, ſheep, hogs, and goats, which are all but little different in ſhape and ſize from thoſe of the Gold Coaſt, but are more fleſhy, and have a more agreeable taſte. Their horſes are, however, very indifferent ones. Farther within land are elephants, buffaloes, tygers, hares, ſeveral ſorts of deer, and vaſt numbers of apes of different kinds. Theſe are remarkably fat, and no fleſh is more eſteemed at Whidah than theirs; it ſells at a higher price than mutton, and is always preferred to it. Even the European ſailors ſoon overcome their prejudices, and eat it with a peculiar reliſh.

The only ſorts of tame fowl are a few geeſe and turkeys, ducks, cocks and hens, of which laſt there are great plenty, and though ſmall, they are fat and good. The whole country ſeems covered with wild fowl, as geeſe, ducks, turtle-doves, ſnipes, and many other ſorts of birds that are both good and cheap.

Among the reſt is one that is very remarkable for changing its colour whenever it moults; ſo that thoſe which are black this year, will be blue or red the next; the following year they will be yellow, and afterwards green; but they never vary from theſe five colours, which are always very bright, and never mixed.

The negroes of Whidah are in general tall, well made, ſtraight, and robuſt. Their complexion is black; but not of ſuch a gloſſy jet as that of the people on the Gold Coaſt.

The people of this country are in general better dreſſed than any other nation on the coaſt; but they are little acquainted with the uſe of ornaments made of gold and ſilver, their country producing none of thoſe metals. The dreſs of the king, and that of the great officers is nearly the ſame, and different from that of the common people. It conſiſts of a piece of white linen about three ells long, which is wrapped round their waiſt in a decent and becoming manner, and then hangs down to the feet like a petticoat. Upon this they wear a ſilk garment of the ſame ſize and form, and over this laſt have a richer piece of ſilk, ſix or ſeven ells in length, which they tie by the two corners, and making a great bunch on the right hip, the reſt hangs down to the ground, ſo as to form a train; but none are allowed to wear red, except the royal family. Some authors ſay, that the king and the great officers wear necklaces and bracelets of pearl, gold, and coral, with gold chains. Moſt of the people never wear any thing on the head to ſhelter them from the rain, or the heat of the ſun; but the great men cover their heads with an European hat and feather.

The common people have generally only a few herbs, or a cotton cloth faſtened round their waiſt; but the women of the ſame rank have five or ſix cloths round the middle, the longeſt of which covers half the leg, and the others which are over it, are each ſhorter than the other.

The wives of the king, and thoſe of the great men are, like the reſt, naked from the girdle upwards, and from the waiſt downwards have two or three coverings of cotton and ſilk, the longeſt of which reaches to their ankles, and the others are a little ſhorter. All theſe are very large, and form a roll about the hips, that makes them appear as if they wore a hoop petticoat. They are adorned with necklaces, and with ſtrings of pearl, gold, and coral, from the wriſt to the elbow, and wear on their heads a cap of plaited and coloured ſtraw, which is very light, and has ſome reſemblance to the Pope's tiara.

The Europeans, the nobility of Whidah, and all the rich negroes, are carried when they go abroad in hammocks or palanquins; theſe are an excellent defence againſt the heat of the climate, which, according to Phillips, is ſo great, that an European could not walk a mile in the middle of the day, without extraordinary fatigue.

Boſman ſays, that the inhabitants of Whidah exceed all the negroes he had ſeen in good and bad qualities. People of all ranks treat the Europeans with extreme civility, courteſy, and reſpect. Other negroes are inceſſantly ſoliciting preſents; but the Whidans ſeem more willing to give than receive. Indeed, when the Europeans trade with them, they expect they ſhould return thanks for the obligation; but their making a preſent to a white man, they value as nothing, and are diſpleaſed at any acknowledgment for what they think ſo trifling. They have an obliging manner of addreſſing each other, and in ſeveral reſpects perfectly reſemble the Chineſe. When any one viſits, or accidentally meets his ſuperior, he inſtantly drops upon his knees, kiſſes the earth three times, claps his hands, and wiſhes him a good day or night, which the other returns in the poſture in which he then happens to be, by gently clapping his hands, and wiſhing him the ſame. The like reſpect is ſhewn to the elder brother by the younger; to fathers by their children; and by women to their huſbands. Every thing is delivered to or received from a ſuperior on the knee, and the clapping of the hands together is eſteemed a mark of ſtill more profound reſpect. When perſons of equal rank meet, they each drop down, clap their hands, and mutually ſalute, while the ſame ceremonies are obſerved and imitated by their ſeveral attendants; ſo that above a hundred perſons may ſometimes be ſeen down on their knees, and might eaſily be miſtaken for their being engaged in ſome public act of devotion. If a ſuperior ſneezes, all round him fall on their knees, clap their hands, and wiſh him happineſs. It is ſurpriſing, ſays a late author, how a nation confined to ſo ſmall a ſpot of ground, ſhould differ ſo widely in their manners from the ſurrounding kingdoms, with which they keep up a conſtant intercourſe. One would almoſt imagine that they had a ſoil, a climate, and a nature peculiar to themſelves, and different from that of the people who are only a few miles diſtant.

They alſo uſe the utmoſt external reſpect to ſtrangers; and if a native of Whidah meets an European twenty times in a day, the ſame ridiculous train of ceremonies is repeated, the neglect of which is puniſhed with a fine. A late king of Whidah carried this reſpect to foreigners to ſuch an extravagant height, that one of his principal officers was beheaded for preſuming to lift his cane in a menacing manner over the head of a Frenchman; and though the chief director of that nation uſed all his influence to get the puniſhment mitigated, the king was inexorable, and nothing leſs than his life could atone for ſuch a notorious breach of hoſpitality.

They excel all other negroes in vigilance and induſtry; and though idleneſs is the favourite vice of the Africans, people of both ſexes are here ſo laborious and diligent, that they never deſiſt till they have finiſhed their undertaking, carrying the ſame ſpirit of perſeverance into every action of their lives. Beſides agriculture, from which none but the king and a few perſons of diſtinction are exempted, they employ themſelves in ſeveral kinds of manufactures. They ſpin cotton yarn, weave fine cotton cloths, make wooden veſſels, plates, and

and diſhes, ſmiths work, and offenſive weapons, in a more perfect manner than any other people on the coaſt. While the men are thus employed, the women not only brew a kind of ale, but till the land, and dreſs proviſions, which, with their huſbands merchandize, they carry for ſale to market. The meaner ſort carry goods from the ſhore, and with a burthen of a hundred pounds on their heads, run in a kind of continual trot, and it is difficult to keep up with them without any load at all. Both ſexes are employed in ſearch of gain, and their emulation is equal to their induſtry. Hence they not only live well, but ſplendidly, when compared with the other negroes of the Coaſt. Labour is cheap, the profits ſolely riſing from the unwearied induſtry of the labourer.

The Whidans alſo reſemble the Chineſe in their diſhoneſty, and their expertneſs at ſtealing, in which they uſe extraordinary addreſs. Mr. Boſman having obtained an audience of the king, his majeſty told him, that his ſubjects did not at all reſemble thoſe of Ardrah, and the other neighbouring kingdoms, who on the leaſt offence would poiſon an European. "This, added he, "you have not the leaſt reaſon to apprehend; but I "would have you take care of your goods; for my peo- "ple are born expert thieves, and will ſteal from you "while you are looking at them." This caution he ſoon found to be juſt in many inſtances. There is no ſecurity againſt their pilfering; but if complaint be made to the king, he orders the offender to be puniſhed.

Like the Chineſe too, they are extremely addicted to gaming; and after having loſt their whole ſubſtance, they play for their wives and children; and when they have loſt them, ſtake their own liberty, and thus become ſlaves to their own countrymen.

Theſe people are in ſome inſtances extremely ignorant, while in others they ſhew an extenſive genius. They have no diviſions of time, nor diſtinction of years, hours, weeks, or any other ſtated periods. They know the time of ſowing by the moon, or rather ſow as ſoon as they reap. Yet without pen, ink, or the aſſiſtance of artificial arithmetic, they calculate the largeſt ſums with ſurpriſing accuracy, ſtate ſhares with great exactneſs, and perform the operations, not only of the firſt elements, but of the more complex rules of arithmetic, with aſtoniſhing truth and quickneſs. Yet Des Marchais obſerves, that the wiſeſt among them cannot tell his age; and if any man be aſked, when ſuch a perſon was born, he tells you, it was about the time that ſuch a ſhip, or ſuch an European factor came to Whidah.

Their muſic is much the beſt of any to be met with in theſe countries, and one inſtrument, which reſembles a harp, is really muſical. It is ſtrung with reeds of different ſizes, which they touch with great dexterity, accompanied with a ſweet voice, and dance to their own muſic in exact time, and with an agreeable air and manner. They have alſo flutes, and ſeveral wind inſtruments; and in war uſe a kind of trumpets and kettle-drums.

SECT. IV.

Of their Polygamy, nuptial Ceremonies, Divorces, and Treatment of the Women. Of Circumciſion and Cuſtoms in Relation to their Children, and to Burials and Mourning.

THE people of this country allow of a plurality of wives, and in this are ſaid to exceed all the neighbouring nations. No people upon earth perform the connubial rites with leſs ceremony; for all contracts, portions, and jointures, are here entirely unknown. The other negroes of the coaſt purchaſe their women with cattle, fiſh, and other commodities, and are allowed to diſmiſs them if they do not prove to be virgins; but here their ideas and practice are totally different. Fruitfulneſs is ſo highly prized at Whidah, that ſhe who has given proofs of it before marriage is always preferred; but it coſts nothing to obtain her.

When a man likes a girl, he demands her of her parents, who never refuſe their conſent, provided ſhe be of the proper age, but conduct her to the houſe of the bridegroom, who immediately preſents her with a new dreſs, which is probably all ſhe poſſeſſes, for ſhe leaves every thing elſe at her father's houſe. The huſband then kills a ſheep, which he eats in company with his wife and her parents; and this is the only time in her life when ſhe is admitted to this honour; and the parents having drank freely of pito, return home: thus the marriage is concluded, without any other ceremony.

A huſband may divorce his wife with as little ceremony as he married her: he only thruſts her out of the door: and if he has certain proofs of her incontinence, the ſeparation is legal. Another law, which is very ſevere upon the women, is a ſtrict prohibition, under pain of death or ſlavery, to enter the houſe of a great man while under their periodical diſorder. No ſooner do they perceive themſelves in this ſituation than they quit the houſe, and avoid even the ſight of men, every family having a houſe to which the women retire during that period, where they are under the care of an antient matron, and ſtay till they have waſhed and purified themſelves; after which they return to their huſbands. Thoſe women who are remarkably handſome are excuſed from labouring in the field, and never permitted to go abroad but in the company of their huſbands; nor can they receive any male viſitors at home.

As they are very ſubject to jealouſy, their laws againſt adultery are very ſevere. When the wife of a great man is taken in the fact, he may kill both her and her lover, or may ſell her to the Europeans for a ſlave. If he chooſes the former, he cauſes her head to be cut off, or has her ſtrangled by the public executioner; and is acquitted on informing the king of what he has done, and paying the executioner's fee. But as he has no power over the man who has diſhonoured him, unleſs he catches him in the very act, he is obliged to apply to the king for juſtice, who never fails to conſent to the death of the guilty.

This ſeverity extends to none but married women. A man runs no danger in being caught with one who is unmarried, and nobody blames him. She is ſuppoſed, in this caſe, to be her own miſtreſs; and it is ſo far from being infamous for her to have children before marriage, that ſhe is ſure this will cauſe her to be ſooner married; becauſe it is a proof of her fruitfulneſs, which is a very valuable qualification in a country where the fathers conſider children, eſpecially the males, as the greateſt riches, and the ſupport of their families.

According to Des Marchais, no people on earth ſhew greater indulgence to their children, whom they never ſell for ſlaves. On the other hand, the children treat their parents with the moſt humble reſpect and veneration, and never addreſs them but on their knees.

All their children, male and female, are circumciſed; but none of them know whence they derived this cuſtom. This operation is performed at no certain age, ſome undergoing it at four, others at five, ſix, or ten years old.

No difference is made between their legitimate and natural children, but the younger pay great reſpect to the elder brother, though but little regard is paid to the mother. Among the women the ceremonies of addreſs are the ſame as thoſe we have mentioned of the men, only they carry their politeneſs to a greater length. At the death of a father, the eldeſt ſon not only inherits his effects, but his women, with whom he lives from that day in quality of huſband. His own mother is alone excepted, who becomes her own miſtreſs, has a houſe appointed for her, and a certain fortune for her ſuſtenance. This cuſtom prevails both in the royal palace and among the people.

The natives are ſo fearful of death, that they cannot ſupport the ſound of the word without viſible emotion; and it is a capital crime for a negro to pronounce it upon any occaſion before the king. Boſman obſerves, that in his firſt voyage he waited on the king before his departure for an hundred pounds, which his majeſty owed him; and, at his taking leave, aſked that prince, Who ſhould

pay

pay him when he returned; in caſe of his death. The by-ſtanders were ſhocked at the bluntneſs of the queſtion; but the king bid him not give himſelf any concern about that, for he ſhould always live; when the Dutchman, perceiving his error, abruptly took his leave.

The burying-place of the kings and nobles is in a long vault, erected by the ſons for their father: here the body is depoſited in the midſt of the vault, and with it the ſword, buckler, bow and arrows of the deceaſed; but though they uſe guns and piſtols, they are never laid in the tomb. The heir always mourns during an entire year, roaming about; he ſecludes himſelf from ſociety, lays aſide his uſual apparel, with his bracelets, chains, and rings; and though he is at liberty to enter upon the poſſeſſion of his eſtate from the day of his father's death, yet ſo ſtrong is his affection, grief, or prejudice, that he ſteadily purſues the cuſtom of abandoning it, till the time of mourning is expired.

SECT. V.

Of the Right of Succeſſion to the Crown of Whidah; the Ceremonies which precede and attend the Coronation of the King; the luxurious Manner in which he lives; the Cruelty with which thoſe are puniſhed who have been caught with any of his Wives; and the Servility with which he is addreſſed by his Nobles.

THE crown of Whidah is hereditary, unleſs the great men have ſome extraordinary reaſons for excluding the eldeſt ſon, and placing the crown on the head of one of his brothers, as was the caſe in the year 1725. But though the king's eldeſt ſon is preſumptive heir of the crown, he muſt have been born after the king's acceſſion; for thoſe he had before his aſcending the throne are only conſidered as private perſons.

They have here a very extraordinary cuſtom that is never to be violated, which is, that the ſucceſſor is no ſooner born than he is carried by the great men into the province of Zangua, on the frontiers of the kingdom, where he is educated as a private perſon, without knowing his birth, or having the leaſt knowledge of ſtate affairs, and none of the great men are allowed to viſit or receive viſits from him. Thoſe charged with his maintenance are not ignorant of his birth, but are prohibited, under pain of death, from giving him the leaſt hint of his quality, or treating him otherwiſe than as their own child. One of the kings who lately ſat on the throne was found at his father's death attending his governor's hogs. He was filled with incredible ſurprize when the nobles made him acquainted with his fortune, nor could they for a long time prevent his imagining it a mere deluſion. By this means the prince, on his aſcending the throne, knowing neither the intereſt nor maxims of the ſtate, is obliged for a long time to abandon the government to the management of the nobles and their ſucceſſors, for their poſts are hereditary, and their eldeſt ſon always ſucceeds them.

The young king generally paſſes ſeveral months, and frequently ſome years, before he is crowned. The nobles who have the power of fixing the time when this is to be done, prolong it, but muſt not exceed ſeven years; and during this interval, the government of the kingdom is entirely in their hands: the king's name is not even ſo much as mentioned in their public acts; while the prince is attended with all the external badges of majeſty, without daring to leave the palace.

At length the long expected day for his coronation being arrived, he aſſembles a council of the nobles, and approving their conduct during their adminiſtration, ratifies all the laws and acts of the interregnum. At about eight at night a diſcharge of eighteen pieces of cannon gives notice that the council is broke up, and then inſtantly a ſhout of joy is heard through the capital, which is ſoon communicated to the remoteſt parts of his dominions.

The next morning the high-prieſt waits on the king to remind him of the homage due to the great fetiche, or ſerpent; and tells his majeſty, that as this deity is dumb, he cannot be ſurprized at his making known his intentions by the tongue of his miniſter. On the coronation of Amer, the late king, the high-prieſt aſked a horſe, a cow, a ſheep and a fowl. Theſe were ſacrificed before the palace, and carried with great ceremony to the moſt public parts of the city. On each ſide of the ſacrifice were two millet-cakes, baked in palm oil: the high-prieſt erected with his own hands a ſtaff nine feet long, and upon it a large ſilk flag; and the whole ceremony was accompanied by the muſic of tabors, flutes, and the acclamations of the people; after which the carcaſſes were abandoned as a prey to the birds, the negroes not being permitted to meddle with any part of them, on pain of death.

While the victims were thus expoſed to public view, the king's women, who from age, or other reaſons, were incapable of adminiſtering to his pleaſure, marched out of the palace, eſcorted by a file of muſketeers, and preceded by muſic. The chief of the women led up the rear, carrying in her arms the ſtatue of a child in a ſitting poſture, which, on her arrival at the place of ſacrifice, ſhe laid down upon the victims; each of them then ſung a hymn, and was accompanied by the inſtrumental muſic. While they paſſed, all the people proſtrated themſelves on the ground with loud ſhouts, and their return was made known to the king by a general diſcharge of the artillery.

The next day the nobility uſually go to the palace, with all the ſtate and magnificence of dreſs and equipage, preceded by a large band of muſic, and followed by a great body of armed ſlaves; and having proſtrated themſelves before the throne, retire in the ſame order in which they advanced. The women, in the mean while, abandon themſelves to the moſt riotous mirth, the cannons inceſſantly roar, and the whole kingdom is filled with tumultuous joy.

The nobles have no ſooner paid the homage, than they diſpatch one of their number to the king of Ardrah, attended by a ſplendid retinue, to entreat his majeſty to ſend a certain nobleman of his kingdom, in whoſe family the honour is hereditary, to crown the king of Whidah. This nobleman of Ardrah is ſupported at the expence of the young monarch, and treated on his journey with the moſt profound reſpect.

When he comes, he muſt ſtay four days in the village neareſt the capital, during which none of his attendants are permitted to enter the city on pain of death. He here receives the compliments of the nobility of Whidah, and the king ſends twice a day great quantities of wine and proviſions by his diſcarded women, who carry it in veſſels on their heads, guarded by a ſtrong convoy, and preceded by muſic. The king at length ſends an ambaſſador to invite him to the capital, and aſſure him that he will be received with joy. The nobleman of Ardrah receives the ambaſſador with great ſolemnity and reſpect; but obſerves, that he muſt wait for inſtructions in relation to the treaty concerning the reparation of the great gate of Aſſem, the capital of Ardrah. Immediately the king ſends commiſſioners to that kingdom to ſee the gate repaired, and upon their return with a proper officer to certify their having executed the treaty, the Ardran nobleman is conducted to Sabi by all the nobility, and prodigious crowds of the populace, who meet him on the road; and he is received by the diſcharge of cannon, the acclamations of the king's women, and the ſhouts of the mob. The king himſelf congratulates him on his ſafe arrival, and orders him to be attended by his own officers and ſervants.

During the firſt five days he neither receives nor makes any viſits to the nobility, who are employed in proceſſions to the temple of the Grand Snake, imploring that divinity that the young monarch may reign with the mildneſs and equity of his predeceſſors, cultivate trade, obſerve the laws, and maintain the people in the full enjoyment of their rights and privileges.

On the evening of the fifth day the people are informed by the firing of nine guns, that the coronation will begin on the morrow; and, at the ſame time, the prince ſends to deſire the European factors to favour him with their company at the ſolemnity. The preceding night is ſpent by the nobility in the company of the Ardran nobleman, where the converſation is grave and polite, interrupted by frequent prayers to the fetiche by way of interlude.

The

The next day, at five in the evening, the king, attended by his favourite women, comes out of the palace, dreſſed in rich ſilk robes, and adorned with gold necklaces, ear-rings, and bracelets. The king is alſo dreſſed in a magnificent manner, wearing on his head a gilt helmet, adorned with red and white feathers, and croſſing the great court before the palace, ſeats himſelf on his throne, which is no more than a large elbow chair. Here the Engliſh, French, and Dutch factors have chairs ſeated for them, while the Portugueſe director is forced to ſtand with his head uncovered.

Before the king ſtand two dwarfs, who alternately repreſent to him the qualities of his predeceſſors, exhort him to follow their example, to render his people happy, and to build his own ſecurity on their affections; concluding with wiſhes for his proſperity, long life, and the happy continuance of his reign.

The Ardran ambaſſador then enters the court, attended by muſic, a grand retinue, and repeated diſcharges of the artillery. He approaches the throne with no other mark of reſpect but a ſlight bow, and after a ſpeech on the ceremony he is about to perform, takes the king's helmet, and turns it towards the people. Upon a ſignal given the muſic ceaſes, and is ſucceeded by a profound ſilence; then the Ardran cries with a loud and clear voice, "O people, behold your king! Be faithful "to him. Pray for him, and your prayers will be heard "by the king of Ardrah, my royal maſter." This he repeats three times, then puts the helmet on the king's head, and, ſtepping back, proſtrates himſelf before him. The great guns, the muſketeers, the muſic, and the acclamations of the people now rend the ſkies: the ambaſſador retires, and the king, with his women, returns to the palace; the Europeans attending him to the gate.

A day or two after the king diſtributes preſents among the nobility, which are returned by others of much greater value. Five days are ſpent in rejoicing, and theſe are concluded by a ſolemn proceſſion to the temple of the Snake.

Notwithſtanding the perſon and education of the king are ſo neglected before he aſcends the throne, yet no ſooner is he crowned than he is no longer conſidered as a man, but becomes in an inſtant a kind of deity, who is never approached but with the moſt profound reverence. The nobles of the firſt rank are ſometimes permitted to eat in his preſence; but never with him, for this honour is reſerved for his women alone. It is never known in what part of the palace the king ſleeps; and if that queſtion be aſked of the captain of his guard, or any of thoſe neareſt to his perſon, they conſtantly anſwer, "Do you imagine that the deity ſleeps?"

The ignorance and meanneſs in which he is bred gives him a high reliſh for pleaſure on his thus riſing by one ſtep to the throne; and he uſually lives in a moſt ſlothful, luxurious, and debauched effeminancy among his women, without ſeeking or ever enjoying the converſation of men, or thoſe exerciſes that are adapted to ſtrengthen his mind, and give vigour to his body.

The king is ſaid to have three or four thouſand wives, who are divided into ſeveral claſſes; and ſhe who has brought forth the firſt male infant is at the head of the firſt: this is the queen, or, as they term her, the king's great wife. She is treated by all the others with reſpect, and all in the ſeraglio are under her command, except the king's mother, whoſe credit is greater or leſs, according to the degree of his majeſty's affection for her, or her power in managing him.

If a man touches by accident any of the king's wives, his head, or at leaſt his liberty, is forfeited; ſhe is conſidered as defiled, and, being unfit to return to the palace, both are doomed to perpetual ſlavery. They alone ſerve his majeſty, and no man is permitted to enter their apartment. When any of them go to work in the fields, which they do by hundreds, if they ſee a man they call out, Stand clear; on which he inſtantly falls on his knees, or flat on the ground, and thus continues while they paſs by, without daring even to look at them. On the leaſt diſguſt the king ſells eighteen or twenty of them; but this does not leſſen their number, for the officers, to whom the government of the ſeraglio is entruſted, ſupply their places with freſh women; and whenever they ſee a beautiful virgin, preſent her to the king, none daring to oppoſe them. If one of them happens to pleaſe him, he does her the honour to lie with her two or three times; after which ſhe paſſes the remainder of her life like a nun, which in this warm climate is conſidered by the women as the moſt dreadful of all puniſhments.

The king never appears in the hall of audience but when his nobles, or the directors of the companies, have affairs to communicate to him, and are to receive his orders: or when he would adminiſter juſtice to his ſubjects. He paſſes the reſt of his time in his ſeraglio, accompanied by his women, ſix of whom uſually entertain him at a time. Theſe are magnificently adorned, and kneel before him, with their heads almoſt touching the floor. In this poſture they endeavour to divert him. They alſo dreſs him and wait upon him at table, uſing every art to render themſelves beloved. When he would be alone with one of them, he touches her ſlightly, and gently claps his hands. The five others inſtantly retire, and having ſhut the door, guard it on the outſide, till the happy woman leaves the room. Then ſix others take the places of the former, and thus they relieve each other.

The people of Whidah are extremely jealous, and puniſh adultery with death; but if a man be ſurprized with one of the king's wives, nothing can ſave him, for the king himſelf pronounces ſentence againſt them both on the ſpot. The officers of the palace inſtantly cauſe two pits to be dug ſix or ſeven feet long, four broad and five deep, ſo near that the criminals may ſee and ſpeak to each other. In one of them a poſt is fixed, to which the woman is faſtened, with her hands tied behind her. Two wooden forks are fixed at the ends of the other pit, and the man being ſtripped quite naked is faſtened with iron chains to an iron bar, reſembling a ſpit. The king's wives then bring faggots, which they put into the pit, and, before they are lighted, the ſpit to which the men is faſtened is put upon the two forks, and fire is put to the wood, which is ſo far below that only the extremity of the flames can reach his body. Thus the miſerable wretch is left to burn by a ſlow fire, a cruel puniſhment that would laſt for a conſiderable time, had not they the charity to turn him with his face downwards, in which ſituation he is ſpeedily ſtifled by the ſmoke. When he no longer gives any ſign of life they undo his chains, and letting him fall in the pit cover him with earth.

The man being thus put to death, about fifty or ſixty of the king's women eſcorted by a party of muſketeers, and accompanied with drums and flutes, come from the palace, each carrying on her head a large earthen pot of ſcalding water, which each pours one after another, on the head of the woman who is tied to the poſt, and throws the pot on her head with all her force; whether dead or not, all the water, and all the pots, are thrown on this unhappy woman; after which they cut the cords, pull up the poſt, and bury her in the pit, under a heap of earth and ſtones.

The natives are unable to approach the king without ſubjecting themſelves to the moſt humbling ceremonies. The greateſt lords of the kingdom are obliged to ſubmit to them as well as others, and none but the chief captains of the ſeraglio and the high-prieſt can enter the palace without leave. When one of the great men has obtained the king's permiſſion, he goes to the palace attended by all his ſervants in arms, and with trumpets, drums, and flutes. On his arrival at the gate of the hall of audience, his men make a general diſcharge of their muſkets, the drums, trumpets, and flutes ſtrike up and all the men give a loud ſhout. In this manner he enters the firſt court, where ſtripping off all his cloaths, he hides his nakedneſs with herbs put round his waiſt; he likewiſe takes off his bracelets, necklaces, rings, and all his jewels. In this condition he walks to the hall of audience, where proſtrating himſelf, he advances creeping to the foot of the throne, ſpeaks with his face towards the earth, and when his audience is ended, retires creeping backward, without changing the poſture with which he entered. On his rejoining his men in the court, he dreſſes, puts on his ornaments,

ments, and the king is informed of his departure by the firing of guns, the ſound of muſical inſtruments, and the ſhouts of his attendants.

But notwithſtanding the ſervility with which the king is treated by his ſubjects, when the directors of companies or the captains wait upon him, he receives them in the hall of audience, cauſes eaſy-chairs to be brought them, and ſometimes drinks and ſmokes with them.

Trade has introduced into Whidah the elegancies and luxuries of Europe; the kings palace is now provided with European furniture, and all the nobility and rich merchants endeavour to furniſh their houſes in the ſame manner. The palace is adorned with canopies, magnificent beds, eaſy-chairs, looking glaſſes, and in ſhort with every ornament fit for a houſe in that climate. The king and nobility are furniſhed with cooks inſtructed by thoſe of France, ſo that when an entertainment is given to an European, he finds the tables of the negroe lords ſerved with as many delicacies as thoſe of Europe. Wine is brought them from France, Spain, Madeira, and the Canaries; they are alſo ſupplied with brandy, ſweetmeats, tea, coffee, and chocolate; and their tables have loſt all the remains of their antient ſimplicity. They are covered with fine linen, and have veſſels of ſilver and ſervices of china. This elegance and politeneſs is, however, confined to the great and wealthy, for the common people ſtill preſerve their antient manners.

SECT. VI.

Of the Religion of the Inhabitants of Whidah.

THE moſt ſenſible people of Whidah believe in one ſpiritual God, who puniſhes vice and rewards virtue; who cauſes the heavens to thunder, the ſky to be covered with lightning, the clouds to pour down rain, and the ſun to ſhine; and maintain that his reſidence is in the heavens, whence with infinite juſtice and goodneſs he governs the world. They have alſo confuſed notions of hell, of a wicked ſpirit, and of the exiſtence of the ſoul after it has left the body.

But with theſe juſt ſentiments they mingle others that are the moſt abſurd and ridiculous; they ſuppoſe that it would be preſumption in them to addreſs their petitions to the great Creator, and have therefore ſeveral inferior deities. Beſides the fetiches which they have in common with the other negroes on the coaſt, they have four principal objects of religious worſhip; the ſerpent, which holds the firſt rank; the trees, which are of the ſecond claſs; the ſea, which is of the third rank; and Agoya, whom they term the god of counſels.

They thus account for their worſhipping the ſerpent: the inhabitants of Whidah being ready to give battle to the king of Ardrah, a great ſnake came from the enemies army to theirs, and appeared ſo gentle that, far from biting, it fawned upon every body; which the high-prieſt obſerving, ventured to take it in his hands, and to hold it up on high, to ſhew it to the whole army; who, being amazed at the prodigy, fell on their faces before the harmleſs animal, and then attacked the enemy with ſuch courage and reſolution, that they gained a complete victory. This the credulous ſoldiers attributing to the ſerpent, they took it away with them, built a houſe for it, brought it proviſions, and in a ſhort time the new god eclipſed all the others, even the fetiches, which were the moſt antient idols of the country.

As its worſhip encreaſed in proportion to the imaginary favours they received from it, the ſnake did not long remain in the firſt houſe they had built it: they erected one in the moſt ſumptuous manner, with many courts and ſpacious lodgings; it had an high-prieſt, an entire order of marabouts, or prieſts, to ſerve it; they dedicated to it the moſt beautiful women, and that it might never want ſervants, choſe new ones every year.

It is ſurpriſing that very ſenſible negroes gravely aſſert, that the ſnake they now worſhip is the very ſame that came to their anceſtors, and gave them the celebrated victory which freed them from the oppreſſion of the king of Ardrah. This ſerpent has multiplied extremely, and its poſterity have not degenerated from its good qualities. They do no injury to any one; but permit the people to put them about their necks, into their boſoms, and into their beds. The only reſentment they ever ſhew is againſt the venomous ſerpents, which they always endeavour to deſtroy; and the people are in no danger of miſtaking the one for the other, for thoſe which are deſtructive are here black, and reſemble vipers; and, though they are four yards long, are only an inch and a half in diamater: but the beneficent ſerpent ſeldom exceeds ſeven feet and a half in length, and yet is of the thickneſs of a man's leg. Its head is large and round, its tail pointed, and its ſkin very beautiful; it being of a whitiſh colour, with waves of brown, blue, and yellow.

The natives think themſelves happy when one of theſe honours their houſe with its preſence; they not only give it a bed, but, if it be a female with young, make for her a little houſe, to which ſhe retires to bring them forth; and when ſhe or her young want food, bring it them, till they are big enough to take care of themſelves. If any one ſhould venture to kill one of theſe reptiles he would ſuffer a cruel death.

Of this the Engliſh, according to the teſtimony of Barbot and Boſman, had a tragical inſtance. When the Engliſh firſt ſettled at Whidah, the captain having landed his goods, the ſailors found at night one of theſe ſnakes in their magaiznes, which they ignorantly killed and threw upon the ſhore, without dreaming of any ill conſequence. The negroes ſoon diſcovering the pretended ſacrilege, the inhabitants of the whole province aſſembled, attacked the Engliſh, maſſacred them all to a man, and conſumed their bodies and goods in the fire they had ſet to the warehouſe.

It is well known that ſnakes multiply extremely, and live for a long time, it might therefore be imagined, that the earth would be covered with them; but neither the black ſnakes nor the ſwine pay any regard to their divinity, but kill and eat them, which greatly diminiſhes their number; but it always coſts the life of thoſe animals when they are caught in the fact: nothing in particular can ſave a hog from being immediately put to death; the people have no reſpect to thoſe to whom they belong; for though they are the king's, they are killed on the ſpot, and their fleſh belongs to thoſe by whom they are ſlaughtered.

The ſerpent of Whidah from which the others of the ſame ſpecies are ſaid to be deſcended, is worſhipped in his houſe or temple upon various occaſions; but the offerings and ſacrifices made to him are far from being confined to bulls and rams, to loaves of bread or fruit. The high-prieſt frequently preſcribes a conſiderable quantity of valuable merchandize, barrels of bougies, gold rings, powder, brandy, hecatombs of bulls, ſheep, fowl, and ſometimes even human ſacrifices, all which depends on the fancy and avarice of the prieſt.

The marabouts, or prieſts of the grand ſerpent are all of one family, of which the high prieſt, who is one of the grandees, is the chief, and all of them pay obedience to him. Their habit is not at all different from that of the common people, though ſuch as can afford it wear the dreſs peculiar to the nobility. They have no ſettled revenues, yet their income ariſing from the ignorance and ſuperſtition of the people is very great. Like the other negroes, they engage in trade, and by the number of their women, children, and ſlaves, are able to cultivate large plantations, and to feed a multitude of cattle; but their moſt certain reſources conſiſt in the credulity of the people, whom they pillage at diſcretion.

But beſides theſe prieſts, there are a number of prieſteſſes, who are frequently more reſpected than the prieſts themſelves, and claim the privilege of being called the children of God. While other females pay the moſt ſlaviſh obedience to the will of their huſbands, theſe arrogate to themſelves an abſolute and deſpotic ſway over them, their children, and effects; and receive no leſs homage from their huſbands, than other huſbands receive from their wives. This makes the men decline thoſe holy matches, and prevent, if poſſible, their wives being raiſed to that honour, which is the height of their ambition.

With reſpect to their other deities, Agoya, or the god of counſels, is conſulted by the people before they

they undertake any thing of importance. This is a little idol of black earth, which rather reſembles a miſhapen monſter than a human being. It is repreſented ſeated or crouching, on a kind of pedeſtal of red earth, on which is a piece of red cloth adorned with cowries, with a ſcarlet band, to which hang four cowries about his neck. His head is crowned with lizards, ſerpents, and red feathers. This idol is placed on a table in the high-prieſt's houſe, and before him are three calabaſhes, in which are fifteen or twenty balls of hard earth. Thoſe who would conſult this idol apply to a marabout, tell him the ſubject that brought them thither and having given him the offering deſigned for the god, and the price of conſulting him, the queſtion is determined by throwing the balls from one calabaſh into another, a certain number of times; when if an odd number be found in each, the marabout boldly declares, that the oracle has pronounced in his favour, and the man may undertake the affair on which he came to conſult the deity.

Whenever the ſea is agitated in ſuch an uncommon manner, that merchandize can neither be embarked nor brought aſhore, they conſult the high-prieſt, and by his advice, ſacrifice a bull or a ſheep on the bank, ſuffering the blood to run into the water, and throw a gold ring as far as they are able into the waves. The blood and the ring are loſt; but the beaſt that is ſacrificed belongs to the prieſt and is accordingly carried to his houſe.

There is ſtill leſs expence in rendering the trees favourable. The ſick have commonly recourſe to them, and make them an offering of millet, maize, or rice, which the marabout places at the foot of the tree to which the ſick man pays his devotions.

However abſurd and extravagant this religion may appear, it has been equalled in folly by the religious ſyſtems of the wiſeſt, the moſt learned, the moſt powerful nations of the earth; and the warm admirers of the ancient Greeks and Romans, ought rather to lament the weakneſs of the human mind, than to deſpiſe theſe ignorant negroes for ſuch abſurdities, when they conſider, that the Romans offered ſacrifices to Æſculapius in the form of a ſerpent; that both they and the Greeks, as well as the people of Whidah, had their oracles, to which they applied for advice. They too ſacrificed to the ſea, under the name of Neptune; and they had alſo conſecrated trees and groves, inhabited by dryades and hamadryades, to whom they offered milk, oil, honey, and wine. What a conformity do we here find between the religion of nations eſteemed the moſt ſavage and the moſt polite!

SECT. VII.

A conciſe Account of the Conqueſt of Whidah, by an inland Prince.

WE ſhall conclude this account of the kingdom of Whidah, with a conciſe relation of a revolution which has lately happened in that kingdom. The wealth of this nation riſing from the fertility of the ſoil and its commerce, produced effeminancy and luxury. The king of Whidah abandoned himſelf to women, to pleaſure, and indolence, while the nobility, in order to poſſeſs an unlimited power, flattered all his paſſions.

This prince was thirty years of age when the king of Dahomay, an inland country, ſent ambaſſadors to him to deſire permiſſion for his ſubjects to trade to the ſea-coaſt, with an offer of paying a yearly tribute of a certain number of ſlaves, or a certain duty upon each ſlave ſold to the Europeans, or to the natives of the coaſt. His requeſt was denied, with a haughtineſs that made the king of Dahomay, who was named Truro Audati, vow revenge. But his menaces were diſregarded by the king of Whidah, who, when Snelgrave, an Engliſhman, told him of the great preparations that were making againſt him, vainly replied, that he would not, according to the cuſtom of the country, cut off the king's head, but make him his ſlave, and employ him in the meaneſt and moſt ſervile offices. But how different was the event!

Truro Audati was a brave and politic monarch, who in a ſhort time had extended his conqueſts towards the ſea as far as Ardrah; after which, he propoſed to enjoy the bleſſings of peace, and ſecure his conqueſt; but the above treatment rekindled his ambition, while it raiſed his reſentment. To this was added another circumſtance; the king of Ardrah had a brother, a prince of great hopes, whom he treated with ſeverity. This young prince, whoſe name was Haſſar, being unable to raiſe a ſufficient party in the kingdom to ſhake off the yoke, and procure his liberty, had recourſe to Truro Audati, whom he promiſed a large ſum of money, if he would revenge the inſults and indignities under which he laboured. That prince entered heartily into young Haſſar's cauſe, as if actuated alone by motives of ſympathy and compaſſion. His deſigns were not long a ſecret to the king of Ardrah, who had recourſe for aſſiſtance to the prince who governed Whidah; but he was too fond of his eaſe to attend to the danger that threatened his neighbour, and conſequently himſelf. Audati was ſuffered to enter Ardrah with an army of fifty thouſand men, and cutting in pieces the forces that oppoſed his paſſage, made the king priſoner, and, according to the ſavage cuſtom of thoſe nations, cauſed him inſtantly to be beheaded.

At that time there was at the court of Ardrah, one Mr. Bullfinch Lamb, an Engliſh factor, who being preſented to the conqueror, he expreſſed the utmoſt ſurprize and ſatisfaction at the ſight of a white man, and ordering him to be conducted to his court, appointed him a houſe, domeſtics, and women. During his ſtay, Mr. Lamb frequently diſſuaded the king from invading Whidah, which he repreſented as inhabited by a numerous and powerful people, accuſtomed to fire arms and cloſely connected with the Europeans, who would not fail to exert themſelves in their defence.

Audati at length diſmiſſed Mr. Lamb, who returned to the factory loaded with gold and rich preſents; when that politic prince, learning from his ſpies in Whidah, the ſloth and indolence in which the king was ſunk, attacked the moſt northern province of that kingdom, which was governed by a chief, who immediately ſent to demand ſuccours from the king; but having enemies at court, they rendered that indolent monarch deaf to his remonſtrances, when finding he could obtain no reinforcement he ſubmitted to Audati, and, by his voluntary homage, procured very favourable terms from the conqueror.

A free paſſage was now opened through the kingdom of Whidah to Sabi the capital, and nothing was left to oppoſe the enemy but a river. The king of Dahomay encamped on the oppoſite bank, not doubting but that the paſſage would be diſputed; but he was miſtaken. The effeminate people of Whidah placed their ſecurity in their number, and their gods, and in the morning met the prieſts on the banks of the river, where having ſacrificed to the grand ſerpent, they returned to the city, fully aſſured of the efficacy of what they had done to ſtop the progreſs of the enemy.

Audati now ſent to aſſure the Europeans, that if they remained neuter, they ſhould not only be treated with kindneſs, but their trade freed from thoſe duties and reſtrictions, which had been laid upon it by the king of Whidah; but if, on the contrary, they took up arms againſt him, they muſt expect all the horrors of war, and the moſt cruel effects of his reſentment. This threw the Europeans into the utmoſt conſternation and perplexity. Some propoſed retiring to wait the event in their forts on the ſea coaſt, a few miles diſtant from Sabi; but others apprehending that this retreat would irritate the king of Whidah and ſet a bad example to his ſubjects, propoſed to ſtay in the capital, and to this they agreed.

Truro finding to his great aſtoniſhment, that the defence of the river was committed to the ſnakes, detached two hundred men to ſound the fords, and this body gaining the oppoſite ſhore without reſiſtance, inſtantly marched towards the capital, attended by a great number of warlike inſtruments. The king of Whidah,

heart

hearing of their approach, fled precipitately out of the palace, with all his women and court, to an iſland diſjoined by the river from the continent, and the reſt of the inhabitants having no canoes to tranſport them, were drowned by thouſands, in attempting to ſwim after him while one half of the people took ſhelter in the wood and thickets.

The ſmall detachment ſent by Audati having entered the city, and meeting with no reſiſtance, ſet fire to the palace, and ſent word to the king, that nothing prevented his approach to the capital. The whole army now began their march, and were inexpreſſibly ſurpriſed at finding that a whole nation had deſerted their liberty and property, their wives, children, and gods, without one attempt to defend them. The Dahomans, were far from paying the ſame regard to the ſnakes as the people of Whidah; for finding them tame and numerous, they took them in their hands and jeeringly deſired them if they were gods, to ſpeak and defend themſelves; but as the ſnakes made no reply, they cut off their heads, gutted and broiled them upon the fire, ſaying they had never before dined upon divinities.

Audati thus took poſſeſſion of the capital in the year 1727, and having received the ſubmiſſion of the chief men of Whidah, returned to proſecute a war he had engaged in with the king of Yos, the ally of Ardrah, when ſome loſſes he ſuſtained there, and the buſy diſpoſition of an European factor at Jachen, was very near reſtoring the former prince to the throne. Governor Wilſon having quitted Whidah in 1729, committed the management of the affairs of the Engliſh to one Teſteſole, a foreigner, but of what nation is not known. This man had made frequent viſits to the king of Dahomay, and was always received with affability, and particular marks of diſtinction; but now imagining that he was weakened by his late loſſes, and his too extended conqueſts, applied to the king of Popo, who approved his deſign; for as ſince the late revolution, the channel of commerce between the kingdoms of Whidah and Popo, had been entirely blocked up, nothing could be more agreeable to the king of Popo, than the reſtoration of the king of Whidah, and the uſual commerce between the nations, and joining in the confederacy, he raiſed an army of five thouſand men, which he put under the command of the depoſed king.

Audati was in the mean while employed in repairing his cities, and ſettling the conquered country of Ardrah; it was a long time before he was appriſed of the revolt, the news of which he received with the utmoſt aſtoniſhment; being amazed that a prince ſo negligent in defending his rights ſhould attempt by force of arms, to regain them. He was now in no condition to make a freſh war; but ſuddenly aſſembling a great number of women, he had them cloathed and armed like men, and forming them into companies, gave to each the proper officers, colours, and muſic.

This army marched againſt the king of Whidah, the firſt line of every company being compoſed of men, the better to ſuſtain the firſt ſhock of the enemy. But the news of this march no ſooner reached the Whidan camp, than thoſe timorous and effeminate ſoldiers, being filled with a ſudden conſternation, abandoned their colours; nor could all the endeavours of their unfortunate king bring them back to their duty. In this extremity he was forced a ſecond time to retire to his barren and deſolate iſland, while Teſteſole took ſanctuary in the Engliſh fort, whither he was purſued by the Dahoman women, who cut off a conſiderable number of his men; after which he ſhut himſelf up in the French fort at Jachen.

While this laſt fort was ſurrounded by the Dahoman army, ſeveral overtures for a peace were made by the king, which Teſteſole rejected with an inſolence that little became a petty factor, blocked up by a powerful monarch. One day the Dahoman ambaſſador being with him, and endeavouring to bring him to reaſon, ſome words aroſe; upon which Teſteſole ſtruck the ambaſſador, at the ſame time ſaying, that were his king in his power, he would uſe him in a different manner. This being afterwards told to the king of Dahomay, he replied with more than uſual compoſure, "This man muſt cer-
" tainly have ſome extraordinary reaſon for his enmity
" to me. It is becauſe he is unable to repay the many
" favours and civilities I have conferred on him?" Teſteſole was, however, ſoon after taken, and being carried bound hand and foot, was put to the moſt cruel tortures, and afterwards ſlain: a puniſhment which he brought upon himſelf by his raſhneſs and diſreſpectful conduct to a prince from whom he had received many obligations.

In this ſituation is at preſent the famous kingdom of Whidah: it is now a province dependent on the king of Dahomay; but the inhabitants enjoy the full and free uſe of their antient religion, laws, and government.

SECT. VIII.

Of the Kingdom of ARDRAH.

Its Situation, Extent, and Face of the Country. The Dreſs, Food, Language, Marriages, Education of the Women, Funerals, and Religion of the People.

THE kingdom of Ardrah is of ſmall extent on the coaſt, where Whidah and Popo are taken out of it; for it reaches only twenty-five leagues along the ſhore, but within land it is ſaid to be above a hundred leagues broad, and to extend ſtill farther in length from north to ſouth.

The air is in general unhealthful, and diſagrees with Europeans; but the country is pleaſant, and produces wheat, millet, yams, potatoes, lemons, oranges, cocoanuts, and palm wine; and the low and marſhy grounds produce ſalt. Between all the cities are great roads, which are extremely commodious for traders and travellers; and deep canals are cut from one river to another, which are conſtantly filled with canoes either for pleaſure or buſineſs. But however commodious for trade and induſtry the fine roads and canals of Ardrah may be, they were the great means of its conqueſt, ſince they enabled the brave Truro Audati, king of Dahomay, not only to march his army into the country, but to ſupply himſelf with proviſions, and every other neceſſary.

The inhabitants of the ſea-coaſt employ themſelves in fiſhing and making ſalt, which they ſend to the interior countries. Thoſe within land are all huſbandmen and graziers. They literally cultivate the earth by the ſweat of their brow; for here they are eaſed by no ploughs or other inſtruments of huſbandry, all is performed by the ſpade and mattoc; whence the ground being more thoroughly broke, and the grain better covered, the fruits are proportionably better, according to the ſuperior degree of care and labour. Wherever huſbandry is alone purſued, the country diſcovers evident marks of the ſkill of the labourer. Every thing is conducted with the niceſt order. Here ſtands a plat of maize, there a field of wheat; on one ſide grow peaſe and cabbages, on the other potatoes and other roots, every ſeparate article being divided by a double row of fruit-trees, and the whole incloſed by tall ſtraight trees, either for ornament or uſe, the boughs affording a pleaſing ſhade to the labourer, ſpent with fatigue, and the too ardent beams of the ſun.

The dreſs of the inhabitants has ſome reſemblance to that of the Whidans: that of the courtiers conſiſts of two ſilk or brocade paans or petticoats, with a broad ſcarf drawn acroſs the breaſt and ſhoulders in the manner of a ſaſh. The people of inferior rank wear five or ſix paans, one over another; theſe are of cotton cloth manufactured in the country; and thoſe who can afford it have them adorned with gold ſtuds, hanging round in a looſe manner. Though it is the general cuſtom to leave the upper part of the body naked, yet many perſons of diſtinction wear over their ſhoulders a ſhort ſattin mantle, by way of morning dreſs: but in viſits, and upon ceremonious occaſions, this is laid aſide, and the natural black ſkin preferred, as more beautiful and becoming. The high-prieſt has a long piece of white cotton wrapped round him, plaited in a pretty taſte. He likewiſe wears long cotton drawers, and has on his feet ſlippers or ſandals of red leather: on his head he wears either a cap or an European hat; by his ſide he has a large couteau with a gilt handle, and has a cane in his hand. The high-prieſt alone ſtands covered in the king's

king's preſence, but the nobility pull off their caps and ſlippers before they enter the preſence-chamber.

The women carry their paſſion for dreſs and finery to a very extravagant height. You may ſee them cloathed with the fineſt ſattins, chintzes, and brocades, adorned with a profuſion of gold, and panting under the weight of their ornaments. This is not ſolely owing to the vanity of the women, ſince the men never think a woman genteelly dreſſed without being loaded with a quantity of ſuperfluous ſilk or ſattin. Both ſexes have the moſt ſcrupulous regard to cleanlineſs, and preſerving their bodies neat and ſweet. They both waſh and perfume themſelves every morning and evening with civet and aromatic herbs; and a woman never preſumes to receive the careſſes of her huſband till this is performed.

The uſual food of the inhabitants is beef, pork, mutton, goats, and dogs fleſh; with rice, fruit, roots, pulſe, and many kinds of vegetables. Their bread is made into cakes, and their drink is their beer called pito, and water.

The people prefer the language of Alghemi to their native tongue, eſteeming it more elegant, ſweet, and ſonorous. No written characters of either of theſe languages are in uſe; but the great men ſpeak, read, and write the Portugueſe fluently.

The men are allowed the ſame liberty as at Whidah, of taking as many women as they are able to ſupport. Little ceremony is obſerved in love affairs; the unbounded liberty enjoyed by ſingle women, whoſe general carriage is looſe and laſcivious, affords abundance of opportunities for making and receiving addreſſes. Birth and fortune are ſeldom regarded; for the men of the loweſt claſs addreſs thoſe of the higheſt quality; love ſets all degrees upon a level, regulates the conduct of parents, and makes all parties happy. But, notwithſtanding this toleration, men ſeldom ſeek for wives out of their own claſs. The nobility marry young ladies of quality, of nine or ten years of age, whom they take home to their houſes; but defer the conſummation of their nuptials till nature indicates their maturity. The marriage-feaſt is then kept, which conſiſts of a great quantity of proviſions, drink, and riotous mirth. Liquors are alſo diſtributed to all the relations, acquaintance, and neighbours of either party.

Their method of courtſhip is extremely conciſe, the man uſing no other ceremony than preſenting the object of his love with a callico paan, and her relations with ſome pots of pito. He then declares to the company, that he will marry the woman whom he names; ſhe grants her conſent, and the courtſhip and marriage are at once ended.

But though polygamy be permitted, adultery is no leſs frequent here than in countries where the men are confined to one woman. This ariſes from the ſtrong deſires of the women, ungratified by their huſbands, who generally confine their favours to one or two of them; on which account the women aſſume the moſt wanton airs and laſcivious manners before all other men; though in the preſence of the huſband they ſeem full of reſpect, awe, and ſubmiſſion.

Some authors obſerve, that the climate of Ardrah is unfavourable to the propagation of the ſpecies, it ſeldom happening that one woman has more than two or three children; but this may perhaps rather proceed from the inconſtancy of the men, and the number of their wives, few of whom can attract his regard for any conſiderable time.

In every town the wives of freemen are by turns ſent to certain ſchools, where they are taught female accompliſhments, in a houſe belonging to the high-prieſt. Old women inſtruct them in dancing and ſinging, the voice being accompanied by the jingling of bits of iron and copper, ſuſpended to their legs and arms, with which they beat time. They are forced to dance and ſing with ſuch violence, and ſo long together, that their ſpirits being fatigued, ſpent, and exhauſted, they drop down with faintneſs. Parties ſucceed each other day and night in this frantic and extravagant employment; nor can any woman return better recommended to her huſband, than by having acquired the ability of holding out longer than any other in the company.

With reſpect to their funeral ceremonies, the people of Ardrah are ſaid to be interred under their own houſes, where there is a vault appropriated for the dead. All funeral obſequies are performed with great pomp and ceremony; for let the perſon be ever ſo much deſpiſed while living, he is reſpected at his death.

The religion of Ardrah is very different from that formerly obſerved at Whidah, and, in particular, they are ſo far from worſhipping the tame and gentle ſerpents, that they ſearch for them, in order to kill and eat them. They have almoſt an infinite number of prieſts, and perſons of the higheſt diſtinction eſteem it an honour to have them at their tables. The great marabout, or high-prieſt, appoints the fetiches worſhipped by every family. Thoſe of the court are certain black birds reſembling the crows of Europe; with theſe the gardens of the palace are filled, and they are fed as well, though they are not treated with the ſame reſpect, as the ſerpents of Whidah. Among private perſons ſome have a mountain, others a ſtone, a tree, a piece of wood, or other inanimate ſubſtance, which they call their fetiche, and regard with a kind of religious reſpect.

Notwithſtanding their being plunged in the groſſeſt idolatry, they have ſome confuſed ideas of a Supreme Being, who directs the time and occaſions of their birth and death, and he has the power of rendering them happy or miſerable on earth; but ſeem to be entirely void of all ideas of a future ſtate. They ſhrink at the thoughts of death, and are alarmed at the ſmalleſt accident. The great marabout is held in the higheſt eſteem and veneration, and is believed to be able to foretel future events by converſing with an image of the devil, which is of the ſize of a young child of about four years old, and is kept by him in his audience-chamber. This image is painted white; for they conſtantly maintain that the devil is of that colour, and will by no means allow of his being black.

The prieſts here, as well as in other places on the coaſt, are the only phyſicians the country affords. They make decoctions of healing herbs, and ſacrifice animals for the recovery of the ſick in their reſpective dwellings. The fetiche is rubbed with the animals blood, and the fleſh eaten or burnt. Snelgrave mentions an extraordinary inſtance of reſpect for thoſe doctors of the ſoul and body. It is an inviolable law, that in whatever houſe near the palace a fire happens to break out, the maſter of that houſe, with all his family, ſuffer death. Unjuſt and cruel as this law is, it is attended with happy conſequences, fewer accidents from fire happening in Ardrah than in any other kingdom, for the law is executed with unrelenting rigour on people of all ranks: yet when the royal palace at Jachen was burnt to the ground, though the fire was well known to begin in a prieſt's houſe, and he was ſtrongly ſuſpected to have purpoſely ſet it on flames, the affair was huſhed up, and no enquiry made.

SECT. X.

Of the principal Towns of Ardrah, particularly Jachen, Offra, Great Foro, and Aſſem, the Capital. With an Account of the Trade of Ardrah; the Manner in which it is conducted, and the Goods proper to be carried thither.

THE coaſt from Whidah to little Ardrah is low and flat, but riſes by a gentle aſcent as you proceed to Jachen. This laſt town is a league north north-eaſt from Praya, or Little Ardrah, and before its being ſurrendered to Audati, was governed by a phidalgo, or prince, who reſided there in a ſplendid manner, in a palace that was extremely magnificent, conſidering the country and his confined dominions. Jachen is fifteen hundred fathoms in circumference, and is ſurrounded by a deep ditch ſupplied with water from a rivulet which runs into it. The Dutch and Engliſh had factories here, but of late years the latter is withdrawn. After the conqueſt of Ardrah, the palace of Jachen was burnt to the ground, notwithſtanding the prince ſubmitted to the king of Dahomay; but how the accident aroſe, we are not informed.

To the north of Jachen ſtands the city of Offra, where the Engliſh and Dutch have each a handſome factory; the Dutch in particular carry on a great trade in the city, and live with a ſplendor proportioned to their profits.

Farther ſtill to the north, is ſituated Great Foro, a populous town, but inferior in beauty to the others. What is very extraordinary in this country is, its having an inn for the accommodation of paſſengers, who are there plentifully ſupplied with all ſuch eatables as the country produces, and Pito beer, which is remarkably good.

Still farther to the north is the metropolis, called Aſſem by the natives, and Great Ardrah by the Europeans. This city was the reſidence of the kings of Ardrah, and was five or ſix leagues in circuit. The royal family had two palaces within it, one of which was only inhabited, and the other was reſerved for a place of retreat, in caſe of fire, or other accidents. Both theſe palaces are ſurrounded with high walls of earth and clay that bind like cement, and are as firm and ſmooth as plaſter. They conſiſt of large courts, with long wide galleries, ſupported by beautiful pillars finely ornamented. Under theſe piazzas the natives are allowed to walk. The buildings are two ſtories high, with long narrow ſlips of windows that are perfectly adapted to the climate, as they occaſion a great draught of air. The floors of the apartments are covered with ſilk carpets, or fine mats, made in a pretty taſte; and before its being conquered by the king of Dahomay, in each room was a ſingle armed chair, a variety of ſilk and brocade cuſhions, tables, folding ſcreens, Japan cabinets, and the fineſt China-ware: the windows were hung with taffety curtains, and ſaſhed with white cloth, glazed in a manner that admitted the light, while the damp air of the night was excluded. The gardens are ſpecious, and laid out in the moſt delicate taſte; and in particular, ſome authors ſay, there are fine long walks ſhaded by odoriferous trees, and lined on each ſide with ſhrubs and flowers of a fragrant ſmell, and pleaſing colours; and nothing can be more beautiful than the elegant parterres, the fanciful graſs-plats, joined by ſerpentine walks, refreſhed by a cooling ſtream, which gildes over ſhining pebbles.

D'Elbee, who viſited this city in 1669, ſays, that you enter it by four gates, the walls which are of mud, are high and thick, and as firm and compact as if built of ſtone and lime. The gates front each other, and are defended by deep ditches on the inſide. Over theſe you paſs by means of a draw-bridge, which may either be raiſed up, or entirely taken away at pleaſure. Over each gate is a guard-room, for the accommodation of the officers and ſoldiers entruſted with the keys of the city, and upon each ſide ſtands a file of muſketeers, with drawn ſwords in their hands. The buildings are only of clay covered with ſtraw, and yet the ſtreets are kept in the utmoſt order, free from filth and every inconvenience.

The Europeans are treated with great civility by the natives, and have apartments appointed them in the palace, where each nation has its diſtinct quarters. The Dutch carry on a conſiderable trade with Ardrah, and that of the Engliſh, without being ſo extenſive, is extremely profitable. Captains of European ſhips, who are conducted and introduced to court by the Fidalgo or governor of Praya, preſent the king with coral, cypreſs, cloths, morees, and damaſk, for cuſtom and liberty of trading. The queen, the prince, and the high-prieſt, are alſo preſented with coral, damaſk napkins, and armoiſin. Beads or braſs rings and bougies are given both to an officer called the captain of white men; to the court dancers and to the porters.

Upon the captains return from Aſſem, licence to trade is proclaimed at a village four miles to the ſouth ſouth-weſt of Praya, called by the Dutch Stock Vis Dorp, and warehouſes are appointed for lodging and ſelling the goods. The honga, or captain of the bar, who directs the landing of all goods, is paid for a canoe's going twelve times to and fro from the ſhip, to the value of a ſlave in effects. When the ſale is ended, the king receives a ſecond preſent, conſiſting of two muſquets, twenty-five pounds of powder, with merchandize to the amount of nine ſlaves. In ſhort, the cuſtoms and duties paid by each ſhip, amount in the whole to ſeventy or eighty ſlaves. The king has the firſt choice of goods, whether in the payment of duties, or in exchange for ſlaves; the hereditary prince the ſecond; the merchant prince the third; the marabout the fourth; and afterwards the great officers of the court. With reſpect to the people, the general price of goods is regulated by a tariff; and when differences ariſe, they are terminated by the king's deciſion.

The ſlaves annually exported amount to three thouſand: theſe are priſoners made in war; contributions levied upon tributary princes; criminals whoſe puniſhment are changed into ſlavery; ſlaves born, or the children of ſlaves; inſolvent debtors, whom they cruelly ſell for the benefit of the creditor; or the wives and relations, to a certain degree, of all who incur the diſpleaſure of the prince.

We have already, in treating of Benin, mentioned the inhuman manner in which the Portugueſe tranſport their ſlaves from thence to America; and it will not be improper to add, before we take leave of the Slave Coaſt, that the Europeans, before they purchaſe theſe ſlaves, examine every limb, with the greateſt care, and the invalids and maimed being ſet aſide, the remainder are numbered. In the mean while, a burning iron, with the arms or name of the companies, lies in the fire, and with this hot iron, both the Engliſh, French, and Dutch, brand theſe poor unhappy wretches, both men and women, to prevent their being exchanged. After this they are confined and kept on bread and water, at the expence of thoſe who bought them, till they are ready to be taken on board; before which, their former maſters ſtrip them entirely naked, in which condition they are ſtowed in the holds of the ſhips, and carried to America, where they are again ſold to the planters. A commerce which every unprejudiced mind muſt ſurely conſider as inconſiſtent with Chriſtianity, and diſhonourable to human nature.

The goods proper for importation are large white beads, large glaſs or cryſtal ear-rings, gilt hangers, iron bars, ſailors knives, copper bells of a cylindric and conic form, copper and braſs baſons of all kinds, guns, Indian ſilks, coloured taffeties, fine coloured handkerchiefs, ſtriped pink ſilks, looking-glaſſes, large umbrellas, long white horſe-tails, and Engliſh and Dutch crowns. By the laſt great profits are gained, ten crowns being the higheſt price for a ſlave; but bougies, or cowries, which are chiefly brought from the Maldivia iſlands are the currency of the country, and the beſt commodities. Europeans in all bargains for ſlaves pay half in bougies; or, if they are ſcarce, a third in bougies, and the remainder in goods.

SECT. XI.

Of the GOLD COAST.

The ſecond Diviſion of Guinea. Its Situation and Extent; the places where Gold is found, and the Manner in which it is gathered. Of the Vegetables, with a particular Account of the Palm Tree, and the Manner of extracting Palm Wine.

THE Gold Coaſt, which is thus named from the abundance of gold found there, is bounded by Nigritia on the north, by the Slave Coaſt on the eaſt, by the ocean on the ſouth, and by the Tooth or Ivory Coaſt on the weſt; extending only about a hundred and eighty miles along the ſhore.

The principal river in this diviſion is the Cabra, or Ancobar, alſo called the Gold River, which bounds it on the weſt, and falls into the ſea near the Dutch fort of St. Anthony, a little to the weſtward of Cape Three Points.

It includes ſeveral diſtricts, in which are a few towns or villages lying on the ſhore. Some of theſe diſtricts have the title of kingdoms, though they contain only a ſmall tract of land. The chief towns which give their names to ſo many petty kingdoms or ſtates, beginning with

with the eaſt and proceeding to the weſt, are Aquamboe, Agona, Acron, Fantyn, Sabo, Fetu, Commany, Jaby, Adom, Anta, and Axim.

That part of the country where moſt of the gold is found, is ſituated at ſome diſtance from the coaſt; and the beſt gold is gathered in or between ſome particular hills, where the negroes dig pits, and ſeparate the gold from the earth dug up with it. It is likewiſe found about ſome rivers and water-falls, where the violence of the torrents cauſed by the heavy rains, waſh it down from the mountains. Gold is alſo gathered on the ſea-ſhore, more particularly at Mina and Axim, where are ſmall branches of rivers into which the gold is driven from the mountainous places.

In the morning ſucceeding a rainy night theſe places are ſure to be viſited by hundreds of negro women, who have no other covering but a cloth tied round the waiſt: each is furniſhed with two calabaſhes, one of which they fill with earth and ſand. This they waſh with many waters, by turning the calabaſh round, the water with the lighteſt of the mud waſhing over the brim; while the gold, if there be any, ſinks by its own weight to the bottom. Thus they continue till two or three ſpoonfuls are only left; and this they put into the other calabaſh: then fill the other again, and continue waſhing till about noon, when the calabaſh that receives the ſettlings, being pretty well filled, is taken home, and what remains diligently ſearched, when they ſometimes find as much gold as is worth half a guinea, ſometimes the value of a ſhilling, and ſometimes none at all.

The gold either thus found or obtained by digging is of two ſorts, gold duſt, which is the beſt, and pieces of different ſizes; ſome being hardly the weight of a farthing, and others weighing as much as twenty or thirty guineas; but few are found ſo large as theſe; though the negroes ſay, that in the country they have pieces that will weigh one or two hundred guineas: but the many ſmall ſtones always adhering to them, occaſion great loſs in the melting.

We ſhall now conſider the vegetables of this part of Guinea. Of the corn there is millet, and maize, or Indian wheat; but there is little rice or other corn on this coaſt.

Of the leguminous plants are ſeveral kinds of beans, one ſpecies of which is of a bright red, and grows in pods three quarters of a yard in length, and another ſpecies grows on trees of the ſize of a gooſeberry-buſh.

The palm tree is of ſingular uſe to the natives, who draw wine from the tree, and preſs oil from its nuts. Theſe trees are ſaid to abound more in Guinea than in any other country. The trunk of the palm tree, when at its full growth, is as thick as a man's body, and ſix feet in height; but its branches ſhoot upwards of twenty feet from the ſtem. The leaves are an ell long, and about two inches broad, terminating in a ſharp point; and with the branches the natives frequently cover their huts. There are indeed a great variety of palm trees, ſome of which are not half ſo thick as this.

When the natives perceive that a tree is of a ſufficient age to yield a good quantity of wine, they cut off all its branches; and having let it ſtand a few days ſtripped of its ornaments, they bore a hole in the thickeſt part of the trunk, and fixing in it a hollow reed, or pipe, the wine trickles out into a pot ſet to receive it; but ſo ſlowly, that they do not get above two quarts in twenty-four hours; but it will run for twenty or thirty days ſucceſſively, according to the goodneſs of the plant: and when it has almoſt done dropping, they make a fire at the bottom of it, which forces out ſomething more. After this the palm dies, and is good for little but the fire; though in the countries where they are ſatisfied with drawing ſmall quantities, a tree will laſt ſeveral years after its being tapped.

This tree is reckoned in its prime at ten or twelve years growth, when it yields ten, fifteen, and ſome near twenty gallons; of which an anchor, or five gallons, is uſually ſold on the coaſt for about an Engliſh half crown. A great deal is brought down from the inland countries, and its cheapneſs ſhews that there muſt be a prodigious number of palm-trees up in the country. This wine, when firſt drawn, is extremely pleaſant, and yet ſtrong; but the negroes, who bring it to the coaſt, frequently mix and adulterate it.

There are here alſo cocoas, oranges, limes, bananas, the cabbage tree, ananas, or pine-apples, water melons, and ſeveral others.

Among the trees fit for timber are many of an extraordinary height and ſize, and others of different coloured wood, fit for the fineſt cabinet-makers work.

Among the roots are yams and potatoes. The yam is ſhaped like a parſnip; but is thicker in proportion to its length, it being commonly about twelve inches long, and as many more in circumference at the top. When roaſted it taſtes like an Engliſh potatoe; but their potatoes reſemble ours only in ſhape, they being of a ſweet maukiſh taſte, and not half ſo agreeable as the yams. They have alſo ſeveral other roots fit for food, as well as different kinds uſed in medicine.

SECT. XII.

Of the Beaſts, Birds, Reptiles, Inſects, and Fiſhes of the Gold Coaſt.

IN the inland parts of the Gold Coaſt are a great number of cows and goats; but few of them are brought to the coaſt; however, great herds of them are bred at Acra, Elmina, and Axim; but they are ſo ſmall, that a full grown cow ſeldom weighs more than two hundred and fifty pounds; and both the beef and veal are very indifferent meat. There are many ſheep along the coaſt; but they are dear, and not above half the ſize of ours; they have hair inſtead of wool, and their fleſh is dry and diſagreeable. The goats are indeed innumerable, and, though they are exceeding ſmall, are fatter and more fleſhy than the ſheep of Europe. There are alſo many hogs; but they are greatly inferior to thoſe of Whidah.

They have no horſes near the coaſt, though there are great numbers of them in the inland country; but they are ſmall and ill ſhaped. If a tall man rides one of them, his feet almoſt touch the ground. Their heads and necks, which they always hang down, reſemble thoſe of an aſs; they hobble along, but will not ſtir without being forced on with blows; but there are no want of aſſes, which are larger and handſomer than theſe horſes.

The negroes here are ſo fond of dog's fleſh, that they willingly give a ſheep for a large dog. Boſman obſerves, that the European dogs, on being brought here, degenerate extremely; their ears growing long and ſtiff like thoſe of the fox, to which colour they alſo incline: ſo that in three or four years time they become very ugly creatures, and in three or four deſcents their barking turns into a howl: but it does not appear that the cats change at all.

Among the wild beaſts the elephant, on account of its ſize, deſerves to be firſt mentioned. Theſe are here twelve or thirteen feet high, and are very prejudicial to the fruit-trees, particularly to the orange banana, and fig-trees; and, with reſpect to the two laſt, eat both the fruit and the ſtem. But though theſe are uſed in the Indies both in war and as beaſts of burthen, none of them are here tamed; and yet, when unprovoked, they ſeldom hurt any man; and it is ſometimes not very eaſy to enrage the elephants of this coaſt.

Tygers are here numerous and of ſeveral ſpecies, ſome of which are very large, and they are all extremely fierce and ravenous; but happily for the natives, they will not attack them, while they can ſatisfy their hunger by feeding on the fleſh of brutes.

The jackal is here ſcarely leſs fierce than the tyger, and ſo bold as to devour both man and beaſt.

The apes are extremely numerous, and of a great variety of ſpecies. The moſt common ſort are of a pale mouſe colour, and thoſe which are full grown, when they ſtand on their hind legs, are about five feet high. The negroes are perſuaded that they can ſpeak if they pleaſe; but will not, for fear of being ſet to work. Theſe are very ugly, and extremely miſchievous; and there is another ſpecies which exactly reſemble them but are ſo ſmall, that four of them put together would not weigh one of the former. A third ſort is very beautiful: theſe

grow

grow to the height of about two feet; their hair is as black as jet, and about a finger's length; and they have a long white beard. There are alſo many other kinds of apes.

There are an incredible number of harts all along the Gold Coaſt, eſpecially at Anta and Acron, where herds of a hundred together are ſometimes ſeen. There are about twenty different ſorts of deer, ſome as large as ſmall cows, others no bigger than cats; moſt of them are red, with a black liſt upon their back; ſome of them red, beautifully ſtreaked with white. All of them are very good to eat, and are eſteemed delicate food particularly one ſort about two feet long, the fleſh of which is much admired. Among theſe animals there is one of a red colour and extraordinary beauty: thoſe of this ſpecies have ſmall black horns, and are ſo little that the legs of ſome of them are ſaid by Mr. Boſman to be no bigger than the ſmall part of a tobacco-pipe.

Theſe laſt ſeem to be the beautiful antelopes deſcribed by Mr. Smith in his Voyage to Guinea. Theſe pretty creatures, ſays he, ſeem rather to vaniſh than run by us among the buſhes; they are nevertheleſs often caught and ſhot by the natives; and, when young, are ſweet veniſon. A brace of theſe bucks may very well be eaten at a meal by a man of a good ſtomach, they being about the ſize of rabbets. The Europeans often tip their feet with gold to make tobacco-ſtoppers of them. They are ſo very tender, that it is not poſſible to bring them alive to Europe.

There are alſo hares and porcupines. Theſe laſt, as well as the former, are eſteemed good food; they are great enemies to the ſnakes, and will attack the largeſt and moſt dangerous of thoſe reptiles. Mr. Boſman ſays, that ſome of his ſervants going into the country beyond Mouree, found a ſnake ſeventeen feet long and very bulky lying by a pit of water, near which were two porcupines; between which and the ſnake began a very ſharp engagement, each ſhooting very violently in their way, the ſnake his venom, and the porcupines their quills: but his men having ſeen this fight a conſiderable time without being obſerved by the combatants, who were too furiouſly engaged to take notice of them, they loaded their muſkets, and let fly upon the three champions with ſuch ſucceſs, that they killed them all, and brought them to Mouree, where they and their companions eat them as very great delicacies.

Here are three or four ſorts of wild cats, of which the civet cat is one; theſe are ſometimes ſold very young to the Dutch, who give about eight or nine ſhillings ſterling for one of them. A great deal of care and trouble are neceſſary in order to bring them up: they feed them with pap made of millet, and a little fleſh or fiſh. They produce civet when very young, but that of the male is better than that of the female.

There are other wild cats which are ſpotted like tygers, and are as fierce; theſe do a great deal of miſchief among the poultry whenever they get among them. Beſides theſe there are ſeveral other quadrupeds.

Among the feathered race there are cocks and hens; thoſe at Axim are fat and good, though ſmall; but in ſeveral places on the coaſt they are extremely dry and lean. There are likewiſe tame and wild ducks, pigeons, a great number of partridges, pheaſants, ſnipes, herons, and parrots. There are a variety of other large and ſmall birds, ſome of which are very beautiful, their plumage being finely variegated with the brighteſt colours, and the heads of ſome of them crowned with tufts of feathers. There are likewiſe falcons, kites, and many of the other birds of Europe, as well as thoſe that ſeem more peculiarly the natives of the torrid zone.

It will not be proper to paſs over the birds without taking notice of the two ſorts of crown birds found on the Gold Coaſt. The firſt is about the ſize of a parrot: it is green about the head and neck; the body is of a fine purple; and the wings and tail are ſcarlet tipped with black.

The other, which is about three feet high, is ſhaped like a heron, and feeds on fiſh: its colour is black and white, and it is crowned with a bunch of feathers that reſembles the taſſel of a coach-horſe.

Among the amphibious animals and reptiles are the crocodiles, with which the rivers ſwarm: there is alſo an animal of nearly the ſame form, though it ſeldom exceeds four feet in length; its body is black, ſpeckled with a round ſort of eyes, and the ſkin is very tender. It injures neither man nor beaſt, but ſometimes makes great ſlaughter among the poultry. All the Europeans who have taſted its fleſh agree that it is much finer than that of a capon.

The lizards are every where extremely numerous, eſpecially by the walls of the forts; and there are various ſpecies of them, which differ in ſize, ſhape, and colour; and alſo many camelions, which are far from living on air alone, and of which we have given a very particular deſcription in treating of Syria.

Frogs and toads are no leſs numerous than in Europe; but Mr. Boſman aſſerts, that the latter are in ſome places as large as a pewter plate. Theſe are mortal enemies to the ſnakes, with which they have frequent engagements. There are great numbers and a prodigious variety of theſe laſt reptiles, ſome of which, if we may credit the above author, are of an amazing ſize. He obſerves, that the largeſt of thoſe taken while he was on this coaſt was twenty feet long, and that he believes they are ſtill larger within land; and we have frequently found, ſays he, in their entrails not only harts and other beaſts, but alſo men. What credit is to be given to Mr. Boſman in this particular we will not ſay; we ſhall only obſerve, that the above gentleman's work is univerſally reckoned one of the beſt deſcriptions of Guinea; and that the Portugueſe have mentioned ſerpents on this coaſt of a ſtill larger ſize.

Moſt of the ſnakes are venomous, but one is ſo to an extraordinary degree; this is ſcarce a yard long, but is two ſpans thick, and variegated with white, black, and yellow. The ſnakes not only infeſt the woods, but the dwellings of the negroes, and even the forts and bedchambers of the Europeans.

There are here abundance of ſcorpions, ſome very ſmall, and others as large as a cray-fiſh; but the ſting of either cauſes intolerable pain, and too often proves mortal. There are alſo many centipedes, whoſe bite occaſions a violent pain for ſeveral hours, but is not mortal. Spiders of a monſtrous ſize are alſo found here, and are ſaid to be venomous.

But none of the inſects of this country appear more extraordinary than the ants. Theſe are of three ſorts, the red, the white and the black. The firſt are of the ſame ſize as thoſe in Europe; but the two laſt are much larger, they being above half an inch long. They build ſometimes in great hollow trees, and ſometimes on the ground, throwing up hillocs ſeven or eight feet high, ſo very full of holes, that they ſeem like honey combs. Theſe ant-hills are of a ſmall circumference in proportion to their height, and, being ſharp at the top, look as if the wind would blow them down. "I one day," ſays Mr. Smith, "attempted to knock off the top of "one of them with my cane, but the ſtroke had no "other effect than to bring ſome thouſands of them "out of doors, to ſee what was the matter. Upon which "I took to my heels, and ran as faſt as I could, well "knowing that they have often attacked our hens, and "ſometimes our ſheep, if lame or wounded, in the "night, with ſuch ſucceſs, that before morning no"thing was to be ſeen of them but the ſkeleton, picked "ſo very clean, that the moſt curious anatomiſt upon "earth could not do the like." They frequently enter the forts in ſuch ſwarms, as to oblige the Europeans to leave their beds in the night. The ſting or bite of the red ant raiſes an inflammation that is extremely painful. The white are as tranſparent as glaſs, and bite with ſuch force, that in one night they will eat through a wooden cheſt of goods.

As the natives have but little fleſh fit for food, they are obliged to ſubſiſt principally on fiſh, and by a particular favour of Providence the ſea and rivers ſeem to contend which ſhall produce the beſt. There are many of the ſorts found in Europe, as pike, thornback, plaiſe, flounders, bream, lobſters, crabs, prawns, and ſhrimps; and likewiſe ſharks and ſword fiſh; with a great

great variety of excellent fiſh that ſeem peculiar to theſe ſeas.

SECT. XIV.

Of the Dreſs of the Natives of the Gold Coaſt, their Marriages, and the Cuſtoms relating to their Women and Children; their Skill in the manual Arts; their Treatment of the Sick, and their Funerals.

THE richeſt of the natives adorn their hair with a kind of coral, called conte-de-terra, which they eſteem more valuable than gold, and with a ſort of blue coral called by the natives acory. They ſet a great value on our hats, for which they will pay a very high price. Their arms, legs, and waiſt, are likewiſe adorned with gold and coral; and particularly on their arms they have rings of gold, ſilver, and ivory. Round their waiſt they wrap three or four ells of ſilk, cloth, perpetuana, or other ſtuff, which hanging down covers half the leg. They alſo wear ſtrings or chains of gold, ſilver, and ſhells round their neck. Their caboceros, or chief men, who have a ſhare in the government, wear only a handſome cloth round their waiſt, a cap of deer ſkin, with a ſtring of coral about their heads, and are never ſeen without a ſtaff in their hands.

Some of the common people have an ell or two of cloth round their waiſt, while others have only a ſort of girdle, to which is faſtened a piece of ſtuff that paſſes between the legs, and is tied to the girdle before, and juſt ſerves to cover their nakedneſs. The fiſhermen add to this a cap made of deer ſkin, or only ruſhes, or ſome old hat bought of an European ſailor.

The women of diſtinction appear to have much more ſkill in the ornaments of dreſs than the men. The cloth which encompaſſes their waiſt is longer, and faſtened with greater neatneſs round their bodies. Their hair is more beautifully adorned with gold, ivory, and coral; and their necks with gold chains and ſtrings of coral; but their arms, legs, and waiſt, are in a manner covered with theſe ornaments; beſides, on the upper part of their bodies they frequently caſt a veil of ſilk, or ſome other fine ſtuff.

While the kings are in their own houſes, they are diſtinguiſhed by no marks of grandeur, and their cloaths are ſometimes ſo mean as to be ſcarce worth a ſhilling. They eat the ſame food as the meaneſt of their ſubjects, for bread, oil, and a little fiſh are their uſual fare, and water their moſt common drink; but they have brandy which they purchaſe of the Europeans, and palm wine which they receive from the inland country. They have no guard at the palace-gates, nor are attended by any other officers than their own wives and ſlaves; and even when they go abroad in their towns they are generally attended by only two boys, one of whom carries the king's ſabre, and the other his ſeat. But if they viſit a perſon of high rank in another town, or receive a viſit from ſome other great man, they take care to ſhew their grandeur. On theſe occaſions both they and their wives are richly adorned, umbrellas are held over their heads, and they are accompanied by armed men.

Marriage is never obſtructed by previous ceremonies. If a man likes a young woman, he has no more to do than to aſk her of her parents, who ſeldom refuſe ſo reaſonable a requeſt, eſpecially if he be agreeable to the daughter. The bride brings no fortune with her; but the huſband keeps an exact account of the expences of the wedding day, and of all the preſents he makes to the bride or her friends, that in caſe ſhe ſhould ever become ſo far diſguſted with him as to leave him, he may demand the whole again. But if he divorces her, he can demand nothing either of her or her relations, except he produces very good reaſons for his diſmiſſing her.

They allow of a plurality of wives, and ſome are ſaid to have even twenty, in which number are doubtleſs included all their female ſlaves. Their wives are obliged to cultivate the earth, and to dreſs proviſions for their huſbands, who commonly ſpend their time in loitering about and drinking palm wine. However, the men of wealth have two wives exempted from labour. Theſe are the firſt wife, who is inveſted with the chief command, and the care of houſekeeping, and the ſecond, who is conſecrated to their fetiche, and is called the fetiche wife. Of this laſt they are frequently very jealous; they lie with her on the night following their birth-day, and on that day of the week which they term their fetiche day. Each wife generally endeavours to pleaſe the huſband, in order to obtain the greateſt ſhare of his affections; and ſhe who is ſo happy as to be pregnant, is ſure to be reſpected and waited on by him.

The women of all this coaſt are delivered with very little pain, even without the aſſiſtance of a midwife; and the child is no ſooner born, than they uſually go to waſh themſelves in the ſea. Immediately after the birth of the infant, a prieſt is ſent for, who binds a number of cords, pieces of coral, and other things about the infant's head, body, arms, and legs. Theſe are to ſecure it from ſickneſs and ill accidents, and are all the cloaths it is to wear till it is ſeven or eight years of age, when it puts on a ſort of apron formed of half an ell of cloth. The number of females born in theſe countries is ſaid greatly to exceed that of the males, which, if true, may render their having ſuch a multitude of wives ſomewhat more excuſeable.

As the heat of the country naturally renders the natives inactive, they are maſters of few manual arts: however, beſides building their huts, making their canoes, and being ſkilled in managing them, and in fiſhing, they employ themſelves in making earthen veſſels and wooden bowls, and in forming chains and rings for the arms and legs, of gold, ſilver, and ivory. They alſo perform ſmiths work, and by means of a ſmall pair of bellows, with two or three pipes, which is entirely their own invention, they, with a great ſtone for an anvil, make not only ſwords, and other offenſive weapons, but inſtruments of agriculture, fiſhing hooks, and harpoons, knives, and tools for making their canoes, the largeſt of which are about thirty feet long. They likewiſe make ſeveral ſorts of muſical inſtruments, which reſemble thoſe we have already deſcribed, in treating of the other parts of Guinea.

The negroes are commendable for their having no beggars among them; for one of them no ſooner finds himſelf ſo poor, that it is difficult for him to procure ſubſiſtence, than he binds himſelf for a certain ſum of money, or his friends do it for him; and the maſter for whom he engages to work, ſets him a taſk that is far from being ſlaviſh, he being uſually obliged to defend him in caſe he ſhould be attacked, and to ſpend his leiſure time in aſſiſting him to cultivate the earth. Yet all the people in general, from the king to the meaneſt ſubject, make no ſcruple of begging of the Europeans whatever they like.

When the natives are ſick, they in the firſt place have recourſe to remedies; but not eſteeming thoſe alone ſufficient to reſtore health and preſerve life, they apply to their ſuperſtitious worſhip. The ſame perſon being both prieſt and phyſician, he eaſily perſuades the relations of his patient that he cannot be recovered without ſome offerings, and therefore propoſes a ſheep, a hog, a cock, or what he likes beſt; but always proportions the ſacrifice to the circumſtances of the perſon whom he endeavours to cure. If the diſeaſe continues to increaſe, more expenſive offerings are made. Frequently one phyſician is diſcharged with a good reward, and another called in his ſtead; and this change of phyſicians is ſometimes repeated twenty times or more ſucceſſively, each of whom makes freſh offerings, and appropriates them as they always do, to his own private uſe.

The boys who are ſlaves or ſervants to the Europeans, when fond of their maſter, will, on his being ſeized with the leaſt indiſpoſition, go without his knowledge, and make offerings for him, that he may recover his health; and accordingly there are ſometimes found on the beds, or in the chambers of the Europeans, things conſecrated by the prieſt, and laid there to preſerve their maſter's lives; but as they are ſenſible that the Europeans are offended at their ſhewing ſuch marks of their gratitude and affection, this is always done privately, and ſo well

well concealed, as ſeldom to be diſcovered before the perſon's death, when they have not time to take them away.

The principal medicines uſed here, are grains of paradiſe, lemon or lime juice, about thirty ſorts of herbs endued with ſanative virtues, with the roots, branches, and gums of trees; and with theſe very extraordinary cures are ſometimes performed.

A perſon has no ſooner breathed his laſt, than his relations and friends ſet up a diſmal cry, while the youth of his acquaintance now uſually fire muſkets, to ſhew their reſpect. If the deceaſed be a man of rank, his wives, inſtantly cauſe their heads to be cloſe ſhaved, then ſmearing their bodies with white earth, they put on an old worn-out garment, and run about the ſtreets, making dreadful lamentations, continually repeating the name of the deceaſed, and the great actions of his life; and this they continue ſeveral days ſucceſſively, till the corpſe is interred.

While the women are thus lamenting abroad, the neareſt relations ſit by the corpſe, making a diſmal noiſe and at the ſame time are employed in waſhing themſelves; the diſtant relations alſo aſſemble from all parts to be preſent at theſe mournful rites. The town's people, and the acquaintance of the deceaſed, likewiſe come to join their lamentations, each bringing a preſent of gold, brandy, fine cloth, ſheets, or other things, to be carried to the grave with the corpſe; and the larger the preſent is, the more it redounds to the perſon's honour who makes it.

During this ingreſs and egreſs of all ſorts of people, brandy is very briſkly filled out in the morning, and palm wine in the afternoon; whence the funeral of a rich negro is very expenſive. The body is afterwards richly dreſſed, and put into the coffin with fetiches of gold, the fineſt corals, and ſeveral other things of value, which it is imagined the deceaſed will have occaſion for in the other world. After two or three days, the relations and friends all aſſemble, and the corpſe is carried to the grave, followed by a number of men and women, without the leaſt order, ſome crying and ſhrieking, and others ſilent. Many young ſoldiers running about at the ſame time, load and diſcharge their muſkets, till the deceaſed is laid in the ground.

The corpſe being interred, the multitude go where they pleaſe; but moſt of them return to the houſe, in order to ſpend their time in drinking and mirth. This continues ſeveral days, during which every thing rather reſembles a wedding, than a time of mourning.

A king, or very great perſon, is ſometimes kept a year above ground; when, to prevent the putrefaction of the corpſe, they lay it upon a wooden frame like a grid-iron, that ſtands a conſiderable height over a gentle clear fire, which dries it by ſlow degrees. When a prince is to be publicly buried, notice is firſt given, not only to the inhabitants of his own country, but to other nations, which brings a prodigious concourſe of people, all of whom are as richly dreſſed as poſſible. Several of the ſlaves of the deceaſed are ſaid to be ſlain at theſe funerals, that they may ſerve him in the other world; as are alſo thoſe whom he has dedicated to his falſe gods, with one of his wives, and one of his principal ſervants: even ſome poor wretches whom the infirmities of age, or other accidents have rendered incapable of labour, are bought in order to encreaſe the number of theſe horrid offerings, and are put to death with every circumſtance of inhumanity. With the utmoſt horror, ſays Mr. Boſman, I ſaw eleven perſons killed in this manner; among whom was one, who, after having endured the moſt exquiſite tortures, was delivered to a child of ſix years of age, who was ordered to cut off his head, which he was about an hour in performing, he not being ſtrong enough to wield the ſabre. But theſe inhuman ſacrifices are only in uſe among the negroes who are at diſtance from the European forts.

They generally erect a ſmall cottage, or plant a little garden of rice on the grave, into which they put ſome of the deceaſed's goods, but none of his houſhold furniture.

SECT. XV.

Of the Religion of the Negroes on the Gold Coaſt.

MOST of the negroes on the Gold Coaſt believe in one God, to whom they attribute the creation of the world, and every thing in it; but, like the other negroes, make their offerings, and offer up their prayers to their fetiches. They have different opinions concerning the creation; many of them believe, that in the beginning God created black as well as white men, and immediately offered them two ſorts of gifts, gold and the knowledge of the arts of reading and writing; and allowing the blacks to chooſe firſt, they made choice of gold, and left the knowledge of letters to the whites. God, they ſay, granted their requeſt; but, being offended at their avarice, ordered that the whites ſhould for ever be their maſters. Hence they believe, that there is no gold in any other country beſides their own; and that no blacks have any knowledge of letters, nor any notion of the extent of the world, but what they obtain from our informations.

However, it is certain that this opinion of the creation cannot be very antient; for if by the white men are meant the Europeans, they could have no idea of there being any ſuch before the Portugueze diſcovered their coaſt.

It appears that all the negroes, and even the inhabitants of Madagaſcar, have their fetiches; though in different countries theſe kind of idols have different names and are formed of different ſubſtances. Thoſe of this country give that name to ſome ornament worn on the head, or any other ſubſtance dedicated to ſome inviſible ſpirit. Beſides, each feticheer, or prieſt, has here a peculiar fetiche, prepared in a different manner; which is moſtly a large wooden pipe filled with earth, oil, blood, the bones of dead men and beaſts, feathers, hair, and the like. By theſe mixtures the prieſt probably ſuppoſes that he forms a kind of necromantic charm or taliſman, by which he can prevail on ſome ſpirit to perform what he deſires.

If a negro is to take an oath before this fetiche, he firſt enquires of the prieſt what is its name, each having a peculiar one; then calling the fetiche by it, he repeats what he is to confirm by an oath, deſiring that he may be puniſhed with death, if he ſwears falſly: then going round the pipe, he ſtops in the ſame place, and repeats the oath a ſecond time, in the ſame manner as before, and ſo a third time. After this the feticheer takes ſome of the ingredients out of the pipe, with which he touches the perſon's head, arms, belly, and legs; and, holding it above his head, turns it three times round. He then cuts a bit of the nail of one finger on each hand, and one toe on each foot, and ſome of the hair of the head, all which he puts into the pipe; and thus concludes the ceremony.

Public religious exerciſes are ſometimes performed by a whole town or nation, on account of great floods, or an extraordinary drought. Upon theſe occaſions the chief perſons of the town or nation aſſemble, and adviſe with the prieſt about the courſe moſt proper to be taken to remove the calamity; and what he orders is immediately commanded or forbidden throughout the land, by a public cryer; and whoever preſumes to act contrary to this order, incurs a large pecuniary penalty.

Almoſt every village has a ſmall grove, in which the governors and principal people frequently repair to make their offerings, either for the public good or for themſelves. Theſe groves are eſteemed ſacred, no perſon preſuming to defile them, or to cut or break off any branches of the trees.

They have particular days in which they refrain from drinking wine, and each perſon is forbid to eat a particular kind of fleſh: thus, one eats no mutton, another no goats fleſh, another no beef, another no pork, wild fowl, or cocks with white feathers; and this reſtraint laſts as long as their lives.

They, like other negroes, imagine that their fetiches inſpect their courſe of life, reward the good, and puniſh the

the wicked; but their rewards generally conſiſt in a multiplicity of wives and ſlaves, and their puniſhments in the want of them, though the moſt terrible puniſhment they can imagine is death. Their ideas of a future ſtate are very different: moſt of them imagine that immediately after death a perſon goes to another world, where he lives in the ſame manner as he did here, and makes uſe of all the offerings his friends and relations made at the time of his deceaſe; but few of them have any idea of being rewarded or puniſhed for the good or evil actions of their paſt life.

Some however believe, that the deceaſed are inſtantly conveyed to a famous river ſituated in the inland country, where their god enquires what ſort of a life they have lived; whether they have religiouſly obſerved the holidays dedicated to him; whether they have abſtained from all forbidden meats, and inviolably kept their oaths; which if they have, they are gently wafted over the river to a delightful country, abounding with every thing that can contribute to their happineſs. But if, on the contrary, the departed hath ſinned againſt any of theſe rules, his god plunges him into the river, where he is drowned and loſt in eternal oblivion.

In this part of Guinea they have a very extraordinary annual ceremony, which conſiſts in baniſhing of the devil out of all the towns. This is preceded by a feaſt of eight days, accompanied with ſinging, dancing, mirth, and jollity; and in this time they are allowed freely to ſing of all the faults, villanies, and frauds of their ſuperiors, as well as inferiors, without the leaſt puniſhment; the only way of ſtopping their mouths being to ply them well with liquor, upon which they alter their tone, and turn their ſatyrical ballads into ſongs in praiſe of thoſe who treat them.

This time of licence being ended, they hunt out the devil with an horrid cry, running after one another, and throwing ſtones, dirt, and every thing that comes in their way at the ſuppoſed fiend. When they have driven him far enough out of town, they return to their houſes; on which the women immediately waſh and ſcour all their wooden and earthen veſſels, to cleanſe them from all pollution.

SECT. XVI.

Of the Kingdoms and States on the Gold Coaſt; and firſt of Aquamboe, Agonna, Acron, Fantin, and Sabu: with the European Forts in each.

WE ſhall now give a deſcription of the ſeveral kingdoms or ſtates into which the Gold Coaſt is divided, and at the ſame time take notice of the factories of the Europeans.

The country of Aquamboe, on the moſt eaſtern part of this coaſt, is ſituated chiefly within land, and is one of the greateſt monarchies on the coaſt of Guinea: the maritime part of this kingdom, which is diſtinguiſhed from the reſt by the name of Acra, indeed extends only twenty miles along the ſhore; but it ſtretches ten times as far within land. The Aquamboe negroes are haughty, arrogant, and warlike; and the neighbouring nations are continually infeſted by their incurſions, in which they plunder and rob all before them.

In this kingdom the Engliſh, Danes, and Dutch have forts, but their authority is very ſmall, and confined within their own walls; for ſhould they make any attempts on the negroes, they would probably end in their deſtruction. Each fort has a village adjacent, diſtinguiſhed by its particular name. It might be reaſonably conjectured, that theſe three companies trading here might be ſufficient to cauſe diſſentions fatal to their commerce; but here is ſuch plenty of gold and ſlaves, that none of them is in danger of wanting a ſhare, eſpecially as each is ſtocked with commodities which the other has not. The king and his nobles, or rather favourites, are ſo very rich in gold and ſlaves, that this country is ſaid to poſſeſs greater treaſures than all the reſt of the Gold Coaſt put together.

The chief employments of the inhabitants, beſides that of war, are merchandize and agriculture; but though the ſoil is ſufficiently fertile, yet they generally fall ſhort of proviſions towards the end of the year, and are therefore obliged to fetch them from other places.

At Acra ſtands the Daniſh fort of Chriſtianſburg, ſituated in five degrees thirty minutes north latitude, and is the only one they poſſeſs on this coaſt. This fort, Mr. Boſman ſays, would be too ſtrong for the united force of the Engliſh and Dutch forts. It is a ſquare building, ſtrengthened with four batteries, and appears very beautiful. As the roof is flat, cannon may be conveniently planted on all parts of it.

Within a cannon-ſhot above this lies the Dutch fort Crevecœur, on the extremity of a high rock, the beach for landing being under the fire of the artillery and muſketry of the fort. The building is ſquare and flanked with batteries, joined by long curtains of a very irregular conſtruction. Mr. Boſman aſſerts, that it ſurpaſſes the Engliſh fort in ſize, and in the goodneſs of the guns, but does not exceed it in ſtrength, the walls being thinner, and conſequently not ſo good a defence.

Within a cannon-ſhot above this fort is that of the Engliſh, called Fort-James. This is a well-built ſquare edifice, with four baſtions: its walls are high and thick. It is built on the top of a ſteep rocky cliff that hangs over the ſea, and has a battery juſt under the wall next the water, where may be planted twenty pieces of heavy cannon; beſides which the fort has four ſtrong and large flankers; on which are mounted twenty-ſeven pieces of ordnance.

Round theſe forts is a delightful champaign country, which, not being ſo woody as the others, is by far the moſt pleaſant on the Gold Coaſt. There are ſalt-ponds belonging to the fort, which yield a ſufficient quantity of ſalt to ſupply not only the whole Gold Coaſt, but alſo all the ſhips that trade thither.

Farther to the weſt are the kingdoms of Acron and Agonna, the firſt of which has a Dutch fort in the middle of the coaſt that has two batteries, on which are mounted eight pieces of cannon, and under it is a ſmall village inhabited only by fiſhermen. The people of Acron ſeldom or never engage in war; for having choſen the Fantinians, their next neighbours to the weſtward, for their protectors, none dare to injure or attack them, which affords them an opportunity of tilling their land in quiet; and hence they have annually a plentiful harveſt, a great part of which they diſpoſe of to other countries.

About a mile to the eaſtward is a very high hill, termed The Devil's Mount, which is ſaid to contain vaſt quantities of gold, a great deal of which is waſhed down by the violent rains. About this hill begins the country of Agonna, which ſurpaſſes Acron in largeneſs, power, and riches, though they are nearly equal with reſpect to fertility and the pleaſantneſs of the countries.

The next country to the weſtward is Fantin, which extends about nine or ten miles along the ſea-ſide, it having on its weſtern extremity the Iron Mount, which is a quarter of a mile long at the baſe, and has from its bottom to its ſummit a delightful walk, ſo thick ſhaded with trees, that the light is obſcured at noon-day. The inland inhabitants are employed in trade, tillage, and the making of palm-wine; and the country, beſides its being rich in gold, produces all the neceſſaries of life, and more eſpecially corn, which the inhabitants ſell in large quantities to the ſhips that arrive there. The government is in the hands of a chief commander, whom they term their braffo, or leader. This is a kind of chief governor, whoſe power is ſuperior to that of any other ſingle perſon in the country; yet his authority is reſtrained by the old men, who form a kind of parliament.

In this diviſion the Engliſh have a ſmall, neat, and compact fort named Anamaboa. This is a large edifice flanked by two towers, and ſecured on the ſea-ſide by two baſtions of brick or ſtone, well cemented with lime. It ſtands upon a rock at the diſtance of thirty paces from the ſea. It is mounted with twelve pieces of cannon and two pateraroes, and defended by a garriſon of twelve whites and eighteen blacks, under the command of the chief factor. The greateſt inconvenience attending the ſituation, ariſes from the difficulty of landing from the ſhips, the ſhore being covered with rocks a ſmall diſtance into the ſea, or rendered equally dangerous by a continual high

high ſurf. The ſhips are therefore forced to come to an anchor on the outſide of the rocks, and the goods are landed by canoes upon a ſandy point, ſurrounded by a wall built at the expence of the company, and rendered very convenient by there being lodgings for the negroes under the cannon of the fort.

The fort of Anamaboa was abandoned in the year 1733; but the Engliſh afterwards reſumed the ſettlement, and have continued in it ever ſince.

The country round Anamaboa is mountainous, but the hills are at a ſufficient diſtance from the town. Five of them are remarkably high, and ſerve at ſea as land-marks to determine this diviſion of the coaſt. They being covered with wood, the multitude and variety of the trees form an agreeable proſpect. Palm wine is here made in great perfection, eſpecially that which they call quacker. The country is alſo populous, and exceeding rich in gold, ſlaves, and all the neceſſaries of life; but more particularly in corn, large quantities of which they ſell to the Europeans.

A little below Aga ſtands the village of Little Cormantin, thus named to diſtinguiſh it from Great Cormantin. This village is ſituated upon an eminence, eaſily diſtinguiſhed by a lofty tree that grows upon its ſummit. Hither the French and Portugueſe formerly carried on a great trade, and the Dutch had alſo a ſhare in it, till it was diſcovered that the negroes adulterated the gold. This firſt gave the Dutch a diſlike to the trade, and at length drove away moſt of the Europeans. Afterwards the trade was reſumed by the Dutch, about the year 1682, when they greatly enlarged and ſtrengthened Fort Amſterdam, which was the chief reſidence of the Engliſh, till they were driven thence by De Ruyter in 1665.

This is a ſquare ſtone building, ſtrengthened by four baſtions, mounting twenty pieces of cannon. In the center is a tower, on which the Dutch flag is fixed. This tower affords fine views of the ſea and country: the apartments of the officers and ſoldiers are neat, clean, and commodious: the parapets are ſpacious, and the fort is well ſupplied with water by means of large ciſterns that contain an incredible quantity of rain. The garriſon is compoſed of twenty-five white men and a number of blacks, who live happily and at their eaſe, and make fortunes with very little trouble.

About a cannot-ſhot from this fort ſtands Great Cormantin, a large and populous town, ſituated upon a high hill under the cannon of Fort Amſterdam. The number of merchants and fiſhermen in the town exceed twelve hundred, beſides the other inhabitants, who have different employments.

The next kingdom to the weſt is that of Sabu, which is of very ſmall extent; but produces an amazing quantity of Indian corn, potatoes, yams, oranges, lemons, bananas, and other fruit, beſides palm oil. The natives are eſteemed the moſt induſtrious people on the Gold Coaſt, being perpetually employed either in tilling the earth, fiſhing, or trading with the Europeans or Acaneſe, who exchange gold for the fruits and fiſh of Sabu.

The city of Sabu, in which the king reſides, ſtands two leagues from the coaſt, and is deſcribed as a long and populous city. The firſt place to the eaſtward of it is the Engliſh fort on Queen Anne's Point, which is built of ſtone and lime, upon an eminence about a mile from Fort Royal, and two miles from Naſſau Fort. It is defended by five pieces of cannon, and a garriſon of five white, and as many black men.

At a ſmall diſtance ſtands Mawry, or Mouree, a village which tho' ſituated upon an eminence, is very unhealthy; its market is bad, and every thing in it, even palm-wine and fruits, ſcarce and dear. The chief trade of the place conſiſts in gold duſt, with which canoes arrive every day from all the ſea-port towns. Before the Dutch fixed their reſidence here, it was an inconſiderable place; but now it carries on a flouriſhing trade, and contains above two hundred houſes, which ſurround three ſides of the Dutch fort of Naſſau. The greateſt part of the inhabitants are fiſhermen, four or five hundred of whom go every morning in canoes to catch fiſh; and, upon their return, are obliged to pay every fifth fiſh to the Dutch factor in the town, by way of toll or tribute. The houſes ſtand at a great diſtance from each other, and the intervening ſpace is generally filled up with a rock, which renders the paſſage from one to another incommodious, and ſometimes dangerous. This place is called The Grave of Dutchmen, on account of the great number who have died there; yet it is ſtill in a flouriſhing condition, as all the ſhips bound to the Gold Coaſt are forced to wood and water here.

Fort Naſſau, the moſt conſiderable Dutch ſettlement in Guinea, except Elmina, is ſituated upon a rock, and is watered towards the ſouth by the ſea. Its form is nearly quadrangular, the front being rather the largeſt ſide. It has four batteries, and eighteen pieces of cannon; and, if we except Elmina, has the higheſt walls of any fort on the coaſt. The curtain comprehends the two ſea-batteries, and is very ſpacious and convenient; but its greateſt ornament and ſtrength conſiſts in four towers at the angles, well provided with artillery, muskets, and ſtores. At a ſmall diſtance from the fort the company have a fine garden, kept in excellent order, and neatly laid out in groves of fruit-trees and parterres.

SECT. XVII.

Of the Kingdom of Fetu, with a particular Deſcription of Cape Coaſt Caſtle, the principal ſettlement of the Engliſh, and St. George Elmina, the chief Settlement of the Dutch on the Coaſt of Guinea.

WE now come to the kingdom of Fetu, or Fetou, which is bounded on the weſt by the river Benja and the kingdom of Commendo, on the north by the country of Ati, on the eaſt by Sabu, on the ſouth by the ocean, and, according to Boſman, is a hundred and ſixty miles in length, and near as much in breadth. The hills are covered with trees of various kinds, and the vallies watered by a number of rivulets; and it is extremely well ſituated for European ſettlements.

On the eaſtern part of this kingdom is Cape Coaſt, in five degrees north latitude, and under the ſame meridian as London. This is the chief Engliſh ſettlement upon the coaſt of Guinea. It is ſaid to have received its name from a corruption of Cabo Corſo, by which it was called by the Portugueſe. The Cape is formed by an angular point waſhed on the ſouth and eaſt by the ſea, and upon it ſtands the Engliſh fort, nine miles from Elmina. The Portugueſe ſettled here in 1610, and built the citadel upon a large rock, that projects into the ſea; but a few years after they were diſlodged by the Dutch, and in 1664, it was taken by admiral Holmes. The next year, De Ruyter, the Dutch admiral, having orders from the States to revenge the inſults committed by the Engliſh, attacked all the ſettlements of this nation along the coaſt, with a ſquadron of thirteen men of war, and even took, burnt, and ſunk all the ſhips belonging to the Engliſh company; but after all, was unable to take this fort, which was afterwards confirmed to the Engliſh by the treaty of Breda; and the king granting a new charter in 1672, the directors of the African company applied all their attention to fortify and render it commodious.

The walls, which are thick and high, particularly on the land ſide, are built partly of ſtone; but chiefly of brick, which the Engliſh made at a ſmall diſtance. To the height and ſtrength of its walls, the fort owes it principal ſecurity, and the neighbouring negroes dependent on the company, a protection againſt the incurſions of the Fantins. The interior parade, which is raiſed twenty feet, forms a quadrangular ſpace, cooled by gentle refreſhing ſea-breezes, to which it lies open, and is agreeably ſituated on account of its having in view Queen Anne's point, and all the ſhipping in the road of Anamaboa. This platform is defended by three pieces of large cannon; and the three other ſides of the ſquare contain ſpacious and handſome lodgings, with offices, and other conveniences; particularly on the ſouth ſide is a handſome chapel. Three pieces of artillery on the platform, command the road and its entrance, nor is the landing-place leſs expoſed to the fire of the muſketry behind the rocks. The fort has four baſtions, mounted with twenty-nine pieces of cannon. On the battle-

battlements are ten more, and upon the wall towards Tabora are ſix, which are of no other uſe than to keep thoſe negroes in awe.

The proſpect of this fortreſs is extremely beautiful towards the ſea; the fortifications are happily imagined, and all the aſſiſtance that art could give is added to nature. You enter it by a large gate, that leads to the ſquare parade juſt mentioned, which is capable of receiving five hundred men drawn up. The four baſtions have a communication with each other, by covered ways and curtains, forming a beautiful chain of batteries of fifteen cannon pointed towards the road. According to Smith, all the artillery of the fort amounts to forty pieces of large cannon, excluſive of demi-culverins; and Phillips ſays, that the garriſon is compoſed of an hundred men. The gates are ſhut every evening at eight o'clock, and defended by a regular guard.

The ſoldiers at Cape Coaſt are lodged in the beſt barracks of any upon the coaſt of Guinea, and daily receive their pay in gold duſt. There are likewiſe convenient apartments for the ſlaves, with forges for ſmiths, ſheds, and workhouſes for carpenters and other mechanics, with a convenient public kitchen.

The firſt ſtory is ornamented with a handſome balcony, which extends the whole length of the front, and the compting-houſe is large and convenient. Near the gate is a priſon for murderers, traitors, and other criminals convicted of capital crimes, where they are detained till an occaſion offers of ſending them to take their trials in England. In ſhort, there is cut in the rock beneath the platform, a large vault for the confinement of ſlaves; an horrid dungeon divided into a number of cells, ſo contrived as to prevent their revolting, or forming conſpiracies. None are confined there but ſuch as are purchaſed for exportation; an iron grate in the roof ſerves to admit the air, and as much light as is thought neceſſary, and the number of ſhips which frequent the coaſt prevent thoſe unhappy wretches being ſo long detained as to contract the diſtempers that proceed from cloſe confinement. The ciſtern for preſerving the water by which the fort is chiefly ſupplied, is hewn out of the rock, and is capable of holding four hundred hogſheads.

The company's gardens are ſaid to be no leſs than eight miles in circumference, but are without walls, or any other incloſure. Here the ſoil is fertile, and produces all the fruits found in warm climates, as citrons, plantains, lemons, oranges, bananas, tamarinds, pine-apples, cocoa-nuts, cinnamon, mangos, water-melons, cucumbers, and all kinds of ſallads and roots. It is thought that the cinnamon-tree would grow here to great perfection, were it properly cultivated. When Phillips was at Cape Coaſt, the African company had two gardens, the firſt a large one, which is probably that mentioned by Smith; the other the pleaſure-garden of the factory, in which they had a pleaſant ſummer-houſe, whither the gentlemen of the fort uſed frequently to retire.

The country is filled with mountains, which, without having any extraordinary height, render the vallies narrow by their ſtanding ſo cloſe to each other. They are over-run with a ſort of low thick briar, that renders them impaſſable, except where the paths are cut. The negroes do not cultivate one tenth part of the ground, and ſix months interruption will produce a new crop of briars in the places they had entirely cleared.

The Engliſh have built two forts in the neighbourhood of Cape Coaſt, the one called Phillips's Tower, and the other Fort Royal, or Queen Anne's Fort; each of them are three quarters of a mile diſtant from Cape Coaſt, the firſt ſtanding on an eminence on the ſide of the garden, ſouth-eaſt of the fort. In Boſman's time, Phillips's tower was garriſoned with ſix men, and intended to keep the negroes in awe, and to guard againſt the incurſions of the neighbouring nations, by means of ſome pieces of cannon.

Queen Anne's fort ſtands near the village of Manfro, on a hill called Daniſtein, where Frederickſburgh formerly ſtood. This is a ſquare building mounted with ſixteen pieces of cannon, twelve of them on a platform, and guarded by ſix white men, and an equal number of blacks. According to Des Marchais, it is acceſſible only by a crooked path, that forms a kind of ſpiral ſtreet, on each ſide bordered by negro huts.

The town of Manfro is of an oval form, ſituated on the banks of a river, and almoſt inacceſſible, by its being ſurrounded by rugged rocks. The inhabitants are conſtantly employed in agriculture, fiſhing, and making ſalt.

In the kingdom of Fetu is alſo the Dutch fort of La Mina, or St. George Elmina, a name which it received from the Portugueſe, but on what account is not eaſily determined, as there are no mines in the country. Boſman however ſuppoſes, with great probability, that the name roſe from the great abundance of gold ſent thither from the interior country, which made them imagine that it was produced in ſome neighbouring mines. The natives call the town Oddena; but the Europeans in general give it the Portugueſe name. It is of great length, but narrow, and the houſes are built of ſtone, hewn out of a neighbouring rock. It ſtands on the river Benja, in five degrees twenty minutes north latitude, upon a low flat peninſula, formed by the ſea on the ſouth, the river on the north, Commendo on the weſt, and the famous citadel of St. George Elmina on the eaſt. Towards Commendo it is fortified by a ſtrong wall of large ſtones, brought from an adjacent rock, a deep ditch, and ſeveral pieces of cannon mounted on each ſide of the gate. The wall extends from the ſea to the banks of the river which ſeparates the town from a fort on mount St. Jago, called Conradſburgh, which the Dutch built for the ſecurity of Elmina, on a ſituation that commands both the town and their chief factory.

The natives of this town are well limbed, of a robuſt and warlike diſpoſition, but more civilized than other negroes, from their familiar acquaintance with the Europeans. They are uſually employed in trading, fiſhing, and making palm wine and oil. They bring their fiſh to market about noon, and pay the Dutch a fifth by way of cuſtom. Their commerce extends along the coaſt even to Whidah.

In Elmina are a conſiderable number of neat artiſts, who work in metals in a manner little inferior to the artiſts of Europe. They caſt and carve in gold and ſilver, make ſword hilts, buttons, plain or filigrean rings, chains, and other ornaments, and are acquainted with the method of cutting, grinding, and poliſhing glaſs and cryſtal, and of giving them all ſhapes and forms. They have great addreſs in adulterating gold, and pretend that they learned that art from the Portugueſe; but if this be true, they greatly excel their inſtructors.

The town contains about two hundred houſes, in moſt of which are ſome mechanics. It is divided into three diſtricts, each of which has its particular privileges, and is governed by a chief, whom the negroes call braffo, under whom are caboceroes, and certain inferior officers, who, in ordinary caſes, are the miniſters of juſtice. The three chiefs, with their councils, form the regency and legiſlative part of this ſmall republic.

The citadel of Elmina, which ſtands in the center of the Gold Coaſt, is commodiouſly ſituated for the purpoſes of trade, and the ſecurity of the traders. It is ſeated upon a rock, and is bounded on one ſide by the ocean, and defended by ſtrong baſtions. The building is ſquare, ſurrounded by a high ſtone wall, cannon proof. The fort, excluſive of the out-works, is forty yards in length, and thirty-two in breadth, encompaſſed by four grand baſtions, or four interior batteries, two of which point towards the ſea, and are of a prodigious height, the peninſula on which they ſtand being there a high perpendicular rock: the other two front the river, where the land deſcends by a gentle declivity. Upon theſe four batteries are mounted forty pieces of heavy cannon, with a greater number of ſwivels and patteraroes. A little below ſtands another battery of large iron cannon, chiefly uſed for ſalutes and public rejoicings.

On the land ſide are two canals formed in the rock, ſerving for the ſecurity and convenience of the citadel, which they ſupply with freſh water, at the ſame time

that by means of a draw-bridge and two redoubts, mounted with eight pieces of cannon, it is rendered in a manner inacceſſible. As it is here leaſt fortified by nature, art has ſupplied that defect by portcullifes, ſtrong barricadoes, and iron rails of prodigious weight. The guard-houſe, which is placed juſt behind, is a ſtrong building, well defended with ſwivels, and a number of ſlits in the walls, by which the muſketry have the entire command of the river.

The principal building is a magnificent ſquare ſtone houſe, the upper part of which is appointed for the reſidence of the governor, and to his apartments is a grand flight of ſteps of black and white marble. On the top are placed two ſwivels, and a variety of ſmaller artillery, defended by a ſtrong guard of ſoldiers. In the way thither is a fine long gallery, beautifully ornamented with ſtucco work, and with Venetian windows handſomely glazed. There is a ſpacious chapel, with a rich altar, where prayers are ſaid every day, and all the officers are obliged to attend under the penalty of forfeiting about a ſhilling for each time of abſence, and double that ſum on Sundays and Thurſdays. The infirmary for the ſick and wounded, which is placed along the ramparts by the river ſide, is capable of containing an hundred perſons, and is attended by the ſurgeons of the fort. The magazines for ſtores, proviſions, and merchandize, are large, convenient, and always well ſtocked; nor is the factory, or the reſidence of the agents neglected, where there are accommodations for ſixty perſons, the number of ſervants, excluſive of ſoldiers, retained by the company. All merchandize and goods enter the fort by a gate towards the ſea, where is erected a crane and other machines for unloading the ſhips. In ſhort, Smith affirms, that this citadel is larger, more convenient, and beautiful than Cape Coaſt; but leſs pleaſant on account of the ſituation.

On the north ſide of the river Benja is Fort Conradſburgh, which ſtands on Mount St. Jago: the fortifying of this hill was judged neceſſary for the ſecurity of Elmina, though, if it once fell into the hands of an enemy, they would ſoon oblige that citadel to ſurrender. The fort of Conradſburgh is of a quadrangular form, with a ſtrong baſtion at each angle, and a curtain between each, built of ſtone, twelve feet high, behind which are four batteries mounted with forty-eight cannon. The interior edifice conſiſts of a tower that commands all the adjacent country, and affords commodious lodging for the garriſon, which conſiſts of twenty-five ſoldiers, with their officers, who are relieved every day from Elmina; and upon extraordinary emergencies are increaſed to double the number.

As this is a poſt of the utmoſt importance, it is always well ſupplied with ſtores and proviſions, and the fortifications kept in conſtant repair. On the ſide next Elmina it is of eaſy acceſs, a fine road being cut with an eaſy aſcent out of the rock; but it cannot there be attacked by an enemy, who would be between two fires, that from Elmina and the poſt of St. Jago. But towards Fetu and Commendo nothing can be ſtronger than the ſituation, which is a high perpendicular rock. The bridge over the river, which forms the communication between the two forts, is in the Dutch taſte, with a draw-bridge in the middle.

Below Mount St. Jago, on the north ſide, the Dutch company have a very fine garden, encloſed by high ſtone walls, and divided into beautiful alleys and parterres by rows of orange, lemon, cocoa, and palm trees. They have here all the fruits, pulſe, and roots that are natives of the country, as well as thoſe that are the natural growth of Europe. In the center is a magnificent dome, or temple, encompaſſed by lofty trees that afford the moſt delightful cooling ſhade and fragrance.

SECT. XVIII.

Of the Kingdoms of Commendo, Jaby, and Anta; with their Towns and European Forts.

THE kingdom called by travellers Commendo, Commany, Agueſto, and Guaffo, is ſituated to the eaſt of Fetu, and extends about five miles along the ſea-coaſt, and about as much up the country. This kingdom produces but little rice, yet the valleys are no leſs fertile than agreeable; and the hills are covered with wood, which affords the moſt delightful proſpects. In the center on the ſtrand ſtands Little Commendo, or Commany, behind which the land riſes by a gentle aſcent into little hills beautifully cloathed with woods of a perpetual verdure; and at the bottom are meadows and plains diſpoſed in the moſt agreeable manner, and filled with fruit-trees of various kinds.

The natives, who are of a warlike diſpoſition, are ſo numerous, that the king is able to raiſe in this little kingdom an army of twenty-thouſand men, and his uſual guard is compoſed of five hundred ſtout fellows well armed.

We ſhall begin with deſcribing Little Commendo, which ſtands upon the banks of a fine rivulet that diſcharges itſelf into the ſea, where there is a little oblong harbour for canoes. The natives are in general turbulent, cunning, and deceitful, much addicted to lying and ſtealing. They are chiefly employed in fiſhing or in commerce, and their neighbours employ them as brokers and factors. Every morning ſeventy or eighty large canoes may be ſeen upon the coaſt fiſhing or trading with the European ſhips in the road. About noon, when the ſouth-weſt winds begin to blow, they put to ſhore, for the facility of unloading, and ſecuring a market for their cargoes, either at Great or Little Commendo; whither the inland negroes aſſemble with the commodities of their ſeveral countries; and no markets upon earth are better ſupplied with all ſorts of grain, fruit, pulſe, roots, and fiſh.

Here the Engliſh and Dutch have forts: that of the former is a regular ſpacious ſquare, with twenty-four pieces of iron cannon, and is well ſupplied with water. According to Smith, this is the principal fortification the Engliſh poſſeſs on the Gold Coaſt next to Cape Coaſt, and is defended by a garriſon of ſixty men, including negroes. The Dutch fort of Wedenburgh is only a muſket-ſhot diſtance; but the advantages ariſing from ſo near a vicinity have been deſtroyed by the quarrels and jealouſies of both nations, who, according to Smith, never live upon a footing of friendſhip.

The fort of Wedenburgh was built in 1688, and is a ſquare building, defended by good batteries capable of mounting thirty-two pieces of ordnance. In 1695 it was attacked by the negroes in the night, at a time when twenty out of the ſmall garriſon, commanded by Boſman, were laid up with ſickneſs; but, after an engagement of five hours, they were repulſed with conſiderable loſs. Though the negroes poured their ſhot into the embraſures, which could not be cloſe ſhut, they were ſuch bad markſmen that Boſman loſt only two men: but they returned a ſecond time to the charge, reſolving to enter ſword in hand. Boſman ſent for relief to Elmina, and a ſeaſonable reinforcement arrived juſt as the negroes were cutting down the port-holes with their ſwords. An obſtinate engagement enſued between this detachment, which endeavoured to force a way into the fort, and the negroes, who ſtrove to oppoſe them. After a warm action, which laſted only half an hour, the Dutch were defeated; but a conſiderable number of them finding means to enter the fort, the ſpirits of the garriſon were raiſed, and the negroes diſcouraged from proſecuting the ſiege. Boſman aſſerts, that his gunner had the treachery to nail up his cannon, which had like to have occaſioned the loſs of the fort. When the ſiege was raiſed, this villain, who had ſo baſely acted contrary to his truſt, was ſent in irons to Elmina to be puniſhed according to his deſerts; inſtead of which, the director-general not only ſet him at liberty, but promoted him to a place of greater truſt and profit.

The chief commodities for which there is a great demand by the negroes of Commendo, are glaſs beads, woollen ſtuffs, linen cloths, braſs bells, and buttons; but theſe articles are ſold only by retail, and ſuch a variety of factors, brokers, and agents are employed by theſe negroes as makes trading with them very tedious. When they are at war with a neighbouring nation, great profit may be made by trading thither for ſlaves; for they

they hurry to diſpoſe of their priſoners, in order to ſave the expence of maintaining them.

A little farther to the weſt lies the country of Jaby, or Jabah, where the king is ſo poor that Boſman adviſed the European merchants not to truſt him with goods to the value of ten pounds ſterling, not from any diſtruſt of his principles, but of his ability to pay. The fertility of the ſoil would ſoon enrich the inhabitants, were they not expoſed to the continual inroads of their neighbours, who ſpoil and deſtroy what they are unable to carry away.

Anta, which lies farther to the weſt, is bounded on the north by the country of Adom, on the weſt by Axim, and on the ſouth and ſouth-eaſt by the ocean, it extending about ten leagues from eaſt to weſt. The country is mountainous, and covered by large trees, among which ſtand a number of villages. The land is well watered; the valleys rich and extenſive, producing abundance of rice, the beſt ſort of maize, ſugar-canes, yams, and potatoes. The ſoil along the banks of the river of Bourtry is as fine as can be met with in any part of the earth, and the country is equally rich and beautiful; but by the continual wars in which the people have been engaged with Adom and their other neighbours, they are far from being a potent and populous people, as they once were; the country is thinned of its inhabitants, and theſe are become entirely diſpirited, ſheltering themſelves under the cannon of the Dutch fort, and leaving the greateſt part of the land uncultivated. Every thing is, however, exceeding cheap; and this country enjoys the advantage of having the moſt healthful ſituation on the coaſt.

The moſt conſiderable villages of this country are Bourtry, or Botro, Tocorary, Suconda, Anta, and Sama, all of which deſerve particular notice. The river that waſhes Bourtry is navigable for only four miles up; its banks are covered with ſtately trees that ſpread a melancholy ſhade over the water; and, where it ceaſes to be navigable, its courſe is interrupted by rocks and prodigious falls of water, which, though they diminiſh the conveniency of that river, add to the beauty of the ſcene. On both ſides you ſee infinite numbers of apes, tygers, wild cats, and ſome elephants; and alſo horſes, cows, ſheep, hogs, fowls, and a great variety of birds of different ſpecies. Its waters are filled with delicious fiſh; but the catching them is rendered dangerous by the multitude of crocodiles and ſharks with which the river is infeſted.

Bourtry is ſituated upon this river, at the foot of an eminence, on which the Dutch have built an irregular and mean fort, of an oblong form, divided into two parts, each defended by four ſmall pieces of cannon. This fort is called Badenſtyn: its batteries command the village of Bourtry, which has no other commerce than the gold trade carried on with the negroes of Adom. The inhabitants, who are of a mild and gentle diſpoſition, are fond of the Europeans, whom they regard as their protectors.

Tocorary, or, as it is called by the Engliſh, Tocorado, is the principal village on the coaſt. It is ſituated on a hill which advances into the ſea, and is ſurrounded by a number of rocks, ſome below and others above the ſurface of the water, for two miles along the ſhore; and thoſe rocks are rendered very remarkable by the prodigious waves that daſh againſt them. The town, which lies behind theſe rocks, is on the land-ſide embelliſhed with plains and delicious valleys, with large trees and thick groves. Here was a fort which ſucceſſively paſſed through the hands of the Portugueſe, Danes, Pruſſians, Dutch, and Engliſh; but only the ruins of it are now to be ſeen.

The inhabitants of Tocorado are ſaid to build the beſt canoes of any in Guinea; theſe are frequently thirty feet long and eight broad, formed of the trunk of a ſingle tree. The European ſhips who frequent theſe coaſts uſually load and unload with theſe canoes, which are in ſuch reputation, that they are never ſold for leſs than forty or fifty pounds ſterling.

Suconda is a rich and pleaſant village about ſix miles diſtant from Bourtry, and before the wars which laid waſte this country, was eſteemed the fineſt village on the whole coaſt. The country for eight or ten miles round is as beautiful as can be imagined. The French had formerly an eſtabliſhment here, but the Engliſh and Dutch are at preſent the only Europeans who maintain forts at Suconda. That of the Dutch, which is called Orange Fort, was built in 1682; the Engliſh fort was erected a few years before. Both theſe forts were taken by the natives, and recovered from them; but in the year 1700 there remained only the walls of the Engliſh fort; but though the Dutch poſſeſſed the whole trade, they drew but little advantage from it, becauſe the efforts of the Engliſh to reſtore themſelves greatly diſturbed their operations. At laſt, however, a re-eſtabliſhment was effected, and a new fort roſe out of the ruins of the old, with more ſplendor and ſtrength than the former. Smith repreſents it as larger and better fortified than Dick's Cove: it is of a quadrangular form, ſituated upon an eminence about fifty paces from the ſea, between the Dutch forts of Tocorado on the weſt, and Sama on the eaſt. It is built of brick, and mounted with ſeveral pieces of cannon, the garriſon conſiſting of five white and twenty black men. The Europeans at Suconda enjoy this advantage, that as the fort ſtands ſo near, the factors of both nations, when they live in friendſhip and harmony, have conſtant opportunities of enjoying each other's company, an advantage of ineſtimable value to ſocial beings placed in a barbarous and ignorant country.

Sama is ſituated on an eminence, and its fort watered by the river St. George, that diſcharges itſelf into the ſea. This town conſiſts of about two hundred houſes, which ſeem to form three villages, one of which is under the cannon of the Dutch fort of St. Sebaſtian. The ſole employment of the natives is fiſhing.

The Dutch fort is built nearly upon the ſame plan as that of Bourtry, the apartments are convenient, and the ſituation for trade exceeding favourable.

SECT. XIX.

Of the Country of Axim; the Manner in which it is governed, and of the European Forts in that Country.

THE next country to the weſt is that of Axim, which was formerly a powerful republic; but on the arrival of the Brandenburghers, one party, in expectation of an eaſier government, put themſelves under the protection of thoſe ſtrangers, while the other adhered to the Dutch. This country produces a very great quantity of rice, ananas, water-melons, cocoas, bananas, lemons of two different kinds, with abundance of other fruit, and vegetables of all ſorts; and the country is ſubject to almoſt continual rains. The natives export rice to all the kingdoms of the coaſt, bringing home in return palm oil, millet, yams, and potatoes. Axim alſo produces great numbers of cows, ſheep, goats, and tame pigeons, as well as other fowls. The country is filled with populous villages, ſome of which are by the ſea-ſide, and others far up the country. The intermediate lands are well cultivated, and the ſoil is ſo fertile, that it richly repays the labour of the huſbandman.

The capital, which is named Achombone, ſtands under the canon of the Dutch fort, and behind is ſecured by a thick wood that covers the whole declivity of a neighbouring hill. All the houſes are ſeparated by groves of cocoas and other fruit-trees, planted in parallel lines, each of an equal width, and forming an elegant viſta. Theſe avenues, with the extenſive proſpect, renders the Dutch fort one of the pleaſanteſt eſtabliſhments in Guinea. This advantage is greatly diminiſhed by the moiſture of the air and the unhealthineſs of the climate, particularly during the rainy ſeaſon.

The government of this little republic is compoſed of two bodies of the natives, the caboceroes, or chiefs, and the manceroes, or the commons. The cognizance of all civil affairs belongs to the caboceroes, but whatever is of general concern equally comes under the cognizance of both members of the ſtate. Thus, making peace or war, treaties or alliances, impoſing taxes, levying or paying tributes to foreigners, are determined upon by both bodies compoſing the legiſlative power. Their conſtitution ſeems to have ſome reſemblance to that of Britain, where nothing paſſes into a law that has not the aſſent of both the lords

and

and commons. Theſe laſt in ſome reſpects enjoy ſuperior privileges to the caboceroes, who are often impeached before the bar of the commons; but no manceroes can be tried for crimes of a public nature, but by their own aſſembly. However, in common affairs juſtice is uſually adminiſtered by the caboceroes, who are ſaid to be greatly influenced by the bribes that are offered them, which they receive, and (except in very notorious caſes) uſually decide in favour of him who brings the moſt gold or brandy.

The plaintiff, ſometimes finding that the ſentence will be either tedious or unfavourable, redreſſes himſelf by ſeizing on the gold or ſlaves of the aggreſſor; but in this method of retaliation keeps ſtrictly within the bounds of juſtice, apprehending no ill conſequence, provided he does but live in another town or village, where he is ſure of being ſupported by his townſmen. Thus a private quarrel is often terminated by a civil broil, which can be no otherwiſe appeaſed than by the ſword, or an agreement between the original opponents. Should the ſentence of the caboceroes happen to be equitable, or the cauſe be decided by the Dutch governor, the diſpute is amicably concluded; but if neither party produces ſufficient evidence by witneſs, or probable circumſtances, the defendant, who clears himſelf by oath, is acquitted. The oath of purgation is always preferred to that of accuſation; but if the plaintiff proves his charge by two, or even one witneſs, the purgation oath is not permitted to be taken.

All crimes are atoned for by fines; but murder is puniſhed either by death or a pecuniary mulct. The former is however ſeldom executed, except where the criminal is poor. Theſe fines are of two ſorts, that for the murdering of a ſlave being trifling in compariſon of that exacted for the life of a freeman. At Axim all fines are paid into the hands of the Dutch factor, who in a manner aſſumes the ſupreme executive power. Theſe fines he diſtributes to the injured perſon, after having firſt deducted his fee, which is no more than eight crowns for determining the moſt important ſuit that comes before him.

The only puniſhment for theft is reſtitution, and paying a fine proportioned to the quality of the offender; but in caſes of debt the creditor may ſeize the property of the debtor, to the value of double the ſum due to him; but the execution of this law being eſteemed oppreſſive, they uſually ſettle the account by arbitration, or by reſtoring the goods bought.

The Dutch fort of St. Anthony ſtands on a high rock, which projects into the ſea in the form of a peninſula, and is ſo inviroued on that ſide by dangerous ſhoals and ſunk rocks, as to be inacceſſible to an enemy, and by land it is fortified by a parapet, a draw-bridge, and a battery of heavy cannon. The building is but ſmall, on account of the narrowneſs of the rock on which it ſtands; but it is neat, ſtrong, and commodious. At ſome diſtance at ſea it reſembles a large white houſe; but for two miles along the ſhore nothing can be more agreeable than the fort in perſpective with the village of Achombone, the wood behind, and the multitude of rocks of unequal heights, which border upon the coaſt.

This fort is of a triangular form, and has three batteries, one towards the ſea and two towards the land, on all which are mounted twenty-four pieces of iron cannon, beſides redoubts. The gate is low, and ſecured by a ditch hewn out of the rock, and, as hath been already mentioned, a draw-bridge, behind which is a platform capable of holding twenty men ranged in military order. The houſe of the factor, or preſident, is of brick; it is of the ſame form as the fort, and has three fronts, each of which has an eſplanade adorned with orange-trees. The garriſon is generally compoſed of twenty-five white men, and an equal number of blacks, under the command of a ſerjeant.

Three leagues to the eaſt of Achombone is Mount Manſore, near which is a large and populous town called Pockeſo, where each houſe is ſurrounded with a grove of cocoa-trees. Mount Manſore is an excellent ſituation for a fort, it being the firſt point of Cape Tres Puntas; and here the Brandenburghers or Pruſſians have their principal factory called Fredericſburgh. This fort is extremely well built, ſtrong, and beautiful, mounting forty-ſix cannon upon four batteries. But Boſman obſerves, that the cannon are too ſmall, conſidering the importance of the ſettlement, and the gate too large. On the eaſt ſide is a beautiful out-work; yet it only ſerves to diminiſh the ſtrength of the fort; its greateſt fault is the breaſt-work's being too low; for as it reaches no higher than the knee, the garriſon, in caſe of an attack, would be expoſed to the fire of the enemy.

According to Des Marchais, this fort was quitted by the Pruſſians in the year 1720, when they put it into the hands of the king of Cape Tres Puntas; ſoon after which the Dutch attacked the place, under pretence of a prior contract with the Pruſſians; but the king received them with ſuch ſpirit and addreſs, that after the loſs of a hundred and fifty-five men, they were forced to quit the ſiege, and embark with great precipitation: but ſome time after the Dutch made a more ſucceſsful effort, took it from the natives, and have kept poſſeſſion of it ever ſince.

Cape Tres Puntas received its name from the Portugueſe, on account of its being compoſed of three points projecting into the ſea. Theſe points, which are little hills, are ſeparated by ſmall bays that afford good anchorage, and each of the hills is covered with beautiful woods, which are ſeen at ſea at a great diſtance. Upon the ſhore of the two bays are three villages, Acora, Acron, and Inſiamma; to the laſt the Engliſh give the name of Dick's Cove. The village of Acora is ſituated at the bottom of the moſt weſterly bay, Acron on the declivity of the middle point, and Dick's Cove on a ſmall gulf formed by the land between that point and Acron. All this coaſt is mountainous and woody; the moſt eſteemed timber it produces is a yellow tree much uſed in tables, chairs, and other houſhold furniture.

Near Acora ſtands the little fort of Dorothea, which conſiſts of one flat-roofed houſe, defended by two batteries of ten guns each, and divided into a great variety of convenient apartments.

Dick's Cove is ſituated two miles to the eaſt of Dorothea. It borders on the ſea, is of a quadrangular form, built of ſtone and mortar, and is deſcribed by Smith as a complete and regular fortification, with four baſtions, mounting twenty pieces of ordnance, and adorned with gardens equally pleaſant and uſeful.

SECT. XX.

Of the TOOTH COAST.

Its Situation, Name, and Diviſion; its Vegetables; the Face of the Country, and the Animals; with a Deſcription of the Sea Devil, the Zingana, and the Sea Bull, or Horned Fiſh.

WE come now to the third diviſion of Guinea, called the Ivory or Tooth Coaſt, which takes its name from the elephants teeth found here, and is bounded by Nigritia on the north, by the Gold Coaſt on the eaſt, by the ocean on the ſouth, and by the Grain or Pepper Coaſt on the weſt; but both geographers and ſeamen are divided in their opinions concerning its extent and limits, ſome confining it between the river Suera da Coſta and Grova, two miles to the eaſt of Cape Palmas; but others ſtretch its boundary from the laſt-mentioned cape to Cape Tres Puntas, or Three Points, all that ſhore being known to mariners under the name of the Tooth Coaſt. Others again repreſent its limits as contained within Cape Apollonia to the eaſt, and Cape Palmas to the weſt.

Cape Apollonia, thus called by the Portugueſe from their diſcovering it on St. Apollonia's day, ſtands, according to Des Marchais, in four degrees fifty minutes north latitude, half way between the river Suera da Coſta and Cape Tres Puntas. It is remarkable for its height, and the lofty trees with which it is covered. It points a little ſouthward, appearing low along the ſhore, and riſing behind into three lofty mountains, that in clear weather may be ſeen at a great diſtance at ſea. Upon each of theſe mountains are groves, and in the intermediate valleys are three or four pretty villages built cloſe to the ſea-ſide. In general, excepting a few capes, all the coaſt from Cape Apollonia is ſo low, equal, and ſtraight, that it is difficult for ſhips to diſtinguiſh places; and,

and indeed, beſides theſe capes, the only diſtinct landmarks are the heights and mountains round Drewin.

The Tooth Coaſt is by ſome authors divided into the Quaqua, the Malagantes, and the Ivory Coaſt.

The Dutch have given the eaſtern part of this coaſt the name of Quaqua, from the natives, on their ſeeing a ſhip approach, repeating that word, which Villault imagines expreſſes a kind of welcome, and obſerves, that the maſter of an entertainment uſually repeats it to his gueſts; but Smith affirms, that Quaqua, in the language of the country, ſignifies no more than teeth or ivory.

All the countries within the limits of the Ivory Coaſt are fruitful in rice, peaſe, beans, cocoa-nuts, oranges, citrons, and gooſeberries; and the natives frequently bring on board large ſugar-canes, which is a proof that ſugar might be cultivated there to advantage. The Ivory Coaſt is indeed one of the fineſt diviſions of Guinea, the proſpect of the mountains, and vallies filled with villages, is very delightful, moſt of thoſe little towns being encompaſſed with groves of lofty palms and cocoa-trees. The ſoil of the high lands is a reddiſh earth, which, with the perpetual verdure of the trees, forms an agreeable mixture of colours. Cotton and indigo are the ſpontaneous growth of the provinces of St. Andrew and Great Drewin, which are indeed the richeſt of the whole. Palm wine and oil are very plentiful, as is alſo a ſpecies of fruit that grows on a kind of palm-tree, called by the natives tombo. This they eat with great pleaſure, drinking at the ſame time a wine drawn from the ſame tree mixed with water; for its ſtrength is ſaid to render it unfit for being drank alone.

In this part of Guinea are elephants, which are very numerous in the inland countries; there are ſuch numbers of cows, ſheep, goats, and hogs, that they are ſold for a trifle; and the coaſt ſupplies the natives with a great variety and abundance of fiſh: but the moſt remarkable are the ſea-devil, the zingana, and the ſea-bull.

The ſea-devil is ſaid to be about twenty-five feet long, and proportionably thick; but what is moſt remarkable are the angles which project from its body, and are of a hard horny ſubſtance. The tail, which is long and taper like a whip, is armed with a ſharp point, which he frequently darts backwards, and his back is covered with hard excreſcences two inches high. The head, which is large, is joined immediately to the body without the ſmalleſt appearance of a neck, and is furniſhed with flat teeth. Nature has beſtowed on this animal four eyes, two of which are near the gills, and are large and round, but the two others on the forehead are of a ſmaller ſize. On each ſide the gullet are three horns of an equal length and thickneſs: that on the right ſide, which ſtands between the other two, is about three feet in length, and an inch and a half in circumference at its inſertion, gradually terminating in a ſharp point; but, as it is yielding and flexible, it is capable of doing little hurt, and affords but a feeble protection to the animal. In ſhort, the fleſh is tough and ill-taſted, though much ſought after by the negroes.

The zingana is a voracious animal, with a flat head, large red fiery eyes, and two rows of ſtrong teeth; the body, which is round, terminates in a ſtrong tail covered with a tough ſkin, ſpotted and not ſcaly. The fins are ſtrong, and aſſiſt him to dart with incredible rapidity at his prey. Nothing comes amiſs to the voracious appetite of this animal; but he is ſaid to be particularly fond of human fleſh.

The ſea-bull, alſo called the horned fiſh, is about three feet long, excluſive of the tail. His body is ſquare, of an equal thickneſs at both extremities, it being evrey where about five feet in circumference. The head has ſome reſemblance to that of a hog, but terminates in a proboſcis, which is ſomewhat like that of an elephant; it has no other paſſage for its food than through this trunk, and nothing is to be found in his ſtomach but ſmall fiſhes and ſea-weeds. His eyes, which are large, are fringed with a kind of ſtrong hard hair, and his forehead armed with two horns, which are bony, ſtrong, rough, pointed at the extremity, and about ſix inches in length. His ſkin is rough, ſtrong, and filled with pointed knobs; but not prickly or covered with ſhells. It is every where ſpotted with different colours, and has a mixture of grey, violet, and white. On his back riſe two excreſcences about three inches high, which run from the baſe of the horns almoſt to the tail, which is compoſed of two parts, the one fleſhy and covered with a continuation of the ſkin of the body, being in fact a part of the vertebræ of the back, but more flatted and pliant; the other a thick fin of a brown colour, ſtreaked with parallel lines of white, and ſerves both for its defence and for a kind of rudder.

SECT. XXI.

Of the Perſons, Manners, Guſtoms, and Trade of the Inhabitants of that Part of the Tooth Coaſt called Quaqua.

THE natives of the eaſtern part of the Ivory Coaſt, called Quaqua, are rather above the common ſtature, clean-limbed, and well-proportioned; at the firſt glance their features appear hideous, but, notwithſtanding the prejudices naturally conceived from their diſagreeable aſpect, ſeveral authors agree in repreſenting them as the moſt rational, civilized, and polite people in all Guinea; and this character they alſo bear among all their neighbours.

They drink a kind of beer called pito, and wine drawn from the Tombo palm, mixed with water; and Des Marchais ſays, that drunkenneſs is among them a crime of ſo odious a nature, that the laws have prohibited it under the ſevereſt penalties; it being a maxim among them, That to deſtroy one's reaſon or health is to level man with the brutes, to prejudice ſociety by robbing it of its uſeful members, and to deſtroy the effects of all laws and government; for a man void of reaſon cannot be influenced by laws, as he is ignorant of the propriety of his actions. Their food is, however, ſaid to be very coarſe and indelicate, and to be principally compoſed of different mixtures of rice, fiſh, fowl, kid and elephant's fleſh, all kept till they ſtink.

They are ſaid to look upon long nails as a great ornament, to dreſs their hair in treſſes, which they keep ſeparate by a paſte of palm oil and a kind of red earth; and they daily anoint their bodies with the ſame kind of paſte. They wear round the ſmall of their legs large rings of iron, and are charmed with the jingling ſound of thoſe rings and of bells faſtened to them, in the multitude of which conſiſt all their dignity and grandeur.

The common people have no other cloaths but a piece of cloth faſtened round the waiſt; but the wealthy have a ſort of cloak, or ſurplice, with long ſleeves, which hangs down below their knees; and by their ſide they wear a hanger, or ſhort ſword.

Their women, according to Villault, ſetting aſide their complexion, which is jet-black, would paſs for beauties in Europe from the regularity of their features, the brilliancy of their eyes, and their tall, ſlender, genteel ſhape. Some of them adorn their hair with little gold plates, in the making of which the artiſts of that country endeavour to excel. Theſe plates are ſometimes large, but in general they are thin, ſmall, and of little value; however, ſome women wear ſuch a number of theſe trinkets, that the whole is worth a conſiderable ſum. Thoſe who are unable to adorn their heads with ſuch ſplendor, divide the hair or wool into an infinity of ſmall treſſes, which they adorn with ivory, bougies, or cowries, pieces of oyſter-ſhells, and other ſhining baubles, which are alſo worn by thoſe who have plates of gold. The only dreſs of the women is a cloth without any particular form, and which falls over the fore part of their bodies, the back being entirely naked.

Theſe negroes have an averſion to the cuſtom which they obſerve among the Europeans, of the men kiſſing each other after a long abſence, or at parting; this they conſider as an unnatural action, and an affront to the other ſex. Their form of ſalutation is laying hold of the fingers, and making them crack.

It is here, as well as in India, a conſtant rule, that the ſon follows the profeſſion of his father, the ſon of a weaver being always bred a weaver, and that of a ſmith, a ſmith. This regulation is ſo firmly eſtabliſhed, that the whole country does not perhaps furniſh a ſingle

inſtance of the contrary; but this cuſtom is ſo far from improving them in the knowledge of the mechanic arts, that they are ſtill but very indifferent workmen; and, according to Atkins, a common lock is ſuch a curioſity, as to draw a whole country together to ſee it; a watch ſtill increaſes their admiration, and making paper ſpeak, as they term it, is quite miraculous. If they are ſent with a note, and told the contents before they go, they frequently make the experiment, whether the Europeans deceive them, in pretending to interpret the thoughts of an abſent perſon by thoſe crooked characters. This they do, by aſking the contents; but their ſurprize is inconceivable on hearing the note read. Of this they can form no idea, and they are ready to believe, that the white men have ſome familiar ſpirit that acts as factor or broker on theſe occaſions.

The uſual trade carried on here conſiſts of ivory, cotton cloths, gold, and ſlaves. All the countries behind Quaqua furniſh great ſtore of elephants teeth, and this is eſteemed the moſt beautiful ivory in the world; whence it is conſtantly bought up, as ſoon as brought to the coaſt, by the Engliſh, French, Dutch, and ſometimes by the Danes and Portugueſe; but though the commerce of this country is free to all nations, the Engliſh and Dutch enjoy the greateſt ſhare of it. The inland countries ſo abound with elephants, that notwithſtanding the perpetual war waged againſt them by the negroes, the elephants are ſo numerous, that according to ſeveral authors the natives are forced to dig their habitations under ground. However, their number is ſaid to have been greatly diminiſhed by a diſtemper that has crept among them, and made terrible havock, as well as by the conſtant endeavours of the natives to extirpate them.

According to Villault, the negroes manufacture a ſort of ſtrong ſtuff, ſtriped blue and white, three quarters wide, and about four ells long; and as theſe ſell well on the Gold Coaſt, the Europeans purchaſe them here for that market.

The country produces abundance of good cotton, which the negroes of the interior countries manufacture. The cotton pieces made here are not only extremely fine, but beautiful in their colours. The negroes on the coaſt act as brokers for thoſe of the inland countries, ſell their ſtuffs for them, and receive a certain ſhare by way of commiſſion. The Quaqua negroes likewiſe manufacture a kind of plant reſembling hemp into a ſtrong cloth, to which they give beautiful colours, and ſuch flowers and deſigns as ſhew them to be no bad artiſts in this way. They have alſo a very conſiderable trade in ſalt with their inland neighbours, to whom they ſell it at a high price, on account of the diſtance and expence of carriage.

The Europeans divert themſelves with ſeeing the canoes filled with men crowding round the ſhips, and each mouth uttering Quaqua, quaqua. One of them is no ſooner hoiſted on board, than the anxiety of the reſt is extremely viſible, from their looking about with the utmoſt impatience, as if waiting the fate of their companions. It is, indeed, with extreme difficulty that any of them are induced to come on board. It is probable, that ſome outrages have been committed by the Europeans, which have ever ſince inſpired them with fear and ſuſpicion. They are particularly afraid of the Engliſh, while they repoſe great confidence in the French. "It "is certain, ſays Mr. Smith, that they never approach "an Engliſh veſſel without dread of being carried away "into ſlavery:" whence it is probable, that ſome attempt of this nature has been made.

The natives uſually come five or ſix in a canoe along the ſhip's ſide; but ſeldom more than one or two have the reſolution to come on board, before they have ſeen how their companions are treated. They uſually enter the ſhips two at a time, with a couple of elephants teeth, and other goods, and theſe return to the canoe before the reſt leave it. Thoſe who come firſt narrowly examine the ſhip, obſerve whether the ſailors are armed, and what number of them are upon deck; but no intreaties can prevail on them to go below deck. When they have ſold their goods they return, and let their friends know the uſage they have received. Such dread have they of fire-arms, that ſeveral of them flung themſelves into the ſea upon Smith's firing a gun to bring to a ſhip he had diſcovered in the offing; and he obſerves, that if they diſcover any arms on board, they inſtantly ſcud away to the ſhore with all poſſible expedition.

It is extremely difficult and tedious trading with a people ſo jealous and timorous, whoſe language is unintelligible to the Europeans, and all the European languages no leſs ſo to them. Every thing is tranſacted by ſigns, or placing a certain quantity of merchandize near the ivory or gold wanted in exchange. They are in general extremely fond of preſents, however trifling, as if they conſidered them as pledges of eſteem and affection. A knife not worth ſix-pence, a braſs ring, a glaſs of brandy, or a biſcuit, the richeſt negro will receive with pleaſure; but the liberality of the Europeans ſeems to render them avaricious; Smith therefore recommends great caution in the manner of making theſe preſents.

SECT. XXII.

A Deſcription of the River St. Andrew, the adjacent Country, and the Manners of the Natives.

AS the Europeans have no ſettlements on the Ivory Coaſt, and uſually trade with the natives in their ſhips, a regular account of this country cannot be expected. The writers who have deſcribed it, have followed the method frequently obſerved in giving deſcriptions of countries they have never ſeen, by repreſenting the natives as the moſt ſavage and barbarous, and particularly being fond of devouring all the white men whom they can get into their power; but the falſehood of ſuch ridiculous aſſertions have been frequently demonſtrated, by a better acquaintance with nations ſo miſrepreſented; for the people of many countries, who, when little known, were deſcribed as anthropophagi, or man-eaters, have been found to be friendly, benevolent, and enemies to cruelty; we ſhall therefore confine our obſervations of this country to ſuch parts of it as are tolerably known.

The river of St. Andrew is a fine deep ſtream, increaſed near its mouth by being joined by another river. The entrance is ſurrounded by lofty trees, fine meadows, and rich fields of great extent. Nature ſeems to have intended this place for a fortreſs; for about five hundred paces from the mouth of the river, a peninſula extends a great way into the ſea, and is joined to the continent by a ſlender neck of land, about five or ſix fathoms broad. The whole peninſula is a high level rock, and has a platform four hundred feet in circumference, that commands all the neighbouring country. It is ſurrounded almoſt entirely by the ſea; the rock is perfectly ſteep and inacceſſible on the ſouth, eaſt, and weſt ſides; and the neck of land may be ſo eaſily defended, that a battery of five guns would render it impregnable. Beſides, to the north of this neck of land there is a fine ſpring of freſh water, capable of ſupplying a large garriſon, and of being ſecured by the cannon of a fort.

The land-marks in this place are ſo diſtinct, that it is impoſſible they ſhould be miſtaken. Here are lofty, thick, and ſhady trees, with three or four large villages that ſtrike the eye all at once, they being within the diſtance of half a mile of each other. All the meadows and fields round the mouth of this river are watered by pleaſant ſtreams that fertilize the ground, and render it fit for producing all kinds of corn, fruit, and roots, eſpecially maize, millet, rice, peas, yams, and melons. There are here fine natural groves of citrons, oranges, limes, and cocoa-nut trees, whoſe boughs are ſo cloſely intermingled, that all theſe ſeveral fruits might be imagined to be the produce of one large tree. Here the ſugar-cane, with a thouſand other plants, ſpring up in the greateſt perfection without cultivation; but are abandoned to the ravages of the elephant, and afford a ſhelter for other wild beaſts. In ſhort, whatever the Gold Coaſt produces, is found here in greater abundance and perfection.

As

As to the natives of this part of the Ivory Coaſt, the men, like thoſe we have juſt deſcribed, are well-made; the women are ſmall, but neatly proportioned; their features are regular, their eyes lively, and their teeth white, ſmall, and even. The men wear a looſe dreſs, reſembling a ſurplice, which reaches to the knees, and the women a narrow cloth round their waiſt, but many go perfectly naked. The rich men wear a poniard or long knife by their ſides, and are not deficient in courage and underſtanding; but the European traders having carried off ſome of them, they are become ſo ſuſpicious, that nothing can prevail on them to come on board, before the captain of the ſhip has gone through the ceremony of putting a drop of ſea-water in his eye, which they alſo perform as a kind of declaration, that they wiſh the loſs of their eyes, if they are guilty of a breach of faith, and a ſolemn engagement that no injury ſhall be offered on either ſide; however, they cannot be prevailed upon to go under the hatches, or enter the cabbin.

They are extremely fond of rings of ivory and iron, mounted with little bells, which they put round their arms, and the ſmall of each leg. Theſe bells give them an additional joy in dancing, of which both they and all the negroes are paſſionately fond. Every diſtrict has a particular mode of dancing, with different contortions and grimaces, which they prefer to thoſe of their neighbours. It is ſaid, that our beſt European maſters would, in this country, paſs for aukward and clumſy, and might find ſome attitudes and poſtures among the negroes which might improve their art. The women in general dance with a fine, eaſy, graceful air; but it is frequently intermixed with ridiculous and burleſque grimaces.

To the eaſt of the river St. Andrew are at leaſt a dozen craggy and broken hills, which ſtretch three or four miles along the coaſt; yet the intermediate fields being watered within this ſhort ſpace by near twenty little rivulets, they are rich and fruitful; and were the inhabitants more civilized or leſs timorous, no country on earth bids fairer for a profitable trade. The elephants muſt be of an enormous ſize, ſince many of their teeth weigh above two hundred pounds. Slaves and gold are likewiſe in great plenty; but the Europeans can never learn by what means they procure the latter; for this they preſerve an inviolable ſecret; but if they are preſſed to explain themſelves, they point with their finger to the mountains on the north-eaſt, intimating that it comes from thence.

There are ſeveral towns and villages along the coaſt, the moſt conſiderable of which appears to be that of Laho, which is ſituated on the cape of the ſame name, in five degrees ten minutes north latitude; and is equally diſtant from Cape Palmas and Cape Tres Puntas. Laho is a large and populous place, extending about a league along the coaſt, which is covered with a beautiful yellow ſand, and againſt which the ſea beats with great violence. The neighbouring country affords all kinds of proviſions, which are here extremely cheap; and the natives, who are of a mild, tractable, and gentle diſpoſition, are viſited by traders of all nations.

On the eaſt ſide of Cape Laho, between two villages, the one called Jack a Jack, and the other Corby Laho, is a ſmall lake of ſalt water, to which the Engliſh and Dutch have given the name of the Bottomleſs Pit, from its extraordinary depth, ſeveral unſucceſsful attempts having been made to ſound it; but at length it was found to be no more than ſixty fathoms, its ſuppoſed depth ariſing from a current at the bottom, which carried away the lead faſter than they could furniſh line.

SECT. XXIII.

Of the MALAGUETTA *or* GRAIN COAST.

Its Name, Situation, Vegetables, and Animals; with a particular Deſcription of Guinea Pepper. Of the Natives, their Perſons, Manners, Language, Arts, and Government.

THE Europeans gave this Coaſt its name from obſerving that it produced this ſpecies of pepper in greater abundance than any other part of Guinea; and indeed, the names of all the other parts of the coaſt were given from the chief commodities they afford. For inſtance, the Slave Coaſt is thus named from its furniſhing a greater number of ſlaves than any other country; the Gold Coaſt, from the great quantity of that metal found there; and the Ivory Coaſt, from the prodigious cargoes of elephants teeth annually brought from thence by the Europeans; though ſlaves, gold, and ivory are purchaſed through the whole coaſt of Guinea, and there are few places which do not produce ſome of this pepper.

Strictly ſpeaking, the Malaguetta, or Grain Coaſt, is contained between the river Seſtos and Greva, a village two or three miles to the weſt of Cape Palmas, and extends about fifty miles along the ſhore.

The productions of the earth are peaſe, beans, gourds, oranges, lemons, bananas, dates, and a kind of nut with an exceeding thick ſhell, the kernel of which is eſteemed a moſt delicious fruit, for which neither the natives nor Europeans have any name. The palm wine of this country is perhaps in greater perfection than in any other part of the globe. But what conſtitutes the principal wealth of the Grain Coaſt is the abundance of Guinea pepper it produces, for which they have a great trade, not only with all the neighbouring inland nations, but with the Europeans.

The plant on which this production grows differs in ſize, according to the nature of the ſoil, and other circumſtances. It ſhoots up like other ſhrubs, and like ivy runs up ſome neighbouring tree: what grows upon the plant thus ſupported has a finer flavour, and a hotter and more pungent taſte than what grows wild in the fields. The leaf, which is ſoft and pointed, is twice as long as it is broad, and in the rainy ſeaſon has a delicate ſmell; ſoon after which it fades, and at the ſame time loſes both its beauty and flavour; but the leaf and buds, when in perfection, on being bruiſed between the fingers, have an agreeable aromatic ſmell. Under the leaves and all along the ſtalk are ſmall filaments, by which it fixes itſelf to the neareſt tree. Its flower cannot be deſcribed, as it buds in thoſe ſeaſons when no trade is carried on with the coaſt. It is however certain, that it does flower; the fruit ſucceeds in long, ſlender, red ſhells, or pods, ſeparated into four or five cells, and covered by a rind which the negroes believe to be poiſonous, and is only a thin film that ſoon dries and crumbles.

Beſides the Guinea pepper, this country produces another ſpecies of fruit, which reſembles the cardamom both in its figure, taſte, and quality. They have here alſo pimento, a ſpecies of pepper common in the Weſt Indies, and known in England by the name of Jamaica pepper. The Dutch purchaſe it here in great quantities, and it is ſaid that a fleet of five or ſix ſail have ſometimes left the coaſt with little or no other merchandize; but this trade is at preſent much declined. The Engliſh ſtill purchaſe ſome Guinea pepper; but the chief commerce of the Grain Coaſt conſiſts in ivory and ſlaves.

Cows, hogs, ſheep, and goats are here in great plenty; as are alſo moſt of the other animals found in thoſe parts of Guinea already deſcribed.

The people have in general handſome features, and are well ſhaped; their dreſs is a piece of cloth round the waiſt. When any of them travels out of his own little diſtrict, and is met by a ſtranger, they mutually embrace, cloſely preſſing each others ſhoulders, and pronouncing the word towa; then they rub each other's arms up to the elbow, ſtill repeating towa; after which they crack each other's fingers, and finiſh their extraordinary ſalutation with crying out, Enfanemate, enfanemate.

Their language is ſo difficult, that it is not only utterly unintelligible to the Europeans, but to the neareſt neighbouring nations, none of whom are able to act as interpreters. The natives of this diviſion are guilty of no exceſſes in eating or drinking; yet freely admit the Europeans to the beds of their wives and daughters: they are alſo ſaid to be extremely addicted to ſtealing.

Among theſe people are ſome excellent mechanics, particularly ſmiths, who perfectly underſtand the art of tempering ſteel and other metals, making arms, and all inſtruments of ſteel; and they have workmen who build their canoes of different ſizes upon certain regular principles.

ciples. Experience has taught them many uſeful improvements in huſbandry, particularly with reſpect to the cultivation of rice, millet, and Guinea pepper.

Their taba-ſeil, or king, has an arbitrary and deſpotic power over his ſubjects, and never appears abroad but with pomp and magnificence. His people entertain for him certain implicit ſentiments of natural ſubmiſſion, and that awe with which they would regard a ſuperior being. Their religion is that of paganiſm; but they have ſome ideas of a future ſtate, as appears by the ceremonies performed to the ſouls of the deceaſed. They welcome the new moon with ſongs, dancing, and diverſions; and have a ſuperſtitious regard for their prieſts.

SECT. XXIV.

A Deſcription of the Country round the River Seſtos, and its Inhabitants.

THE country round the river Seſtos having been more accurately examined by Europeans than any other part of the Grain Coaſt, we ſhall give a conciſe deſcription of it. Phillips, who took great pains in ſounding the different bays and creeks near the mouth of that river, obſerves, that the anchorage is very good and ſecure; but that the ſea is rough, and the currents ſtrong towards the ſouth-eaſt and the north-weſt of the channel: it is beſides obſtructed by blind rocks covered with ſix feet of water, and by two rocks that riſe in ſight. The true channel is between the rock that ſtands in the middle of the largeſt eaſtern branch, where the breadth is half a cable over, and the depth thirty-ſeven fathoms; beyond which the river is broad, and ſhips of an hundred tons may ſecurely anchor.

It is ſaid that barks and ſmall craft may paſs about twenty miles up the river, after which it is filled with rocks and flats, that render it impaſſable to any other veſſels but canoes. Its banks are adorned with fine trees, and planted with villages refreſhed with ſtreams of freſh water, that fall from the higher grounds, and diſcharge themſelves into the river. All the country on both ſides is extremely fertile, and abounds with wild fowl. Here is alſo found a beautiful kind of flint or pebble, which is ſaid to be more tranſparent than agate; it reſembles a diamond in hardneſs, and, when well cut, almoſt equals it in luſtre.

Barbot, who in 1687 viſited the king of the country, deſcribes the place where he reſided as a ſmall town of thirty or forty houſes on the banks of a pleaſant rivulet; they were built of mud, and ſurrounded by a rampart of earth. Every houſe was at leaſt one ſtory above the ground-floor, ſome of them three, and all of them whitened with a lime made of calcined ſhells. Their floors are made of rough beams, or branches of palm, laid cloſe to each other, which renders it difficult walking acroſs the upper rooms without ſtumbling. The roof is compoſed of the ſame materials, covered with banana and palm leaves. Barbot, to his great ſurprize, ſaw in the council chamber the figure of a woman holding an infant in her arms, cut in baſſo relievo.

The king, when Barbot was there, had an agreeable aſpect, and a tender diſpoſition, but a weak judgment. The town had hardly any other inhabitants beſides the women, children, court, and ſlaves of the king. His wives and concubines amounted to thirty, one of whom was extremely well proportioned, and her arms, legs, and other parts of the body were marked with the figures of beaſts and birds, ornaments which in that country are reckoned ſtriking beauties. The king and all his children wore a cap made of oſier twigs, the only badge that diſtinguiſhed them from the ſubjects; for the children labour in the ſame employments as the meaneſt negro. The negroes of Seſtos are extremely civil and obliging, a glaſs of brandy being a ſufficient inducement or reward for the moſt important ſervices. They are of a tall ſtature, well made, robuſt, and have a martial air; their courage is frequently exerted in their excurſions againſt the neighbouring inland countries in ſearch of ſlaves.

According to Des Marchais, the people never wear any covering on their heads, nor any thing more on their bodies than a ſmall cloth before to cover their nakedneſs. Their diet is no leſs ſimple, their chief nouriſhment being from vegetables.

The ſole employment of many of the natives is fiſhing, and every morning there are large fleets of canoes ranged along the ſhore for that purpoſe. Their uſual method of catching fiſh is by a hand-line and hook, which they ſeldom draw empty out of the water.

The ſhips employed in the ſlave-trade touch at Seſtos to take in rice, which they buy at the rate of two ſhillings per quintal in exchange. The European merchants ſend their merchandize to the council-room, ſuch as copper veſſels, lead, and powder, which they exchange for goats, fowl, and other proviſions.

Authors have given a very particular account of the marriages and funeral ceremonies of thoſe people; but as they all profeſs themſelves both ignorant of the language, and but little converſant with the people, they can deſerve but little credit; ſince they do not give us the leaſt intimation by what means they acquired ſuch knowledge of a people whom they cannot underſtand.

We have now taken a view of the weſt coaſt of what may properly be termed South Africa, and of the coaſt of Guinea; we ſhall therefore, before we proceed with the continent, deſcribe the principal African iſlands within this compaſs.

CHAP. XII.

Of the Iſlands of ST. HELENA, ASCENSION, ST. MATTHEW, ANNABON, ST. THOME, PRINCES ISLAND, and FERNANDO PO.

SECT. I.

Of St. Helena.

Its Name, Situation, Extent, Fortifications, Produce, Buildings, and Inhabitants.

ST. Helena, ſo named by the Portugueſe from their diſcovering it on St. Helen's day, is ſituated in ſixteen degrees ſouth latitude, about ſix hundred leagues north-weſt of the Cape of Good Hope, almoſt in the mid-way between the continent of Africa and America; but is nearer to that of Africa, from which it is diſtant about twelve hundred miles.

This iſland is about twenty-one miles in circumference, and conſiſts of ſuch high and mountainous land, that it may be diſcovered at ſea at above twenty leagues diſtance. It is indeed formed of one vaſt rock, on every ſide as ſteep as a church ſteeple, and reſembles a caſtle in the midſt of the ocean: its natural walls are ſo high, that it is impoſſible to ſcale them; nor is there any landing, except at a ſmall valley on the eaſt ſide of it.

It is defended by a battery of forty or fifty guns, planted level with the water; and as the waves are perpetually daſhing on the ſhore, it is always difficult landing even here. There is, however, one little creek where two or three men may land at a time; but it is now defended by a battery of five or ſix guns, and rendered inacceſſible. There is no other anchorage about

the iſland, but at Chapel Valley bay; and as the wind always blows from the ſouth-eaſt, if a ſhip over-ſhoots the iſland ever ſo little, ſhe cannot recover it again.

Though the iſland appears on every ſide a hard barren rock, yet it is covered with earth a foot, or a foot and a half deep, and produces not only graſs but fruits, herbs, roots, and garden ſtuff; it is agreeably diverſified with hills and plains, adorned with plantations of fruit-trees, and kitchen-gardens, among which are interſperſed the houſes of the natives. In the open fields are herds of cattle always grazing, ſome of which are fatted to ſupply the ſhipping that touches here, and the reſt furniſh the dairies with milk, butter, and cheeſe. The country alſo abounds in hogs, goats, turkies, and all ſorts of poultry; and the ſea is well ſupplied with fiſh. But amidſt all this affluence, they have neither bread nor wine of their own growth; for though the ſoil is extremely proper for wheat, yet the rats which harbour in the rocks, and cannot be deſtroyed, eat up all the ſeed before the grain is well out of the ground; and though the vines flouriſh, and afford a ſufficient quantity of grapes, yet the climate is too hot for making wine. Indeed no good wine is produced from grapes within the torrid zone, for neither very hot nor very cold countries are proper for that liquor.

Beſides grapes, they have bananas, figs, plantains, and the other fruits uſually produced in hot countries. They raiſe kidney-beans, and other kinds of pulſe in their gardens; and the common people ſupply the want of bread with potatoes and yams.

A little beyond the landing-place, in Chapel Valley, is the fort where the governor reſides, with a garriſon; and in the ſame valley is a pretty town, conſiſting of forty or fifty houſes, built after the Engliſh manner, to which the people of the iſland reſort when any ſhips appear, as well to aſſiſt in the defence of the iſland as to entertain the ſeamen, if they are friends; for the governor has always centinels on the higheſt part of the iſland to the windward, who give notice of the approach of all ſhips, and guns are fired to ſummon every man to his poſt. It is impoſſible for any ſhip to come in the night-time, but what has been diſcovered the day before. The above fort and the town, which has the ſame name as the iſland, is ſituated in ſix degrees thirty minutes weſt longitude from London, and in the ſixteenth degree of ſouth latitude.

The natives of this iſland are remarkable for their freſh ruddy complexion, and robuſt conſtitutions. In all other places near the tropics the children and deſcendants of white people have not the leaſt red in their cheeks; but the natives of St. Helena have generally an agreeable mixture of red and white, and are pretty healthful, which is aſcribed to ſeveral cauſes, particularly to their living on the top of a mountain, always open to the ſea breezes, which conſtantly blow; to their being uſually employed in the healthful exerciſes of gardening and huſbandry; to their iſland being frequently refreſhed with moderate cooling ſhowers; and to there being no fens or ſalt-marſhes to annoy them with their unwholeſome ſteams. They are likewiſe uſed to climb the hill between the town in Chapel Valley and their plantations, which is ſo ſteep, that they are forced to have a ladder in the middle of it; whence it is called Ladder-hill, and they cannot avoid aſcending it without going three or four miles about; ſo that they ſeldom want air or exerciſe, the great preſervers of health.

As to the genius and temper of the natives, Mr. Salmon, who was there, aſſures us, that they ſeemed to him the moſt honeſt, inoffenſive, and hoſpitable people he had ever met with, having ſcarce any tincture of avarice or ambition. He ſays he aſked ſome of them, if they had no curioſity to ſee the reſt of the world, of which they had heard ſo many fine things, and how they could confine themſelves to a ſpot of earth ſeparated from the reſt of mankind, and ſcarce ſeven leagues in circumference: to which they anſwered, that they enjoyed all the neceſſaries of life in great plenty; they were neither ſcorched with exceſſive heat, nor pinched with cold; they lived in perfect ſecurity, in no danger of enemies, robbers, or wild beaſts, and were happy in a continued ſtate of health: that as there were no very rich men amongſt them, ſcarce any planter being worth more than a thouſand dollars, ſo there were no poor in the iſland, and hardly a man worth leſs than four hundred, and conſequently were not obliged to undergo more labour than was neceſſary to keep him in health: that ſhould they remove to any other country, they ſuppoſed their ſmall fortunes would ſcarce preſerve them from want, and they ſhould be liable to innumerable hazards and hardſhips, which they knew nothing of here but from the report of their countrymen.

There are about two hundred families upon the iſland, moſt of them Engliſh, or deſcended from Engliſh parents, and a few French refugees. Every family has its houſe and plantation on the higher part of the iſland, where they look after their horned cattle, their hogs, goats, and poultry, fruit, and kitchen gardens. They ſeldom come down to the town in Chapel Valley, unleſs it be once a week to church, or when ſhips arrive, when moſt of the houſes in the Valley are converted into punch-houſes, or lodgings for their gueſts, to whom they ſell their cattle, poultry, fruit, and garden ſtuff. But the inhabitants are not allowed to purchaſe any merchandize of the ſhips that touch there; for whatever they want of foreign growth, or manufacture, they are obliged to buy at the company's warehouſe, where they may furniſh themſelves twice every month with brandy, European or Cape wines, Batavia arrack, beer, malt, tea, coffee, ſugar, china, and Japan ware; woollen cloth and ſtuffs, linen, calicoes, chintz, muſlins, ribbons, and all manner of clothing; for which they are allowed ſix months credit. Engliſh money and Spaniſh dollars are the coin chiefly current here.

There is ſaid to be no town, either in England or in any other part of the world, where there are fewer diſorders committed than in that of Chapel Valley; for tho' the people appear with an air of freedom, not known in other governments, yet an exact order and diſcipline are obſerved, and univerſal quiet and ſatisfaction ſeem to reign in the iſland.

The hiſtory of St. Helena may be contained in a few words: it was diſcovered in 1502 by the Portugueſe, who ſtored it with hogs, goats, and poultry, and uſed to touch at it in their return from India for water and freſh proviſions; but it does not appear that they ever planted a colony here; or if they did, they afterwards deſerted it, and the Engliſh Eaſt India company took poſſeſſion of the iſland in 1600, and held it without interruption till the year 1673, when the Dutch took it by ſurprize. However, the Engliſh, under the command of captain Munden, recovered it again within the ſpace of a year; and, at the ſame time, took three Dutch Eaſt India ſhips that lay in the road. The Dutch had fortified the landing-place by batteries of great guns to prevent a deſcent; but the Engliſh, being acquainted with the ſmall creek where only two men could go abreaſt, climbed up in the night to the top of the rocks, and appearing the next morning at the backs of the Dutch, they threw down their arms, and ſurrendered the iſland without oppoſition.

SECT. II.

A conciſe Account of the Iſlands of Aſcenſion, St. Matthew Annabon, St. Thome, Prince's Iſland, and the Iſland of Fernando Po.

THE iſland of Aſcenſion lies in eight degrees ſouth latitude, upwards of two hundred leagues to the north-weſt of St. Helena, and in ſeventeen degrees twenty minutes weſt longitude from London. It received its name from its being diſcovered by the Portugueſe on Aſcenſion-day. It is about four leagues in length, one in breadth, and eight or ten leagues in circumference; and ſome of it is high lands, but very barren. This iſland has ſcarce any wood, fruit-trees, plants, or herbage; and neither the Portugueſe, nor any other nation, have yet thought fit to plant it. The European ſhips, however, uſually call here in their way from India, particularly ſuch of our Eaſt India ſhips as have miſſed St. Helena, when they make uſe of this iſland as a place of refreſhment; it having a ſafe and convenient harbour. Here are a few wild goats, but they are lean; and ſeveral ſorts of birds,

but they are ſo ill taſted, that none will eat them: yet, as it abounds in turtle, the ſailors ſometimes ſtay on ſhore, feeding upon them ten or fifteen days together; they alſo here frequently take a large ſupply of theſe amphibious animals on board. The ſailors, going aſhore in the night-time, frequently turn two or three hundred of them on their backs before morning; and are ſometimes ſo cruel, as to turn many more than they uſe, leaving them to die on the ſhore; for if once turned upon their backs on the level ground, they can never turn upon their feet, and muſt thus periſh for want of food.

On this iſland is a place called the Poſt-Office, where mariners leave letters, which are generally put in a cloſe corked bottle. This the next that comes breaks, and leaves another in its ſtead. The iſland of Aſcenſion has no freſh water, and that gathered from rain ſtinks in twenty-four hours.

The iſland of St. Matthew is ſituated in the firſt degree forty minutes of ſouth latitude, and in nine degrees twelve minutes weſt longitude from London, a hundred leagues to the north-eaſt of the iſle of Aſcenſion; and was alſo diſcovered by the Portugueſe, who planted and kept poſſeſſion of it for ſome time; but afterwards deſerting it, it now remains uninhabited, this iſland having little to invite other nations to ſettle there, except a ſmall lake of freſh water.

The four following iſlands are ſituated in the gulph of Guiney, between Congo and Benin; all of them were diſcovered by the Portugueſe, and are ſtill in the poſſeſſion of that nation.

Annabon, or Happy Year, a name which it received from its being diſcovered on New Year's day 1571, is ſituated in two degrees ſouth latitude, two hundred miles to the weſt of Congo, and is about thirty miles in circumference. This iſland is mountainous, and abounds in rice, Indian corn, oranges, cocoa-nuts, and the other fruit uſually found in hot countries; and has plenty of cows, hogs, and poultry. There is a convenient road for ſhips, and the Portugueſe have ſtill the government and property of the iſland; but moſt of the inhabitants are negroes brought from the continent of Africa, and their deſcendants. There are likewiſe ſome Portugueſe, and a mixed breed called Malottos.

The iſland of St. Thome, which is ſomewhat of a round figure, and about a hundred and twenty miles in circumference, is ſituated juſt under the equator, thirty leagues to the north-eaſt of Annabon, and between forty and fifty to the weſtward of the continent of Africa. This is the moſt conſiderable iſland in the gulph of Guinea; but the heat and moiſture of the air render it extremely unhealthful to the Europeans: yet the Portugueſe negroes and Malottos who inhabit it are ſaid to live to a good old age.

This iſland is well ſupplied with wood and water, and in the middle of it is a high mountain almoſt covered with a cap of clouds. It produces plenty of Indian corn, rice, and fruits, and the inhabitants make a good deal of ſugar; and among other plants is the cinnamon tree.

The chief town in the iſland is called St. Thome, and ſometimes Pavoſan. It is the ſee of a biſhop, and contains five or ſix hundred houſes: theſe are two ſtories high, and neatly built of wood, and ſurrounded after the Portugueſe faſhion, with handſome balconies. Here is alſo a monaſtery, which Mr. Smith ſays has more black friars and nuns than white ones.

Prince's Iſland, ſaid to be the leaſt of thoſe in the gulph of Guinea, is ſituated in one degree thirty minutes north latitude, and is very mountainous and woody. It affords plenty of fruit, rice, Indian corn, roots, and herbs; but chiefly abounds in ſugar-canes. It has no want of cows, hogs, and goats; but the country is much peſtered with ſeveral kinds of apes, who will ſometimes attack a man, and when there is a number of them together, will tear him to pieces.

The iſland of Fernando Po is ſituated in three degrees ſixty minutes north latitude, ten leagues to the weſtward of the continent, and is about thirty miles long, and twenty broad. Its produce and inhabitants are the ſame as the others.

The Portuguſe uſually call at ſome of theſe laſt iſlands for refreſhments, in their paſſage from Braſil to Africa, and in their voyages to and from the Eaſt Indies. As the Dutch found them conveniently ſituated for trade, and ſupplied with plenty of proviſions, they made two attempts to drive the Portugueſe from St. Thome; and even made themſelves maſters of that iſland: but this conqueſt was attended with very unhappy effects; for they loſt almoſt all the officers, ſeamen, and ſoldiers engaged in thoſe expeditions, by malignant fevers, and were therefore obliged to abandon it. On which the Portugueſe again ſeized it, and ever ſince have remained in the peaceable poſſeſſion of thoſe iſlands; the unhealthfulneſs of the climate ſecuring them from invaſion.

CHAP. XIII.

Of NIGRITIA, including the Countries between Guinea and Zaara.

SECT. I.

Of Sierra Leona.

Its Name, Situation, and Extent, with a particular Account of the River Scherbro; and of Scherbro and York Iſlands. A Deſcription of Cape Monte, with the Produce of the adjacent Country.

We come now to Sierra Leona, a name which, according to ſome authors, was derived from the Portugueſe giving it to ſeveral of the mountains on this coaſt, on account of their abounding with a great number of lions; while others derive the name from the terrible noiſe made by the beating of the ſea againſt the ſhore, which they compare to the roaring of a lion. Geographers however are far from being unanimous in giving its preciſe boundaries. Roberts extends its limits from the Grain Coaſt on the ſouth-eaſt, to Cape Verga, or Vega on the north-weſt; but other writers reduce theſe limits, and confine the country ſtrictly called Sierra Leona between the capes Ledo or Tagrim, and Verga, theſe two promontories forming the ſpacious bay into which the river Scherbro diſcharges its ſtream.

This river, which by ſome authors is alſo called Selboba, Palmas, and Madre Bomba, ſeparates the country called Seſtos, from that named Sierra Leona, and has its ſource in Superior Ethiopia; whence ſome authors think it probable, that the Scherbro is a branch either of the river Gambia, or the Senegal. Large ſhips ſail up as far as Bagos, twenty-five miles from the mouth of the river, where the Engliſh had formerly a factory, and veſſels from ſixty to eighty tons burden, as far as Kedham, which is above two hundred miles from the ſea; but on paſſing that place, the channel grows gradually narrow. The navigation of this river, as it is chiefly carried on in the rainy ſeaſon, is frequently interrupted with tornadoes, on the approach of which the people are obliged to faſten the veſſels with cables to the large trees on the banks.

By the mouth of the river is the iſland called by the Engliſh Scherbro, by the French Cerbero, by the Dutch Maſta Quaja, and by the Portugueſe Forulba, extending ſouth-eaſt, and north-weſt along the coaſt, where it forms a large bay between it and the continent. From the weſt point of this iſland extend three ſmall ones in a direct line, to which the Engliſh have given the name of

of Plantain Iſlands, from the quantity of that fruit produced in them,

The iſland Scherbro produces plenty of rice, maize, yams, potatoes, bananas, citrons, oranges, water-melons, ananas, Indian figs, with a variety of other fruits and roots. Fine pearls are found in oyſters on the ſhore; but fiſhing for them is dangerous, on account of the multitude of ſharks and alligators, with which the mouth of the river is infeſted. Elephants and wild fowl are alſo found here in ſuch plenty, as could not be expected in an iſland of ſuch ſmall dimenſions as ten miles in length. The inhabitants are idolators, and, like many other negroes, practiſe circumciſion.

On a ſmall iſland to the north-eaſt of Scherbro, called York Iſland, was a fort erected by the Engliſh, and mounted with twenty pieces of large cannon, and at the diſtance of twenty paces were two large parapets, each defended by five pieces of artillery. Theſe were all built of ſtone, and the garriſon conſiſted of thirty-five Europeans, and fifty or ſixty negroes. Before the building of this fort, the Engliſh had a lodge on the continent cloſe to the ſea, and fronting the eaſtern point of Scherbro; but they abandoned both this and York fort in the year 1727, when the factors retired to Jamaica, a ſmall iſland four miles to the weſt of York Iſland; but now they are all deſerted, and the Engliſh have no factory either on the iſland or river Scherbro.

Though the Scherbro be the firſt great river between the Seſtos and the river Sierra Leona, there are ſeveral intermediate ſtreams and ſmall rivers, ſome of which are navigable for ſeveral miles up, particularly the Junco, the river St. Paul, the Galinas, and the Maguiba, or Nunez.

Having given this general account of the country and its rivers, we ſhall give a more particular deſcription of it, beginning with Cape Monte. This cape, called by the natives Waſh Kingo, is ſeen ſeveral leagues off at ſea, and has the appearance of a great mountain encompaſſed by the ocean; and according to M. D'Anville's charts, is in ſeven degrees forty minutes north latitude. It is a peninſula, which ſtretches eaſt-ſouth-eaſt, and weſt-north-weſt, affording ſecure anchorage in two fine bays on the weſt ſide. A ſmall river of the ſame name, that falls into the bay within half a mile of it, ſupplies the ſhipping with good water.

A plain ſeveral leagues in extent runs along the banks of this river, and is covered with villages, and all kinds of quadrupeds, as cows, ſheep, goats, hogs, antelopes, deer, hares, and a great variety of others. Fowls are alſo found here in the greateſt abundance: nor is the earth leſs fruitful in maize, rice, millet, roots, and fruit of various kinds; among which are oranges, lemons, citrons, pine apples, and moſt of the rich fruits of Europe, Aſia, and America. The palm wine is eſteemed excellent, the air moderate, and the water of the ſprings cooling and refreſhing. In ſhort, this country, except in the rainy ſeaſon, appears a kind of paradiſe.

SECT. II.

The Manners and Cuſtoms of the Inhabitants near Scherbro River; their Dreſs, Houſes, and Trade.

THE inhabitants are repreſented as mild, generous, ſociable, induſtrious, and diſintereſted. They are chiefly employed in cultivating rice and other grain, and in making ſalt, a certain quantity of which is paid as a tribute to the king of Quoja, to whom they are ſubject. They are little acquainted with war, and in all diſputes with their neighbours prefer peaceable negotiations to arms. The men are allowed to keep as many women as they can ſupport, and the females being no leſs laborious than the males, they find their intereſt in the multiplicity of their women; nor are the huſbands jealous at the freedoms taken by ſtrangers with their wives.

The ſupreme power under the king and the courts of juſtice are in the hands of the caboceroes, who deliberate upon all public affairs, and decide by a majority of voices.

Children of both ſexes wear no cloaths till they are thirteen or fourteen years of age, when thoſe of people of diſtinction wear a cotton cloth from the waiſt downwards, and the common people remain in their primitive nakedneſs; for none beſides the king, his court, and the officers of his houſhold go always cloathed. The women of the middle rank however wear girdles of ruſhes, or palm leaves, prettily interwoven, and hanging down to their knees; theſe are bordered with a fringe of ruſhes, or flounced with palm leaves. They likewiſe wear copper, braſs, or iron bracelets round their wriſts, and large rings of the ſame metals upon their legs, to which they hang ſilver bells. The moſt common dreſs among the people of rank of both ſexes is the tomy, which is made of woollen cloth manufactured by themſelves. This the women tie round the waiſt, letting it fall to the knee; but the men fix it before, and bringing it between their legs faſten it to their girdle behind.

Both ſexes take great pleaſure in dreſſing the hair or wool of their heads, and adorning it with little plates of gold and other ornaments. The women endeavour to attract the regard of the men by making a line of paint, either white, yellow, or red, acroſs their forehead; they have likewiſe circles of paint round their arms, legs, and waiſt; for they diſcover extraordinary beauty in this diverſity of colours. The men wear much the ſame ornaments, differing only in the ſize of their bracelets and rings, with which their arms, legs, fingers, and toes are loaded. The pooreſt negro is ſeldom without ſome of theſe, and the number increaſes in proportion to the wealth and vanity of the wearer.

Their houſes are built in the ſame model as thoſe in Senegal, which we ſhall deſcribe in treating of that country, and theſe they keep neat and clean. The royal palaces, and the houſes of the great, are an oblong ſquare, with one ſtory floored, and ſo cloſely covered with palm leaves as to render them impenetrable by the heavieſt rains and the moſt ſcorching beams of the ſun. Thoſe of the great have on the ground-floor ſeveral apartments allotted to different purpoſes; the firſt, which may be conſidered as an audience-chamber, is ſurrounded with ſophas raiſed about a foot above the floor, and covered with mats of palm leaves, handſomely united, and diverſified with a thouſand colours. Here the great ſpend moſt of their time, ſtretched on theſe ſophas, with their heads reſting in the laps of their favourite women; and when they receive ſtrangers they here eat, drink palm wine, and ſmoke tobacco; but uſe another apartment when the family is alone.

They are more civilized in their manner of eating than moſt other negroes; for they uſe trenchers of hard wood, and plates of ivory, neatly turned, and kept white with great care. They likewiſe uſe wooden ſpits for roaſting, and, to prevent the apartments in which they ſit being incommoded by heat, ſmoke, or the fumes of victuals, they have their kitchens placed at a ſmall diſtance from their houſes.

It has been obſerved, that the language of the negroes gradually alters as you paſs along from eaſt to weſt. As arts and ſciences are entirely unknown to theſe people, their language conſiſts but of few words, yet is ſufficient for all the purpoſes of life. However, from their poverty of ſpeech probably ariſes that ſilence which is obſervable in all their public meetings and entertainments; the number of their words being, perhaps, inſufficient to expreſs all their ideas ſo as to enliven converſation, and furniſh a conſtant fund of diſcourſe.

The Engliſh, Dutch, and other Europeans who trade hither, purchaſe great quantities of cotton cloth, mats, and ivory, which is not at all inferior to that on the Ivory Coaſt; but what the natives purchaſe of the northern negroes, though it is larger than what is found in their own country, has a yellow caſt, and is of leſs value. Here are alſo purchaſed the ſkins of lions, tygers, panthers, and other wild beaſts, with which all the mountains abound. This coaſt alſo annually affords five or ſix hundred ſlaves; but theſe are only ſuch as they buy or obtain in exchange for their commodities from the king of Mundingo, and the interior parts of Africa; for cuſtom forbids their enſlaving any other than criminals,

who

who are ſold for the king's emolument. The woods alſo abound in trees, which are of uſe in dying, and are cut down and brought in logs to the ſhore, ready to be ſhipped. This wood our merchants call cam, and prefer it in many reſpects to Braſil wood.

According to Atkins, the timidity of the natives is almoſt the only obſtruction to an advantageous trade with this coaſt. They ſurround the ſhips in their canoes, which they row with great dexterity; and if they happen to have a cabocero on board, ſing all the while out of reſpect to him. Before they board a ſhip, they examine her cloſely, and when they have mounted the deck, betray their fears by an impatience and anxiety viſible in every countenance, which makes them hurry over buſineſs; and upon the ſlighteſt accident leap into the ſea. When a cabocero comes on board, he inſtantly ſhews the captain a certificate from the laſt European ſhip that touched there, in teſtimony of the kindneſs with which he was treated.

SECT. III.

A Deſcription of the great River Sierra Leona; the Climate of the Country on its Banks; an Account of the principal Iſlands it contains: the Face of the adjacent Country; its Produce; with a particular Account of a poiſonous Fruit, and the Animals with which the Country abounds. The Cuſtoms and Manners of the Inhabitants.

IT would be equally tedious and unneceſſary to give a particular account of every ſeparate kingdom in Sierra Leona, as the natural productions and manners of the people are in moſt places nearly the ſame: we ſhall therefore proceed to the great river of Sierra Leona, which lies to the north-weſt of Scherbro, and is by ſome called Mitomba, and by others Tagrim, or Tagrin. The mouth of this river is three miles, ſome ſay three leagues wide; but on ſailing three or four miles up, its breadth is reduced to one mile. The entrance does not exceed two fathoms deep, except in a narrow channel that lies cloſe under the mountains, and varies from ſix to ten fathoms water. It abounds with fiſh, but is infeſted with alligators as far as it is known to the Europeans, and probably to its very ſource. It is bordered with fine large trees, and has many little iſlands all covered with wood, and particularly with the palm, whence the natives make great quantities of wine. Villault ſays, that when he was here in 1666 the Engliſh had a factory in one of the moſt fertile and beautiful of theſe iſlands; their houſe was built of brick and hewn ſtone, and defended by four pieces of cannon and a ſmall garriſon.

The north ſide of the river being low and flat, the ſouthern country, which is filled with high mountains, is properly called Sierra Leona; but moſt voyagers give all the coaſt, from Seſtos to Cape Verga, this general appellation.

In the open and plain country the heat of the ſun is intolerable before any breeze ariſes; but as a refreſhing gale always ſprings up about noon, it renders the country very ſupportable. It muſt, however, be allowed an unhealthy climate, particularly to the Europeans. The conſtant thunder and rain, with a cloſe ſtifling heat that more particularly prevails during four months in the year, produce ſuch a corruption of the air, that all animal food is in a few hours reduced to a ſtate of putrefaction, and people are for ſeveral days together confined in their chambers, to avoid as much as poſſible the peſtilential infection of the atmoſphere. The tornadoes ſometimes produce a moſt frightful and aſtoniſhing ſcene; the moſt horrible darkneſs comes on at mid-day, and all the face of nature ſeems ſuddenly changed. However, with whatſoever amazement and terror this may ſeize ſtrangers, it is ſeldom attended with any fatal conſequences; and ſo powerful is cuſtom and habit, that it is but little regarded by the natives.

To return to the river: it is filled with iſlands and ſmall rocks that reſemble a number of hay-ricks: the chief iſlands are Benſe, Taſſo, and Togu; in the former of which the Engliſh had a factory, and a ſmall fort built of ſtone, and flanked with parapets, mounted with five pieces of heavy artillery, with an intermediate curtain and platform mounted with ten cannon. The garriſon was generally compoſed of twenty-five white men, and thirty free negroes, who lived in huts covered by the cannon of the fort; but in 1704 this fortreſs was taken without reſiſtance by two French men of war, commanded by Guerin. The garriſon then amounted to an hundred men, all of whom, except a gunner and ſix ſoldiers, abandoned the fort, with their commander at their head, on ſeeing the ſhips approach. After plundering the fort, and ſeizing four thouſand elephants teeth, with other merchandize, the French razed it to the ground.

At a ſmall diſtance from the head of the bay of France, a creek near the entrance of the river, is a baſon of freſh water, which falling from the mountains, is collected in this reſervoir in ſo large a quantity, that an hundred tons may be filled by a few hands within the ſpace of an hour. Nothing can exceed the beauty of this delightful ſpot, ſurrounded by hills covered with trees that afford a perpetual ſhade; and, what muſt appear doubly delightful, in a country parched by the heat of the ſun, numberleſs caſcades glide down the mountains in gentle murmurs, or ruſhing with an impetuous ſtream with a loud noiſe, aſſiſt in giving an additional air of coolneſs to the ſcene. The whole country on each ſide the river is rich in rice and millet, which is the chief ſuſtenance of the inhabitants. The women grind the rice, and form it into little cakes or balls, which the men ſteep in water, and eat without any other preparation. Lemons, oranges, bananas, and citrons, are produced in great plenty and perfection; and farther up the country are alſo ananas, Indian figs, watermelons, white prunes, wild pears, caſſava, and different ſorts of pulſe; and theſe proviſions the natives bring on their ſhoulders to the ſhore, for the uſe of the ſhips in the road.

But beſides theſe fruits, there are others extremely poiſonous. Finch in his voyage mentions a tree that reſembles a beach, and which the negroes call agon. It bears an oblong fruit like the pod of a bean, and is diſtinguiſhed by its ſize into three kinds, all of which have the moſt malignant qualities. Within the pod are incloſed four or five ſquare beans, encircled with a hard rind, within which is a yellow kernel, from whence the poiſon is extracted. Theſe fruit are uſed by the natives in poiſoning their arrows, and nothing can more effectully anſwer that purpoſe, as the ſmalleſt quantity entering the humours of the body proves fatal.

Beſides theſe ſpontaneous productions of the earth, there are in great abundance deer, hogs, hares, and fowls, all which the mariners may purchaſe for a little brandy, of which the natives are extremely fond, preferring it to the beſt palm wine.

The mountainous parts abound in elephants, lions, tygers, wild boars, different ſorts of apes, together with ſerpents of ſo monſtrous a ſize, that if any credit is to be given to theſe writers, each of them is capable of ſwallowing a man whole. Monkeys are ſo plentiful, that forming themſelves into bodies, they enter the plantations, where they ravage and ſpoil every thing before them. One kind of theſe animals, which the natives call barry, is very tall, and of an amazing docility. Theſe are probably the ſame with the orang-outang. When they are taken young, they are taught to walk erect, and ſeldom chooſe any other poſture; they grind rice, ſteep it in water, carry it in veſſels on their heads, and are taught to turn the ſpit when meat is roaſting. Nothing is too difficult for theſe imitative animals; they will even open oyſters, of which they are very fond, with a knife. The negroes admire the fleſh of monkies, which they prefer to that of all other animals, except the elephant. It is very probable that many nations have been eſteemed canibals upon no other foundation.

The woods furniſh a retreat to an infinite number of pigeons, parrots, parroquets, and other birds of the moſt beautiful kinds; but it is difficult to take them, on account of the thickneſs and cloſeneſs of the trees.

The inhabitants of both ſides the river are not ſo black and flat-noſed as moſt of the other negroes who border upon

upon them. They adorn their ears with a great number of toys, and uſually mark their cheeks and noſes with certain figures raiſed by a red-hot iron. Their arms are loaded with bracelets, and their fingers with iron rings. Both ſexes go naked till they are fifteen years of age, at which time they begin to wear round the waiſt a ſmall piece of cloth, or the leaves of trees formed into aprons. They likewiſe wear a leathern girdle, to which hangs a long knife, or a poniard; but perſons of rank appear abroad in a long flowing robe of ſtriped calico, reſembling the Mooriſh dreſs.

Authors ſay, that as they are naturally of a malicious, turbulent, and jealous diſpoſition, they ſeldom live long without quarrels and diſſenſions among themſelves; and that the Europeans, who are continually expoſed to their inſults, can contrive no better way of revenge than burning their huts, and ruining their plantations. By this account it appears, that if the natives are naturally malicious, theſe European intruders are no leſs ſo. It is however acknowledged, on the other hand, that theſe negroes are temperate and ſober, from a diſlike to gluttony and drunkenneſs: for though they are great admirers of brandy and other ſpirituous liquors, they are ſaid never to drink exceſs, eſteeming the wilful loſs of reaſon one of the moſt ſhameful vices a man can commit; they have alſo great quickneſs of apprehenſion and delicacy of ſentiment, but are at the ſame time extremely laſcivious and effeminate.

Anointing their bodies, eſpecially their arms and legs, with palm oil, is daily practiſed by the negroes of both ſexes, which cannot be omitted without the imputation of ſlovenlineſs; and ſome mix with it civet, which they procure from civet-cats found on the banks of the Scherbro.

Their huts are generally round, and their doors paved with oyſter and cockle-ſhells, two or three croſſes are erected in different parts of the houſe, and the whole ſurrounded by limes, papas, plaintain-trees, and bee-hives, which they make out of the trunk of a tree, and erect upon high poles.

They have their pallavers, or halls, where the chief perſons of the village meet, to adjuſt differences among the inhabitants, or with the Europeans. On entering this hall they ſalute each other by bending the elbow, and touching the forehead with the hand. After both parties are heard, and the caſe fully debated, the equity of their ſeveral claims is ſettled by a vote of the majority of the judges. If a man has been defrauded by his neighbour, he is allowed by cuſtom to ſeize from the other as much as amounts to his own loſs; but he muſt prove before the judges of that court, that he is no gainer by the exchange.

SECT. IV.

Of the interior Countries between the River Seſtos and the Sierra Leona; and in particular of the Empire of Manow, and the Kingdom of Quoja. Of the Policy and Government of the Quojans; the State of the Dandaghs, and the Ceremonies attending the Arrival of a foreign Ambaſſador.

IN examining the interior countries between the Seſtos and the river Sierra Leona, the firſt people of note we meet with are the Quabes, who inhabit the ſouthern banks of the river Seſtos, and are a free people under the protection of the emperor of Manow. Next are the powerful nation of Folgia, and the great empire of Manow, the limits of both which are entirely unknown. Both theſe kingdoms are watered by the rivers Arvorada and Junco, which divides Folgia from the kingdom of Carrow. The Folgians are dependent on the emperor of Manow, and the Quojans upon them.

This potent monarch extends his authority over all the neighbouring nations, who pay him an annual tribute of the produce of their country, or of European merchandize, purchaſed from the maritime negroes; as cowries, bars of iron, and glaſs toys: and the Folgians, in their turn, expect the ſame tribute from their vaſſals. But, notwithſtanding this ſubmiſſion to the emperor, each king enjoys an unbounded juriſdiction within his own territories, and can make laws, and declare peace or war, without the permiſſion of any other.

The next is the powerful kingdom of Lower Quoja, which comprehends all the country from Cape Maſurado to the river Scherbro. Upper Quoja is ſituated farther to the north-weſt, and is bounded by the Scherbro and the kingdom of Hondo on the north, that of Silm on the north-weſt, and the kingdom of Eaſtern Bolm on the ſouth. As to the kingdom of Galis, Galavey, Hondo, and Carrow, we know nothing more than their names, and that they form a chain behind the maritime provinces from Quoja to Mittombo. It is remarkable, that the Quojans maintain their authority over the extenſive and potent kingdoms of Silm, Bolm, &c. by the ſame policy with which the emperor of Manow preſerves his power over the Folgians, Quojans, and all the country from the river Seſtos to the Sierra Leona. Their councils are compoſed of the oldeſt, wiſeſt, and moſt experienced perſons in the nation; their government is mild, and the diſtribution of juſtice ſimple and equitable.

Though the Quojans are tributary to the Folgians, yet the prince of the latter people gives the king of Quoja the title of Dandagh, which he himſelf receives from the emperor of Manow; and the king of Quoja allows it to the monarch of Silm and Bolm, who pay him the ſame ſubmiſſion that his ſuperior exacts. This title of Dandagh is conferred with ſome extraordinary ceremonies. Thus, when the king of Quoja is inſtalled by the king of Folgia, he proſtrates himſelf upon the earth, till the other monarch, having ſprinkled over his body a handful of duſt, aſks him what title he chooſes to bear; when having made his anſwer, it is proclaimed in a loud voice by an herald, repeated by the king of Folgia, and echoed by the joyful and numerous aſſembly of ſpectators. The new Dandagh being then deſired to riſe, the king of Folgia inveſts him with the ſword of ſtate, puts a quiver upon his left ſhoulder, a bow in one hand, and arrows in the other; and the ceremony is concluded by the king of Quoja's doing him homage, by his making him preſents of cloth, table-furniture, and kitchen utenſils.

The Dandaghs, who are abſolute within their dominions, defend their prerogatives againſt the incroachments of the people, and yet never ſcruple paying their ſubmiſſion to a ſuperior Dandagh. A great part of the ſtate of one of theſe princes conſiſts in the number of his women brought from diſtant countries; and when he appears in public he ſits leaning upon a ſhield, to ſhew that he is the protector of his people.

When a ſubject demands an audience of the Dandagh, he firſt makes preſents to the chief women of the ſeraglio, who carry them to the prince, and ſolicit him to permit ſuch a one to enter his preſence, and proſtrate himſelf before him. If his majeſty conſents, the preſents are accepted, and the viſitor introduced; otherwiſe they are returned, and the petitioner retires, without preſuming to approach the palace again till he has made his peace with the king. When an offender has obtained his pardon, and leave to approach the monarch, he advances ſlowly, with a low inclination of his body; and, on coming before the mat on which the king is ſeated, he falls upon his knees, and kiſſes the king's hand, which is extended for that purpoſe, reſpectfully pronouncing the word Dandagh; upon which the king anſwers, I forgive you, and, if he be a perſon of high rank, orders him to ſit on a ſtool, or mat, placed at a ſmall diſtance; otherwiſe he muſt ſtand in his majeſty's preſence.

If a foreign ambaſſador is coming to court, he ſtops on the frontiers of the kingdom, and ſends one of his train with notice of his approach; upon which a nobleman is immediately diſpatched to welcome him, and in the mean time, preparations are made for his reception. When he makes his public entry, he is attended by a multitude of the officers and guards, dreſſed in the richeſt manner of the country, each having a bow in his hand, and a quiver filled with arrows on his ſhoulder. The proceſſion is made amidſt the ſound of warlike inſtruments, while thouſands of people dancing, keep time to the muſic. On their arrival at the palace, the ambaſſador is received between two lines of the Dandagh's body guards, new clothed for the occaſion, and

paſſes on to the chamber of audience. If he is ſent from the king of Folgia, his attendants are permitted the privilege of dancing between the lines of the life-guard; and when the dance is finiſhed, the whole retinue enter the audience-chamber, and kiſs the ground before the king. They then approach the throne, while the ambaſſador turning his back upon his majeſty, bends his bow, falls upon his knee, and by his menacing poſtures ſhews his inclination to defend the king againſt all his enemies. During this ceremony, his retinue dance to ſome ſongs compoſed in honour of the king; and the Quojans return the compliment, by reciting verſes in praiſe of the ambaſſador and his maſter.

Theſe mutual eulogies being concluded, the ambaſſador ſends the principal perſon in his train to proſtrate himſelf before the king, his own character exempting him from that ſubmiſſion. Suddenly the ambaſſador commands ſilence, and begins his harangue, which the royal interpreter explains word by word. If the diſcourſe relates to affairs of ſtate, it is referred to the king's council; otherwiſe an immediate anſwer is given, and the ambaſſador is conducted to the apartments provided for him. At night a number of ſervants flock to his houſe, to offer him their aſſiſtance in rendering his ſituation commodious; and afterwards the king's women, dreſſed in their richeſt habits, attend him with plates of rice, and the moſt delicate food the country affords. In ſhort, after the king has ſupped, he ſends him a large quantity of palm wine, and preſents to his maſter, which generally conſiſt of large veſſels and diſhes of copper.

SECT. V.

The Manners of the interior Negroes in general; their Marriage Ceremonies; and thoſe which attend their naming a Child. Their Laws in relation to Inheritances; their Language, and Funeral Rites.

THE negroes of the interior countries, as well as thoſe on the coaſt, are ſaid to be ſo libidinous as to abridge their lives, and even to emaſculate themſelves before they reach their prime. The women, who are equally addicted to the pleaſures of ſenſe, uſe filtres, potions, and herbs ſuppoſed to be poſſeſſed of provocative qualities, in dreſſing proviſions for their huſbands. This is ſaid to be their greateſt vice, and indeed, nothing can be more prejudicial to ſociety. In every other reſpect, they are ſaid to be temperate, modeſt, gentle, and ſociable, in a far greater degree than the negroes on the coaſt.

They have an averſion to the ſhedding of human blood, and ſeldom make war but in their own defence. They are united by the cloſeſt bonds of friendſhip, and are always ready to aſſiſt and relieve each other. If a friend be under misfortunes, they will ſhare their cloaths, their proviſions, and all they have with him; and ſhould it be their caſe to be diſtreſſed, they would meet with the ſame treatment from him. If a perſon happens to die when his effects are not ſufficient to bury him, his friends contribute to his interment, and attend with the ſame reſpect as if he had divided an eſtate among them.

Polygamy, as in all the other negroe nations, is encouraged; but how numerous ſoever their wives may be, the huſband chiefly attaches himſelf to one. The marriage ceremony is much the ſame as in other countries, only the bridegroom muſt make three nuptial preſents to his intended bride. The firſt generally conſiſts either of a piece of coral, or ſome glaſs trinkets; the ſecond is uſually compoſed of pieces of cloth for apparel; and the third is a ſmall cheſt or box, in which ſhe is to depoſit her moſt valuable effects. The value of all theſe is proportioned to the wealth and affection of the bridegroom; and, in return, the father of the lady makes the huſband a preſent of two ſuits of cloaths, a quiver filled with arrows, a ſword and belt, and three or four baſkets of rice. The care of the male children devolves upon the father, and that of the females on the mother. Both here and on the coaſt, they abſtain from the connubial embrace from the inſtant a woman is diſcovered to be pregnant, till after her delivery.

The child has a name given him on the tenth day after its birth, when the father with all his domeſtics armed with bows and arrows, make a tour round the town, ſinging a kind of triumphant ſong, accompanied with inſtrumental muſic; and all the people they meet in their way join their voices: afterwards a perſon takes the infant, and lays him upon a ſhield that is placed in the midſt of the aſſembly; puts a bow and arrow in the infant's hands, and then pronounces a long diſcourſe to the ſpectators; after which he addreſſes himſelf to the infant, wiſhing his proſperity; that he may reſemble his father, and like him be induſtrious, faithful, and hoſpitable; that he may be able to build his own houſe, and to conduct his own affairs; have no inclination for the wives of his neighbours, but be affectionate to his own; and, in ſhort, that he may be neither a drunkard, a glutton, or a ſpendthrift. The harangue being concluded, he gives him a name, reſtores him to the arms of his mother or nurſe, and the aſſembly diſperſes, except a few ſelect friends, who have an entertainment provided for them, and ſpend the day in feſtivity and mirth.

If the child prove a female, it is carried by the mother or nurſe to the midſt of the town, where the concourſe is greateſt, and there laid upon a mat, with a ſtick in its hand. A female orator pronounces the harangue, with prayers that the child may inherit the accompliſhments of the mother, and like her be poſſeſſed of every female virtue, as chaſtity, obedience to her huſband, affection for her children, and reſolution to aid, follow, and ſupport her lord in all dangers and difficulties.

The eldeſt ſon is allowed to inherit all the effects and women of his father, except his giving ſmall portions to the younger ſons; but a married man who dies without male iſſue, paſſes over his daughters, and leaves his ſubſtance to his nephews; and if the whole male line happens to be extinct, the effects then belong to the crown, only the king is to ſee that care be taken of the daughters.

The chief employment of theſe negroes conſiſts in cultivating the earth; for they have no fiſhing, except in a few rivers; nor trade, but in exchanging the productions of their plantations for the fiſh and other commodities found among the negroes of the coaſt.

The general language of the inland countries is the Quojan, though ſeveral provinces have particular dialects, which almoſt form a new language. The negroes of rank endeavour to talk with elegance, and are particularly fond of ſimilies, allegories, and parables. Thus the moſt trivial diſcourſe has ſomething of poetical ornament. Nor are they entirely ignorant of the ſciences, eſpecially aſtronomy, for they diſtinguiſh the time of the night by the ſtars.

In this country the ceremonies of interment in general reſemble thoſe related of the other neighbouring nations, but differ in ſome particulars. The body being waſhed, they prop it up in an erect poſture, adorn the hair, dreſs it in its beſt cloaths, put a bow and arrow in its hands; and in the mean while the friends perform a kind of mock ſkirmiſh; after which falling upon their knees with their backs to the corpſe, they with a menacing air draw their bows, and vow to be revenged on any one who has been acceſſary to the death of their friend, or ſhall dare to aſperſe his character. They then ſtrangle ſome of their ſlaves, whom they exhort to attend their friend in the next world with great diligence; but before theſe unhappy victims are thus offered at the ſhrines of ſuperſtition and ignorance, they feed them with all the delicacies the country affords. At length the corpſe is laid upon a plank or bier, and carried upon the ſhoulders of men to the grave, into which it is thrown, together with the bodies of the ſacrificed ſlaves, their mats, baſons, and kitchen utenſils. Over all is thrown another mat, and upon this abundance of earth. The relations build round the grave a hut, with an iron rod at the top, to which are ſuſpended the bow and arrows, and other arms of the deceaſed, by way of eſcutcheon.

cutcheon. But if the deceaſed be a female, inſtead of arms, they hang up all the implements of domeſtic induſtry. For ſeveral months all kind of proviſions and liquors are brought to the tomb to nouriſh the deceaſed in the next world; for they ſuppoſe it will be ſome time before he has cleared his new plantations, and formed connections in a ſtrange country.

They uſually bury all who belong to the ſame family in one grave, at a ſmall diſtance from the place where they have died, and theſe burying-places are generally choſen in ſome deſerted village. They eſteem human blood too precious to be ſpilt, and therefore ſtrangle the ſlaves deſtined for ſacrifices. This barbarous cuſtom, however, declines in moſt provinces; and where it is ſtill retained, the parents uſually conceal themſelves and children, upon the leaſt appearance of danger to the king's life, when a number of theſe ſacrifices are made.

SECT. VI.

Of the Religion of the interior Kingdoms of Sierra Leona.

THESE different nations acknowledge one Supreme Being, the Creator of all things, to whom they attribute infinite power, infinite knowledge, and omnipreſence; this being they call Canno. They believe that the dead are converted into ſpirits, whom they call januanins, or protectors, who are employed in guarding their former friends. A negroe who flies from any danger, haſtes to the tomb of his patron ſpirit; and if he eſcapes, it is attributed to his protection, in return for which he ſacrifices a cow, rice, and palm wine, in the preſence of the living friends of the januanin, who ſing and dance round the tomb. When the Quojans have received any injury, they fly to the groves, the ſuppoſed reſidence of the januanins, and there pouring out their complaints, beſeech them to grant their aſſiſtance in obtaining revenge, or to mediate with Canno in their behalf. In all difficulties and emergencies they have likewiſe recourſe to them. In ſhort, their veneration for the ſpirits of the deceaſed is extreme. Every village has a ſacred grove ſet apart for their worſhip, to which great quantities of proviſions are brought in the proper ſeaſons. Here alſo perſons labouring under any affliction implore the aid of the januanins; but women, children, and ſlaves, are prohibited entering theſe ſacred retreats; for a treſpaſs of this nature would paſs for the moſt abominable ſacrilege, which they ſuppoſe would be inſtantly puniſhed in the moſt exemplary and tragical manner.

The Quojans have no leſs faith in magicians and ſorcerers than in ſpirits; for theſe they imagine ſuck human blood, and are the inveterate enemies of mankind. They likewiſe believe, there are other enchanters, whom they ſtile billis, that have a power over the ſeaſons, and can forward or entirely ſtop the growth of rice.

The Quojans never venture to paſs through a wood without company, for fear of meeting with a billi buſied in culling plants and herbs; and generally fortify themſelves with a charm againſt the ſava or devil, and all his miniſters.

Theſe imaginary inviſible agents, eſpecially the januanins, are made the moving ſprings by which the affairs of government are conducted; for if a woman be accuſed of adultery, and no other proof but the allegation of her huſband appears, ſhe is acquitted upon beſeeching a ſpirit named belli poari, to confound her if ſhe varies from the truth; but if ſhe be afterwards convicted, the law ordains that her huſband ſhall bring her in the night to a public place, where a council ſits. Here, after invoking the januanins, her eyes are covered, to prevent her ſeeing thoſe beings, who are to carry her out of the world; and ſhe is left for a while in the belief, that this will certainly be her fate. When ſhe has ſuffered the moſt dreadful apprehenſions, and the moſt painful ſuſpenſe, the oldeſt in council begins a ſolemn diſcourſe on the ſhamefulneſs of a diſorderly life, threatening her with the moſt cruel puniſhment if ſhe perſiſt in it. Suddenly a confuſed murmur, that paſſes for the voice of the januanins, is heard, declaring, that though her crime merits the moſt rigorous chaſtiſement, ſhe will be pardoned on account of its being her firſt tranſgreſſion; enjoining certain mortifications, and recommending the moſt auſtere chaſtity. But if ſhe fall a ſecond time under the ſame cenſure, and the preſumptions are clear, the bellimo or high-prieſt, with one of his miniſters and proper officers, go early to her houſe, making a prodigious noiſe with a kind of rattles, and ſeizing her, bring her to court, obliging her to walk three times round the market-place, attended by the ſame noiſe and inſtruments, all of the ſociety of belli being admitted evidences of what happens. Then, without hearing her defence, or promiſes of reformation, they conduct her to a wood ſacred to the januanins, from which time ſhe is never more heard of, nor are the people ever permitted to mention her name; the negroes being ſo credulous as to imagine, that ſhe is carried out of the world by the januanins.

They have a feſtival at the approach of the new moon, which is chiefly obſerved in the country villages; but ſtrangers are not allowed to be preſent at theſe ceremonies. The reaſon they aſſign for this practice is more ridiculous than the cuſtom itſelf; for they ſay, that the firſt day of the moon being a bloody day, their rice would change to a red colour, were theſe ceremonies to be neglected.

There are other ſuperſtitious ceremonies equally obſerved by the negroes of Manow, Folgia, Hondo, Seſtos, Silm, and Bolm; in each of which is eſtabliſhed a ſociety called belli, which is properly a ſeminary for the education of youth, of which the king is viſitor or ſuperior. Here the young men learn to dance, fight, fiſh, hunt, and eſpecially to chant a certain hymn called bellidong, or the praiſes of the bellis, conſiſting of the repetition of ſome lewd expreſſions, joined to the moſt indecent and laſcivious poſtures.

This ſchool is always ſeated in a thick wood of palm trees, and includes a compaſs of nine or ten miles, in which they build huts, and clear plantations, for the ſupport of the ſcholars. All females are forbid to approach the ſacred grove; and, to render this prohibition the more effectual, the girls are taught from their infancy to believe, that if they violate ſo ſacred a law, the bellis will deſtroy them with the moſt excruciating tortures. The ſtudents are alſo ſtrictly forbid to paſs beyond certain bounds, or to converſe with any but the ſtudents, during the time they ſtay there, which is five years; and as theſe are known by a peculiar mark, no excuſe is admitted to extenuate the offence. This mark is extremely viſible, it conſiſting of cicatrices made from the ear to the ſhoulder by hot irons; a painful operation, to which all muſt ſubmit before they are duly matriculated, after which they have a new name.

While they reſide in this retreat, they go entirely naked. On the day they have finiſhed their ſtudies, they are conducted to a village built for that purpoſe, where they receive the viſits of their relations of both ſexes, and have all the conveniencies of bathing and anointing themſelves.

After their friends have ſpent a few days in poliſhing their manners, their necks are adorned with glaſs beads and leopards teeth, their legs are encircled by copper rings and bells, and their head covered with a cap of oſier. With theſe marks of wiſdom, and a cap adorned with plumes of feathers, they are publicly conducted to the palace, where they are ranged in order, amidſt ſurrounding crowds of ſpectators, eſpecially women, who flock from all parts to gratify their curioſity. They firſt uncover their heads, and afterwards repeat, one after another, the hymn and dance taught them at the college for this occaſion. The dance being finiſhed, each ſagona, or teacher, calls his own pupil, and delivers him over to his parents, letting them know the name he had given him upon entering the college.

A perſon who has paſſed through his ſtudies with reputation, is eſteemed qualified for all employments, and is intitled to a number of important privileges; but the quolgas, or dunces, who have either not been admitted into the ſociety, or were incapable of inſtruction, are by an eſtabliſhed law excluded from all public offices.

They have alſo a female inſtitution of the ſame nature. At a time appointed by the king, a number of ſmall huts are erected, in the midſt of a remote wood, for the reception of thoſe young females who chuſe to be initiated into the myſteries of the ſociety. When they firſt meet, the ſoguilly, an ancient matron of diſtinction, appointed by the king to preſide over the reſt, enters upon the office, by giving an entertainment to her ſcholars, and then exhorts them to comply with the laws of the ſiſterhood, to live together in perfect harmony, and labours to reconcile them to this ſhort receſs of four months from the world. Upon this they ſhave their heads, throw off the few cloaths they wear, and remain naked during their abode in the ſeminary. They are no ſooner ſtripped, than they are conducted to a rivulet, where they are waſhed, anointed, and circumciſed, by cutting off part of the clitoris; an operation ſoon over, and eaſily healed.

Their ſtudies conſiſt in learning to dance, and ſing verſes, which are equally indecent, both in the words and poſtures, with thoſe taught the boys in the male college. No men are allowed to viſit them, and even the women who enter their bounds are firſt ſtripped naked. When the time of their noviciate is expired, their parents ſend them pieces of ſcarlet cloth, copper rings and bracelets, glaſs necklaces, and other ornaments. Thus equipped, they march to the royal palace, preceded by the matron, the inhabitants of whole provinces aſſembling to behold them. There the matron ſits idle, while the girls friſk it away, dance and ſing merrily to the ſound of a tabor; after which they are delivered to their ſeveral families, with applauſes proportioned to their merit, and the proficiency they have made.

SECT. VII.

A Deſcription of the River Gambia, and of the Engliſh and other European Forts upon it; with a conciſe Account of the Trade carried on with the Negroes on its Banks.

THE great river Gambia was formerly known by the name of Gambro, which is ſtill retained by the French. This river diſcharges itſelf into the ocean between Cape Verd and Cape Roxo; or, to ſpeak with more preciſion, between Cape St. Mary on the ſouth, and Bird, or Broken Iſland, on the north, which are ſix leagues diſtant from each other. The river is divided by a multitude of iſlands and ſand-banks; and its broadeſt channel does not exceed three leagues. At Joar, fifty leagues up the river, it is a mile broad; a forty-gun ſhip may ſail up thither: and at Baracconda, which is five hundred miles diſtance from its mouth, it is navigable for ſhips of a hundred and fifty tons burthen. The ſeaſon for making this voyage is from December till June, when the river flows in a ſmooth, equal, and not very rapid ſtream; but during the reſt of the year the paſſage up it is difficult, if not impaſſable, on account of the extraordinary ſwell occaſioned by the rains, which fall in theſe countries with great violence.

Many attempts have been made to penetrate to the ſource of this river; but all of them have been unſucceſsful, the Engliſh ſeldom reaching farther than Baracconda.

From James's iſland, which is near the mouth of the river, to Baracconda, the ſoundings are never leſs than four fathoms and a half in the ſhalloweſt parts of the true channel, and are generally from five to eleven. The river is enriched with a multitude of beautiful iſlands, ſome covered with wood, and filled with animals. Theſe frequently render it extremely narrow; but balance that inconvenience by adding to its depth, from the water being there confined within narrower limits.

As the chief trade with the natives of Gambia is carried on with the Engliſh, we ſhall begin with deſcribing their ſettlements upon it. The time when they firſt began to frequent it cannot be determined; nor is it known who were the firſt Europeans that eſtabliſhed this commerce. However, Labat aſſerts, that the merchants of Dieppe and Roan were conſiderable traders on this river before the Portugueſe began their diſcoveries in Africa: but as the Normans found it leſs advantageous than their commerce with the coaſt of Guinea, which brought gold and ivory to France, they at laſt abandoned it for their eſtabliſhments on the ſouthern coaſt of Africa.

Whether there be any truth in the above aſſertion, we ſhall not here pretend to determine: it is certain that the Portugueſe, eager in the ſearch of diſcoveries, and of whatever could contribute to the advancement of trade, eſtabliſhed factories, not only along the coaſt, but in the interior kingdoms up the Gambia, as high as the Engliſh trade at preſent; which is proved by the ruins of many forts in different places. The Engliſh at length ſucceeded the Portugueſe in the trade of this river, ſeizing a number of advantageous poſts which they had abandoned, and fortified themſelves on a ſmall iſland between Albreda and Jilfray, ſituated at the diſtance of ſix miles from the mouth of the river. Here they built a fort, which was razed to the ground by the French, and afterwards by pirates; a loſs which the company could never have recovered without the aſſiſtance of parliament.

The next eſtabliſhment of the Engliſh company is on the river Cabata, which falls into the Gambia almoſt oppoſite to the ſouth ſide of James's Iſland; but here the trade is inconſiderable, the chief purpoſe of the factory being to furniſh James's Fort with proviſions. On the north ſide of the river, oppoſite to James's Iſland, ſtands the Engliſh factory of Jilfray, or Gillyfree, which is pleaſantly ſituated, and ſupplies James's Fort with all kinds of vegetables. Here the king of Barra exacts a duty upon all ſhipping that paſs up the river, to which the Engliſh are obliged to ſubmit.

James's Fort, or, as it is uſually called, James Fort, is ſituated in a ſmall iſland of the ſame name, in the middle of the Gambia, the whole breadth of the river being here about ſeven miles. The iſland is the property of the Engliſh; but ſubject to a ſmall tribute to the king of Barra. It is about three quarters of a mile round; the fort is regular, and defended by four batteries, each mounting ſeven pieces of cannon, which on every ſide command the river. Under the walls of the fort, facing the water, are erected two batteries, each mounted with four twenty-four pounders; and between both are planted ſmaller guns for ſalutes. The whole artillery of the fort amounts to forty-five pieces of cannon. Within the walls is a number of very commodious apartments for the governor, chief merchants, factors, writers, and military officers, the lower apartments being employed in magazines and ſtorehouſes. The ſoldiers, artificers, ſervants, and ſlaves of the fort are lodged in barracks without the walls; but they are built with ſtone and lime, and are as ſtrong and convenient as the fort itſelf, the whole being ſurrounded with paliſadoes, by the river, and by canals drawn from it. Underneath the apartments of the ſervants are magazines, and the ſlaves are lodged below the ſoldiers barracks. Centinels are placed at proper poſts, and the garriſon kept in conſtant duty and ſecurity, a patrole being ſent round at certain hours to examine into the ſituation of the fort, and to make a report to the governor.

The next Engliſh factory is at Vintain, or Bintan, upon a river of the ſame name, which falls into the Gambia about ſix miles above James's Fort. The chief commerce of this ſmall factory conſiſts in hides, ivory, and wax. Eight miles farther up the river is a factory called Jereja, ſituated in a kingdom of the ſame name, which affords little trade beſides that of wax, of which there is great plenty. The next is a ſmall factory at Tankeoval, in the kingdom of Caen, on the ſouth ſide of the Gambia; and ſomething higher up the river is the factory of Joar, ſituated three miles up the country in the dominions of the king of Barſally. There is not upon the whole river a more flouriſhing trade than is carried on by this town and factory. Higher up the river are the factories of Samy, that of Yamyakenda, and that of Fataden-da; which laſt place is ſituated at leaſt four hundred and eighty miles from the ſea, and yet Mr. Moore obſerves, that the river is as broad as the Thames at Tilbury-fort. Here the Gambia, with its beautiful windings, forms a moſt agreeable proſpect, only equalled by the

the verdure of the trees and the fertility of the adjacent country at Cantor, ſeveral provinces of which are ſurrounded on three ſides by theſe delightful curvatures of the river.

The principal articles of trade on this river are gold, ſlaves, ivory, and wax; for as to the gum-trade, it is not yet brought to any degree of perfection. The factors ſome years purchaſe above two thouſand ſlaves, moſt of which are priſoners of war, perſons ſtolen from neighbouring countries, or criminals; though ſome are the children of thoſe who are born ſlaves, and are bred by the deſcendants of the Portugeſe, who make them an article of trade. Since the ſlave trade became ſo profitable to the negroe princes, it has ſubverted the courſe of juſtice; and not only every crime, but every ſlight miſdemeanor, is puniſhed with ſlavery. Thus murder, adultery, theft, and robbery are confounded with the moſt trivial faults, and all puniſhed in the ſame manner. Moore obſerves, that a negroe ſhooting an arrow at a tyger who had killed his goat, had the misfortune to ſlay a man; when, though the king was informed of the circumſtances of this fact, he had the inhumanity to ſell the offender, with his wife, children, and effects, among the other ſlaves for whom he had bargained with the Engliſh.

Large quantities of ivory are ſometimes brought to the factories from Mundingo. The negroes procure it either by hunting elephants, and ſlaying them with their arrows, ſwords, darts, or from ſuch of theſe animals as have died a natural death. The bees-wax, of which prodigious quantities are produced in all the kingdoms along the Gambia, is another article of commerce.

SECT. VIII.

Of the Kingdom of Mundingo, with an Account of the Manners and Cuſtoms of the Natives.

THERE are a great variety of kingdoms, principalities, and petty ſtates between the rivers Sierra Leona and Senegal, of which we ſcarcely know the names, travellers having related only ſuch trivial circumſtances as fell under their own obſervation, or occurrences merely relating to the trade and navigation of the Gambia; but with reſpect to the extent of the dominions, and the peculiar cuſtoms of the different nations, their religion, policy, and laws, they are almoſt entirely ſilent; and we know little except what relates to the Mundingoes, Jolloiffs, Pholeys, or Foulies, and Portugueſe. When this country was conquered by theſe laſt people, about the year 1420, ſome of that nation ſettled in it, who have cohabited with theſe Mundingoes, till they are now nearly as black as they; but as they ſtill retain a ſort of baſtard Portugueſe language, and as they chriſten and marry by the help of a prieſt annually ſent thither from St. Jago, one of the Cape de Verd iſlands, they ſtill eſteem themſelves Portugueſe Chriſtians, as much as if they were actually natives of Portugal; and nothing makes them more angry than to call them negroes, that being a term they uſe only for ſlaves.

The various nations that dwell on the banks of the Gambia, and extend to Cape Verga, have the general name of Mundingoes, and are ſaid to reſemble each other not only in their complexion, features, and language, but in their manners and policy. This kingdom is of vaſt extent, both along the coaſt, and into the interior countries on the banks of the Gambia; but its frontiers cannot be determined with any degree of certainty.

Moore obſerves, that the natives are generally of a jet-black complexion, and are remarkable for the flatneſs of their noſes and the thickneſs of their lips. Janequin, however, affirms, that theſe features are by no means natural to them, but the conſequence of the cuſtom of the women's ſuckling their children over their ſhoulders; and Moore attributes it to the great care taken to form their features to that caſt; for nothing, he obſerves, is in their opinion ſo beautiful as large noſtrils, flat noſes, thick lips, and among the women large, looſe, and flabby breaſts.

The people are ſociable, rational, and humane. Whenever Mr. Moore viſited their towns, he met with the moſt cordial reception, the men running out to welcome his arrival by kiſſing his hands; though ſome women, who had never beheld a white man, fled at the ſight of him. Some have preſſed him to enter their huts, have entertained him in the beſt manner they were able, and brought out their wives and daughters for him to ſalute; their aſtoniſhment and curioſity being equally raiſed by his complexion, habit, ſpeech, and manners.

Theſe people are in general briſk and lively, and conſume half their time in muſic, dancing, mirth, and a good-humoured gaiety; yet being fond of company, and at the ſame time warm and impetuous, they fall into frequent quarrels, and the unhappy diſcord of the night tarniſhes the pleaſures of the day. Nothing is more uſual, upon any affront or injurious expreſſion, than challenges to ſingle combat; but their heat ſubſiding almoſt as ſoon as kindled, they ſeldom fight a deliberate battle, for all the blows that are uſually given are the effects of ſudden paſſion. But when they really engage, nothing can be more furious than the animoſity with which they ruſh upon each other with whatever weapons come in their way. The fury of tygers, ſays Jobſon, is far inferior to their's, every organ and limb expreſſing the moſt riveted hatred; their eyes ſeem to dart fire; they gnaſh their teeth, and pour forth the moſt opprobrious and vilifying expreſſions; and when they thus fight, the diſpute is ended by the death of one of the parties, and ſometimes in a bloody war between two nations, each taking part with their countryman.

In points of honour they are extremely jealous, particularly in reſpect to pride of birth and anceſtry. While Mr. Moore was at Butto, on the river Gambia, he ſaw a diſpute of honour ariſe between Bo-John, a prince of the blood, and a ſon of the reigning monarch. Each flew to arms, and were fired with ſuch reſentment, that the ſpectators had the utmoſt difficulty to prevent fatal conſequences; and yet the whole contention only proceeded from a compariſon of their parentage. Though they were parted, there was no preventing a formal challenge, after which the author found it no hard matter to reconcile them; but at the very time they were vowing a ſincere friendſhip, they alſo threatened to reſume the diſpute as ſoon as they had a proper opportunity, as if they thought menaces neceſſary to prevent the by-ſtanders entertaining a mean opinion of their courage.

The character of the people who inhabit the interior parts of the country is at preſent much altered for the better, for they were formerly extremely crafty and knaviſh even in the moſt trifling affairs. If a perſon had ſold any thing in the morning, it was allowable for him to retract his bargain, upon offering reſtitution before ſun-ſet: a cuſtom that gave occaſion for much fraud; for if a perſon had bought only a fowl, or an egg, he could not, without much danger, eat it before the next day, as he might be ſubject to pay ten times the value, ſhould reſtitution be demanded, and he unable to produce it. Theſe pernicious practices are, however, in a good meaſure aboliſhed, commerce with ſtrangers having taught them the neceſſity of being delicate in points that affect their credit.

The men ſalute each other by ſhaking hands; but if a man ſalutes a woman, he runs his noſe cloſe to her, as if to ſmell her, and falls back twice. It is the higheſt indignity to offer their left hand in ſalutations. When a man after an abſence of two or three days, returns to his family, his women throw themſelves on their knees before him; and their omitting this mark of reſpect is thought a great crime, and a proof of their little eſteem for their lord.

Every thing relating to domeſtic œconomy is left to the care of the women, while the men cultivate the rice wanted for the family, and ſpend the reſt of their time in indolence. After laying up what is ſufficient for their own conſumption, the women have a right to diſpoſe of the reſt; but are accountable to their huſbands for the profits. The ſame regulations take place with reſpect to their poultry, of which they breed a great number; for theſe articles are their principal ſupport, and no inconſi-

derable branch of trade. Many of the Mundingoes take a pride in keeping a crowd of ſlaves, whom they treat in ſo kind, gentle, and humane a manner, that it is not eaſy to diſtinguiſh the maſter from the ſlave: the women, in particular, wear necklaces, bracelets, and ear-rings of ſilver, amber, and coral; and Mr. Moore ſays, that he has ſeen female ſlaves wear trinkets to the value of thirty pounds ſterling. Moſt of theſe ſlaves are born in the families of their maſters, and as natural to them as their own children. At Butto, he adds, is a village of two hundred ſouls, compoſed of female ſlaves, all of them belonging to one nobleman of Mundingo, who treats them with the tenderneſs of wives and children. In moſt other parts of Africa the maſter has a right to ſell all the ſlaves born in his family; but in Mundingo this is conſidered as a crime; ſo that if any of them are diſpoſed of without their own conſent, and againſt the will of their fellow-ſlaves, they all abandon their maſter, and ſeek a retreat in another kingdom; for though in this caſe he has no power to puniſh them, yet they think it diſhonourable to enter into the ſervice of another maſter in the ſame kingdom.

We might here treat of the marriages and funerals of the Mundingoes; but a deſcription of theſe and other ceremonies we ſhall defer to another ſection, in which we ſhall give a minute deſcription of the cuſtoms of the interior negroes on the banks of the Gambia.

SECT. IX.

Of the Pholeys, or Foulies, with an Account of their Cuſtoms and Manners.

SOME authors aſſert, that the kingdom of Pholey is divided from the kingdom of Jaloff by a lake called, in the language of the Mundingoes Cayor, and ſtretches from eaſt to weſt about one hundred and eighty miles; but its limits from ſouth to north are not aſcertained, though it extends a great way to the ſouthward.

Mr. Moore, however, gives a very different account, and ſays, that the Pholeys live in clans, build towns, and are in every kingdom and country on each ſide of the river; yet are not ſubject to any of the kings of the country, though they live in their territories; for if they are uſed ill in one nation, they break up their towns and remove to another. They have chiefs of their own, who rule with ſuch moderation, that every act of government ſeems rather an act of the people than of one man. This form of government is eaſily adminiſtered, becauſe the people are of a good and quiet diſpoſition, and ſo well inſtructed in what is juſt and right, that a man who does ill is the abomination of all.

The natives of all theſe countries, not being avaricious of land, deſire no more than they can uſe; and as they do not plough with horſes, or other cattle, they can uſe but very little; and hence the kings willingly allow the Pholeys to live in their dominions, and cultivate the earth.

The Pholeys have in general a tawny complexion, tho' many of them are of as deep a black as the Mundingoes; and it is ſuppoſed that their alliances with the Moors have given them the mixed colour between the true olive and the black. They are rather of a low ſtature, but have a genteel and eaſy ſhape, with an air peculiarly delicate and agreeable.

Though the Pholeys are ſtrangers in the country, they are the greateſt planters in it. They are extremely induſtrious and frugal, and raiſe much more corn and cotton than they conſume, which they ſell at reaſonable rates; and are ſo remarkable for their hoſpitality, that the natives eſteem it a bleſſing to have a Pholey town in their neighbourhood; and their behaviour has gained them ſuch reputation, that it is eſteemed infamous for any one to treat them in an inhoſpitable manner. Their humanity extends to all, but they are doubly kind to people of their own race; and if they know of any one of their body being made a ſlave, they will readily redeem him. As they have plenty of food, they never ſuffer any of their own people to want; but ſupport the old, the blind, and the lame equally with the others.

These people are ſeldom angry, and Mr. Moore obſerves, that he never heard them abuſe each other; yet this mildneſs is far from proceeding from want of courage, they being as brave as any people of Africa, and very expert in the uſe of their arms, which are javelins, cutlaſſes, bows and arrows, and, upon occaſion, guns. They uſually ſettle near ſome Mundingo town, there being ſcarce any of note up the river that has not a Pholey town near it. Moſt of them ſpeak Arabic, which is taught in their ſchools; and they are able to read the Koran in that language, though they have a vulgar tongue called Pholey. They are ſtrict Mahometans, and ſcarce any of them will drink brandy, or any thing ſtronger than ſugar and water.

They are ſo ſkilful in the management of cattle, that the Mundingoes leave theirs to their care. The whole herd belonging to a town feed all day in the ſavannahs, and after the crop is off, in the rice-grounds. They have a place without each town for their cattle, ſurrounded by a circular hedge, and within this encloſure they raiſe a ſtage about eight feet high, and eight or ten feet wide, covered with a thatched roof; all the ſides are open, and they aſcend to it by a ladder. Round this ſtage they fix a number of ſtakes, and when the cattle are brought up at night, each beaſt is tied to a ſeparate ſtake with a ſtrong rope made of the bark of trees. The cows are then milked, and four or five men ſtay upon the ſtage all night with their arms to guard them from the lions, tygers, and other wild beaſts. Their houſes are built in a very regular manner, they being round ſtructures placed in rows at a diſtance from each other to avoid fire, and each of them has a thatched roof ſomewhat reſembling a high-crowned hat.

The Pholeys are alſo great huntſmen, and not only kill lions, tygers, and other wild beaſts, but frequently go twenty or thirty in a company to hunt elephants; whoſe teeth they ſell, and whoſe fleſh they ſmoke-dry and eat, keeping it ſeveral months together. As the elephants here generally go in droves of one or two hundred, they do great miſchief by pulling up the trees by the roots, and trampling down the corn; to prevent which, when they have any ſupicion of their coming, they make fires round their corn to keep them out.

The Pholeys are almoſt the only people who make butter, and ſell cattle at ſome diſtance up the river. They are very particular in their dreſs, and never wear any other cloaths but long robes of white cotton, which they make themſelves. They are always very clean, eſpecially the women, who keep their houſes exceeding ſweet. They are, however, in ſome particulars very ſuperſtitious: for if they know that any perſon who buys milk of them boils it, they will on no conſideration ſell that perſon any more, from their imagining that boiling the milk makes the cows dry.

SECT. X.

Of the Cuſtoms and Manners of the Jaloffs; with a conciſe Account of the Kingdoms of Damel and Barſally.

THE Jaloffs, or Jalloiffs, inhabit the north ſide of the river Gambia, extending a great way into the interior country, and alſo to the river Senegal. Their complexion is exceeding black, and more beautiful than that of moſt of the ſurrounding nations; nor have they, like the Mundingoes, very flat noſes and thick lips. Hence the notions they entertain of beauty are ſaid by moſt writers to be very different from thoſe of their neighbours, for they admire a ſmall well-proportioned noſe, a little mouth, thin lips, with a gentle pouting in the under lip, and lively eyes; for people generally fix the ſtandard of beauty among themſelves, and judge by that ſymmetry of features that is moſt familiar to them.

The general dreſs of the Jaloffs is a kind of looſe calicoe ſurplice, that hangs down below the knee, and which they ſometimes plait about the waiſt in a very agreeable manner. They wear a great number of gold trinkets in their hair, ears, noſes, and round their necks, arms,

arms, and legs; but the women are particularly fond of theſe ornaments.

Theſe people are in general of a warlike diſpoſition, and naturally ſtrong and vigorous. Thoſe, at leaſt, who live near the Gambia are good-natured, humane, generous, hoſpitable, modeſt, and are remarkable for their honeſty. Their eſtates chiefly conſiſt in droves of camels, dromedaries, cows, goats, millet, and fruit. In the audiences they grant the Europeans, they always appear with a becoming magnificence, and great decorum of behaviour. They are uſually ſeated on a throne, and covered with a long red or blue robe, adorned with tufts of hair from the tail of an elephant, or ſome other beaſt; ſmall pieces of ivory or coral, and a crown of oſier on their head, adorned with little horns of ſmall deer, antelopes, and other animals. They proceed with great ſolemnity to the place of audience, which in fine weather is commonly under the ſhade of a wide ſpreading tree, round which their guards are ranged, and always have a pipe of tobacco in their mouths. Nothing, ſays our author, can exceeed the dignity with which theſe princes take out the pipe to interrogate an ambaſſador concerning his commiſſion; for this is done with a gravity and ſolemnity of countenance and manner altogether peculiar, and of which no European who has not ſeen it, can form any idea.

It is ſaid that the damel, or prince of the Jaloffs near Senegal, has two officers under him, of very high rank. The one, called condy, preſides over all military affairs, and has the command of the army; the other, called the great jarafo, ſits at the head of the civil affairs, and is chief in all courts of juſtice; whence he takes circuits round the provinces to hear complaints, and redreſs grievances. Another officer, called the alkair, is treaſurer to the crown, and has under him ſubaltern officers, named alcades, who are the chiefs in the villages where they reſide, and a kind of juſtices of the peace, though, in all important caſes, appeals are frequently made to the jarafo when he performs his circuit.

As there are a great number of petty kings included under the general name of Jaloff princes, ſo there are perpetual wars in ſome part or other of this large tract of country. When a rupture of ſome other power is reſolved on, the condy aſſembles the troops, which ſeldom or never exceed five hundred in number; and thus their greateſt battles are only ſkirmiſhes, in which very few are left dead in the field. It is ſaid, that in the whole kingdom of Damel there are ſcarce horſes ſufficient to mount two hundred men, and yet the ſtrength of their armies chiefly conſiſts in their cavalry. The king of Damel is, however, a potent prince for that part of the world; his army is well ſupplied with proviſions, and hundreds of women daily attend the camp with live cattle for the uſe of the troops, as well as fruit, roots, and all kinds of vegetables.

The arms of the cavalry are long darts, a kind of javelin bearded like an arrow, and ſhort ſwords, which they uſe when they diſmount, a part of diſcipline they are always taught, and frequently practiſe in battle. The infantry are armed with ſcymetars, javelins, and a quiver containing ten or twelve poiſoned arrows, a wound from which is attended with almoſt certain death. Their bows are made of a kind of hard reed, that reſembles the bamboo. The negroes are ſuch excellent markſmen, that few of them will miſs a ſhilling at fifty paces diſtance; but they fight in an irregular and tumultuous manner, both ſides marching into the midſt of the plain pitched upon for the engagement, without the leaſt order or diſcipline, their inſtruments of war ſounding all the while, and making a moſt horrible din. On their coming within a proper diſtance, the infantry make a general diſcharge of their arrows, after which they engage ſword in hand; but having their commercial intereſt in view, kill as few, and make as many priſoners as poſſible; for the captives of all ranks and ages are ſold for ſlaves. Though the carnage in the field is frequently inconſiderable, yet their battles have often fatal conſequences, as few of thoſe wounded with their poiſoned arrows ever recover. Mr. Moore affirms, that the Jaloffs are extremely delicate with reſpect to military honour, preferring death to the ſmalleſt reproach on their courage; and this animates them no leſs than the dread of ſlavery, to behave with the utmoſt intrepidity. Should the firſt ſhock of battle fail to decide the victory, they frequently renew it for ſeveral days, and at length, when the obſtinacy of both ſides begins to faint under the fatigue of action, they enter upon a treaty, by means of their marbuts, who meet in the field between the two armies; and if they agree about the articles of convention, they ſwear upon the Koran to be faithful to their engagements.

The king of Barſally, whom Mr. Moore ſaw in 1732, had a great number of women; but when he went abroad, he was ſeldom attended by above two, who were dreſſed in all their finery. The uſual reſidence of this prince was then at Cahone, a town ſituated near the ſea, an hundred miles from Joar, another town belonging to the ſame king on the river Gambia.

When this king was in want of brandy, or any other of the luxuries of Europe, he ſent to deſire the governor of James's fort to diſpatch a boat with it, and in order to purchaſe it, plundered the neighbouring towns, and ſeized a number of his ſubjects, whom he ſold for ſlaves, and exchanged for European commodities. This was his method of ſupplying himſelf when at peace with his neighbours; whence his people were never ſo happy and ſecure as when at war, their moſt cruel enemy being their king, and their greateſt danger ariſing from him who ought to protect them in their liberties, lives, and property.

The kingdom of Barſally is divided into a number of provinces, over which are governors, called bumeys, who pay the king an annual homage and a certain revenue or tribute. Theſe bumeys have abſolute power within their juriſdictions, but ſeldom carry their prerogative ſo far as to incur the diſlike of the people, whoſe affections are the ſureſt barriers againſt the tyrannical encroachments of the king. His majeſty has, however, an abſolute authority over thoſe governors; for if they attempt to throw off their ſubjection, his ſtanding forces are always ſufficient to reduce them to obedience: but this ſeldom or never happens, it being for the intereſt of both to live in amity, the one to acknowledge the homage that is due, and the other to require no more. Thus the king enjoys a deſpotic dominion without having the whole load of government upon his ſhoulders: while the bumeys enjoy all the privileges of crowned heads, except their being obliged to acknowledge a ſuperior; and the people, when freed from violence, are in the full poſſeſſion of happineſs, by having a kind of mediator between them and the monarch, who conſiders them as his ſlaves.

The king maintains ſo ſtrictly his deſpotic power, that he has no other counſellor beſides his prime miniſter, or rather his prime ſlave; for nothing can be more ſervile than the implicit reſpect paid by him to the nod of his maſter. This miniſter is at the ſame time general of the king's forces and interpreter of his will, from the latter of which he muſt never deviate: he is termed the great ſarbro, or maſter of the horſe, and upon all publick occaſions bears the ſword of ſtate before the king.

SECT. XI.

A particular Deſcription of the River Senegal, and the Country on its Banks; with an Account of the valuable Drug called Gum Senegal, or Gum Arabic, the Manner in which it is produced, and the Conqueſt of the Country by the Engliſh.

WE now come to the great river Senegal, the ſource of which is as little known as that of the Gambia. Some geographers maintain, that it is one of the channels by which the Niger diſcharges its waters into the Atlantic ocean. The Niger riſes in the eaſtern parts of Africa, and after a courſe of above three hundred miles, nearly due eaſt and weſt, is ſaid to divide into three branches, the moſt ſouthern of which is the Sierra Leona, the middle the Gambia, and the moſt nor-

northerly the Senegal; whence all this tract of country deſcribed in this chapter, obtained the name of Nigritia, from the river Niger. This opinion can, however, be no otherwiſe ſupported than by conjectures, and cannot poſſibly be decided till voyagers have carried their diſcoveries much farther up theſe rivers; though there is no doubt that one of them is at leaſt that called by the ancients the Niger.

The Senegal is one of the largeſt rivers of Africa; for from the lake Benin, the fartheſt part to which the Europeans have penetrated, it is two thouſand four hundred miles to the ſea. In this courſe it generally proceeds from the eaſt to the weſt; but within two leagues of the ocean it takes a ſudden turn to the ſouth, and for the remainder of its paſſage is ſeparated from the ſea only by a natural ridge, in ſome places not above two hundred yards broad. By this curve it prolongs its courſe for twenty-five leagues farther from north to ſouth, till at length it diſcharges itſelf into the ocean, in the ſixteenth degree of north latitude.

Both this river, the Gambia, and Sierra Leona, overflow their banks like the Nile, and much about the ſame time of the year. The Senegal is forty days before it come to its height, and when it has over-flowed its banks, its channel is difficult to be found by thoſe who have rowed up it in boats. The French once ſent thirty men up this river, who rowed a thouſand miles; but ſuffered ſuch hardſhips, that only five returned back alive. Their boat once ſtuck faſt, it is ſaid, on the tops of trees, and with great difficulty they diſengaged it.

This great river is extremely rapid at its mouth, which is attributed to ſo large a body of water being confined within ſo narrow a channel; the mouth of the river being only half a league over, and choaked up by a bar, which renders the paſſage exceeding difficult and dangerous; eſpecially in the rainy ſeaſon, when the prodigious ſwell of the river, and the ſouth-weſt winds, oppoſed to its rapid courſe, raiſe waves of ſo prodigious a height at the bar, that their claſhing reſembles the ſhock of mountains, and are ſaid to be ſo furious as to daſh in pieces the ſtouteſt ſhips: yet, according to Labat, the worſt ſeaſon, with reſpect to commerce, is in September and November, when the winds blowing northerly, exclude all navigation, even of the ſmalleſt boats.

This bar is doubly dangerous, not only on account of the violence of the waves, but the ſhallowneſs of the water, and the ſhifting of the bar after floods and heavy rains, by which the channels are loſt, and new ſoundings become neceſſary to diſcover them. The Senegal would indeed be quite ſhut up, were it not for one channel, four hundred yards broad, and two fathoms deep, that has long kept its ſituation immoveable. The moſt proper time for croſſing the bar is from March to September, when the winds are variable, and the bar fixed till the enſuing rainy ſeaſon.

A perſon has no ſooner croſſed the bar, than he finds himſelf in a ſmooth and gently gliding river, four fathoms deep.

On advancing a league higher up the country, on the ſouth ſide, it is covered with a beautiful verdure; lofty trees of different kinds are in perpetual bloom, and filled with a variety of birds; ſome red, others blue, and others black, of the ſize of a linnet, and of the brighteſt colours; and with ſquirrels and monkeys that divert the paſſengers, by playing a thouſand antic tricks.

The country alſo abounds with elephants, lions, and other wild beaſts; but the former do no hurt, except they are firſt attacked. In ſome places the low grounds are covered with thorny trees, that riſe to a prodigious height, and bear large bunches of bright yellow flowers, of a fragant ſmell. The bark of theſe trees is of different colours, as black, green, white, and red; the colour of the timber nearly reſembles that of the bark; though from its hardneſs, it ſeems a ſpecies of the ebony: and yet the flower of theſe different kinds are exactly the ſame.

The river has a great number of iſlands covered with trees, fruits, herbage, and birds; but none of theſe were put to any uſe by the French company, except the iſland of Senegal, on which ſtands Fort Louis, in ſixteen degrees five minutes north latitude. This iſland is ſituated in the middle of the river four or five miles from its entrance, and is two thouſand three hundred yards in length from north to ſouth; but at the end towards the bar, it is no more than one hundred and eighty yards; at the oppoſite extremity three hundred and ſixty, and two hundred and ſixty yards in that part where the fort ſtands. The iſland is a dry, ſandy, and barren ſpot of ground deſtitute of freſh water during one half of the year, it having neither ſprings nor wells, and the water of the river is too ſalt for uſe.

The fort of St. Louis is a quadrangle and has two baſtions of conſiderable ſtrength; but the greateſt ſecurity of the fort is its natural ſituation. The cannon of the fort are numerous, and the arſenal well ſupplied with ſmall arms and ſtores. Beſides this the French had no other fort upon the river, but fort St. Joſeph, which ſtands about four leagues below the cataract at Govina, though they had a few factories in different parts.

The principal commodity of this country is that of gum Senegal, or Arabic; which is a valuable branch of commerce, as it is uſed in many arts and manufactures, particularly by the painters in water colours, the ſilk weavers and dyers.

This tree is deſcribed by Labat as a ſpecies of acacia, ſmall, prickly, full of branches, and covered with leaves moderately long, very narrow, and of a perpetual verdure. Some ſay it bears a white flower compoſed of five leaves, which form a kind of cup; but other naturaliſts repreſent it as formed of one leaf in the manner of a funnel, and ſay the flowers are in cluſters. The piſtil riſes from the bottom of the flower, and at length becomes a pod, three or four inches long, filled with ſmall, round, hard, and black grains, which ſerve to propagate the ſpecies. Of this ſpecies of gum-tree there are three foreſts, all of them ſituated in the deſart north of the river, and at nearly equal diſtances from it. Every year produces two crops, if we may thus term it, of gum; the firſt and beſt in December, and the other in March. The firſt tears or exudations are the largeſt, the drieſt, and moſt pure, with every other advantage required in this drug; and the other more ſoft, glutinous, and impure. The December crop is gathered after the rains have ceaſed, and the moiſture of the earth has rendered the ſap more abundant: but that in March is procured by making inciſions in the trees, which have then too little vigour to produce it of themſelves. The natives ſell the gum by a cubic meaſure called a quintal, which holds about two hundred weight, and this they exchange for goods of about two ſhillings value.

The French, when in poſſeſſion of this river, imported from thence not only this gum, but elephants teeth, hides, bees-wax, gold-duſt, cotton, oſtrich feathers, ambergris, indigo, and civet.

The firſt Europeans who ſettled at Senegal were the Dutch, who fortified themſelves there; but were driven from thence by the French in the year 1687. Afterwards, in 1692, this ſettlement was firſt taken by the Engliſh; but the following year it was retaken by the French, who continued in poſſeſſion of it till the laſt war. In 1758, a ſmall ſquadron fitted out under the command of captain Marſh, having on board a body of marines commanded by major Maſon, with a detachment of artillery, ten pieces of cannon, eight mortars, and a conſiderable quantity of warlike ſtores and ammunition, were ſent againſt Fort Louis. Captain Walker was appointed engineer, and Mr. Cumming, a quaker of good ſenſe, who had propoſed the expedition, ſailed before to engage the negroe princes, with whom he was acquainted, to join the Engliſh.

On the twenty-third of April this Engliſh ſquadron ſaw the French flag flying on Fort Louis, and came to an anchor in Senegal road, after taking a large Dutch ſhip richly loaded with gum, and ſoon perceived that ſeveral armed French ſloops were placed to diſpute the paſſage of the bar. The Engliſh immediately prepared for landing; and having diſcovered the channel, Captain Millar, in the London Buſs, paſſed the bar, and the next morning was followed by the other veſſels, ſuſtaining a conſtant fire from the French ſloops. A regular engagement now enſued, which was maintained on both ſides, till the buſſes and one dogger running aground, inſtantly bulged,

bulged, and were filled with water. Upon this the troops took to their boats, and, notwithſtanding the difficulties with which they were ſurrounded, reached the ſhore, where they formed in a body, and were ſoon joined by their companions in the other veſſels, the whole amounting to three hundred and ninety marines, beſides the detachment of artillery. They immediately threw up an intrenchment to prevent their being attacked by the natives, who lined the ſhore at ſome diſtance; but this precaution was unneceſſary; for the negroes came in great numbers and ſubmitted, and on the following day they were reinforced by three hundred and fifty ſeamen, who paſſed the bar in ſloops with their enſigns and colours flying.

While they were preparing to attack Fort St. Louis, two French deputies arrived with propoſals from the governor for a capitulation, when it was agreed, that all the white people belonging to the French company of Senegal ſhould be ſafely conducted to France in an Engliſh veſſel, without being deprived of their private effects: that all their merchandize and uncoined treaſure ſhould be delivered up to the victors: that the forts, ſtorehouſes, veſſels, arms, proviſions, and every article belonging to the company in that river, ſhould be inſtantly put into the hands of the Engliſh: that the free natives of Fort Louis ſhould remain in the quiet poſſeſſion of their effects, and the free exerciſe of their religion: and that all the negroes, mulattoes, and others, ſhould be at their option, either to remain in the place, or to retire to any other part of the country.

This capitulation was no ſooner agreed upon, than the Captains Campbell and Walker were ſent up the river with a flag of truce, to ſee the articles ſigned and executed. Mean while the negroes on the iſland took arms, and blocked up the French in Fort Louis, reſolving to defend the place, unleſs they were included in the capitulation, inſiſting that the French director-general ſhould be permitted to remain with the natives as a ſecurity for that article of the capitulation in which they were concerned. The Engliſh readily granted this requeſt, and marching to St. Louis, took poſſeſſion of the caſtle, where they found ninety-two pieces of cannon, with a conſiderable quantity of treaſure and merchandize. The corporation and burghers of the town of Senegal ſwore allegiance to his Britannic majeſty, and the neighbouring princes, attended by numerous retinues, viſited the commander, and concluded treaties with the Engliſh. The number of free independent negroes and mulattoes ſettled at Senegal amounted to three thouſand; and the other French factories being included in the capitulation, Great Britain became poſſeſſed of a conqueſt from which great riches may be derived, and which was acquired without the loſs of a ſingle man.

SECT. XII.

Of the Manners and Cuſtoms of the People of the interior Countries from the Gambia to the Senegal; containing a minute Deſcription of their Dreſs, Food, Marriages, Education of Children, and Funerals.

THE moſt uſual dreſs all over this part of Africa is a kind of ſhirt and wide drawers of blue and white cotton cloth. The ſleeves of this ſhirt are large, and therefore they tuck them up over their arms when they have any buſineſs that requires the free uſe of their hands, and their drawers hanging in a bag which ſeparates the legs, they ſtraddle as they walk. They have leather ſandals on their feet, buttoned at the inſtep, the toes, and behind at the heel. Some wear a ſword ſlung over the right ſhoulder, others a long dart, and others a bow and arrows; but all of them have a long knife by their left ſide. This is to be underſtood of perſons of ſuperior rank; for the poor generally go naked, and at leaſt barefooted.

As to the women, their dreſs only conſiſts of a piece of cotton tied round the waiſt, and falling down to the knee, much in the ſame manner as among the negroes of Guinea. The upper part of their bodies is naked; but, by way of ornament, they mark, ſtain, and paint it with various figures and colours, ſo that at a diſtance they ſeem covered with a painted calicoe, or flowered ſtuff. Some have a looſe piece of cotton cloth careleſsly thrown over their ſhoulder: but this is an unuſual piece of extravagance. Both ſexes take a pride in having a large bunch of keys hanging at their girdles.

Theſe negroes live upon a plain and ſimple diet, chiefly compoſed of rice, roots, and fruit, which they naturally eat with great appetite, as many of them make but one meal a-day, and that in the evening; for they carefully keep their cows, ſheep, and goats, for milk. The ordinary drink of all the negroes is water, though people in good circumſtances uſe palm-wine diluted with water, and a kind of beer called ballo. They are indeed extremely fond of brandy and other ſpirits; but as theſe are purchaſed from the Europeans, none but perſons of ſuperior rank are able to drink them to exceſs. Nothing can exceed the temperance and ſimplicity of diet and drink practiſed by the women, for they ſeldom or never taſte any thing ſtronger than water, or at moſt a little wine or ballo, plentifully diluted.

According to ſome authors, the negroes make two meals a-day, one about noon, and the other in the evening. They ſit at table without any of the furniture we eſteem neceſſary, eating with their fingers, and always uſing the right hand, thinking it indecent to touch their food or lips with the left, which they employ in none but the meaneſt offices.

Every man has a right to marry the girl he loves, without regard to rank or fortune, or any other circumſtance than being of a proper age; yet theſe contracts are ſeldom made without the conſent of the parents, in whoſe hands he depoſits the jointure intended, or at leaſt a proper ſecurity for the payment of it. The preliminaries are no ſooner adjuſted than the bridegroom, accompanied by a number of young fellows, ſets out by moon-light, or at leaſt in the night, and ſurround the houſe of the bride, in order to carry her off by force, while ſhe and her female attendants pretend to make all poſſible reſiſtance, and alarm the whole village with their cries: but this coyneſs being only looked upon as a neceſſary part of the ceremony, no oppoſition is made to the raviſher, and the affair is always terminated by a wedding.

In ſome places this farce is ſaid to be carried ſtill farther; the lover haunts the houſe for ſeveral weeks before, and conceals himſelf in woods and groves round the reſidence of the object of his wiſhes, covering his face with a veil, to prevent a diſcovery, and giving the courtſhip an air of intrigue. This is thought neceſſary to heighten the joy, which would otherwiſe be thought flat and inſipid.

In the countries near the Gambia, a father frequently betroths his daughter to ſome neighbouring infant on the day of her birth; an engagement ſo firm and binding, that the parents can never after break the match; but it is in the power of the man never to come and claim his wife, and yet without his conſent ſhe cannot marry another.

The women in general marry very young, and leave off bearing children at the time of life when others begin. The huſband muſt give an entertainment, to which all the neighbours come without invitation; and this ceremony, the neglect of which inevitably incurs the contempt of the whole village, continues three or four days. The bride is carried from her father's houſe upon the ſhoulders of young men who are friends to the bridegroom; her face being covered with a veil, which ſhe never lays aſide till after conſummation, her doing this being a teſtimony to the whole aſſembly that the nuptial rites are performed; for it is uſual for the married pair to retire, while the company continue dancing, ſinging, and drinking till they return.

In the countries bordering on the Senegal, theſe ceremonies, according to Labat, are very different. The young lover applies to his miſtreſs's parents, in order to obtain their influence, but without expecting that any conſtraint ſhould be laid on her inclinations. If he is ſo fortunate to gain her affections, he makes ſome preſents to her neareſt relations, ſhe is then conducted to his houſe, and he gives a feaſt to the village. On her approaching the houſe, the bridegroom offers her

his hand to conduct her to the beſt apartment, which ſhe no ſooner enters, than, to ſhew her ſubordination, he inſtantly employs her in fetching water, or in ſome other ſervile office, while ſhe reſpectfully retires at the firſt motion to execute his commands. She ſups after him, attends him in quality of a ſervant during ſupper, and patiently waits his time to be led to bed. All this is looked upon as a part of the marriage ceremony; but no good-natured huſbands aſſume this authority after the firſt night.

If the bride knows herſelf a virgin, ſhe always, from a motive of vanity, and compliment to her huſband, ſpreads a white cotton cloth upon the bed, which, as a proof of her former chaſtity, and the abilities of the bridegroom, ſhe expoſes publicly to the company after conſummation, who receive it with profound reſpect, and carry it in triumph round the village, attended by crowds of people, with variety of muſic, and great rejoicings.

It is ſaid, that if the proper marks of virginity do not appear, the parents may be obliged to take her back, if the bridegroom inſiſts upon it; but this ſeldom happens, for the huſband chooſes rather to take no notice of the affair, than to embroil two families, the inevitable conſequence of ſending back the bride. Indeed, in many parts of this coaſt, very little value is ſet upon virginity, the Africans being greatly divided about the worth of the female jewel, ſome eſteeming it above, and others below all eſtimation.

Polygamy is permitted here, with the ſame latitude as in all other negroe countries, the huſband being confined to no number, and taking as many women as he is able to ſupport.

In general, the huſband has the power of puniſhing the infidelity of his wife, by ſelling her to the higheſt bidder, or driving her out of his houſe with all her children, without any thing to ſupport them. Yet notwithſtanding the ſeverity of theſe laws, the women look upon an intrigue with a white man as a great honour; and their huſbands frequently compliment the factors with the uſe of their wives, ſiſters, or daughters.

Among both the Mahometan and Pagan negroes of this country, perſons under certain degrees of conſanguinity are prohibited by law from marrying. A man, for inſtance, cannot marry his daughter, his ſiſter, his aunt, or his niece.

The women in general are incredibly fruitful, and in the pains of labour never utter either a groan or a ſigh. None but thoſe who are pregnant very young require the aſſiſtance of a midwife, and the women never keep their beds above a day or two, if at all; for in general the mother and infant are immediately waſhed, and the child being wrapped up in a cloth, is faſtened to the ſhoulders of the mother, who goes about her work, as if nothing extraordinary had happened.

A new-born child is dipped three or four times a-day over head and ears in cold water, and as ſoon as he is dry, they rub him over with palm-oil, particularly the neck, the back-bone, the ſmall of the back, the hips, knees, and elbows. When firſt born they are of an olive colour, and ſometimes do not turn black till they are a month or two old.

The women treat their children with extraordinary tenderneſs, ſparing no fatigue or labour till they are able to walk, after which they carefully cheriſh and aſſiduouſly attend them till they are able to provide for themſelves. As the boys are bred in a perpetual courſe of idleneſs, this becomes habitual. As to the girls, they are bred to labour from their infancy, and to a modeſt and reſerved behaviour in company, eſpecially before their ſuperiors. Here, as well as in ſome other countries, the woman avoids the careſſes of her huſband for three years after child-bearing, a cuſtom founded upon their extraordinary affection for their children, who they imagine would contract diſtempers from the mother's milk being injured by the nuptial embrace.

Upon the death of any perſon, the whole village is inſtantly informed of the loſs, by the lamentations of the family: the marbut or prieſt carefully waſhes the body, and then covers it with the ſame cloaths the perſon uſually wore. The relations, coming one after another, aſk the deceaſed the moſt ridiculous queſtions, as, Why he was unwilling to live with them? whether he was diſſatisfied with the narrowneſs of his fortune? whether he had too few handſome women? or whether any of his relations had offended him, that he ſhould take this cruel method of puniſhing them? On the other hand muſicians play and ſing the praiſes of the dead, and a ball is given to all the attendants, who perform a particular dance in memory of the deceaſed. Slaves are ſold to purchaſe brandy, and after the entertainment, the cover is removed from the grave in which the body is to be depoſited. Four of the neareſt relations hold up a cloth which is ſpread over the corpſe, while the prieſt whiſpers ſome inarticulate ſounds in its ear. It is then covered with duſt, the tomb-ſtone laid over it, and upon that a piece of cloth of any colour the relations chooſe. At the head is placed ſome plates of proviſions, and a jar of water, and near them a pole, on which are ſuſpended the ſword, darts, bow and arrows of the deceaſed. In ſome countries they encompaſs the grave with a deep ditch, to prevent the corpſe being ſcratched up by wild beaſts, which is frequently the caſe where this precaution is omitted.

At the death of a king, a certain time is fixed for the public mourning, which conſiſts of a full chorus of howling over the grave, and hundreds of negroes, who, when the king was living, deteſted him as a tyrant, now ſeem to tear their hair, to beat their breaſts, and pour forth their unfelt lamentations for his death. All the wealthy ſubjects from every part of his dominions ſend preſents of ſheep, rice, and millet, for the uſe of the mourners, and an open table is kept round the grave for ſeveral days. Some writers ſay, that their complaints begin with the riſing of the ſun, and continue till the evening, when all this tragic farce is ſucceeded by dancing, ſinging, jollity, and the moſt extravagant debauchery.

SECT. XIII.

Of the Languages, Mechanic Arts, Buildings, Furniture, and Activity of the People in the interior Countries between the Gambia and the Senegal.

MOORE ſays, that the common language ſpoken on both ſides the Gambia is the Mundingan, with which you may bargain and perform every branch of trade, from the mouth of the river to the country of the Jonkos, or merchants, who are ſo called from the vaſt number of ſlaves they annually ſell, and are ſituated at leaſt a voyage of ſix weeks from James's fort; but a corrupt kind of Portugueſe is commonly ſpoken by the vulgar natives who trade with the Europeans. The other languages are the Jaloffian and Pholian, which are all the languages ſpoken by the many nations in this diviſion.

The negroes of theſe countries have made no great progreſs in arts and manufactures; for they have no mechanics but ſuch as are abſolutely neceſſary, and among theſe the ſmiths and cutlers are the principal, as they make all the implements of war, huſbandry, and fiſhing, and in general work in all kinds of metals. The artiſt next in eſteem is called ſepatero, and is employed in making the griſgris, or caſes for the charms which the marbuts diſpoſe of to the people. This is a very profitable buſineſs, as the price of labour is regulated by ſuperſtition, and the people would think it the higheſt impiety to diſpute the price of any thing belonging to a griſgris. The third mechanical employment is that of the maſon, who is alſo a plaiſterer and a potter; the building conſiſting of a kind of loam mixed with lime; and theſe are the people who make all their earthenware.

The women and girls are employed in ſpinning and weaving cotton cloths; but the artiſts in this way have made but ſmall progreſs, being confined entirely to three colours, and giving their pieces of cotton only two yards in length and ſix inches in breadth, though they have the art of joining them together ſo neatly as to form a piece of any ſize, that appears to be of one entire web.

The

The negro houſes and towns bear evident marks of the ignorance of the people; they have nothing like architecture, and ſcarce any attempts after beauty, order, or convenience: each generation follows the faults of the former, and all proceed in the ſame beaten track as their anceſtors. The negro hut uſed by the common people is no more than a ſmall conical cabbin, with no other light than what enters by the door, which is ſo low, that they are forced to ſtoop down in entering it; after which a man of ordinary ſtature cannot walk round without hitting his head againſt the walls; and here the fathers, mothers, brothers, ſiſters, ſervants, and ſlaves lie together promiſcuouſly. Theſe huts are formed of a kind of wicker-work plaiſtered over with earth, and are ſometimes joined to each other by walls, by which means thoſe of ſuperior rank have diſtinct and ſeparate apartments for the different parts of their families, and alſo a hut for the reception of ſtrangers.

Their towns are always built of a circular form, with ſpiral ſtreets; hence, in a village not half a mile in diameter, it is ſaid that a perſon is frequently obliged to walk two or three miles to viſit an acquaintance, when by a ſhort croſs ſtreet the diſtance might be reduced to an hundred paces.

The palace of the damel, or king, of Cayoar, is mentioned as an exception to the general rule which the negroes ſeem to have eſtabliſhed in building. This palace is encompaſſed by a wall, oppoſite to the firſt gate of which is a ſpacious court for exerciſing the king's horſes, with ſtables all round it. At the farther end is another gate, on each ſide of which are the apartments of the different officers of the court; and from thence, through a fine viſto of fruit-trees, forming a thick ſhade, you proceed to the royal apartments, on each ſide of which are the lodgings of the king's women, with proper officers for their ſervants and ſlaves. As his majeſty has a private paſſage that leads to each apartment, it is never known with which of his women he ſpends the night; a method which, it is ſaid, ſecures his perſon againſt all plots, and prevents jealouſy and murmuring among the women.

The negroes of great wealth imitate in their buildings the magnificence of the royal palaces, and ſometimes ſurpaſs them, eſpecially thoſe deſcended from the Portugueſe, who build entirely in the European taſte, but without the leaſt notion of the principles of architecture.

According to a late French writer, ſome nations of the Mundingoes build in a more commodious manner than the reſt, the walls being made of a fat binding clay, that ſeems ſmooth and hard like porcelain; theſe ſtructures are thatched with ſtraw, which projects beyond the building to a little wall breaſt-high, forming a ſmall gallery round the hut, in which they are ſheltered from the ſcorching rays of the ſun. Mr. Adamſon mentions a village burnt down before his arrival, when the walls that withſtood the violence of the flames were partly of a beautiful red, and in a manner vitrified by the intenſe heat; at a diſtance the whole ſeemed covered with a bright enamel, and reſembled the fineſt china.

The furniture of the common people conſiſts of nothing more than a few neceſſaries; as ſome earthen veſſels, calabaſhes, wooden bowls, diſhes, plates, and the like utenſils; their mats ſupply the place of chairs, tables, and beds, except one bed for the maſter of the family, which conſiſts of a kind of hurdle, laid upon croſs pieces of wood, ſupported by wooden forks a foot above the ground; upon this they throw a mat, which ſerves them for a mattreſs, and generally for ſheets and covering.

Deficient as theſe negroes are in the arts, they excel in agility. As they obtain great quantities of palm-wine, by making inciſions on the top of the trunk, as already deſcribed, it is neceſſary that they ſhould have a method of aſcending theſe trees; and indeed it is very ſurpriſing to ſee how nimbly they run up them, though they are ſometimes ſixty, ſeventy, or even a hundred feet high, and the bark ſmooth. They have no other help in aſcending than a piece of the bark like a long ſtrap of leather, with the ends tied together, to incloſe both themſelves and the tree; then fixing it under their arms, they ſet their feet againſt the trunk of the tree, and their backs againſt the ſtrap of bark, and thus go up very faſt, moving the ſtrap up higher and higher with their hands: but ſometimes they miſs their footing, or the bark on which they reſt breaks, or comes untied; when falling down, they are in danger of loſing their lives.

Their activity and ſkill are alſo ſhewn in their horſemanſhip; for it is a common practice among the negroes to ride a full gallop ſtanding on the horſe's back; to vault into their ſeat; to raiſe themſelves up again; to throw themſelves with one hand on the ground, and again to recover the ſaddle, without the leaſt fear or danger.

SECT. XIV.

Of the Religion of the Negroes bordering on the River Senegal; with a particular Account of the Griſgris, the Mumbo Jumbo, the Marbuts, or Prieſts, and the Method of Education.

THE religion of the nations on both ſides the river Senegal, and ſtretching eaſt and ſouth into the interior countries, is that of Mahomet, mixed with pagan ſuperſtitions, and entirely conſiſts in the belief of the Unity of the Godhead, and the obſervance of the faſt of Ramadan, the feaſt of Biram, circumciſion, and a few other ceremonies. They believe in the miſſion of Mahomet, but never invoke or pray to him; and they obſerve their Friday-ſabbath, without interrupting their ordinary work and the regular courſe of buſineſs. The grandees and people of faſhion have an apartment in their houſes ſet apart for public worſhip; but they have neither temples nor moſques, but aſſemble to perform their devotions in the open air, under the ſhade of a large tree.

Theſe negro Mahometans content themſelves with praying twice on every day in the week, except their Sabbath, when they pray three times. Every village has its marbut, who aſſembles them to their devotions; and after he has given them abſolution from their Koran, they range themſelves behind him, in order to imitate his geſtures and grimaces, with their faces turned towards the eaſt.

The negro Mahometans have their faſt of Ramadan fixed to the month of September, though among the Moors it is a moveable faſt; they obſerve it with the ſame ſtrictneſs as the Turks, and neither eat nor drink till after ſun-ſet, and the devotees will not even ſwallow their ſpittle: but when night comes, they ſolace themſelves with a joy proportioned to the rigour of the abſtinence of the day; and ſome of the wealthy paſs the whole day in ſleep, and the night in pleaſure.

Circumciſion is rigorouſly obſerved, and performed on the males at four or five years of age. When the children of the king, or of any man of quality, have arrived at the proper age, all their ſubjects and dependants bring their children; for the grandeur of the feſtival conſiſts in the number of perſons circumciſed. Here one good conſequence flows from this practice; for at the circumciſion-feaſt the young people frequently contract alliances that continue for the remainder of their lives.

The people are extremely ſuperſtitious: the Mundingoes believe that the eclipſes of the moon are occaſioned by a large cat putting her paw between the moon and the earth; and upon theſe occaſions they ſpend their time in dancing and ſinging in honour of Mahomet.

Whenever they intend to make an expedition, they ſacrifice a pullet; and, by obſerving the entrails, reſolve whether it is beſt to purſue or drop it. They pay a great regard to lucky and unlucky days, and nothing will prevail on them to undertake any important affair on the latter. The cuſtom of making vows, and of wearing large bracelets to remind them of what they have ſworn, is extremely frequent. Thus a perſon vows that he will make a preſent of ſuch a ſlave; and, that he may not ſell him through forgetfulneſs, he wears a bracelet on his arm, till it is convenient for him to fulfil his engagement; and their failing in this particular, they imagine, will be followed by ſome immediate judgment from heaven.

But the moſt general and remarkable of all their ſuperſtitions are their griſgris, which, according to Le Maire, are certain Arabic characters, mixed with necromantic figures, drawn by the marbuts on paper; but

Labat

Labat affirms, that they are nothing more than ſcraps of the Koran written in Arabic. However, they lay ſuch ſtreſs on theſe ſuppoſed charms, that the pooreſt negro never goes to war without his griſgris, as a charm againſt wounds; and if it prove ineffectual, the marbut lays the blame on the immorality of his conduct. Theſe impoſtors invent charms againſt all kinds of danger, and in favour of all their deſires; and, by virtue of them, the poſſeſſors imagine that they can obtain or avoid whatever they pleaſe. They are ſuppoſed to defend them from ſtorms, enemies, diſeaſes, pains, and misfortunes; and to preſerve health, wealth, honour, and merit. Theſe prieſts indeed reap great benefit from them, no clergy upon earth being more honoured and revered; and they are ſold at ſo exorbitant a price, that they ſometimes exact for them three ſlaves, and four or five cows. Thoſe intended for the head are made in the form of a croſs, reaching from the forehead to the back part of the neck, and from ear to ear; nor are the arms and ſhoulders neglected. Sometimes they are planted in their bonnets in the form of horns; at other times they are made like lizards, ſerpents, or ſome other animal, cut out of a kind of paſte-board. In ſhort, their forms are as various as the purpoſes for which they are intended.

To theſe charms they add a bug-bear, which they call a mumbo jumbo, and is intended by the Mundingoes to render their wives ſubmiſſive and obedient. This is a kind of image eight or ten feet high, made of the bark of trees, dreſſed in a long coat, and crowned with a whiſp of ſtraw. Whenever the men have any diſpute with the women, this is ſent for to determine the conteſt, which is almoſt always done in favour of the men. One who is in the ſecret conceals himſelf within the image, and walking in it, is the oracle upon theſe occaſions. None is allowed to come armed within his preſence, and when the women hear him coming, they are ſo affrighted, that they run away and hide themſelves; but if the perſon concealed in the mumbo jumbo is diſpoſed to ſend for them, they are all obliged to come, and at his command either ſit down, or ſing and dance, as he pleaſes; and if any refuſe to obey his ſummons, he has them brought by force, and then whips them.

When any man enters into this ſociety, he is obliged to ſwear in the moſt ſolemn manner, never to divulge the ſecret to a woman, or to any perſon that is not entered into it; and that the ſecret may continue inviolable, no boys under ſixteen years of age are ever admitted among them. The people alſo ſwear by the mumbo jumbo, and this oath is eſteemed irrevocable. Indeed there are few towns of any note that have not one of theſe objects of terror to frighten the poor women into obedience.

We are told, that in the year 1727, the king of Jagra, having a very inquiſitive woman to his wife, was ſo weak as to diſcloſe to her the whole myſtery of the mumbo jumbo, for which ſhe had long ſolicited him; but ſhe was ſcarcely in poſſeſſion of this important ſecret, when, contrary to her moſt ſolemn promiſes, ſhe haſted to reveal it to all the other women. This ſoon reaching the ears of the chief negro lords, who were before but ill affected to the king's perſon, and were now ſhocked at his weakneſs, and filled with dread, leſt if the affair took vent, it ſhould put a period to the ſubjection of their wives, they aſſembled to deliberate upon the meaſures neceſſary to be taken, and, putting a man into the mumbo jumbo, went to the palace, and with an air of authority, ordered the prince to appear before the idol; when he, not daring to diſobey the ſummons, went, and after being ſeverely cenſured by the object of female terror, was ordered to produce all his women, who had no ſooner made their appearance, than they were inſtantly aſſaſſinated by order of the mumbo jumbo; and thus this diſcovery was ſuppreſſed, before it had proceeded farther than the king's family.

We ſhall now take notice of the marbuts, who are a numerous eccleſiaſtical body. Though they are in moſt reſpects a diſtinct people from the laity, yet on common occaſions their habit differs but little from that of the common people: they are ſaid to be formal, affected, ſtiff, and deſigning; they have towns, and even whole provinces ſequeſtered from the ſtate for their maintenance, into which they admit no other negroes but their ſlaves, who are employed in tilling the lands, and cultivating their grain, fruits, roots, and all the other neceſſaries of life. They marry entirely among themſelves, never making any alliances with the laity. Their male children are born prieſts, and particular care is taken to inſtruct them in the principles of the Levitical law, on which many of their ceremonies are founded, and to which, next to the Koran, they pay the moſt profound reſpect. Polygamy is permitted among them, and in general every thing elſe that is allowed to the laity.

On the other hand, their conduct in many reſpects is worthy of praiſe; they ſtrictly obſerve thoſe laws of the Koran which relate to abſtinence and temperance, carefully avoiding all exceſs in eating, and never touching wine and ſpirituous liquors. They carry on a conſiderable trade among themſelves, and are honeſt and fair in their dealings with each other. They are extremely charitable to all who are of the ſame profeſſion, and never permit any of their ſociety to be ſent into ſlavery: but if any one of them has offended againſt the laws, they puniſh him according to the inſtitutions of their order.

Theſe good qualities, though ſometimes blended with the vices of ambition and avarice, are the cement which firmly binds the fabric of this inſtitution, and procures the reſpect of kings as well as of the vulgar. If perſons of the firſt diſtinction meet a marbut, they form a circle round him, fall upon their knees, and receive his benediction, a cuſtom which is obſerved even in the palaces of kings.

The marbuts of Mundingo ſpend great part of their time in the inſtruction of their children; and Jobſon informs us, that he had ſeen ſeminaries for learning that contained ſome hundreds of youth, where they are taught to read, to write, to expound the Koran, the principles of the Levitical law, and the nature of the marbut ſociety; but what they inſtil with their firſt milk is an inviolable attachment to the intereſt of the marbuts, a reſerved converſation and conduct, with ſobriety, temperance, and all the morals neceſſary to conſtitute the good order of the fraternity, and to command the reſpect of the laity.

They teach their children to read and write in a book formed of hard wood. They uſe a black ink made of the bark of a tree, and a pen reſembling a pencil. Their laws are written in a language entirely different from that of the vulgar, and is ſuppoſed to be a corrupt Hebrew, or Arabic.

It is ſaid that the great volume of the marbut laws, or inſtitutions relating to the ſociety, is a manuſcript, of which they take copies for their private uſe. Jobſon ſays, that they are far from confining their knowledge to their own ſchools, and to their own children, but communicate it to whole provinces, and to every youth they meet. According to him, they travel with their books and families from province to province, teaching wiſdom and religion wherever they paſs, inforcing their doctrine equally by precept and example. All towns are open to them, and the marbuts travel unmoleſted through whole kingdoms in the heat of the moſt bloody wars.

Some authors affirm, that in their travelling they live like mendicants upon the public; while others maintain, that they ſupport themſelves by trade, and particularly by the ſale of griſgris, aſking no other alms but pieces of paper, which they convert into food and raiment, by virtue of the myſterious characters they impreſs upon them. Indeed they carry on the richeſt commerce of the country, and ſome of them trade very largely, not only in griſgris, but in gold and ſlaves. Hence theſe people oppoſe by all poſſible means the endeavours of the Europeans to penetrate to the ſource of the river Gambia and the Senegal, from the apprehenſion that this might leſſen their trade, and render them leſs neceſſary.

SECT.

The King of Jagra summonid before Numbo Jumbo

SECT. XV.

Of the Iſland of GOREE.

Its ſituation and extent.

BEFORE we conclude this chapter, it is proper to take particular notice of Goree, the only European ſettlement between the rivers Gambia and Senegal, which we ſhall deſcribe with all poſſible minuteneſs.

This iſland, which is ſituated in fourteen degrees thirty minutes north latitude, and in ſeventeen degrees twenty minutes weſt longitude from London, is called by the natives Barſaguiche; but the Dutch, who were the firſt Europeans that took poſſeſſion of it, gave it the name of Goree, from an iſland and town of the ſame name in Holland. It is only about eight hundred and forty yards in length, and two hundred and forty-eight in breadth; its whole circumference, including a point at the eaſtern end of the iſland, being, according to a late menſuration, about two Engliſh miles. It ſtands to the ſouth-weſt of Cape Verd, within cannon-ſhot of the ſhore, and conſiſts of a long narrow piece of land, and a ſmall but ſteep mountain. Notwithſtanding its ſmallneſs, its ſituation renders it agreeable: for on the north part of the iſland the inhabitants have a view of Cape Verd and the neighbouring promontories. Though it is ſituated in the torrid zone, the people breathe a temperate air all the year round, owing to its being continually refreſhed by alternate breezes from the land and ſea. A multitude of ſurrounding rocks render it almoſt inacceſſible, except at two particular bays. Upon the ſummit of a rocky hill is St. Michael's Fort, which the late director M. de St. Jean embelliſhed with ſeveral new buildings, and added works which, in the opinion of the French, rendered the iſland impregnable: the land is alſo defended by other forts and batteries.

The ſoil was formerly compoſed of only a red ſand, without either graſs, trees, water, and ſcarce any thing beſides reeds: but, by the diligence of the above gentleman, ſeveral ſprings of freſh water were diſcovered in the iſland; gardens were planted with excellent fruit-trees; pulſe and all kinds of vegetables were made to grow in great abundance; and, in ſhort, from a ſmall, barren, and diſagreeable iſland, it was rendered one of the pleaſanteſt and moſt important ſettlements in Africa.

The iſland of Goree was ceded to the Dutch in the year 1617 by the king of Cape Verd, when they immediately built a fort on a rock to the north-weſt, to which they gave the name of Naſſau-Fort; but finding that it could not command the harbour, they erected a fortification, called Orange Fort, nearer the ſhore. The Dutch kept the iſland till admiral Holmes taking it in 1663, placed an Engliſh garriſon in it. Two years after it was retaken by De Ruyter, and the governor and garriſon obliged to ſurrender priſoners of war. The Dutch then augmented the fortifications, and the iſland enjoyed perfect tranquillity, till in 1677 a French ſquadron, commanded by the count d'Eſtrees, attacked the place, and obliged the Dutch governor to ſurrender at diſcretion. D'Eſtrees found that the lower fort mounted forty pieces of heavy cannon, and that the works were kept in excellent repair; but having no inſtructions to garriſon them, he diſmantled this, and entirely demoliſhed Naſſau Fort. Soon after M. Du Caſſe arriving at Goree with a forty-gun ſhip, ſolemnly took poſſeſſion of the iſland, and concluded a treaty with the king and negroes on the ſame conditions the Dutch had enjoyed the iſland; and as this meaſure, which he had voluntarily taken, was approved by the court of France at his return, he was ſent back the following year in quality of governor; and ſoon after this conqueſt was ſecured to the French company by the treaty of Nimeguen.

The French inſtantly repaired and added new works to both the forts, calling the lower fort Vermandois, and the higher St. Michael. Afterwards ſeveral unſucceſsful attempts were made by the Dutch to recover a place of ſuch importance to trade, but all of them proved abortive.

The French continued in the poſſeſſion of this iſland till the year 1759, when a ſquadron was fitted out under the command of commodore Keppel, conſiſting of the Torbay, Fougueux, Naſſau, Prince Edward, and the Dunkirk, ſeveral frigates, two bomb-ketches, and ſome tranſports, with ſeven hundred regular troops on board, commanded by colonel Worge. On their arrival before the iſland, it was reſolved to make the attack on the weſt ſide, not becauſe it was the weakeſt, but from its being the weather ſide; and therefore ſhould their cables be cut by a chain ſhot, or any other accident, the ſhips might, without danger, put to ſea, and, beating to windward, renew the action; but if they had anchored on the eaſt ſide, ſuch an accident might have cauſed the ſhips to be driven on ſhore.

On the eleventh of November, at about nine in the morning, the Prince Edward and the Fire Drake bomb bore down towards the iſland, and in ten minutes after the action was begun by throwing a ſhell from a bomb. The enemy inſtantly returned the fire from the forts and batteries; and at the ſecond ſhot carried away the Prince Edward's enſign-ſtaff, and ſet fire to an arms-cheſt cloſe by it, which, blowing up, killed one of the marines. Encouraged by this ſucceſsful beginning, they levelled their ordnance at the Prince Edward, and began a terrible fire; and few in the ſquadron ſaw this veſſel, in the midſt of this ſhower of bombs and bullets, without ſending up their moſt fervent wiſhes on the occaſion.

The commodore obſerving that the Fire Drake overcharged her mortar, and that all her ſhells fell beyond the iſland to the ſouth, ſent his boat on board the Furnace bomb, with advice, that as they ſaw the error of the other in over-charging the mortar, they ſhould avoid that extreme, and that as the enemy ſeemed bent upon ſinking the Prince Edward and the Fire Drake, he deſired they would begin their fire, and endeavour as much as poſſible to draw part of the enemy's attention from their ſuffering friends; and theſe orders were inſtantly obeyed. The fire from all the ſhips was ſoon diſcharged with prodigious fury on the enemy, and that of the Torbay alone, in which was the commodore, ſeemed ſufficient to have razed the very foundations of the iſland. The commodore had brought up with ſuch judgment a-breaſt of the angles of both the weſt-point battery and St. Francis fort, that the enemy could not bring a gun from thence to bear upon him. Five guns only could have touched him with advantage; two from St. Peter's, and three from a ſmall lunette on the hill before St. Michael's; both which were ſo warmly attacked by the other ſhips, that they were ſoon deſerted. Indeed the fire from the Torbay was ſo terrible, ſo near, and ſo well aimed, that none but madmen could have ſtood it. The ſhip ſeemed in a continual blaze, and that part of the Iſland was darkened by a cloud of ſmoak. Several hundred negroes lined the oppoſite ſhore, to behold the engagement, and were aſtoniſhed at ſeeing ſhips bear down with the utmoſt intrepidity againſt ſtone walls, and receiving the fire from the batteries with intrepid courage.

The governor was at length prevailed upon to ſtrike his flag; but Mr. Keppel, in the midſt of the noiſe and ſmoak, was ſome time before he perceived the ſilence of the enemy, and at laſt only ſuſpected they had ſtruck, from the ſilence of the reſt of the ſquadron. He ſlackened his fire to look around him, when not a Frenchman was to be ſeen but thoſe who were flying towards the caſtle on the hill. Upon this he ſent a lieutenant, attended by his ſecretary, to wait upon the governor; but before they had left the boat they were met by M. St. Jean on the beach; who aſked on what terms the honourable Mr. Keppel propoſed he ſhould ſurrender? Surpriſed at the queſtion, they aſked, If his flag was not ſtruck? He anſwered No, he only meant it as a ſignal for a parley: and being told that the commodore would hear of no terms but his own, replied that he was ſufficiently prepared, and knew how to defend himſelf; to which the others returned, that the commodore had brought up in a ſituation where no gun could hurt him, and did not care if they ſtood out for a month. Hence the engagement was renewed; but M. St. Jean, ſoon finding it impoſſible to keep his ſoldiers to their quarters, ſurrendered himſelf

and garriſon priſoners at diſcretion, and the Britiſh flag was hoiſted on Fort St. Michael.

This iſland was however reſtored to the French king by the treaty of peace ſigned at Paris in 1763; when the French king, at the ſame time, ceded and guarantied to Great Britain the forts and factories on the river Senegal.

CHAP. XIV.

Of the CAPE VERD ISLANDS, with BISSAO, and the ſmall Iſlands called the BISSAGOES.

SECT. I.

Of the CAPE VERD ISLANDS.

Their Situation and Number, with a conciſe Deſcription of the principal of thoſe Iſlands, viz. Bravo, Fuego, St. Jago, Buena Viſta, or Bona Viſta, Mayo, Sal, St. Nicholas, St. Vincent, St. Antonio, and St. John's.

THE iſlands of Cape Verd are thus named from the largeſt of them, being ſituated oppoſite to that cape, which projects into the ſea between the rivers Gambia and Senegal, though theſe iſlands lie a hundred and twenty leagues to the weſtward of it. They were diſcovered in the year 1460, by Anthony Noel, a Genoeſe in the Portugueſe ſervice, and are about twenty in number; but ſome of them, being only barren uninhabited rocks, are not worth notice. They are ſituated between the thirteenth and nineteenth degrees of north latitude, and the principal of them are ten in number, lying in a ſemicircle. Theſe, beginning at the ſouth, are Bravo, Fuego, St. Jago, Mayo, Buena Viſta, the iſle of Sal, St. Nicholas, St. Vincent, St. Antonio, and St. John's.

The iſle of Bravo is ſituated in the fourteenth degree of north latitude, and conſiſts of very high land, the mountains riſing in the form of pyramids. It is remarkable for its excellent wines, and is inhabited by Portugueſe. It abounds in ſalt-petre, and produces Indian corn, water-melons, gourds, potatoes, horſes, aſſes, and hogs; and the coaſt ſupplies the natives with plenty of fiſh.

The iſland of Fuego, or Fogo, is ſituated in latitude fifteen degrees twenty minutes: it is much higher than any of the reſt, and appears at ſea like one continued mountain. In ſailing by it no valleys are to be ſeen, theſe only reſembling gutters, made by torrents of rain running down the mountain: but when a perſon is on ſhore near one of theſe ſeeming gutters, he finds that they are deep valleys bordered by lofty mountains.

On the top is a volcano, which may be ſeen at a great diſtance at ſea. It ſometimes caſts forth rocks of an amazing ſize to a vaſt height, with a noiſe like that of the loudeſt thunder, and ſometimes torrents of flaming brimſtone pour from the peak, like a torrent of water down a ſteep mountain; after which the inhabitants can gather what quantities they pleaſe. It is not unlike common brimſtone; but is of a much brighter colour, and on being burnt gives a clearer flame. At other times the volcano caſts forth ſuch an amazing quantity of aſhes, that the adjacent parts are covered, and many goats ſmothered.

There are no brooks in the iſland, and in ſome places the inhabitants are obliged to go ſix or ſeven miles for freſh water: yet, notwithſtanding this, it produces great quantities of pompions, water-melons, feſhoons, and maize; but no bananas and plaintains, and hardly any fruit-trees, except wild figs: however, in ſome of their gardens they have guava trees, oranges, lemons, and limes. They have alſo ſome good vineyards, of which a ſmall quantity of wine is made; but it is generally all drank before it has done fermenting.

The iſland was firſt inhabited by the Portugueſe, to whom the king gave the land. Theſe brought negro ſlaves with them, and ſtocked the country with cows, aſſes, horſes, and hogs; the king ſending goats, which run wild on the mountains. Hence the profit of their ſkins is reſerved to the crown; and he who has the management of this revenue is called captain of the mountains, none daring to kill any of them without his licence. It is cuſtomary here, and at all the other iſlands, for every perſon at his death to give freedom to his blacks. Theſe are now the principal inhabitants, there being an hundred negroes on the iſland to one of the whites. They make cotton cloths for cloathing, and breed mules, which they ſell to other nations.

All the inhabitants are Roman Catholics, but mingle with that religion ſome Pagan ſuperſtitions. Moſt of the whites live with the governor in the town of St. Philip, which is the capital of the iſland, and have at the ſame time country houſes on that part of their eſtates which they keep in their own hands, and manage by their ſlaves. Theſe ſupply them with food, and the rents of the plantations let to the blacks are paid them in cotton cloth.

The iſland of St. Jago, or St. James, is the largeſt of them all, and took its name from its being diſcovered on the firſt of May, the feſtival of that ſaint. It is ſituated in fifteen degrees north latitude, and in ſix degrees five minutes longitude from Cape Verd. It is of a triangular form, fifty or ſixty leagues in circumference, and though rocky and mountainous, the valleys produce Indian corn, oranges, lemons, pine-apples, cocoa-nuts, guavas, cuſtard-apples, bananas, tamarinds, plaintains, pompions, water and muſk-melons, ſugar-canes, and grapes; but they are not allowed to make wine; they have alſo ſome cedar trees, and plenty of cotton. In ſhort, it is the moſt fruitful of all theſe iſlands.

The animals are horſes, aſſes, mules, cows, deer, goats, hogs, civet cats, and monkeys, and almoſt all ſorts of fowls and birds. Their ſeas alſo abound with prodigious plenty of fiſh. Here our ſhips bound for the Eaſt-Indies uſually reſort for freſh water and proviſions, and are ſupplied with hogs and poultry in great abundance.

Salmon mentions in a very entertaining manner, the alteration of the air on arriving at this iſland. "We "ſailed out of the Thames, ſays he, on the 30th of "January, in an extreme cold winter, the Thames full "of ice; and within the ſpace of a month arrived at "St. Jago, where we found it ſo warm, that the men "all lay naked upon their cheſts, not being able to en-"dure any cloaths on; and when we came aſhore, we "found groves, and gardens of ever-green and ripe fruits, "a ſerene air, and almoſt every thing that could afford "delight to a people juſt arrived from a frozen region. "The ſudden change from a cold to a warm country, "from winter to ſummer, from naked trees deſtitute of "leaves and fruits, and a land covered with ſnow and "ice, to a place where oranges, and all the fruits of "the earth diſplayed their beauties, and were ready for "gathering, was ſuch an agreeable change in little "more than the compaſs of three weeks, that it ex-"ceeded any metamorphoſis that is to be met with in "the moſt romantic relations. An unuſual gaiety ſeem-"ed to poſſeſs all the ſhip's company, and nothing but "mirth and good humour reigned amongſt us."

The capital of the iſland is Ribeira Grande, where the governor, oviodore, and biſhop reſide. Here alſo is a monaſtery, which is adorned with a large garden, and affords the fineſt proſpect of any building about the

city, except the cathedral. Moſt of the prieſts among theſe iſlands, as alſo thoſe ſent to Guinea, are negroes. The inhabitants, who are about three whites to forty blacks, pay no tax to the crown.

The iſland has four other towns, which are St. Jago, St. Domingo, St. Domingo Abacen, and Braya, which laſt is the moſt noted port.

Buena Viſta, or Bona Viſta, thus named from its being the firſt of the Cape de Verd iſlands diſcovered by the Portugueſe, is ſituated in the ſixteenth degree of north latitude, two hundred miles weſt of the coaſt of Africa, and is twenty miles long, and twelve broad, moſtly conſiſting of low land, with ſome ſandy hills, and rocky mountains. It produces great quantities of indigo, and more cotton than all the other Cape de Verd iſlands; yet there is not one of them where there are fewer cotton cloths to be ſold: for the natives will not even gather the cotton before a ſhip arrives to buy it; nor will the women ſpin till they want it. They have, in general, the ſame animals as in the other iſlands, with plenty of fiſh and turtle.

The Engliſh who frequently land there, to take in a lading of ſalt, hire men and aſſes to bring it down to the ſea; for which they pay them in biſkets, flour, and old cloaths. This iſland had alſo formerly a pretty good trade for horſes and aſſes, which are the beſt of all that are upon theſe iſlands. The people are very fond of ſilk, with which they work the boſoms of their ſhirts, ſhifts, caps and women's waiſtcoats.

The men commonly wear the Engliſh dreſs; for moſt of them have ſuits of cloaths bought of the Engliſh, and have learned to make cotton cloths to imitate the European faſhion. The women have one, two, or three cotton cloths wrapped about them like petticoats, tied on with a girdle about the hips, and ſometimes without a girdle. Their ſhifts are made like a man's ſhirt, but ſo ſhort, as ſcarcely to reach to the girdle; the collar, neck, and waiſtbands of the young people of ſome rank, are wrought in figures with ſilk in various colours in needlework; but the old and the poor have theirs worked with blue cotton thread. Over their ſhifts they wear a waiſtcoat, with ſleeves to button at the arms, not above four inches deep in the back part, but long enough before to tie with ſtrings under their breaſts. Over all they have a cotton cloth in the manner of a mantle; thoſe of the married women are generally blue, and the darker the colour, the richer it is reckoned; but the maidens, and gay young wives and widows, wear blue and white, ſome ſpotted, and ſome figured. They however rather chuſe, if they can get them, linnen handkerchiefs wrought on the edges, and ſometimes only on the corners, with red, green, and blue ſilk; the firſt being the colour they moſt admire. They wear neither ſhoes nor ſtockings, except on holidays; and, indeed, at other times the women have generally only a ſmall cotton cloth wrapped round their waiſt, and the men a ragged pair of breeches; to which, if there be but a waiſtband, and a piece hanging to it before to hide what modeſty teaches them to conceal, they think it ſufficient. The people of Bona Viſta are fond of the Engliſh, and moſt of them can ſpeak a little of the Engliſh tongue.

Mayo, or May, obtained its name from its being diſcovered on the firſt of that month. It is ſituated in fifteen degrees five minutes north latitude, near three hundred miles from Cape Verd, and is about ſeventeen miles in circumference. The ſoil is in general very barren, and water ſcarce: however, they have plenty of cows, goats, and aſſes; and alſo ſome corn, yams, potatoes and plantains. What trees they have are ſituated on the ſides of the hills, and they have ſome water-melons and figs. The ſea likewiſe abounds with wild fowl, fiſh, and turtle. There grows on this iſland, as well as on moſt of the others, a kind of vegetable ſtone, extremely porous, and of a greyiſh colour, which ſhoots up in ſtems, and forms ſomething like the head of a colliflower.

The inhabitants, who amount to about two hundred, are not ſo well affected to the Engliſh as thoſe of Bona Viſta; but they have more cows and oxen, which are the fatteſt and beſt on the Cape de Verd iſlands. They have more cotton than they can uſe; but are ſo indolent, that half of it is loſt for want of gathering. Their cloaths nearly reſemble thoſe worn at Bona Viſta; but few of them have their ſhirts and waiſtcoats ſtitched in colours.

The iſle of Salis is ſituated in the ſeventeenth degree of north latitude, three hundred miles weſt of the coaſt of Africa, and is about forty-two miles in circumference. It receives its name from the great quantity of ſalt naturally produced here from ſea water, that from time to time overflows part of the land, which is moſtly low, it having only five little hills. This iſland formerly abounded with cows, goats, and aſſes; but the want of rain cauſed it to be deſerted. There are abundance of land crabs about the iſland, and the ſea abounds with fiſh.

St. Nicholas is the longeſt and moſt conſiderable of all the Cape de Verd iſlands, except St. Jago, it extending about ſeventy-five miles in length. It is ſituated in ſeventeen degrees north latitude, and is moſtly high land. It is fruitful in maize, and produces the beſt ſeſhoons in all theſe iſlands, and likewiſe orarges, lemons, plantains, bananas, pompions, muſk and water-melons, ſome ſugar-canes; and the inhabitants have vineyards, from which they make a tartiſh ſort of wine. They have likewiſe the dragon-tree, from which flows the drug called gum dragon.

The natives make the beſt cloths and cotton quilts of all the iſlands: theſe are too good for the Guinea trade; but fit for that of Braſil. They make them up into cloaths, as neatly as our common country taylors, and will make buttons to imitate almoſt any pattern you ſhew them; they knit cotton ſtockings, tan cow-hides and goat-ſkins, and make tolerable good ſhoes. The women are much more houſewifely and ingenious with their needles than thoſe of the other iſlands; and ſhe who does not appear with a worked cap, like thoſe worn at Bona Viſta, is thought very idle.

The town of St. Nicholas is the moſt compact and populous of any on all the iſlands, though it is not ſo large as the city of St. Jago; but the houſes, and even the church, are only covered with graſs thatch. The inhabitants are the only people of the iſlands who build boats, with which they fiſh, and catch turtle. They have a number of horſes, and there are few families that have not a ſtock of hogs and fowls. The people ſpeak the beſt Portugueſe, and are the exacteſt Roman catholics of any of the iſlands.

St. Vincent is uninhabited; but on the north-weſt ſide of the iſland is a good bay, called Porto Granda, where ſhips may wood and water, and alſo wild goats may be obtained for taking the pains to ſhoot them. Here are alſo many aſſes; it is ſaid there are more turtle and fiſh caught at this iſland than in all the reſt; and that it abounds with ſalt-petre.

The iſland of St. Antonio, or St. Anthony, is ſituated in ſeventeen degrees nineteen minutes north latitude, fifteen miles from St. Vincent. It is little inferior in height to Fuego, and conſidering the amazing loftineſs of the mountains, one of which is thought to be as high as Teneriff, and the deepneſs of the vallies, is ſuppoſed to contain as much ground as St. Jago. It has many brooks of freſh water, which render the vallies through which they flow, extremely fertile in maize, and in a variety of trees, as oranges, lemons, limes, bananas, plantains, pompions, guavas, muſk and water-melons. The inhabitants have great plenty of wine; but it is the worſt and cheapeſt of any produced in theſe iſlands. They have alſo a large ſtock of cows, hogs and aſſes, and the mountains abound with goats. In this iſland are likewiſe produced great quantities of gum dragon, and a great deal of indigo is cultivated here, as are likewiſe large plantations of cotton.

The natives are ſaid to be remarkable for their innocence and humanity. There are ſuppoſed to be two thouſand five hundred perſons in the iſland, four-fifths of which number are ſaid to be compoſed of ſlaves, who, like the free negroes, have wives, houſes, and plantations, and cultivate ſome of the beſt cotton and indigo, which

are worked up by these slaves, who are governed by a steward placed there by a Portuguese marquis, who is proprietor of the island.

The last of the Cape Verd islands we shall mention is that of St. John's, which is situated in fifteen degrees twenty-five minutes north latitude, and seven degrees two minutes west of Cape Verd, and is very high and rocky. It has more salt-petre than any of these islands: this is found in several caves covering the sides like a hoar frost, and in some hollow rocks, like icicles as thick as a man's thumb. This island abounds with pompions, bananas, water-melons, and other fruit, and also with fowls and goats.

The natives, who are a simple, harmless, and friendly people, wear in common only a little slip of cotton fastened to a string before, which passing between the thighs, is tied to the same string behind; but when full dressed they also wear a piece of cotton cloth, which the men hang over their shoulders, and wrap round their waists, while the women put it over their heads, and then wrap it about their bodies; and on both of them it extends to the calf of the leg, or lower. This cloth they spin and weave themselves.

Their fishing utensils are long canes for rods, cotton lines, and bent nails for hooks. As to their hunting, the governor having the sole privilege of killing the wild goats, none dare hunt without his consent. This was a law made by the Portuguese when they peopled these islands from the coast of Africa, in order to prevent the breed being entirely destroyed.

When the governor chooses to make a general hunt, all the inhabitants are assembled, who scarcely exceed two hundred; and the dogs which are between a beagle and a greyhound, are called. At night, or when the governor thinks proper to put an end to the sport, they all meet together, and he parts the goats flesh between them as he pleases, sending what he thinks proper to his own house with all the skins; and after he comes home, he sends pieces to those who are old, or were not out a hunting; and the skins he distributes among them as he thinks their necessities require, reserving the remainder of them for the lord of the soil.

This is one of the principal privileges enjoyed by the governor; who is also the only magistrate, and decides the little differences that sometimes happen among the people. Upon their not submitting to his decision, he confines them till they do, in an open place, walled round like a pound: but, instead of a gate, they generally lay only a stick across the entrance, and those innocent people will stay there without attempting to escape, except when overcome by passion, and then they rush out in a rage; but these are soon caught again, tied hand and foot, and a centinel set to watch them, till they agree with their antagonist, ask the governor's pardon for breaking out of his prison, and have remained there as long as he thinks they have deserved. Nay, if one kills another, which hardly happens in an age, the govetnor can only confine him till he has pacified the relations of the deceased, by the mediation of his friends, who are bound for the criminals appearance, in case a judge should be ever sent from Portugal to execute justice: but imprisonment is here reckoned such a scandal, that Mr. Roberts says, it is as much dreaded as Tyburn is by the criminals in England.

SECT. II.

Of the Island of BISSAO.

Its Situation and Extent; the Face of the Country; its Produce; and the Dress, Manners, Religion, and Government of the Inhabitants; with the Manner in which they make War.

WE shall now give a description of the island of Bissao, and of a cluster of islands called the Bissagoes. These islands stand close to the continent, a few leagues to the south-east of the river Gambia, in the latitude of eleven degrees north.

Bissao, which is about thirty-five or forty miles in circumference, affords a very agreeable prospect from the sea, rising on every side by a gentle ascent to an eminence in the center of the island; yet there are a number of hills inferior in height to that in the middle, separated by beautiful and fertile valleys, divided by small rivulets, which at the same time augment the richness and elegance of the scene. There are little groves of palms, and the rest of the ground is cultivated, and produces a harvest equal to the most sanguine wishes of the inhabitants. Wheat and maize spring up to a great height, so as to resemble a field covered with reeds of bamboos. They have likewise another grain that is a species of maize, which they make into cakes. They have also oranges, bananas, mangoes, and every kind of fruit to be found in the warm climates, and perhaps in greater perfection than in any other place. The cattle of Bissao are of an uncommon size, and seem to keep pace with the most extravagant growth of the corn: milk and wine are in the greatest abundance; but the island affords neither swine nor horses, the natives forbidding the importation of the former, and something either in the climate or soil preventing the increase of the latter.

The populousness of Bissao is equal to its fertility, notwithstanding the perpetual state of war in which the natives are engaged with the neighbouring islands, and the kingdoms on the continent: yet, though very numerous, they live in cottages dispersed up and down the country, without the least vestige of a town, except where the French and Portuguese have established themselves. Even the palace of the king only consists of a number of irregular huts, that have a communication with each other. In the Portuguese town are about six hundred persons, all of whom speak Portuguese, and pretend that they are descended from that people, though their complexion is jet-black, and they have a fixed and inveterate dislike to that nation.

The dress of the women consists of a cotton girdle, which falls down before; and bracelets of glass, coral, and copper; but the virgins go entirely naked, and those of high quality have their bodies marked or painted with a variety of hideous pictures of snakes and other reptiles, that give their skins some resemblance to flowered sattin. Even the eldest daughter of the king is distinguished from the other ladies only by the elegance of these paintings, and the richness of the bracelets.

The men of all ranks have no other cloathing but a skin fixed to their girdle, and drawn up between their legs. One of the most extraordinary ornaments is a large iron ring, with a flat round surface on the outside instead of a stone, upon which they ring changes with a bit of iron, in such a manner as to converse with the same facility with their castanets, as by means of the most polished language. There is, however, something in this that appears highly improbable, for it is difficult to conceive, how ideas can be conveyed by striking together two pieces of iron; it is nevertheless acknowledged, that besides this artificial language, they have another that is vocal, and used upon all common occasions.

The Bissaons are all idolators; but their ideas of religion appear so confused, that it is difficult to enter perfectly into their system. Their chief idol is a small image which they call Shina; but we are unacquainted with the sentiments they form of this object of their worship: besides this, it is said, that every man creates a divinity according to his own fancy. Trees are held sacred, and worshipped as the residence of some deity or spirit superior to man.

With respect to their government, it is entirely despotic, the will of the prince being a law to his people; he has nothing to lose, and yet every thing within his dominions may be said to be his, as his power extends over his people and their effects. Authors give the following instance of the policy of one of these princes. Two slaves, who had been sold to an European merchant, made their escape, and were taken by the king's troops. Equity seemed to require their being restored to their masters; but the king gave a different verdict, saying, they had obtained their freedom by having escaped, and by being retaken by his troops were again reduced to slavery; and consequently were the property of the conqueror.

At the death of the king all the women and slaves, for whom he had a peculiar regard, are sacrificed and buried near

near their maſter, in order to attend him in the next world. It is likewiſe cuſtomary for the nobility to have ſome of their living friends buried with them. Labat mentions an inſtance, where a father deſired that his three ſons, of whom he was very fond, might accompany him into the other world.

The natives are warlike, and fight with extreme fury, though with little diſcipline. As treaties of peace are unknown among theſe nations, they have no kind of intercourſe except in war, and hence no ſcheme of politicks is carried on among them. The Europeans are far from offering their mediation; for they find it their intereſt to ferment their quarrels, as war is their harveſt, by its augmenting the number of ſlaves.

When the king of Biſſao reſolves to carry war into the neighbouring territories, he orders an inſtrument, called the bonbalon, to be ſounded; this is the general ſignal to arms, in which all in the government's pay aſſemble at certain head-quarters, that are always fixed; where they find the royal fleet, which uſually conſiſts of thirty canoes, each carrying thirty men, with their arms and proviſions, under the command of an admiral; for the king ſeldom puts himſelf at the head of his fleets and armies. Before the fleet ſets ſail, a number of ſacrifices are offered to the gods, and the fleſh of the victims divided between the court, the prieſts, and the ſoldiers. In this conſultation of the gods the king always receives a favourable anſwer; for the deities being of wood, it is eaſy for the prieſt to direct what they ſhould ſay: and hence the army always begins a campaign with the fulleſt aſſurance of ſucceſs. They make a deſcent with all poſſible privacy, ſurround the enemy's towns and villages, carry off the inhabitants with every thing of value, and then embark before their troops have time to aſſemble in order to oppoſe them. One half of the booty belongs to the king, and the remainder is divided among thoſe who obtained it. The ſlaves are ſold to the Europeans, except where any of them happen to be of quality or fortune; in which caſe he is reſtored to his friends, on condition of their ſending a certain number of ſlaves in his room.

The heroes, upon their return, aſſume an air of great importance, and go round the country, ſhewing their wounds, and relating the wonders they have done and ſeen, with a long train of priſoners behind them, whom they oblige to ſing the praiſes of the conquerors; for which they make them preſents of pieces of cloth and other things, which they immediately exchange for palm wine.

But when the expedition is attended with leſs honour and profit than was expected, the priſoners are in danger of being ſacrificed, eſpecially if the Biſſaons have loſt an officer of diſtinction. Thoſe who fall upon theſe occaſions receive public honours by dances performed to the muſic of tabors. The women expreſs their grief in a manner extremely affecting, pulling their hair, and beating their breaſts; after which they are ſerved with palm wine, in order to ſupport their ſpirits. When thus recruited they begin their mourning with redoubled vigour, and ſhed tears moſt plentifully, till the corpſe is laid in the grave; when their countenances ſuddenly brighten, and they ſeem to have loſt all ideas of their affliction.

The king's palace is about a league diſtant from the point of Biſſao. He never ſtirs out without being ſurrounded by ſome thouſands of his nobility, women, and guards, all of them richly dreſſed and armed, as far as the ſkins of beaſts and the brightneſs of their ſcymetars and lances can make them ſo.

The Portugueſe had formerly a fort in Biſſao, which they mounted with eight pieces of cannon in order to awe the natives, and prevent their trading with any other foreigner but themſelves: the Biſſaons, however, ſoon threw off this reſtraint, and now maintain the full liberty of receiving all ſtrangers into their ports, where they enjoy perfect ſecurity under the king's protection; but, before they are ſuffered to land, his majeſty conſults the gods, by ſacrifices, whether admitting thoſe ſtrangers be for the good of the iſland, and the intereſt of himſelf and people.

SECT. III.

A conciſe Account of the Biſſago Iſlands; and more particularly of the Iſland of Bulam.

THE Biſſago iſlands are ſituated near the mouth of the river Sierra Leona, and conſiſt of the iſlands of Bulam, La Gallina, Caſnabac, Cazegut, Calacha, and ſome others. The iſland of Bulam is about ten leagues in length from eaſt to weſt, and five in breadth from north to ſouth; the whole coaſt is bordered with woods, beyond which the country is fertile, rich, and beautiful, covered with rice, Indian corn, millet, roots, and fruit: yet the Iſland is ſaid to be uninhabited, and cultivated only by the natives of the other iſlands, who come hither in ſeed-time and harveſt, continuing at home the reſt of the year.

The ground riſes gently from the ſhore for the ſpace of two leagues, which preſents mariners with a moſt delightful proſpect, while it excites their admiration at ſeeing ſo beautiful a ſpot uninhabited. This aſcent ſerves as a baſe to higher mountains, which riſe in the center of the iſland, and are covered with fine woods, and divided by beautiful valleys, ſo that nature ſeems to have been improved by art.

This iſland produces a tree which might be employed to great advantage in ſhip-building; it is called michery; it grows to a great height, is eaſily worked, and at the ſame time is hard, ſolid, and proof againſt worms; all its pores being filled with a bitter oil, which is ſaid to deter them from harbouring in it.

La Gallina was thus named from the great number of hens the Portugueſe found there. This and the iſland of Caſnabac are very populous and fruitful, and have plenty of good water. Cazegut, one of the moſt conſiderable of theſe iſlands, is about ſix leagues long, and two broad. Its ſoil is very good, and produces millet, rice, and all kinds of pulſe, beſides orange and palm trees.

We have no particular account of theſe iſlands, none of them being inhabited by the Europeans; we ſhall therefore only add, that each of the Biſſago iſlands, except Bulam, is governed by a chief, who aſſumes the authority of a king. All theſe monarchs are perfectly independent, and frequently at war with each other. They have canoes that carry from twenty-five to forty men, with their proviſions and arms, which are ſabres, bows and arrows. The negroes of theſe iſlands are tall, ſtrong, and healthy, though it is ſaid they live only on fiſh, nuts, and palm oil; and ſell their rice, millet, and other produce of the earth to the Europeans for the ornaments they wear. They are in general idolaters, and are ſaid to be of a ſavage and cruel diſpoſition, not only to ſtrangers, but to one another; for authors ſay, that they frequently quarrel about trifles, and if diſappointed of their revenge, will drown or ſtab themſelves.

CHAP. XIV.

Of ZAARA, TOMBUTO, and BILEDULGERID.

SECT. I.

Of ZAARA, ZAHARA, *or the* DESART.

Its Situation, Extent, Diviſions, Produce, and Animals, with a Deſcription of its ſeveral Provinces.

WE now come to the countries north of the Senegal, and ſhall begin with deſcribing the deſart of Zaara, or Zahara, a vaſt inhoſpitable region, extending from the Atlantic ocean on the weſt, to the kingdom and deſarts of Barca and Nubia on the eaſt, and from the river Senegal on the ſouth, to Biledulgerid on the north; that is, from the eighth degree weſt, to the twenty-ſixth of eaſt longitude, and from the fifteenth degree of eaſt latitude to the tropic of Cancer, comprehending a ſpace of at leaſt fifteen hundred miles in length from eaſt to weſt, and about five hundred in breadth from north to ſouth.

This immenſe tract of land is divided by the Arabians into three general diviſions. Cahel, Zahata, and Aſgar, that is, the ſandy, ſtony, and marſhy deſarts, according to the nature of the ſoil; but later geographers divide this country into ſeven provinces, which are Zanaga, Zuenziga, Targa or Hayr, Lempta or Iguidi, Bardoa, Bornou, and Gaoga.

In a country covered with burning ſands, the ſoil cannot be ſuppoſed to be fertile, though that ſituated on the northern banks of the Senegal being watered, peopled, and cultivated, produces corn, rice, millet, and a variety of fruits, but, except dates, little more perhaps is reaped than is ſufficient for the uſe of the inhabitants.

Beſides camels and common cattle, this country is remarkable for a ſpecies of domeſtic animal called adimnaim, of which there is great plenty. This is a kind of ſheep, about the ſize of an aſs, with long hanging ears: the females have horns, but not the males, and the wool is ſhort, but ſoft and fine. This animal is ſo ſtrong that it can eaſily carry a man for ſeveral miles, and ſo gentle, that it never refuſes a burthen. The miſeries to which the inhabitants of this parched, ſandy, and barren deſart are expoſed, are increaſed by incredible multitudes of lions, tygers, wolves, and other ſavage animals.

To afford the reader as diſtinct an account of this great tract of country as poſſible, we ſhall deſcribe the different provinces and deſarts into which it is divided. Beginning at the ſouth, the province of Zanaga extends from the Senegal on the ſouth, to the province of Suz on the north; it is bounded by the Atlantic ocean on the weſt, and by the territories of Seram, Sunda, and Zuenziga on the eaſt. It contains the two deſarts Azvo and Tagguzza or Taggoſt. The laſt of theſe produces a prodigious quantity of rock ſalt, which is conveyed hence into all the adjacent countries, and is uſed in the deſart chiefly to moiſten the mouth parched with the ſultry heat, and to preſerve the gums againſt a ſcorbutic diſorder to which the natives are ſubject.

Travelling is here extremely fatiguing and dangerous, eſpecially if the ſummer proves dry; ſcarce a drop of water being to be ſeen for thirty leagues together; and when any is found it is ſo brackiſh, as to be equally unwholeſome and unpalatable. Nor do the cattle fare better, the barren earth not yielding ſo much as a blade of graſs, or any thing for their ſuſtenance, which obliges the paſſengers to carry not only proviſions for themſelves, but for their beaſts of burthen. Beſides the country being flat and ſandy, without mountains, woods, rivers, lakes, or any objects to direct their courſe, it would be impoſſible to avoid loſing their way, were it not for the flight of certain birds, who are obſerved to go and return at certain ſtated periods. They are alſo guided by the courſe of the ſun by day, and by the ſtars by night; which laſt is probably the uſual time of travelling here, as well as in the deſarts of Arabia.

Yet it is certain, that every part of theſe deſarts is not equally inhoſpitable, as they are allowed to be inhabited by ſeveral different nations, particularly by the Berviches, Ludayers, Duleyns, and Zenequi, ſome of which are ſo numerous as to raiſe fifteen or twenty thouſand men; there are alſo a variety of Arab tribes no leſs numerous, potent, and warlike, and conſequently they find lands capable of ſupporting them and their cattle.

The province, or deſart, of Zuenziga is ſtill, if poſſible, more dry and barren than Zanaga; and we are told, that of large caravans that paſs through this country, ſeldom half the number, either of men or beaſts, ever return; moſt of them dying of thirſt, hunger, fatigue, or under the whirlwinds of ſand with which they are overwhelmed: but this is doubtleſs greatly exaggerated.

The inhabitants of this diſtrict breed many beautiful horſes, and are ſuch expert horſemen and warriors, that they are become formidable to the princes of Barbary, who ſtudy to keep on good terms with them; nor are they leſs dreaded by the negroes, whom they ſeize on all occaſions, and ſell to the people of Fez and Morocco; and, in return, when the negroes get any of them in their power, they cut them in pieces.

The province of Targa is ſaid to be leſs barren, dry, and ſultry than either of the former, it having a variety of good wells of freſh water dug deep in the ground, and the ſand produces graſs and ſeveral vegetables fit for food; the climate is healthful, and great quantities of manna are gathered here, which they ſell to the neighbouring kingdoms.

To the eaſt of Targa is the province of Lempta, which travellers find no leſs dangerous than any of the former, on account of the exceſſive heat of the ſun reflected from the ſand, the ſcarcity of water, the whirlwinds of ſand, and the barbarity of the people, who endeavour to rob and plunder all that come in their way. Through this inhoſpitable region caravans paſs from Conſtantina, and other towns of Algiers and Tunis, to Nigritia, though equally in danger of periſhing by thirſt, hunger and the ſword; but their attachment to commerce, and the advantages they reap from it, make them encounter theſe hazards with the utmoſt intrepidity.

Bardoa ſtretches from the ſixteenth to the twenty-ſecond degree of eaſt longitude. De Liſle ſays, the inhabitants, who are named Bardoaits, have towns, but live in tents on the plunder of merchants and paſſengers. But near the mountains, which form the northern barriers between this province and Tripoly, ſtands the town of Kala, where are kept ſome conſiderable fairs, to which merchants reſort from every part of Zahara, and the nations bordering upon the Mediterranean ſea, with the wealth of their ſeveral countries. The ſoil is in general dry, barren, and produces no commodities that merits a particular deſcription.

The province or kingdom of Bornou extends from the twelfth to the twenty-ſecond degree of eaſt longitude, and from the ſeventeenth to the twenty-firſt degree of north latitude. The northern part reſembles in barrenneſs the other provinces of Zahara; but all the reſt, which is the greater part, is well watered by ſprings and rivers, that fall with a dreadful noiſe from the mountains, and render the country fertile in corn, graſs, and fruits. Both the eaſtern and weſtern frontiers are inhabited by people of a roving diſpoſition, who live in tents, and are ſaid to enjoy every thing in common, no ſuch thing as property being known among them. The eaſtern and weſtern frontiers

frontiers are divided into mountains and valleys, covered with flocks of cattle, fields of rice and millet, and many of the mountains with timber, fruit-trees, and cotton.

In hot weather the natives, who are chiefly ſhepherds and huſbandmen, go naked, except wearing a ſhort apron before, which they put on out of regard to modeſty; but during the winter they are warmly cloathed with the ſofteſt ſheep-ſkins, of which they alſo form their bed-cloaths; and indeed this is ſcarce a ſufficient defence againſt the inclemency of the weather at certain ſeaſons of the year, when a cold piercing wind blows from the northern mountains, that chills the blood in proportion as the pores have been opened by the late ſcorching heats.

Towards the ſouth there are towns and regular formed ſocieties, where the people are tractable, polite, and hoſpitable; and great part of them artificers and merchants, of various nations, and of all complexions.

It is ſaid that the government is in general monarchical; and that the king has all his houſhold-furniture, and even his ſtirrups and ſpurs, with the bit and ornaments of his bridles of ſolid gold; whence it may be inferred, that either a great traffic in that valuable metal is carried on here with the diſtant countries, or that Bornou, or ſome of the neighbouring kingdoms, produces gold. The capital of this kingdom is a conſiderable city of the ſame name; beſides which there are ſaid to be the towns of Amozen, Sagra, and Semegonda, all of them to the northward of the metropolis, and to the eaſtward thoſe of Sama and Nebrina. However, very little is known of any of theſe towns, and ſome writers queſtion their exiſtence.

We now come to the laſt and moſt eaſtern province of the deſart of Zahara, called by the natives Gaoga, which on the eaſt is contiguous to Nubia, and on the north to Egypt. This province is computed to be a hundred and eighty leagues in length from north to ſouth, and about a hundred and ſixty from eaſt to weſt where broadeſt, extending from the nineteenth to the twenty-ninth degree of eaſt longitude, and from the twelfth to the twenty-ſecond of north latitude.

The only city in the whole kingdom is Gaoga, which ſtands on the north ſide of a lake of the ſame name, in fifteen degrees forty minutes north latitude, and twenty-five degrees thirty minutes eaſt longitude, which is all we know of either, as no traveller gives any particular account of them.

The kingdom of Gaoga is moſtly mountainous, and the natives rude and illiterate: they dwell in poor ſlight hovels, of materials ſo combuſtible, that they are frequently ſet on fire: and feed large herds both of ſmall and great cattle, which are their principal wealth as well as ſuſtenance.

SECT. II.

The Complexion and Manners of the Inhabitants of Zahara, different from thoſe of the People on the other Side the Senegal. Their Dreſs, Villages, Camps, Furniture, Manner of eating, Freedom from Diſeaſes, Marriages, and Funerals.

HAVING deſcribed the various provinces of this barren and ſultry deſart, we ſhall now give ſome account of the general cuſtoms and manners of the inhabitants.

It is remarkable that though the river Senegal only divides this deſart from Nigritia, and tho' the paſtoral lives of the inhabitants expoſes them to the vertical rays of the ſun, under a climate as hot at leaſt as that of Nigritia, their complexion is very different, they being for the moſt part no more than tawny, while the others are of a jet-black; and few or none of them on this ſide that river approach either in complexion or features to the negroes, who ſeem to be a people entirely diſtinct from thoſe: nor do the inhabitants of Zahara differ leſs from thoſe of the ſouthern countries in their manners, cuſtoms, and religious rites, than in their external appearance. The former are all profeſſors of the Mahometan religion, a few only excepted, who are worſhippers of fire. Hence the various tribes of Arabs, Barabars, &c. found in this country are probably deſcended from thoſe Saracens and Arabians, who breaking out of Aſia in the ſeventh century, over-ran the greateſt part of northern Africa, and were here ſtopped by the river Senegal. Hence we may account for that inbred and inveterate hatred that ſtill reigns between them and the native Africans on the other ſide the river.

The women never appear without a long veil that covers their face and arms; nor can the Europeans ever ſee them uncovered, except by accident. Both the men and women are of a middling ſtature, and, in general, well proportioned, with a beautiful ſymmetry of features. Their complexion is tawny, but delicate; and, as the women are leſs expoſed to the ſun, they are probably more fair and beautiful. Labat aſſures us, that they are remarkable for their prudence, œconomy, and ſtrict fidelity to their nuptial engagements. They not only live alone, but a man turns away his head when he chances to meet a woman, even his own wife, except at the time appointed for marriage freedoms. One who is too poor to have ſeparate tents for the women, tranſacts all buſineſs and receives viſits at the door in the open air, his neareſt friends not being permitted to converſe with his wives in the tent. This is a privilege, ſays a modern author, reſerved for their horſes, or rather mares, which are preferred on account of their beauty, for the advantages of breeding, their tameneſs, and docility. They lie down in their tents promiſcuouſly with the women and children, their little foles being the play-fellows of infants.

The dreſs both of the Moors and the Arabs of this country chiefly conſiſts of a robe or caftan of ſerge, ſome woollen ſtuffs, or blue and white cotton, and ſometimes, but very ſeldom, of ſilk. They are cloathed in a large ſhirt tied round the neck; this is ſo wide as to fold two or three times about the body, and is bound round the waiſt by a ſaſh, in which is ſtuck a long knife like a bayonet, and ſometimes two. According to Mr. Adamſon, the dreſs of both the men and women conſiſts in a large ſhirt, generally of black linen, and a cloth with which the women cover their head and ſhoulders; the men ſometimes rolling it about their heads, in imitation of a turban, and ſometimes round their middle. Some of the women wear their hair tied up in a knot, and others let it hang down; but the men are in general very negligent of it. They wear ſandals, or rather ſocks, of Morocco leather, which riſe to the ſmall of the leg, and their heads are covered with a red bonnet, or cap, bordered with white cotton. They frequently wear above their other cloaths a long looſe robe of white or ſtriped cotton, or a woollen ſtuff, which they call haik, and is extremely becoming. This robe has a long pointed hood that falls down behind, to the extremity of which hangs a taſſel by a long ſtring. However, the poor are cloathed after the manner of the negroes, and wear only a piece of cloth hanging down from the waiſt.

The women wear a long cotton ſhift, with long and wide ſleeves, large drawers, and a piece of calicoe, or linen, that covers them from head to foot, and flows in an eaſy manner behind. They are all adorned with ear-rings and pendants, which are valuable in proportion to their ſtation and quality: their fingers are alſo covered with rings, their arms with bracelets, and their legs with chains of braſs or copper.

When a conſiderable number of tents or cabbins are placed together, and form a kind of town or village, they call it adouar. Theſe villages are uſually of a circular form, the tents ſtanding very thick, and in the center is an empty ſpace in which they keep their cattle. They have centinels on every ſide of this encampment to guard againſt ſurprizes from robbers, and from wild beaſts. On the leaſt appearance of danger, the alarm is given by the centinels, and ſoon ſpread over the camp, by the barking of dogs, and the noiſe of different animals; upon which every man able to bear arms ſtands on his defence, each before his own tent. As theſe people never encumber themſelves with much houſhold furniture, theſe villages are eaſily tranſported from place to place. Indeed all the domeſtic implements belonging to a family are contained in a leathern bag, or ſack, which is eaſily tranſported, tent and all, on the back of a camel to any diſtance.

Their

Their uſual drink is milk or whey, and their only bread cakes made of millet; indeed wheat and barley grow to great perfection in ſeveral parts of the country near the Senegal; but they are continually moving from one place to another, and their diſlike to a fixed reſidence deſtroys all taſte for agriculture. If they were to ſow their corn, it might be reaped by other nations, for no inducements can engage them to continue a whole ſeaſon in one place; for however uſeleſs and unneceſſary their excurſions might be, they would conſider ſuch an inſtance of inactivity as highly culpable.

When they happen to have a ſtock of wheat or barley, they lay it up in deep pits hewn out of the rock; theſe they contrive with abundance of art, in order to cauſe a conſtant draught of freſh air though the whole cavern, which is narrow at the entrance, and gradually enlarges itſelf in proportion to its length, which is ſometimes above thirty feet. It is certain, that the grain will keep ſound for many years in theſe ſubterraneous ſtore-houſes, the mouths of which, after the corn is ſufficiently dry, are cloſed up with wood and ſand.

In ſome parts of the country the people have portable mills, with which they grind their corn as they want it, and theſe they always carry with them wherever they go; but authors do not deſcribe their form. Their manner of eating reſembles that of the Aſiatics. At their meals they ſit croſs-legged round a covering of Morocco leather, or a mat of palm leaves, ſpread upon the ground, upon which their diſhes or plates of copper or ivory are laid; and they never drink till they riſe in order to waſh, a ceremony that cannot be omitted without the greateſt indecency. They never allow themſelves more than two meals a day, one in the morning and the other at night, and the women are never allowed to eat with the men. Their repaſts are ſhort and ſilent, not a ſyllable being uttered till they have waſhed and returned to their pipe and coffee, and then converſation begins.

From this temperance in their meals ariſes that ſtrong health and freedom from diſeaſes that renders them ſtrangers to medicine, which was ſo much cultivated by their predeceſſors. The only diſtempers to which they are ſubject are dyſenteries and pleuriſies, both which they are ſaid to cure by the internal and external application of ſimples; but as for the gravel, ſtone, gout, and a number of other acute and chronical diſeaſes, they are abſolute ſtrangers to them. The inhabitants are ſaid to live to a great age, without knowing what ſickneſs is, they ſeldom dying before the courſe of life is conſumed by years, and the vital heat extinguiſhed by the rigidity of the ſolids, and diminution of the circulating fluids. With them a man at ſixty is ſaid to be in the prime of life, and to marry and beget children with all the vigour of an European at thirty. It has been found by experience, that the leſs they are connected with foreigners, and the more ſtrictly they adhere to their primitive manners, the fewer are their maladies and diſeaſes; and that while they maintain their original ſimplicity and frugality, no people upon earth are bleſſed with ſuch an uninterupted flow of health and ſpirits.

The mothers have a paſſionate fondneſs for their children, and take the utmoſt care to prevent their being injured by any accident. They are ſo weak as to imagine, that they can be greatly hurt by an evil eye, which they ſuppoſe capable of bringing diſeaſes and death upon them; but this opinion is not pecular to the Moors and Arabs, ſince it prevails among the vulgar in Spain and Portugal, and even among the papiſts of Ireland. The boys are circumciſed at fourteen years of age, and are at liberty to marry as ſoon as they can purchaſe a wife; for the fathers here make an eſtate by having a great number of daughters; for thoſe who addreſs them make preſents to the parents of camels, horſes, and horned cattle. They form a judgment of the affection of the huſband from his liberality, and the young lady is never delivered to him till by his preſents he has made her parents ſenſible of his merits. If upon her being brought home he is diſappointed in his expectations of her beauty and chaſtity, he may ſend her back; but in this caſe he forfeits the preſents he had made.

A man has no ſooner breathed his laſt, than one of his women, or ſome relation, puts her head in at the door of the tent, and burſts into a terrible cry; upon which all the women within the village ſet up a lamentable ſhriek and diſmal ſcreams, which alarm the whole camp or village. All the people then aſſemble round the tent of the deceaſed, ſome deploring his own loſs in mournful ſtrains, and others ſinging the praiſes of the deceaſed in melancholy accents ſuited to the occaſion. From their lively and natural repreſentation of grief, from their aſſumed melancholy, feigned ſighs and tears, they ſeem to be all the friends and kindred of the deceaſed; yet all this is mere form, and is beſtowed on every man without the leaſt regard to his merit. The body is afterwards waſhed, dreſſed, and placed on a riſing ground, to be viewed by every one till the grave is dug; after which it is interred with the head elevated a little, the face turned to the eaſt, and the grave covered with large ſtones.

SECT. III.

Of the Learning, Poetry, and Muſic of the Natives of the Deſarts of Zahara; their Method of making War; and their Skill in Horſemanſhip. They ſometims ride upon the Back of an Oſtrich; and are fond of making long Journies.

WITH reſpect to the learning of the Moors and Arabs of the deſarts, it is ſo extremely limited, that few of them are able to read Arabic or any other language; yet ſome of them have a tolerable notion of aſtronomy, and talk with the preciſion of an European ſcholar upon the ſtars, their number, ſituation, and diviſion into conſtellations. The clear and ſerene ſky in which they live has greatly aſſiſted their obſervations, an advantage they have improved by a warm imagination and a happy memory: their ſyſtem of aſtronomy is, however, ſo replete with fable and abſurdity, that it is in general difficult to comprehend their meaning: yet, with all their ignorance, they ſeem formed by nature for liberal ſentiments, and with a taſte for the polite arts, as their eſſays in poetry and muſic, which are far from being contemptible, ſeem to indicate, Thoſe who are acquainted with the genius of the oriental tongues, from which theirs is derived, have been highly delighted with their ſongs ſung in recitative, accompanied by a kind of guitar, in which they take the greateſt pleaſure.

From the ſoftneſs and effeminacy of their muſick it might be imagined, that theſe people cannot be very warlike; but if we may judge from ſome of their maxims, they are far from being puſillanimous. "Can any thing, "ſay they, be more daſtardly, than to kill a man before "you approach him near enough to be diſtinguiſhed." Hence they never attack an enemy till they come within the length of their lances, and then retiring to a proper diſtance, throw them or ſhoot their arrows with ſurpriſing dexterity. They fight chiefly on horſeback with ſhort ſtirrups, and by raiſing themſelves high in the ſaddle, ſtrike with greater force. They never draw up their cavalry in long lines and extended wings, but in ſmall detached ſquadrons, by which means they are leſs liable to be broke or thrown into confuſion; and when ſuch an accident happens, are more eaſily rallied. The agility of their horſes, and their own ſkill in riding, give them great advantages by attacking in all quarters, wheeling off, and returning to the charge with amazing dexterity.

It may be proper here to obſerve, that they ſometimes mount the oſtrich. Mr. Adamſon ſays, that ſome of thoſe he had ſeen among the burning ſands on the north ſide of the Senegal, are incredibly large, ſwift, and ſtrong. Two boys were mounted upon the back of one of theſe gigantic fowls not full grown, with which weight it ran ſeveral miles with a velocity exceeding belief, and the ſwiftneſs of the fleeteſt courſer. To try the ſtrength of an exceeding large oſtrich, Mr. Adamſon had two ſtout men mounted upon his back, when their weight appeared by no means diſproportioned to his ability, as it was far from retarding its progreſs. At firſt the bird went a pretty high trot; but when he was heated he extended his wings, as it were to catch the wind, to which his ſwiftneſs ſeemed indeed equal. "Every body, ſays he, "muſt have ſeen a partridge run, and conſequently muſt "know

"know there is no man whatever able to keep up with "it; and it is eaſy to imagine, that if its ſteps were "longer its ſpeed would be greatly augmented. The "oſtrich moves like the partridge, but with the advan-"tages of a long ſtep, and great aſſiſtance from its wings; "and I am ſatisfied, thoſe I am ſpeaking of would have "diſtanced the fleeteſt race-horſes in England." Whence, ſay the authors of the Modern Part of the Univerſal Hiſtory, we may judge of their utility, could they be tamed and broke in the ſame manner as a horſe.

Theſe people are in general fond of long journies and excurſions into remote countries on affairs of trade and commerce, in which reſpect they are ſo indefatigable, that no hazard is too great where profit is the motive. Theſe expeditions being undertaken in large caravans, in which their goods and neceſſaries are carried on camels, they are able to make head againſt any oppoſition they may meet with on the road, and ſeldom return without rich ladings of gold, ivory, gum, oſtrich-feathers, camel's-hair, ſlaves, and other commodities, which they ſell to the Europeans, or to the merchants of Fez and Morocco. It has been already intimated, that as no road or path can be preſerved in theſe ſandy deſarts, they are directed in their courſe by the flight of certain birds. Theſe the devout and zealous Mahometans conſider as guides ſent by their prophet to direct them in their journey; and, it is ſaid, that without their direction they never preſume to undertake an expedition of any conſiderable length.

SECT. IV.

Of the Kingdom of TOMBUTO.

Its Situation; a Deſcription of its Capital; the Wealth and State of the King; and a conciſe Account of the City of Cabra.

BEFORE we take leave of this country, it may be proper to take ſome notice of the kingdom of Tombuto, which is ſituated to the ſouth-eaſt on both ſides the Niger; and, though little known, is ſaid to be of great extent. It took its name from Tombuto its capital, which ſtands in the latitude of fourteen degrees thirty-two minutes, and in the longitude of two degrees twenty five minutes eaſt from London. This kingdom borders on the province of Zuenziga, already deſcribed.

In this town, and the ſurrounding country, the houſes are built of a bell form, and only compoſed of hurdles plaiſtered over with loam: but it has a handſome moſque built with ſtone and lime. The royal palace is likewiſe built with the ſame durable materials, after a deſign drawn and executed by an excellent artiſt of Granada, who was driven hither when the Moors were expelled from Spain. Beſides theſe there are ſome other tolerable ſtructures.

The city of Tombuto has many weavers of cotton; and mechanics are more encouraged than in any other part of Africa. Hither European cloths are brought from Barbary, and the coaſt of Guinea. Of theſe markets and public fairs are held, to which the women reſort with their faces veiled. Some of the native inhabitants and ſtrangers who reſide in the city are ſo rich, that the king thinks it not beneath the dignity of his rank to enter into an alliance with them. Leo Africanus mentions two princeſſes in his time, who were married to wealthy merchants, one a native of the place, and the other a foreigner.

This kingdom is well watered by natural ſprings, canals drawn from the Niger, and wells, that render it fertile in all kinds of grain, graſs, cattle, milk, butter, and all the neceſſaries of life, except ſalt, which they procure by land carriage from Tagaza, which is about five hundred miles diſtant, and is ſo highly valued, that a camel-load is ſaid to ſell for eighty ducats.

The king of Tombuto has in his poſſeſſion a prodigious quantity of gold plate, and the whole court is ſaid to eat out of gold veſſels; ſilver, or any other metal, being ſeldom uſed. When he travels he rides upon the back of a camel, richly capariſoned; all the furniture ſhining with burniſhed gold, while one of his great officers leads his horſe after him. He likewiſe rides upon a camel in war; but all his ſoldiers are mounted upon horſes. His general retinue and guards conſiſt of three thouſand horſemen well armed with poiſoned arrows and darts, beſides a number of foot, who have ſhields and ſwords. He often levies in perſon the tribute he receives from thoſe princes who do him homage, and frequent ſkirmiſhes paſs between the guards and the troops of thoſe vaſſals, who unwillingly give this teſtimony of their ſervitude. As no good horſes are bred in the country, the cavalry are uſually mounted upon Arabian horſes and barbs, which the king purchaſes at a great expence. The court and merchants, however, ride upon little horſes bred in the country, which are hardy, and in every reſpect, except in beauty, equal to the former. When the king is informed of a merchant's arrival in town with a droye of horſes, he inſtantly orders a number of the fineſt of them to be brought him; for which he pays a high price, ſcrupling no expence to have his troops handſomely mounted.

The moſt profound homage and reſpect is paid by thoſe who addreſs him; for all who approach the throne muſt proſtrate themſelves on the ground, take up the duſt, and ſprinkle it over their head and ſhoulders: a ceremony that is particularly obſerved by all who never had this honour before, and alſo by foreign ambaſſadors.

This monarch is ſuch an enemy to the Jews, that he has ſtrictly prohibited their entering the city, and laid a heavy penalty on all the merchants who trade with them. His taſte for literature is ſaid to appear from the great number of doctors, judges, and prieſts, whom he maintains at a great expence in the capital, furniſhing them with all the conveniencies of ſtudy. Manuſcripts from Barbary are brought hither, and ſold as the moſt valuable merchandize; and, we are told, that ſome traders have amaſſed immenſe wealth by confining themſelves to this literary traffic, which the monarch encourages with the ſpirit, taſte, and generoſity of a prince. Learning has, however, made but little progreſs, except about the court, it having produced no viſible alteration in the manners of the people. Theſe are mild and gentle in their diſpoſition, frugal in their œconomy, induſtrious in the diſcharge of their ſeveral employments, and cheerful in the hours of relaxation, which they devote to ſinging, dancing, and feſtivity.

The Tombuton gentry place the higheſt mark of pomp and pageantry in keeping a great number of ſlaves, but their careleſſneſs frequently produces the moſt dreadful calamities: thus the whole town is often in flames, occaſioned by their means; for the houſes, being built of combuſtible materials, catch fire upon the moſt trivial accident. Without the ſuburbs the Tombutons have neither gardens nor orchards.

The currency uſed in commerce conſiſts of ſmall bits of gold, and certain ſhells, which they uſe in purchaſing things of little value, four hundred of theſe being only worth a ducat.

About twelve miles from the city of Tombuto, to the ſouth, ſtands Cabra, a large town built in the ſame manner as the former, but without walls. Here is a judge appointed by the king to decide all diſputes; but the people have the liberty of appealing from his deciſion to the throne. The inhabitants of Cabra are ſaid to be ſubject to ſeveral diſeaſes, which are ſuppoſed to be owing to the heterogeneous qualities of their food, which is uſually compoſed of fleſh, fiſh, milk, butter, oil, and wine.

SECT. V.

Of BILEDULGERID.

Its Situation, Extent, and Produce; with an Account of the Perſons, Dreſs, Manners, and Cuſtoms of the Inhabitants; and a Deſcription of the City of Teuſera.

BILEDULGERID is almoſt of a ſquare form, and extends above eighty leagues every way, or from

twenty-eight degrees thirty minutes to thirty-two degrees fifty minutes north latitude, and from five degrees thirty minutes to eleven degrees fifty minutes east longitude; and is bounded on the east by a ridge of lofty mountains which divide it from the kingdom of Tripoly and part of Gudamis, on the weſt by the countries of Zeb and Mezeb, and on the ſouth by the province of Verghela: this is all that can with propriety be comprehended within the juſt limits of Biledulgerid, though it is uſual to include under that name all the countries here mentioned as its frontiers.

The whole country of Biledulgerid is mountainous, ſandy, and barren, producing little beſides dates, which grow here in ſuch plenty, that the face of half the country is covered with trees bearing that fruit. The climate is hot and unhealthy, the people lean, ſwarthy, with ſhrivelled complexions, and their eyes inflamed, owing to the reflexion of the ſun-beams from the white hard ſoil; and the ſhowers of duſt and ſand driven by the high winds that blow here at certain ſeaſons with ſuch violence, as ſometimes to bury men and cattle under heaps of it.

To their eating dates is attributed an inveterate ſcurvy in the gums of the inhabitants, which frequently makes all their teeth drop out, and ſometimes ſpreads over their whole bodies, by which means they are rendered unhappy and extremely loathſome. In other reſpects the natives are ſound, vigorous, and healthy; and many of them live without ſickneſs to a good old age, though they diſcover a furrowed countenance, ſhrivelled ſkin, and hoary locks very early in life, and before infirmity, decrepitude, or any decay of their faculties begin to appear. The plague, which makes ſuch havock in Barbary, is in a manner unknown at Biledulgerid; though the countries are contiguous, and there is a conſtant intercourſe between the inhabitants at all ſeaſons. This is alſo the caſe with the ſmall-pox, which in other hot countries is no leſs contagious and fatal than the plague itſelf.

The natives are repreſented as a ſavage, treacherous, and thieviſh people, conſiſting of a mixture of old Africans and Arabs. The former live with greater regularity in villages, compoſed of a number of ſmall huts, and the latter in tents, ranging from place to place in queſt of food and plunder. There is not a town in the whole country beſides Teuſera and Tonſera worthy of notice: nor is it leſs deſtitute of rivers, there being in all this large territory ſcarce a ſingle ſtream worth mentioning, or that is not dried up during half the year.

The Arabs, who value themſelves on their being ſuperior in birth and talents to the primitive inhabitants, are perfectly free and independant, and frequently enter into the ſervice of the neighbouring princes who are at war. They are fond of hunting, particularly the oſtrich, of which they make great advantage, for they eat the fleſh, exchange their feathers for corn, pulſe, and other things they want, uſe the talons as pendants for their ears and other ornaments; their fat is eſteemed a medicine of ſingular virtue, and they convert their ſkins into pouches and knapſacks; ſo that no part of the animal is left unemployed in ſome uſeful purpoſe. The Arabs likewiſe live upon the fleſh of camels and goats, and drink either the broth in which it is boiled, or camels milk, for they ſeldom taſte water, that which is good being generally more ſcarce than milk itſelf.

They have ſome horſes which they uſe in the chace, where people of rank are attended by negro ſlaves; and thoſe of inferior fortune by their women, who are no leſs obſequious than the ſlaves themſelves, looking after the horſes, and performing the moſt ſervile and laborious offices.

Though learning is here at a very low ebb, they have ſchools to which all the boys of diſtinction are ſent in order to be inſtructed in that kind of knowledge which is moſt in repute, and are raiſed from thence to the dignities of judges or prieſts, in proportion to their genius and the proficiency they have made in their ſtudies. Some addict themſelves to poetry, for which many of the natives of this country ſhew a very early genius; and it is not uncommon to ſee a perſon merit the higheſt diſtinctions by means of this talent, which, conſidering the rude ignorance of the people in general, they ſometimes carry to an amazing pitch of ſweetneſs and ſublimity. Their invention is ſurpriſingly fertile, and they particularly excel in fables and parables. A few of them purſue the mechanic arts: but the people in general deſpiſe them as mean and ſervile, and where any of them engage in the employments of huſbandry, they leave all the labour to their wives and ſlaves.

The city of Teuſera, which de Liſle has placed within the limits of Biledulgerid, ſtands on the confines of Tunis, in thirty-two degrees twenty-eight minutes north latitude, and in ten degrees twenty-ſix minutes eaſt longitude from London. Of this city Marmol has given us the following account: that it was built by the Romans, and fortified with high walls, the ruins of which are ſtill to be ſeen. The Mahometans on their entering this country plundered and deſtroyed the city on account of the reſiſtance made by the inhabitants, and thus all its noble ſtructures were demoliſhed, the preſent buildings conſiſting only of low and mean huts. Here they have fairs at certain ſeaſons, to which the merchants of the ſurrounding countries reſort. Through the center of the town runs a river, by which the Arabs and Africans are ſeparated, each poſſeſſing a certain quarter, the one to the ſouth, and the other to the north, enjoying different privileges, though all are equally the inhabitants of the ſame city. They are even continually at war with each other, and make incurſions acroſs the river with all the rancour and animoſity of declared enemies; but both frequently unite to repel all endeavours to bring them under a foreign government.

It might now be expected that we ſhould come to Morocco; but as that kingdom is only a part of a very extenſive region, diſtinguiſhed by the name of Barbary, and reſembles the other countries in that great diviſion in its climate, and in the religion and manners of the inhabitants, it will be proper to place them all in one view; and therefore before we take leave of the weſtern coaſt of Africa, we ſhall deſcribe the Canary Iſlands and the Madeiras, which lie oppoſite to it.

CHAP.

CHAP. XVI.

Of the CANARY and MADEIRA ISLANDS.

SECT. I.

Of the Situationand Extent of the Canary Iſlands in general; with a Deſcription of Lancerota and Fuertaventura.

THE Canaries, antiently called the Fortunate Iſlands, lie in the Atlantic Ocean oppoſite to the coaſt of Africa, between the twenty-ſeventh degree thirty minutes, and the twenty-ninth degree thirty minutes north latitude, and between the twelfth and ſeventeenth degree fifty minutes weſt longitude from London. Mr. Glas obſerves, that on ſailing four hundred and fifty miles to the ſouth-weſt from the mouth of the Streights of Gibraltar, along by the coaſt of Fez and Morocco on the Atlantic Ocean, we arrive at the ſouth-weſt extremity of Mount Atlas; then leaving the land, and ſailing into the ocean, directly weſt, one hundred and ſixty miles, we come to the iſland of Lancerota, the firſt of the Canary Iſlands in that courſe; the reſt of theſe iſlands lie all to the weſt and ſouth of Lancerota. The Canaries are ſeven in number; theſe are Lancerota, Fuertaventura, Canaria, Tenerife, Gomera, Hierro, or Ferro, and Palma: theſe lie from eaſt to weſt in the order in which they are here placed; and the laſt is about ſixty-five leagues diſtant from the firſt.

The firſt of theſe iſlands, named Lancerota, is very high, and may be diſcovered at a great diſtance. On approaching it appears black, rocky, and barren. It is about fifteen miles long and ten broad, and the center of the iſland is in latitude twenty-nine degrees eight minutes north.

The principal port is on the ſouth-eaſt ſide of the iſland, it is called Porto de Naos, and any veſſel that does not draw above eighteen feet may enter at high water, and lie ſecure from all winds and weather; yet in ſailing along the coaſts the ſhips appear as if at anchor in an open road; for the harbour is formed by a ridge of rocks, which at a ſmall diſtance cannot be perceived, as moſt of them lie under water: theſe breaking off the ſwell of the ſea, the inſide is as ſmooth as a mill-pond. As this is the only convenient place among the Canary Iſlands for cleaning and repairing large veſſels, it is much frequented for that purpoſe by the ſhips that trade to theſe iſlands. At the weſt end of the harbour is a ſquare caſtle built of ſtone, and mounted with ſome cannon, but is of no great ſtrength, as ſhips of war may approach it within muſket-ſhot. There is no town or village at this port, though there are ſome magazines in which corn is depoſited for exportation.

At the north end of Lancerota is a ſpacious harbour called El Rio, which is a channel dividing the iſland of Lancerota from the uninhabited iſland of Gracioſa, and through this channel ſhips of any burthen may paſs. That part of Lancerota which faces this harbour, is an exceeding high and ſteep cliff, from the bottom of which the ſhore is about two muſket-ſhot diſtance. The ground here is low, and in it is a ſalt-work, which is a ſquare piece of land levelled and divided by ſhallow trenches about two inches deep; into theſe they let the ſea-water, which, by the heat of the ſun, and the nature of the ſoil, is ſoon turned into ſalt.

There is no other way of acceſs into Lancerota from the ſhore of this harbour, than by climbing up a narrow, ſteep, and intricate path, that leads to the top of the cliff; and it is ſcarce poſſible for a ſtranger to aſcend it without a guide; for ſhould he chance to wander from the path, it would be difficult to regain it, and he would be in great danger of falling to the bottom.

There are only two towns in the iſland: one called Cayas, or Rubicon, is ſituated about two leagues to the north-weſt of Porto De Naos, and may be termed the capital of the iſland, ſince it was formerly a biſhop's ſee; but it contains only about two hundred houſes, an old caſtle mounted with ſome guns, a church, and a convent of friars; but moſt of the dwelling-houſes have a mean appearance.

About two leagues within land, to the ſouthward of the narrow path of the cliff at El Rio, is the town of Haria, the next in ſize to Cayas. It contains about three hundred inhabitants; but all the buildings, except the church and three or four private houſes, are very mean ſtructures.

The iſland of Gracioſa lies on the north ſide of Lancerota, and is barren, uninhabited, and deſtitute of water; though it is about three miles in length, and two in breadth; beſides this, there are ſeveral other rocky, barren, and uninhabited iſlands.

We ſhall now give a deſcription of Fuertaventura, and then give an account of the produce and inhabitants of both theſe iſlands.

The north end of Fuertaventura lies about ſeven miles ſouth-and-by-weſt from the ſouth-weſt point of Lancerota, and in the channel between them is the little uninhabited iſland of Lobos, or Seals, which is about a league in circumference.

Fuertaventura is about eighty miles in length, and in general about fifteen in breadth; but in the middle it is narrow and low, being almoſt cut in two by the ſea. That part of the iſland on the ſouth ſide of the iſthmus is mountainous, ſandy, barren, and almoſt uninhabited; but though the northern part is alſo mountainous, yet within land it is fertile and well peopled.

This iſland has ſeveral bays and harbours; and there are three ſmall towns, one of which, called Oliva, is ſituated ſomewhat leſs than two leagues within land from the road of Lobos, in the midſt of a plain that abounds with corn-fields. Here is a church, and about fifty good houſes. The next to this is La Villa, the chief town in the iſland, which is ſituated in the center of that part which lies north of the iſthmus, and has a church, a convent of Franciſcan friars, and near an hundred houſes. There is alſo a town called Tunche, which contains about one hundred houſes; but they are very mean when compared with thoſe of La Villa and Oliva. Beſides theſe there are many ſmall villages ſcattered up and down in the northern and inland part of the iſland, which ſtand ſo thick, that we no ſooner loſe ſight of one than we come in view of another.

It is remarkable, that when there is a great weſterly ſwell the ſea breaks on the rocks, at the north-weſt end of Lobos with ſuch violence, as to ſtrike the beholder with terror. "I may without exaggeration affirm, ſays "Mr. Glas, that I have ſeen breakers there near ſixty "feet high: were one of theſe to ſtrike the ſtrongeſt ſhip, "ſhe would be ſtaved to pieces in a moment. When "I ſaw thoſe mighty breakers, our ſhip had juſt paſſed "through the channel between Fuertaventura and Lobos: "we had a fine briſk trade-wind at north-north eaſt, "and though we had no leſs than ten fathoms water, "when we come into the weſterly ſwell, ye we trembled "for fear the waves would have broken, and thought "ourſelves happy when we got out of ſoundings. We "heard the noiſe of theſe breakers like diſtant thunder, "after we were paſſed them ſix or ſeven leagues."

SECT. II.

The Climate, Soil, Vegetables, and Animals of Lancerota and Fuertaventura; with an Account of a Volcano in the former of thoſe Iſlands.

BOTH theſe iſlands have the advantage of a wholeſome climate, which perhaps is owing to the dryneſs

twenty-eight degrees thirty minutes to thirty-two degrees fifty minutes north latitude, and from five degrees thirty minutes to eleven degrees fifty minutes eaſt longitude; and is bounded on the eaſt by a ridge of lofty mountains which divide it from the kingdom of Tripoly and part of Gudamis, on the weſt by the countries of Zeb and Mezeb, and on the ſouth by the province of Verghela: this is all that can with propriety be comprehended within the juſt limits of Biledulgerid, though it is uſual to include under that name all the countries here mentioned as its frontiers.

The whole country of Biledulgerid is mountainous, ſandy, and barren, producing little beſides dates, which grow here in ſuch plenty, that the face of half the country is covered with trees bearing that fruit. The climate is hot and unhealthy, the people lean, ſwarthy, with ſhrivelled complexions, and their eyes inflamed, owing to the reflexion of the ſun-beams from the white hard ſoil; and the ſhowers of duſt and ſand driven by the high winds that blow here at certain ſeaſons with ſuch violence, as ſometimes to bury men and cattle under heaps of it.

To their eating dates is attributed an inveterate ſcurvy in the gums of the inhabitants, which frequently makes all their teeth drop out, and ſometimes ſpreads over their whole bodies, by which means they are rendered unhappy and extremely loathſome. In other reſpects the natives are ſound, vigorous, and healthy; and many of them live without ſickneſs to a good old age, though they diſcover a furrowed countenance, ſhrivelled ſkin, and hoary locks very early in life, and before infirmity, decrepitude, or any decay of their faculties begin to appear. The plague, which makes ſuch havock in Barbary, is in a manner unknown at Biledulgerid; though the countries are contiguous, and there is a conſtant intercourſe between the inhabitants at all ſeaſons. This is alſo the caſe with the ſmall-pox, which in other hot countries is no leſs contagious and fatal than the plague itſelf.

The natives are repreſented as a ſavage, treacherous, and thieviſh people, conſiſting of a mixture of old Africans and Arabs. The former live with greater regularity in villages, compoſed of a number of ſmall huts, and the latter in tents, ranging from place to place in queſt of food and plunder. There is not a town in the whole country beſides Teuſera and Tonſera worthy of notice: nor is it leſs deſtitute of rivers, there being in all this large territory ſcarce a ſingle ſtream worth mentioning, or that is not dried up during half the year.

The Arabs, who value themſelves on their being ſuperior in birth and talents to the primitive inhabitants, are perfectly free and independant, and frequently enter into the ſervice of the neighbouring princes who are at war. They are fond of hunting, particularly the oſtrich, of which they make great advantage, for they eat the fleſh, exchange their feathers for corn, pulſe, and other things they want, uſe the talons as pendants for their ears and other ornaments; their fat is eſteemed a medicine of ſingular virtue, and they convert their ſkins into pouches and knapſacks; ſo that no part of the animal is left unemployed in ſome uſeful purpoſe. The Arabs likewiſe live upon the fleſh of camels and goats, and drink either the broth in which it is boiled, or camels milk, for they ſeldom taſte water, that which is good being generally more ſcarce than milk itſelf.

They have ſome horſes which they uſe in the chace, where people of rank are attended by negro ſlaves; and thoſe of inferior fortune by their women, who are no leſs obſequious than the ſlaves themſelves, looking after the horſes, and performing the moſt ſervile and laborious offices.

Though learning is here at a very low ebb, they have ſchools to which all the boys of diſtinction are ſent in order to be inſtructed in that kind of knowledge which is moſt in repute, and are raiſed from thence to the dignities of judges or prieſts, in proportion to their genius and the proficiency they have made in their ſtudies. Some addict themſelves to poetry, for which many of the natives of this country ſhew a very early genius; and it is not uncommon to ſee a perſon merit the higheſt diſtinctions by means of this talent, which, conſidering the rude ignorance of the people in general, they ſometimes carry to an amazing pitch of ſweetneſs and ſublimity. Their invention is ſurpriſingly fertile, and they particularly excel in fables and parables. A few of them purſue the mechanic arts: but the people in general deſpiſe them as mean and ſervile, and where any of them engage in the employments of huſbandry, they leave all the labour to their wives and ſlaves.

The city of Teuſera, which de Liſle has placed within the limits of Biledulgerid, ſtands on the confines of Tunis, in thirty-two degrees twenty-eight minutes north latitude, and in ten degrees twenty-ſix minutes eaſt longitude from London. Of this city Marmol has given us the following account: that it was built by the Romans, and fortified with high walls, the ruins of which are ſtill to be ſeen. The Mahometans on their entering this country plundered and deſtroyed the city on account of the reſiſtance made by the inhabitants, and thus all its noble ſtructures were demoliſhed, the preſent buildings conſiſting only of low and mean huts. Here they have fairs at certain ſeaſons, to which the merchants of the ſurrounding countries reſort. Through the center of the town runs a river, by which the Arabs and Africans are ſeparated, each poſſeſſing a certain quarter, the one to the ſouth, and the other to the north, enjoying different privileges, though all are equally the inhabitants of the ſame city. They are even continually at war with each other, and make incurſions acroſs the river with all the rancour and animoſity of declared enemies; but both frequently unite to repel all endeavours to bring them under a foreign government.

It might now be expected that we ſhould come to Morocco; but as that kingdom is only a part of a very extenſive region, diſtinguiſhed by the name of Barbary, and reſembles the other countries in that great diviſion in its climate, and in the religion and manners of the inhabitants, it will be proper to place them all in one view; and therefore before we take leave of the weſtern coaſt of Africa, we ſhall deſcribe the Canary Iſlands and the Madeiras, which lie oppoſite to it.

CHAP.

CHAP. XVI.

Of the CANARY and MADEIRA ISLANDS.

SECT. I.

Of the Situationand Extent of the Canary Iſlands in general; with a Deſcription of Lancerota and Fuertaventura.

THE Canaries, antiently called the Fortunate Iſlands, lie in the Atlantic Ocean oppoſite to the coaſt of Africa, between the twenty-ſeventh degree thirty minutes, and the twenty-ninth degree thirty minutes north latitude, and between the twelfth and ſeventeenth degree fifty minutes weſt longitude from London. Mr. Glas obſerves, that on ſailing four hundred and fifty miles to the ſouth-weſt from the mouth of the Streights of Gibraltar, along by the coaſt of Fez and Morocco on the Atlantic Ocean, we arrive at the ſouth-weſt extremity of Mount Atlas; then leaving the land, and ſailing into the ocean, directly weſt, one hundred and ſixty miles, we come to the iſland of Lancerota, the firſt of the Canary Iſlands in that courſe; the reſt of theſe iſlands lie all to the weſt and ſouth of Lancerota. The Canaries are ſeven in number; theſe are Lancerota, Fuertaventura, Canaria, Tenerife, Gomera, Hierro, or Ferro, and Palma: theſe lie from eaſt to weſt in the order in which they are here placed; and the laſt is about ſixty-five leagues diſtant from the firſt.

The firſt of theſe iſlands, named Lancerota, is very high, and may be diſcovered at a great diſtance. On approaching it appears black, rocky, and barren. It is about fifteen miles long and ten broad, and the center of the iſland is in latitude twenty-nine degrees eight minutes north.

The principal port is on the ſouth-eaſt ſide of the iſland, it is called Porto de Naos, and any veſſel that does not draw above eighteen feet may enter at high water, and lie ſecure from all winds and weather; yet in ſailing along the coaſts the ſhips appear as if at anchor in an open road; for the harbour is formed by a ridge of rocks, which at a ſmall diſtance cannot be perceived, as moſt of them lie under water: theſe breaking off the ſwell of the ſea, the inſide is as ſmooth as a mill-pond. As this is the only convenient place among the Canary Iſlands for cleaning and repairing large veſſels, it is much frequented for that purpoſe by the ſhips that trade to theſe iſlands. At the weſt end of the harbour is a ſquare caſtle built of ſtone, and mounted with ſome cannon, but is of no great ſtrength, as ſhips of war may approach it within muſket-ſhot. There is no town or village at this port, though there are ſome magazines in which corn is depoſited for exportation.

At the north end of Lancerota is a ſpacious harbour called El Rio, which is a channel dividing the iſland of Lancerota from the uninhabited iſland of Gracioſa, and through this channel ſhips of any burthen may paſs. That part of Lancerota which faces this harbour, is an exceeding high and ſteep cliff, from the bottom of which the ſhore is about two muſket-ſhot diſtance. The ground here is low, and in it is a ſalt-work, which is a ſquare piece of land levelled and divided by ſhallow trenches about two inches deep; into theſe they let the ſea-water, which, by the heat of the ſun, and the nature of the ſoil, is ſoon turned into ſalt.

There is no other way of acceſs into Lancerota from the ſhore of this harbour, than by climbing up a narrow, ſteep, and intricate path, that leads to the top of the cliff; and it is ſcarce poſſible for a ſtranger to aſcend it without a guide; for ſhould he chance to wander from the path, it would be difficult to regain it, and he would be in great danger of falling to the bottom.

There are only two towns in the iſland: one called Cayas, or Rubicon, is ſituated about two leagues to the north-weſt of Porto De Naos, and may be termed the capital of the iſland, ſince it was formerly a biſhop's ſee; but it contains only about two hundred houſes, an old caſtle mounted with ſome guns, a church, and a convent of friars; but moſt of the dwelling-houſes have a mean appearance.

About two leagues within land, to the ſouthward of the narrow path of the cliff at El Rio, is the town of Haria, the next in ſize to Cayas. It contains about three hundred inhabitants; but all the buildings, except the church and three or four private houſes, are very mean ſtructures.

The iſland of Gracioſa lies on the north ſide of Lancerota, and is barren, uninhabited, and deſtitute of water; though it is about three miles in length, and two in breadth; beſides this, there are ſeveral other rocky, barren, and uninhabited iſlands.

We ſhall now give a deſcription of Fuertaventura, and then give an account of the produce and inhabitants of both theſe iſlands.

The north end of Fuertaventura lies about ſeven miles ſouth-and-by-weſt from the ſouth-weſt point of Lancerota, and in the channel between them is the little uninhabited iſland of Lobos, or Seals, which is about a league in circumference.

Fuertaventura is about eighty miles in length, and in general about fifteen in breadth; but in the middle it is narrow and low, being almoſt cut in two by the ſea. That part of the iſland on the ſouth ſide of the iſthmus is mountainous, ſandy, barren, and almoſt uninhabited; but though the northern part is alſo mountainous, yet within land it is fertile and well peopled.

This iſland has ſeveral bays and harbours; and there are three ſmall towns, one of which, called Oliva, is ſituated ſomewhat leſs than two leagues within land from the road of Lobos, in the midſt of a plain that abounds with corn-fields. Here is a church, and about fifty good houſes. The next to this is La Villa, the chief town in the iſland, which is ſituated in the center of that part which lies north of the iſthmus, and has a church, a convent of Franciſcan friars, and near an hundred houſes. There is alſo a town called Tunche, which contains about one hundred houſes; but they are very mean when compared with thoſe of La Villa and Oliva. Beſides theſe there are many ſmall villages ſcattered up and down in the northern and inland part of the iſland, which ſtand ſo thick, that we no ſooner loſe ſight of one than we come in view of another.

It is remarkable, that when there is a great weſterly ſwell the ſea breaks on the rocks, at the north-weſt end of Lobos with ſuch violence, as to ſtrike the beholder with terror. "I may without exaggeration affirm, ſays "Mr. Glas, that I have ſeen breakers there near ſixty "feet high: were one of theſe to ſtrike the ſtrongeſt ſhip, "ſhe would be ſtaved to pieces in a moment. When "I ſaw thoſe mighty breakers, our ſhip had juſt paſſed "through the channel between Fuertaventura and Lobos: "we had a fine briſk trade-wind at north-north eaſt, "and though we had no leſs than ten fathoms water, "when we come into the weſterly ſwell, ye we trembled "for fear the waves would have broken, and thought "ourſelves happy when we got out of ſoundings. We "heard the noiſe of theſe breakers like diſtant thunder, "after we were paſſed them ſix or ſeven leagues."

SECT. II.

The Climate, Soil, Vegetables, and Animals of Lancerota and Fuertaventura; with an Account of a Volcano in the former of thoſe Iſlands.

BOTH theſe iſlands have the advantage of a wholeſome climate, which perhaps is owing to the dryneſs

neſs of the ſoil, and the ſtrong northerly winds that almoſt continually blow; whence the inhabitants in general live to a great age. From the middle or end of April, to the beginning or middle of October, the wind blows violently, and almoſt without intermiſſion from the north and north-eaſt. From the middle of October, to the end of April, it moſt commonly blows in the ſame direction; but ſometimes intermits, and gives place to other winds. The ſouth-weſt wind always brings rain, and therefore is moſt welcome. Other winds, particularly the north-weſt, bring ſhowers; but theſe are partial, and of ſhort duration; but the rain which comes from the ſouth-weſt frequently laſts two or three days. When theſe rains begin to fall, the natives ſow their grain, and about fourteen or twenty days after the latter rains, that is towards the end of April, it is ready for reaping. The north, and north-north-eaſt winds blow ſo hard and conſtantly, as to prevent the growth of all ſorts of trees, eſpecially in Lancerota, which is moſt expoſed to their violence: yet we find there a few ſhrubs called tubaybas, which never grow to a great height any where; but here ſpread along the ground, except when ſheltered from the wind by rocks and walls. In the gardens are fig trees, and ſome low trees or ſhrubs which ſeldom ſhoot up higher than the garden walls.

Fuertaventura, being leſs expoſed to the wind than Lancerota, is not quite ſo bare of trees and ſhrubs, and produces the palm, the wild olive, and a ſort of wild pine; the cotton and euphorbium ſhrubs, fig-trees, and the ſhrub which bears the prickly pear.

Though theſe iſlands are ſo deſtitute of trees, they abound in excellent herbage, and ſeveral kinds of odoriferous flowers. The great plenty and variety of theſe induced the inhabitants to bring bees from the other iſlands in order to propagate here; but they were diſappointed; for none of thoſe inſects would remain with them, they not being able to bear the violent winds.

Corn of various kinds grow in both theſe iſlands, as wheat, barley, and maize, which are produced in ſuch abundance, as not only to ſerve the inhabitants, but alſo thoſe of Tenerife and Palma, who depend greatly on theſe iſlands for their ſuſtenance. No vines were produced at Lancerota till within thirty years paſt, when a volcano breaking out, covered many fields with aſhes, which have ſo improved the ſoil, that vines are now planted and yield grapes; but the wine made from them is thin, poor, and ſo ſharp as to reſemble vinegar, yet is very wholeſome. Fuertaventura produces a greater quantity of wine, of a quality ſomething ſuperior to that of Lancerota.

Upon the rocks on the ſea coaſt grows a great quantity of orchilla-weed, an ingredient uſed in dying. It grows out of the pores of the rocks, to about three inches, and ſometimes eight or ten inches. It is of a round form, and of the thickneſs of common ſewing twine; it is of a grey colour, inclining to white, and on the ſtalk are white ſpots. Many ſtalks proceed from one root, at a diſtance from which they divide into branches. This weed dyes a beautiful purple, and is alſo much uſed for brightening and enlivening other colours. The beſt ſort is that of the darkeſt colour, and of a form exactly round: the more it abounds with white ſpots or ſcabs, the more valuable it is. This weed alſo grows in the Madeira and Cape de Verd Iſlands, and on the coaſt of Barbary; but the beſt ſort and the greateſt quantity is found in the Canary iſlands. There is ſome reaſon to believe, that the orchilla was the Getulian purple of the ancients; and in ſupport of this opinion, it is obſerved, that the coaſt of Africa adjacent to the Canary Iſlands was called by the ancients Getulia, and abounds with orchilla.

In Lancerota are few ſprings or wells. The inhabitants uſe for themſelves and cattle rain water, which they preſerve in pits and ciſterns. This is alſo practiſed at Fuertaventura, though they have more ſprings and wells; but the water is generally brackiſh. At El Rio, to the northward of the ſalt works mentioned in the laſt ſection, is a well of medicinal water, eſteemed a ſovereign cure for the itch. It is alſo good for common drinking, and will keep ſweet at ſea.

The cattle of theſe iſlands are camels, horſes, aſſes, bullocks, ſheep, goats, and hogs, all of which, except the ſheep and goats, were brought from Barbary and Spain, ſince the conqueſt of theſe iſlands by the Spaniards. The horſes are of the Barbary breed, and are much eſteemed in Canaria and Tenerife, for their ſpirit and ſwiftneſs; but the natives of theſe two iſlands we are now deſcribing have little or no uſe for them, on account of their having no great diſtance to travel, and therefore little care is taken to increaſe the breed; whence their number is at preſent very ſmall. The natives uſe for travelling aſſes of a larger ſize than thoſe of the other iſlands, which ſerve well enough for their ſhort journies, and are maintained with little or no expence.

In the ſpring their cattle, being fat and good, appear plump, ſleek, and gliſten as if rubbed with oil; but in the beginning of autumn, when all the graſs is either withered or eaten up, they have a very different appearance, and are unfit for food.

The people here generally plow with a camel, or a couple of aſſes, for the ſoil is light, and they do not plow deep.

The want of wood or buſhes occaſions a ſcarcity of birds and wild fowl; yet there are ſome canary birds, and a bird called tubayba, about the ſize of a ſtarling, ſpeckled black and white. Here are likewiſe partridges and ravens, with plenty of dunghill fowls; but neither turkies, geeſe, nor ducks: the want of the two laſt ſpecies may probably be owing to the ſcarcity of water in theſe iſlands.

Here are no other venemous animals but the black ſpider, the bite of which the natives ſay occaſions a ſwelling, attended with a burning pain. Their cure for it is to eat a ſmall quantity of human excrement.

The ſea coaſt of Lancerota and Fuertaventura afford the inhabitants great plenty of fiſh of various kinds, particularly a kind of cod, much better taſted than that of Newfoundland, or of the north ſea. Another fiſh of a ſtill more excellent taſte is caught here, called mero: it is as long as a cod; but much thicker, and has long ſtraps or whiſkers hanging at his mouth. There are many other ſorts of fiſh for which we have no name; one of them however ought not to be omitted: this is the picudo or ſea pike, the bite of which is as poiſonous as that of a viper; yet when this fiſh is killed and dreſſed, it is good and innocent food. On the rocks by the ſea-ſhore are many ſhell fiſh, and particularly limpets.

In Lancerota and Fuertaventura are many hills that were formerly volcanoes, the tops of which are of a ſmall circumference, and are hollow for a little way downwards; the edges of the tops being uſually narrow and ſharp, and on the outſide is generally ſeen a great deal of black duſt and burnt ſtone like pumice-ſtone, only darker and more ponderous. No eruptions have been known to happen for ſeveral ages, except that already mentioned at Lancerota, which about thirty years ago broke out on the ſouth-weſt part of the iſland, throwing out ſuch an immenſe quantity of aſhes and huge ſtones, and with ſo dreadful a noiſe, that many of the natives leaving their houſes, fled to Fuertaventura; but ſome time after, finding that thoſe who had ventured to ſtay had received no hurt, they took courage and returned. This volcano was near the ſea, in a place remote from any habitation. At a ſmall diſtance from the volcano a pillar of ſmoke iſſued from the ſea, and afterwards a ſmall pyramidal rock aroſe, and ſtill continues. This rock was joined to the iſland by the matter thrown out of the volcano. The noiſe of this eruption was ſo loud, that it was heard at Tenerife, which ſtands at the diſtance of forty leagues; which was probably occaſioned by the winds generally blowing from Lancerota towards that iſland.

SECT. III.

Of the Manners and Cuſtoms of the ancient Inhabitants of Lancerota and Fuertaventura.

THE ancient inhabitants of theſe two iſlands were of a larger ſize and better made than thoſe of the others, and ſo they are to this day. The habit of the natives of Lancerota

cerota was made of goat-ſkins ſewed together, reaching down to the knees, and was formed like a cloak with a hood. The ſeams of this habit were neatly ſewed with ſlender thongs of leather, which were as fine as common thread. Thoſe thongs they prepared with ſharp flints or ſtones, inſtead of knives or ſciſſars. They wore bonnets made of goat-ſkins, with three large feathers ſtuck in the front. The women wore the ſame, with a fillet of leather died red with the bark of ſome ſhrubs. They had long hair, and wore their beards plaited. The king of the iſland wore a diadem like a biſhop's mitre, made of goats-leather, and adorned with ſea-ſhells. Their ſhoes were alſo of goat-ſkin, with the hairy ſide outwards.

When they were ſick, which ſeldom happened, they cured themſelves with the herbs that grew in the country; and when they had acute pains they ſcarified the part affected with ſharp ſtones, or burned it with fire, and then anointed it with goats butter. When any one died, they laid him in a cave, ſtretching out the body, and laying goats-ſkins under and above it.

Their food was barley-meal roaſted, which they called goſſio, and goats fleſh boiled and roaſted; alſo milk and butter. They ate their victuals out of veſſels made of clay, hardened by the heat of the ſun.

Their method of lighting a fire was by taking a ſtick of dry, hard, thorny wood, which they cauſed to turn rapidly round on the point, within a ſoft, dry, ſpongy thiſtle, and ſo ſet it on fire: and this method has been uſed to this day. When they ſowed their land with barley, which was their only grain, they turned it up with goats horns, they threſhed their barley with ſticks, winnowed it with their hands, and ground it in a hand-mill made of two ſtones.

Theſe two iſlands, as well as the others, were divided into portions, each governed by its own lord, or captain, and ſeparated from the reſt by a wall of looſe ſtones, that croſſed the iſland from ſea to ſea. The inhabitants of theſe quarters had a great eſteem for their reſpective chiefs.

The people of both iſlands were of a humane, ſocial, and cheerful diſpoſition, extremely fond of ſinging and dancing. Their muſic was vocal, accompanied with a noiſe made by clapping their hands, and beating with their feet. They were remarkably nimble, and took great delight in leaping and jumping, which were their principal diverſions: two men took a ſtaff, which they held by the ends, and lifted as high above their heads as they could reach, keeping it parallel with the ground; and he who could leap over it, was eſteemed very dexterous. Some of them had ſuch agility, that they could, at three leaps, bound over three poles placed in that manner behind each other.

They frequently quarrelled, and then fought with ſticks a yard and a half long. It was a cuſtom among them, that if a man entered the door of his enemy's houſe, and wounded or killed him, he was not puniſhed; but if he came upon him unawares, by leaping over the wall, and killed him, the captain, or chief, by whom the cauſe was tried, ordered him to be ſlain. Their manner of executing criminals was as follows: they carried them to the ſea-ſhore, and placing their heads on a flat ſtone, took another of a round form, and with it daſhed out their brains; after which their children were held infamous.

They were excellent ſwimmers, and uſed to kill the fiſh on their coaſts with ſticks. Their houſes were built of ſtone, without cement, yet were ſtrong; and the entry was made ſo narrow, that only one perſon could paſs through at a time. They had alſo houſes for worſhip and devotion; theſe were round, and compoſed of two walls, one within the other, with a ſpace between; and, like their dwelling-houſes, were built of looſe ſtones, with a narrow entry. They worſhipped only one God, and in theſe temples offered to him milk and butter. To him they alſo made offerings on the mountains, pouring out goats milk from earthen veſſels, at the ſame time adoring him by lifting up their hands towards heaven.

The inhabitants of Fuertaventura wore jackets made of ſheep-ſkins, with ſhort ſleeves that reached no farther than their elbows. They had ſhort breeches that left the knees bare, and ſhort ſtockings that reached but juſt above the calf of the leg. They wore the ſame ſort of ſhoes as the natives of Lancerota, and had high caps on their heads made of goat-ſkins. They dreſſed the hair of their heads and beards like the natives of Lancerota.

SECT. IV.

Of the preſent Inhabitants of Lancerota and Fuertaventura; their Perſons, Dreſs, Buildings, Food, Manners, Cuſtoms, Government, and Trade.

THE natives of theſe iſlands, though they paſs for Spaniards, are ſprung from a mixture of the ancient inhabitants, the Normans, and other Europeans, by whom they were ſubdued, and from ſome Mooriſh captives whom the Spaniards brought to theſe iſlands from the coaſt of Barbary.

They are generally tall, robuſt, ſtrong, and of a very dark complexion; but the natives of the other Canary Iſlands account them rude and unpoliſhed in their manners.

They dreſs coarſely, and after the Spaniſh modern faſhion; for the ſhort cloak and golilla, formerly uſed by the Spaniards, are here unknown. They neither ſpeak nor underſtand any other language but the Caſtilian, which they pronounce moſt barbarouſly.

Their houſes are built of ſtone and lime; thoſe of the gentry are covered with pantiles; but the meaner ſort are thatched with ſtraw. Few even of the better kind have either cielings or lofts, but are built in the form of large barns, and divided into apartments by boarded partitions that riſe no higher than the walls; ſo that all the rooms are open above, and have no other covering than the roof. They generally pave the floors with flag-ſtones.

The uſual food of the peaſants is what is called goſſio, which is the flour of wheat, or barley, well heated by the fire: this they make into dough with water, and then eat it; a ſimple diet, that requires neither knives, forks, nor ſpoons. This they ſometimes make up with their hands in balls or lumps, which they dip in honey or molaſſes; and during the winter, when graſs is in perfection, and they have plenty of excellent milk, they put the goſſio into it, uſing ſea-ſhells inſtead of ſpoons. They alſo prepare goſſio by putting it into boiling milk, and ſtirring it about till it is ſufficiently boiled and thickened. On particular occaſions, as at feſtivals and weddings, the poor eat fleſh and fiſh: but bread is rarely uſed by any but the gentry, and there are ſome people in theſe iſlands who do not even know the taſte of it. They ſeldom drink wine, or any thing but water.

The peaſants are employed in plowing the ground, ſowing corn, reaping, and other parts of huſbandry. Few of the men in Lancerota and Fuertaventura are artificers; for almoſt all their cloaths are made by the women, and their houſhold-furniture is brought from the other iſlands.

The gentry are ſo averſe to leaving their country, and have ſo little curioſity, that few of them viſit Spain, or even Canaria, except when obliged to attend their law-ſuits in that iſland. A gentleman poſſeſſing a few acres of land, a camel, a couple of aſſes, and a dozen ſheep, would chooſe rather to live all his days on goſſio, than venture to the Spaniſh Weſt Indies, in order to mend his fortune by trade, which, in his opinion, would diſgrace him and his family for ever: yet he will, without ſhame, oppreſs the poor peaſants, and deceive ſtrangers, in order to ſupport his imaginary rank, which, among the poor gentry, wholly conſiſts in not working, and riding a little way on an aſs, attended by a ragged ſervant, inſtead of walking on foot.

There are but few monks, and no nuns in theſe iſlands; they are, however, in no want of prieſts, for there are ſeveral pariſh-churches, and an inferior court of inquiſition in each of theſe iſlands, in order to prevent hereſy: ſo that the religion of the church of Rome is alone profeſſed among them.

Though all the Canary iſlands are ſubject to Spain, yet the natives of the two of which we are now treating, with

thoſe of Gomera and Hierro, do not hold their lands of the crown, but of the family of Don Diego de Herrera, who conquered the iſland of Canaria.

The chief part of the power originally poſſeſſed by the proprietors of theſe iſlands has been, however, taken from them, and annexed to the crown, probably on account of their making an ill uſe of ſuch an extenſive authority. The government is now veſted in an alcalde major and a ſargento major, alſo called governador de las armis. The firſt is the head of the civil, and the other of the military government. There is an appeal from the deciſion of the alcalde major to the royal audience in the iſland of Canaria; and the ſargento major receives his orders from the governor-general of the Canary Iſlands, who uſually reſides in Tenerife. No ſtanding forces are kept here; but there is a militia properly regulated and divided into companies, to each of which is a captain, lieutenant, and enſign. The ſargento major is colonel, and takes care that their arms are kept in order, and that the companies may be raiſed at a ſhort warning.

Though theſe iſlands are but little eſteemed by the Spaniſh government, they are really of great value; for were they once ſubdued by any other nation, Palma and Tenerife would fall of courſe, on account of their depending on Lancerota and Fuertaventura for their corn. Beſides, the forts in Lancerota would afford convenient retreats, where the cruiſing ſhips of an enemy might careen, and be ſupplied with proviſions.

The exports from hence are entirely confined to the other iſlands, and conſiſt of wheat, barley, maize, cattle, fowls, cheeſe, orchilla-weed, goats-ſkins, and ſalt-fiſh; but the two laſt are only exported from Lancerota. The wheat is ſmall-grained, but hard, clean, and ſo good, that it always ſells at Tenerife at a higher price, by one fifth, than either Engliſh or other European wheat. About ten years ago a number of camels were exported from Fuertaventura to Jamaica, and other parts of the Engliſh Weſt Indies; but this trade was ſoon prohibited, for fear of loſing the breed, or at leaſt raiſing the price of thoſe animals.

The aſſes brought by the Spaniards to Fuertaventura increaſed ſo faſt, that they ran wild among the mountains, and were ſo prejudicial to the natives by eating their corn and other grain, that in the year 1591 they aſſembled all the inhabitants and dogs in the iſland, in order to deſtroy them; and accordingly killed no leſs than fifteen hundred. Since that time there have been no more in the iſland than is ſufficient to ſupply the inhabitants.

They have impoliticly prohibited the exportation of corn to any place except the other iſlands; whence in a year of great plenty it becomes of ſo little value, as ſcarcely to pay the expence of cutting it down. Hence they are very indifferent about raiſing more than what they can conſume themſelves, or ſell in the other iſlands; ſo that in a bad year the people ſtarve for want, eſpecially the inhabitants of Tenerife, unleſs they are ſo happy as to be ſupplied from Europe.

Almoſt all the imports are from the other iſlands, eſpecially from Tenerife, which is the center of trade for all the Canary Iſlands. Theſe conſiſt in Engliſh woollen goods and German linens, both of the coarſeſt kinds, wine, brandy, oil, fruit, planks and other timber, barks and fiſhing-boats, houſhold furniture, tobacco, ſnuff, beeswax, ſoap, candles, and a conſiderable quantity of caſh, which they receive in the balance of trade, part of which is paid to the proprietors of the lands, and the reſt ſent to Gran Canaria, to ſupport the expence of their law-ſuits; the natives of all the Canary Iſlands being generally extremely litigious.

SECT. V.

Of Gran Canaria.

Its Situation and Extent; with a particular Account of the Calms on the South-eaſt Side of theſe, and ſome of the other Mountains; with a conciſe Deſcription of the Ports, and of the City of Palmas, the Capital of the Iſland.

THE two iſlands we have juſt deſcribed are almoſt deſarts, if compared with the fertile and pleaſant iſland of Canaria, which, on account of the delightful temperature of the air, and the plenty of good water, trees, herbs, and delicious fruits found upon it, juſtly merits the name of the Fortunate Iſland.

The north-eaſt point of Canaria lies at the diſtance of eighteen leagues from the ſouth-weſt end of Fuertaventura, and in clear weather either of thoſe iſlands may be ſeen from the other. Canaria is about forty-two miles in length, twenty-ſeven in breadth, and a hundred and five in circumference, reckoning the length from the north-eaſt point ſouthward to the point Arganeguin, and the breadth from the port of Agaete, on the weſt ſide of the iſland, to that of Gando on the eaſt.

The inland part, towards the center of the iſland, is filled with lofty mountains, which riſe ſo far above the clouds, as to ſtop the current of the north-eaſt wind that generally blows here; ſo that when this wind blows hard on the north ſide of the mountains, it is either quite calm on the other, or a gentle breeze blows from the ſouth-weſt. The calms and eddy winds cauſed by the height of the mountains above the atmoſphere, extend twenty or twenty-five leagues beyond them to the ſouth-weſt. There are alſo calms beyond ſome of the reſt of the iſlands; for thoſe of Tenerife extend fifteen leagues into the ocean, the calms of Palma thirty, and thoſe of Gomera ten. Upon firſt coming to the calms the waves appear foaming and boiling like a pot, breaking in all directions; and when a veſſel enters the verge of them, ſhe is ſhaken and beaten by the waves on all ſides in ſuch a manner, that one would imagine it impoſſible to withſtand them. This confuſion, however, does not laſt long; for after a ſhip is once fairly entered into the calms, ſhe will either find a dead calm, and ſmooth water, or a pleaſant and conſtant breeze at ſouth or ſouth-weſt, according as the wind blows without; for this eddy wind, as it may be called, conſtantly blows in an oppoſite direction to it.

At the north-eaſt end of Canaria is a peninſula, about two leagues in circumference, connected with the main land by an iſthmus about two miles in length, and a quarter of a mile in breadth at the narroweſt part. On each ſide of the iſthmus is a bay, which on the north ſide is expoſed to the ſwell of the ſea. That on the other ſide is called by ſome Porto de Luz, and by others Porto de Iſletes, from ſome ſteep rocks or iſlands at the entrance of the bay, towards the north-eaſt. This is a good road for ſhips of any burthen, with all winds, except the ſouth-eaſt; but that wind is not common, and rarely blows ſo hard as to endanger ſhips.

The landing-place is at the bottom of the bay, where ſtands a hermitage, or chapel, dedicated to St. Catharine, and a caſtle of no ſtrength mounted with a few guns. At three miles diſtance is the city of Palmas, the capital of the iſland, between which and the above caſtle are two other forts, mounted with guns; but they have no garriſons, except a few invalids. At the other end of the city is another caſtle, called St. Pedro; but neither of them are capable of ſtanding againſt a regular attack.

Though the city of Palmas is of no ſtrength, it is pretty large, and contains ſeveral fine buildings, particularly the cathedral of St. Anne, with many churches, convents of friars of all orders, and nunneries. The private houſes are in general good, and built with ſtone. The city is divided into two parts, which have a communication by a bridge thrown over a ſmall ſtream of water, and the number of inhabitants is ſuppoſed to amount to ſix thouſand.

There is alſo the port of Gando, ſituated on the ſouth-eaſt part of the iſland, and the port of Gaete, or Agaete, on the north-weſt part of the iſland, which has a caſtle for its defence. The whole coaſt, except theſe ports, is generally inacceſſible to boats and veſſels, on account of the breaking of the ſea upon it. This indeed is the caſe of the ſhores of all the Canary Iſlands, particularly at the full and change of the moon, except thoſe of Lancerota and Fuertaventura. There are no inland cities or large towns in Canaria, though there are many villages, the chief of which are Galdar and Telde.

SECT.

SECT. VI.

Of the Climate, Trees, Fruits, Plants, and Animals of Canaria; with a particular Deſcription of the Face of the Country.

WE ſhall now treat of the temperature of the air, which is no where more delightful than in this iſland; for the heat in ſummer ſeldom exceeds what is generally felt in England in the months of July and Auguſt, and the coldeſt part of the winter is not ſharper than with us about the end of May in a backward ſeaſon. The ſame winds blow here at the ſame periods as at Lancerota and Fuertaventura; but the northerly wind is leſs furious, and, compared with that, is only a gentle breeze that cools the air, ſo as to render it agreeably temperate; and the ſky is almoſt continually ſerene and free from ſtorms and thunder. The only diſagreeable weather is when the ſouth-eaſt winds blow from the deſart of Zahara, which we have lately deſcribed; but this ſeldom happens. Theſe winds being very hot, dry, and ſtifling, are of great prejudice to the fruits of the earth, by their pernicious quality, and by their bringing clouds of locuſts, that wherever they alight devour every green thing. The weather is indeed very different in the mountains, where the air is not only cold in winter, but their ſummits are uninhabitable, from the great quantities of ſnow that fall upon them in that ſeaſon. Beſides, the air is ſo exceeding wholeſome, that the natives are ſaid to enjoy health and longevity beyond any people upon earth.

Canaria is well watered, and abounds with wood of various kinds; for almoſt every thing planted here thrives. The pine, palm, wild olive, laurel, poplar, dragon-tree, lena nueſſa, or lignum rhodium, the aloe ſhrub, Indian fig, or prickly pear, and the tubayba, a ſhrub whoſe branches have no leaves except at the extremities, grow ſpontaneouſly, and without cultivation. The euphorbium ſhrub grows here in great plenty, and to an extraordinary ſize. All the large trees natural to the iſland, except the palm, grow on the mountains near the clouds, which deſcending upon them near the evening, furniſh them with moiſture.

Among the fruits are the orange, lemon, citron, lime, pomegranate, walnut, cheſnut, apple, pear, peach, apricot, cherry, plum, mulberry, fig, banana, date, and, in ſhort, all the American and European fruits, except the anana. They have wheat, barley, and maize; but peas and beans are ſcarce and dear. They have potatoes, yams, the beſt onions in the world, and many kinds of roots; nor are cabbages and ſallads wanting.

Though there is more level and arable land in Canaria than in any of the iſlands to the weſtward of it, yet it bears no proportion to the ſtony, rocky, and barren ground. The moſt fertile part of this iſland is the mountain of Doramas, ſituated about two leagues from the city of Palmas, and ſhaded by groves of fragrant trees of different kinds, whoſe lofty boughs are ſo interwoven as to exclude the rays of the ſun. The rills that water theſe ſhady groves, the whiſpering of the breezes among the trees, and the ſinging of the Canary birds, form a moſt delightful concert; and a perſon in one of theſe enchanting ſolitudes cannot help calling to mind the fine things written by the ancients of the Fortunate Iſlands.

The upper part of the iſland is, on the contrary, entirely barren and deſolate; for it projects far above the clouds, and therefore receives neither dew nor rain; but is expoſed to a dry, parching wind, in a direct oppoſition to the trade-wind below, which generally blows from the weſt. In the night this weſterly wind blows hard, but lulls in the day. The amazing quantity of calcined ſtones, aſhes, and lava, that cover the greateſt part of all the Canary Iſlands, greatly diſfigure them. The volcanoes from whence theſe proceeded may be diſcerned in all quarters of this and the other iſlands, as alſo the channels made by the fiery ſtreams that flowed from them; but it does not appear that any volcano has burnt in Canaria ſince that iſland was conquered by the Spaniards.

Though the wine of Canaria is good, it has not ſuch a body as that of Tenerife, and is therefore leſs fit for exportation, yet many pipes of it are annually ſent to the Spaniſh Weſt Indies. Olives have been planted in this iſland; but no oil is made of the fruit, which does not come to ſuch perfection as in Spain, Barbary, and other countries. Formerly much ſugar was made here; but the great demand for the wines and brandies of this iſland in the Spaniſh Weſt Indies ſtopped the culture of the ſugar-cane, and the natives find it more for their advantage to receive the produce of their wines at the Havanna in ſugar, than to raiſe it in their own country. Canaria alſo abounds in honey, which is good, though of a black colour.

The animals of this iſland are camels, horſes, aſſes, a few mules, bullocks, ſheep, goats, hogs, rabbits, dunghill fowls, turkies, geeſe, ducks, partridges, crows, and Canary birds, with ſome others.

Lizards abound in this and all the other iſlands; but there do not appear to be any ſnakes, ſcorpions, or other venemous creatures, except the ſpider of Lancerota, and a very innocent kind of ſnake peculiar to the iſland of Gomera.

SECT. VII.

Of the ancient Inhabitants of Canaria, their Perſons, Dreſs, Manners, and Cuſtoms. Their Nobility, Combats, Buildings, Furniture, and Employment. The Butchers ignominious. The Education of their Children; their Government, and the Manner in which it was changed to a Monarchy; with a conciſe Account of their Funerals.

ON the firſt arrival of the Europeans at Gran Canaria, that iſland was ſuppoſed to contain no leſs than fourteen thouſand fighting men; but a peſtilence breaking out ſome time after, ſwept away two thirds of the inhabitants. Theſe were of a dark complexion like the natives of Lancerota and Fuertaventura, of a good ſtature, and well proportioned, active, warlike, cheerful, good-natured, and faithful to their promiſes; for they conſidered a lye as one of the greateſt crimes. They were very fond of hazardous enterprizes, ſuch as climbing to the top of ſteep precipices, and there fixing poles of ſo great a weight, that one of them was a ſufficient burthen for a man of common ſtrength to carry on level ground.

The Canarians were dreſſed in a tight coat, with a hood to it, like that of a Capuchin friar; it reached to the knees, and was faſtened to the waiſt by a leathern girdle. This garment was made of a kind of ruſh, which they beat till it became ſoft like flax, and then they ſpun and wove it. Over this they had a goat-ſkin cloak, with the hairy ſide inward in winter, and outward in ſummer. They had likewiſe caps made of the ſkins of the heads of goats, taken off almoſt entire, which they formed in ſuch a manner, that a goat's beard hung under each ear, and theſe they ſometimes tied under the chin. Some had bonnets of ſkins, adorned with feathers. Theſe garments were all neatly ſewed and painted, and were in every reſpect much more curious than thoſe of the natives of the other iſlands. Their ſhoes, like thoſe of Lancerota and Fuertaventura, were made of raw hides.

The Canarians had an order of nobility diſtinguiſhed from the vulgar by the cut of their hair and beards; but a man could not be intitled to this honour merely from his being the offspring of noble or rich parents; but was to be declared noble by the faycag, a perſon whoſe buſineſs was to decide differences among the natives, and regulate the ceremonies of their religion; in ſhort, he was a prieſt, and acted alſo as judge in civil affairs. The manner by which nobility was conferred was very ſingular: at a particular time of life the ſon of a nobleman let his hair grow long, and when he had obtained ſufficient ſtrength to endure the fatigues of war, went to the faycag, and ſaid, "I am the ſon of ſuch a noble-"man, and deſire alſo to be ennobled." Upon this the faycag went to the town or village where the young man was

was brought up, and there aſſembled all the nobles, and other perſons of the place, whom he cauſed to ſwear ſolemnly by their god Acoran, to declare the truth. He then aſked them, If they had ever ſeen the youth ſo far demean himſelf as to dreſs victuals, or to go into the folds to look after the ſheep or goats, and whether he was ever ſeen to milk or kill them? If he was ever known to ſteal cattle, or forcibly take them in time of peace from their owners? Whether he was diſcourteous, of a ſlanderous diſpoſition, or guilty of any indecent behaviour, eſpecially to women? If they all anſwered theſe queſtions in the negative, the faycag cut the youth's hair in a round form, ſo ſhort as not to hang below his ears, and giving him a ſtaff, declared him noble. But if any of the ſtanders-by could charge him with any of the offences mentioned by the faycag, and bring ſufficient proof of them, inſtead of being declared noble, the faycag ſhaved his head, and ſent him away in diſgrace, by which means he was rendered incapable of nobility, and obliged to remain a plebeian during the reſt of his life.

In their wars they eſteemed it baſe and mean to moleſt or injure the women and children of the enemy, whom they conſidered as weak and helpleſs, and therefore improper objects of their reſentment; nor did they offer the leaſt damage to the temples of the enemy.

The offenſive weapons uſed by the Canarians were clubs and ſharp pointed poles hardened by fire; but after the Europeans began to invade their iſland, they formed ſhields, in imitation of theirs, and ſwords of pitch-pine, the edges of which were hardened by fire, and ſharpened in ſuch a manner, that it is ſaid they cut like ſteel; but their chief ſtrength lay in their wooden ſpears, and their throwing ſtones with great force and dexterity.

Public places were appointed for fighting, in which a kind of ſtages were raiſed for the combatants, that they might be more eaſily ſeen by the ſpectators. On a challenge being given and accepted, the parties went to the council of the iſland, which conſiſted of twelve members, for a licence to fight, which was eaſily obtained, and then they went to the faycag, to have this licence confirmed. Afterwards they aſſembled all their relations and friends, that they might be ſpectators of their bravery and ſkill, and with them repaired to the public place, or theatre, where the combatants mounting upon two ſtones flat at the top, and placed at the oppoſite ſides, threw ſtones at each other, which, though good markſmen, they generally avoided, merely by their agility in writhing their bodies, without moving their feet. When each had thrown three ſtones at his antagoniſt, they armed themſelves with a cudgel in their right hand, and a ſharp flint in their left; then drawing near, they beat and cut each other till they were tired, and then retired with their friends to take ſome refreſhment; but ſoon returning, fought till the twelve members of the council called out, Gama, Gama, or Enough, Enough, when they inſtantly deſiſted, and ever after remained good friends. If during the combat one of the parties happened to break his cudgel, the other inſtantly deſiſted from ſtriking, and the diſpute was ended in an amicable manner, though neither of the parties was declared victor.

Theſe combats were uſually fought on public feſtivals, rejoicings, or the like occaſions; and if either of the combatants was deeply wounded, they beat a ruſh till it became like tow, and dipping it in melted goats butter, applied it to the wound as hot as the patient could bear it; and the older the butter was, the ſooner, they ſay, it effected a cure.

They had alſo public houſes or rooms, in which they aſſembled to dance and ſing. The Canarian dance is ſtill in uſe in theſe iſlands; it has a quick and ſhort ſtep, and is called Canario. Their ſongs were either dirges, or amorous ſonnets ſet to grave and plaintive tunes.

The houſes in Canaria were built of ſtone without cement, and yet were ſo neat and regular, that they made a handſome appearance. The walls were very low, and the floors ſunk beneath the level of the ground on which they ſtood, being ſo contrived for the advantage of warmth in the winter ſeaſon. At the top they laid wooden beams, or rafters cloſe to each other, and covered them with earth. Their beds and bedding were the ſkins of goats dreſſed in their hair. Their other furniture conſiſted of baſkets and mats of palm-leaves and ruſhes very neatly made; for they had people among them whoſe ſole employment was building houſes and making of mats.

The women were generally employed in painting and dying; and in the proper ſeaſon they carefully gathered the flowers and ſhrubs from which they extracted their ſeveral colours. The thread they uſed in ſewing was made of the nerves and tendons of the loins of ſheep, goats, or ſwine, with which they were ſupplied by the butchers. Theſe they firſt anointed with butter, and then prepared by fire in ſuch a manner, that they could ſplit them into fine threads at their pleaſure. Their needles were of bone, and their fiſh-hooks of horn. The veſſels they uſed in cookery were made of clay, hardened in the ſun.

None of the Canarians would follow the trade of a butcher, except the very dregs of the people; for their employment was thought ſo ignominious, that they would not allow one of that profeſſion to enter any of their houſes, or to touch any thing belonging to them. It was even unlawful for the butchers to keep company with any that were not of their profeſſion; and when they wanted any thing of another perſon, they were obliged to carry a ſtaff, and ſtanding at a conſiderable diſtance, point at what they wanted; but, to compenſate for this abject ſtate, the natives were obliged to ſupply the butchers with every thing they wanted. It was unlawful for any Canarian, except the butchers, to kill cattle; and when any perſon wanted his beaſt to be ſlain, he was forced to lead it to the public ſhambles, but was not permitted to enter himſelf; and this prohibition was extended even to the women and children.

The wealth of the inhabitants chiefly conſiſted in their ſheep, goats, and hogs. Their common food was barley-meal roaſted, which they ate with milk or goats fleſh; and when they made a feaſt, they dreſſed the latter with hog's lard or butter. They ground their barley with a hand-mill. When they went to plough their lands, about twenty people aſſembled together, each had a wooden inſtrument reſembling a hoe, with a ſpur at the end of it, on which they fixed a goat's horn: with this they broke the ground, and if the rain did not fall in its proper ſeaſon, they moiſtened the earth with water, which they brought by canals from the rivulets. The corn was gathered in by the women, who reaped only the ears; theſe they threſhed with ſticks, or beat out the corn with their feet, and winnowed it with their hands.

The poor lived by the ſea-coaſt, chiefly on fiſh, which they uſually caught in the night, by making a great light with torches of pitch-pine. In the day-time, whenever they perceived a ſhoal of ſardinas, a ſmall fiſh that has ſome reſemblance to a pilchard, a multitude of men, women, and children, went at a ſmall diſtance into the ſea, and ſwimming beyond the ſhoal, chaſed the fiſh towards the ſhore, and with a net, made of a tough kind of ruſh, incloſed and drew them to land, where they equally divided their prize: but in doing this every woman who had a young child received a ſhare for each; or if ſhe happened to be pregnant, ſhe received an additional ſhare for the child in her womb.

The Canarians had never more than one wife. When the parents were diſpoſed to marry their daughter, they fed her thirty days with large quantities of milk and goſſio, in order to fatten her; for they thought that lean women were leſs capable of conceiving children than thoſe who were fat.

They were very careful in the education of their children, and never failed to chaſtiſe them when they did amiſs. It was uſual to propoſe two of the youth, as examples to the reſt, the one of virtue, the other of vice; and when a child did any thing that was praiſe-worthy, he was commended, and told that ſuch behaviour was amiable, and reſembled that of the good boy. On the other hand, when a child diſpleaſed its parents, they obſerved that ſuch an action reſembled thoſe of the perſon ſet up as a bad example. By this means they raiſed a ſpirit of emulation for excelling in virtuous actions.

Among

Among the Canarians were religious women, called magadas, a number of whom lived together in one houſe, or convent, of which there were many in Canaria; and theſe were held ſo ſacred, that criminals, who fled to any of them, were protected from the officers of juſtice. The magadas were diſtinguiſhed from other women by their long white garments, which ſwept the ground as they walked. They maintained that Acoran, their god, dwelt on high, and governed every thing on earth; and when they addreſſed him, lifted up their joined hands towards heaven.

There are two rocks in the iſland, to which the inhabitants, in times of public calamity, went in proceſſion, accompanied by the religious women, carrying in their hands palm-branches, and veſſels filled with milk and butter, which they poured on the rocks, dancing round them, and ſinging mournful ſongs: from thence they went to the ſea-ſhore, and all at once, with one accord, ſtruck the water with their rods, all ſhouting together as loud as poſſible.

The Canarians were remarkable for their good government, and ſtrict adminiſtration of juſtice. At the time of the conqueſt of the iſland it was governed by two princes, each of whom had his ſeparate diſtrict; but before they were ruled by captains, or heads of tribes, who preſided over ſmall circles. The people of each tribe was confined to their own diſtrict, and not allowed to graze their flocks on the ground belonging to another tribe. Such crimes as deſerved death were puniſhed in the manner already related, by daſhing out their brains with a ſtone; but for thoſe of a leſs criminal nature they uſed the law of retaliation, and took an eye for an eye, or a tooth for a tooth.

As the manner in which Canaria changed its government from the heads of tribes to its being under the juriſdiction of two princes, appears ſingular and entertaining, we ſhall give it our readers from the account given of that revolution by Mr. Glas. In the diviſion of Galdar, the moſt fertile part of the iſland, lived a virgin lady of great merit, named Antidamana, who was ſo highly eſteemed by the natives for her prudence and judgment, that they frequently applied to her to determine their differences, and never appealed from her deciſions; for ſhe hardly ever ſuffered the party againſt whom ſhe had given the cauſe to depart, till ſhe had firſt convinced him of the juſtice of her ſentence; which ſhe ſeldom failed to do by the force of her eloquence, and the high character ſhe bore for equity. After ſome years the nobles, vexed at obſerving the deference paid to this woman while ſhe acted as a judge, or arbitrator, which they thought more properly belonged to them, perſuaded the people no longer to regard her ſentences, or to refer their cauſes to her deciſion. This lady now perceiving herſelf diſregarded and deſpiſed, was ſtung to the quick; for ſhe had in a manner ſpent the prime of her life in the ſervice of the public, who had now moſt ungratefully deſerted her; but, inſtead of venting her reſentment in vain complaints, ſhe went to one Gumidafe, a captain of one of the diſtricts, who was eſteemed the moſt brave and prudent of all the nobles of Canaria, and had great influence over the people. To him ſhe related all her grievances, and propoſed a match between them, to which Gumidafe readily conſented, and accordingly they were ſoon after married. Gumidafe now, under various pretences, made war upon the other captains, and proved victorious over them all; ſo that at length he became king of the whole iſland. He had by his wife Antidamana a ſon, named Artemis, who ſucceeded him in the government of the kingdom, and at his death left two ſons, who ſhared the iſland between them, and were both upon the throne when it was conquered by the Spaniards.

But to return: when any of the nobles died they brought out the corpſe, and placing it in the ſun, took out the entrails, and buried them in the earth; then drying the body, they ſwathed it round with bandages of goats-ſkins, and fixed it upright in a cave, cloathed with the ſame garments which the deceaſed wore when alive; but if no proper cave was at hand, the body was carried to one of the ſtony places now called Mal Paices, where levelling the ground, and fixing the looſe ſtones, they made a ſort of artificial cave of large ſtones placed ſo as not to touch the body, and then taking another large ſtone two yards in length, wrought into a round form, with this cloſed the entrance, and afterwards filled up the outſide between the top of the round ſtone and the outward part of the other large ones with ſmall ſtones in a very neat manner. Some of their dead bodies were put into cheſts, and afterwards depoſited in ſtone ſepulchres.

People of the lower claſs were interred in the Mal Paices in holes covered with ſtones, and all the bodies, except thoſe placed upright in the caves, were laid with their heads towards the north.

SECT. VIII.

Of the Iſland and Pike of TENERIFE.

Its Situation and Appearance at Sea. A Deſcription of the Port and Town of Santa Cruz; of the Chapel of Our Lady of Candelaria; of the Haven and Town of Garrachica, and of a dreadful Earthquake there. Of the Towns of Port Orotava, La Villa De Orotava, and St. Chriſtobal de la Laguna. The Face of the Country, and the Number of its Inhabitants.

THIS iſland was named Tenerife, or the White Mountain, by the natives of Palma; in their language Thener ſignifying a mountain, and Ife white, the ſummit or pike of Tenerife being always covered with ſnow. This name has been continued ever ſince by the Spaniards and other European nations; but the natives called it Chineche, and the preſent inhabitans Vincheni.

The north-eaſt point of Tenerife, called Point Nago, or Anaga, bears north-weſt about ſixteen leagues diſtant from the north-weſt part of Canaria; but from that part of Canaria to the neareſt part of Tenerife, the diſtance does not exceed twelve leagues. This iſland is nearly triangular, the three ſides being almoſt equal, and each about twelve leagues long. In the center is the famous pike of Tenerife, called by the ancient inhabitants Teyde, and this name it ſtill retains among the preſent inhabitants.

The accurate Mr. Glas obſerves, that in coming in with this iſland, in clear weather, the pike may be eaſily diſcerned at a hundred and twenty miles diſtance; and in ſailing from it, at the diſtance of a hundred and fifty miles, it then reſembles a thin blue vapour, or ſmoke, very little darker than the ſky; and at a farther diſtance, the ſhade diſappearing, is not diſtinguiſhable from the azure of the firmament. Before we loſe ſight of this towering mountain, it ſeems a conſiderable height above the horizon, though from its diſtance, and the ſpherical figure of the earth, the reſt of the iſland, notwithſtanding its being exceeding high, is ſunk beneath the horizon.

Near Punto de Nago are high perpendicular rocks, and five or ſix leagues diſtant from them, on the ſouth-eaſt ſide of the iſland, is the harbour of Santa Cruz, the moſt frequented port in the Canary Iſlands. The beſt road for ſhips is between the middle of the town and a fort, or caſtle, about a mile to the northward. Ships may here lie ſecure in all winds, though the bay is expoſed to thoſe which blow from the north-eaſt, eaſt, and ſouth-eaſt; yet theſe winds do not blow ſo hard as to cauſe any conſiderable damage above once in the ſpace of four or five years. However, ſome years ago moſt of the ſhipping in the road were driven on ſhore by one of theſe gales. Some Engliſh ſhips were then in the harbour; but the crews prudently cutting away their maſts, rode out the ſtorm. On that occaſion ſome Spaniſh ſeamen publickly declared, that in the height of the tempeſt they ſaw the devil very buſy in aſſiſting the heretics.

In the midſt of the town is a mole, built at a vaſt expence, for the convenience of landing. It runs up to the northward, and the outermoſt part turns towards the ſhore. However, in mild weather, goods are landed at a creek among the rocks, near the Cuſtom-houſe, at the diſtance of a ſtone's caſt to the ſouthward of the mole.

On proceeding from the mole into the town, you come to a ſquare fort on the left hand, named St. Philip's; this is the principal one in the bay. To the northward of it are ſome forts and batteries mounted with guns, the moſt

was brought up, and there aſſembled all the nobles, and other perſons of the place, whom he cauſed to ſwear ſolemnly by their god Acoran, to declare the truth. He then aſked them, If they had ever ſeen the youth ſo far demean himſelf as to dreſs victuals, or to go into the folds to look after the ſheep or goats, and whether he was ever ſeen to milk or kill them? If he was ever known to ſteal cattle, or forcibly take them in time of peace from their owners? Whether he was diſcourteous, of a ſlanderous diſpoſition, or guilty of any indecent behaviour, eſpecially to women? If they all anſwered theſe queſtions in the negative, the faycag cut the youth's hair in a round form, ſo ſhort as not to hang below his ears, and giving him a ſtaff, declared him noble. But if any of the ſtanders-by could charge him with any of the offences mentioned by the faycag, and bring ſufficient proof of them, inſtead of being declared noble, the faycag ſhaved his head, and ſent him away in diſgrace, by which means he was rendered incapable of nobility, and obliged to remain a plebeian during the reſt of his life.

In their wars they eſteemed it baſe and mean to moleſt or injure the women and children of the enemy, whom they conſidered as weak and helpleſs, and therefore improper objects of their reſentment; nor did they offer the leaſt damage to the temples of the enemy.

The offenſive weapons uſed by the Canarians were clubs and ſharp pointed poles hardened by fire; but after the Europeans began to invade their iſland, they formed ſhields, in imitation of theirs, and ſwords of pitch-pine, the edges of which were hardened by fire, and ſharpened in ſuch a manner, that it is ſaid they cut like ſteel; but their chief ſtrength lay in their wooden ſpears, and their throwing ſtones with great force and dexterity.

Public places were appointed for fighting, in which a kind of ſtages were raiſed for the combatants, that they might be more eaſily ſeen by the ſpectators. On a challenge being given and accepted, the parties went to the council of the iſland, which conſiſted of twelve members, for a licence to fight, which was eaſily obtained, and then they went to the faycag, to have this licence confirmed. Afterwards they aſſembled all their relations and friends, that they might be ſpectators of their bravery and ſkill, and with them repaired to the public place, or theatre, where the combatants mounting upon two ſtones flat at the top, and placed at the oppoſite ſides, threw ſtones at each other, which, though good markſmen, they generally avoided, merely by their agility in writhing their bodies, without moving their feet. When each had thrown three ſtones at his antagoniſt, they armed themſelves with a cudgel in their right hand, and a ſharp flint in their left; then drawing near, they beat and cut each other till they were tired, and then retired with their friends to take ſome refreſhment; but ſoon returning, fought till the twelve members of the council called out, Gama, Gama, or Enough, Enough, when they inſtantly deſiſted, and ever after remained good friends. If during the combat one of the parties happened to break his cudgel, the other inſtantly deſiſted from ſtriking, and the diſpute was ended in an amicable manner, though neither of the parties was declared victor.

Theſe combats were uſually fought on public feſtivals, rejoicings, or the like occaſions; and if either of the combatants was deeply wounded, they beat a ruſh till it became like tow, and dipping it in melted goats butter, applied it to the wound as hot as the patient could bear it; and the older the butter was, the ſooner, they ſay, it effected a cure.

They had alſo public houſes or rooms, in which they aſſembled to dance and ſing. The Canarian dance is ſtill in uſe in theſe iſlands; it has a quick and ſhort ſtep, and is called Canario. Their ſongs were either dirges, or amorous ſonnets ſet to grave and plaintive tunes.

The houſes in Canaria were built of ſtone without cement, and yet were ſo neat and regular, that they made a handſome appearance. The walls were very low, and the floors ſunk beneath the level of the ground on which they ſtood, being ſo contrived for the advantage of warmth in the winter ſeaſon. At the top they laid wooden beams, or rafters cloſe to each other, and covered them with earth. Their beds and bedding were the ſkins of goats dreſſed in their hair. Their other furniture conſiſted of baſkets and mats of palm-leaves and ruſhes very neatly made; for they had people among them whoſe ſole employment was building houſes and making of mats.

The women were generally employed in painting and dying; and in the proper ſeaſon they carefully gathered the flowers and ſhrubs from which they extracted their ſeveral colours. The thread they uſed in ſewing was made of the nerves and tendons of the loins of ſheep, goats, or ſwine, with which they were ſupplied by the butchers. Theſe they firſt anointed with butter, and then prepared by fire in ſuch a manner, that they could ſplit them into fine threads at their pleaſure. Their needles were of bone, and their fiſh-hooks of horn. The veſſels they uſed in cookery were made of clay, hardened in the ſun.

None of the Canarians would follow the trade of a butcher, except the very dregs of the people; for their employment was thought ſo ignominious, that they would not allow one of that profeſſion to enter any of their houſes, or to touch any thing belonging to them. It was even unlawful for the butchers to keep company with any that were not of their profeſſion; and when they wanted any thing of another perſon, they were obliged to carry a ſtaff, and ſtanding at a conſiderable diſtance, point at what they wanted; but, to compenſate for this abject ſtate, the natives were obliged to ſupply the butchers with every thing they wanted. It was unlawful for any Canarian, except the butchers, to kill cattle; and when any perſon wanted his beaſt to be ſlain, he was forced to lead it to the public ſhambles, but was not permitted to enter himſelf; and this prohibition was extended even to the women and children.

The wealth of the inhabitants chiefly conſiſted in their ſheep, goats, and hogs. Their common food was barley-meal roaſted, which they ate with milk or goats fleſh; and when they made a feaſt, they dreſſed the latter with hog's lard or butter. They ground their barley with a hand-mill. When they went to plough their lands, about twenty people aſſembled together, each had a wooden inſtrument reſembling a hoe, with a ſpur at the end of it, on which they fixed a goat's horn: with this they broke the ground, and if the rain did not fall in its proper ſeaſon, they moiſtened the earth with water, which they brought by canals from the rivulets. The corn was gathered in by the women, who reaped only the ears; theſe they threſhed with ſticks, or beat out the corn with their feet, and winnowed it with their hands.

The poor lived by the ſea-coaſt, chiefly on fiſh, which they uſually caught in the night, by making a great light with torches of pitch-pine. In the day-time, whenever they perceived a ſhoal of ſardinas, a ſmall fiſh that has ſome reſemblance to a pilchard, a multitude of men, women, and children, went at a ſmall diſtance into the ſea, and ſwimming beyond the ſhoal, chaſed the fiſh towards the ſhore, and with a net, made of a tough kind of ruſh, incloſed and drew them to land, where they equally divided their prize: but in doing this every woman who had a young child received a ſhare for each; or if ſhe happened to be pregnant, ſhe received an additional ſhare for the child in her womb.

The Canarians had never more than one wife. When the parents were diſpoſed to marry their daughter, they fed her thirty days with large quantities of milk and goſſio, in order to fatten her; for they thought that lean women were leſs capable of conceiving children than thoſe who were fat.

They were very careful in the education of their children, and never failed to chaſtiſe them when they did amiſs. It was uſual to propoſe two of the youth as examples to the reſt, the one of virtue, the other of vice; and when a child did any thing that was praiſe-worthy, he was commended, and told that ſuch behaviour was amiable, and reſembled that of the good boy. On the other hand, when a child diſpleaſed its parents, they obſerved that ſuch an action reſembled thoſe of the perſon ſet up as a bad example. By this means they raiſed a ſpirit of emulation for excelling in virtuous actions.

Among

Among the Canarians were religious women, called magadas, a number of whom lived together in one houſe, or convent, of which there were many in Canaria; and theſe were held ſo ſacred, that criminals, who fled to any of them, were protected from the officers of juſtice. The magadas were diſtinguiſhed from other women by their long white garments, which ſwept the ground as they walked. They maintained that Acoran, their god, dwelt on high, and governed every thing on earth; and when they addreſſed him, lifted up their joined hands towards heaven.

There are two rocks in the iſland, to which the inhabitants, in times of public calamity, went in proceſſion, accompanied by the religious women, carrying in their hands palm-branches, and veſſels filled with milk and butter, which they poured on the rocks, dancing round them, and ſinging mournful ſongs: from thence they went to the ſea-ſhore, and all at once, with one accord, ſtruck the water with their rods, all ſhouting together as loud as poſſible.

The Canarians were remarkable for their good government, and ſtrict adminiſtration of juſtice. At the time of the conqueſt of the iſland it was governed by two princes, each of whom had his ſeparate diſtrict; but before they were ruled by captains, or heads of tribes, who preſided over ſmall circles. The people of each tribe was confined to their own diſtrict, and not allowed to graze their flocks on the ground belonging to another tribe. Such crimes as deſerved death were puniſhed in the manner already related, by daſhing out their brains with a ſtone; but for thoſe of a leſs criminal nature they uſed the law of retaliation, and took an eye for an eye, or a tooth for a tooth.

As the manner in which Canaria changed its government from the heads of tribes to its being under the juriſdiction of two princes, appears ſingular and entertaining, we ſhall give it our readers from the account given of that revolution by Mr. Glas. In the diviſion of Galdar, the moſt fertile part of the iſland, lived a virgin lady of great merit, named Antidamana, who was ſo highly eſteemed by the natives for her prudence and judgment, that they frequently applied to her to determine their differences, and never appealed from her deciſions; for ſhe hardly ever ſuffered the party againſt whom ſhe had given the cauſe to depart, till ſhe had firſt convinced him of the juſtice of her ſentence; which ſhe ſeldom failed to do by the force of her eloquence, and the high character ſhe bore for equity. After ſome years the nobles, vexed at obſerving the deference paid to this woman while ſhe acted as a judge, or arbitrator, which they thought more properly belonged to them, perſuaded the people no longer to regard her ſentences, or to refer their cauſes to her deciſion. This lady now perceiving herſelf diſregarded and deſpiſed, was ſtung to the quick; for ſhe had in a manner ſpent the prime of her life in the ſervice of the public, who had now moſt ungratefully deſerted her; but, inſtead of venting her reſentment in vain complaints, ſhe went to one Gumidafe, a captain of one of the diſtricts, who was eſteemed the moſt brave and prudent of all the nobles of Canaria, and had great influence over the people. To him ſhe related all her grievances, and propoſed a match between them, to which Gumidafe readily conſented, and accordingly they were ſoon after married. Gumidafe now, under various pretences, made war upon the other captains, and proved victorious over them all; ſo that at length he became king of the whole iſland. He had by his wife Antidamana a ſon, named Artemis, who ſucceeded him in the government of the kingdom, and at his death left two ſons, who ſhared the iſland between them, and were both upon the throne when it was conquered by the Spaniards.

But to return: when any of the nobles died they brought out the corpſe, and placing it in the ſun, took out the entrails, and buried them in the earth; then drying the body, they ſwathed it round with bandages of goats-ſkins, and fixed it upright in a cave, cloathed with the ſame garments which the deceaſed wore when alive; but if no proper cave was at hand, the body was carried to one of the ſtony places now called Mal Paices, where levelling the ground, and fixing the looſe ſtones, they made a ſort of artificial cave of large ſtones placed ſo as not to touch the body, and then taking another large ſtone two yards in length, wrought into a round form, with this cloſed the entrance, and afterwards filled up the outſide between the top of the round ſtone and the outward part of the other large ones with ſmall ſtones in a very neat manner. Some of their dead bodies were put into cheſts, and afterwards depoſited in ſtone ſepulchres.

People of the lower claſs were interred in the Mal Paices in holes covered with ſtones, and all the bodies, except thoſe placed upright in the caves, were laid with their heads towards the north.

SECT. VIII.

Of the Iſland and Pike of TENERIFE.

Its Situation and Appearance at Sea. A Deſcription of the Port and Town of Santa Cruz; of the Chapel of Our Lady of Candelaria; of the Haven and Town of Garrachica, and of a dreadful Earthquake there. Of the Towns of Port Orotava, La Villa De Orotava, and St. Chriſtobal de la Laguna. The Face of the Country, and the Number of its Inhabitants.

THIS iſland was named Tenerife, or the White Mountain, by the natives of Palma; in their language Thener ſignifying a mountain, and Ife white, the ſummit or pike of Tenerife being always covered with ſnow. This name has been continued ever ſince by the Spaniards and other European nations; but the natives called it Chineche, and the preſent inhabitans Vincheni.

The north-eaſt point of Tenerife, called Point Nago, or Anaga, bears north-weſt about ſixteen leagues diſtant from the north-weſt part of Canaria; but from that part of Canaria to the neareſt part of Tenerife, the diſtance does not exceed twelve leagues. This iſland is nearly triangular, the three ſides being almoſt equal, and each about twelve leagues long. In the center is the famous pike of Tenerife, called by the ancient inhabitants Teyde, and this name it ſtill retains among the preſent inhabitants.

The accurate Mr. Glas obſerves, that in coming in with this iſland, in clear weather, the pike may be eaſily diſcerned at a hundred and twenty miles diſtance; and in ſailing from it, at the diſtance of a hundred and fifty miles, it then reſembles a thin blue vapour, or ſmoke, very little darker than the ſky; and at a farther diſtance, the ſhade diſappearing, is not diſtinguiſhable from the azure of the firmament. Before we loſe ſight of this towering mountain, it ſeems a conſiderable height above the horizon, though from its diſtance, and the ſpherical figure of the earth, the reſt of the iſland, notwithſtanding its being exceeding high, is ſunk beneath the horizon.

Near Punto de Nago are high perpendicular rocks, and five or ſix leagues diſtant from them, on the ſouth-eaſt ſide of the iſland, is the harbour of Santa Cruz, the moſt frequented port in the Canary Iſlands. The beſt road for ſhips is between the middle of the town and a fort, or caſtle, about a mile to the northward. Ships may here lie ſecure in all winds, though the bay is expoſed to thoſe which blow from the north-eaſt, eaſt, and ſouth-eaſt; yet theſe winds do not blow ſo hard as to cauſe any conſiderable damage above once in the ſpace of four or five years. However, ſome years ago moſt of the ſhipping in the road were driven on ſhore by one of theſe gales. Some Engliſh ſhips were then in the harbour; but the crews prudently cutting away their maſts, rode out the ſtorm. On that occaſion ſome Spaniſh ſeamen publickly declared, that in the height of the tempeſt they ſaw the devil very buſy in aſſiſting the heretics.

In the midſt of the town is a mole, built at a vaſt expence, for the convenience of landing. It runs up to the northward, and the outermoſt part turns towards the ſhore. However, in mild weather, goods are landed at a creek among the rocks, near the Cuſtom-houſe, at the diſtance of a ſtone's caſt to the ſouthward of the mole.

On proceeding from the mole into the town, you come to a ſquare fort on the left hand, named St. Philip's; this is the principal one in the bay. To the northward of it are ſome forts and batteries mounted with guns, the moſt

conſiderable of which is named Paſſo Alto. Near it is a ſteep rocky valley, which begins at the ſea-ſhore, and runs a great way within land. There are ſeveral batteries at the ſouth end of the town, and beyond them, cloſe to the ſhore, is a fort called St. Juan. All theſe forts are mounted with cannon, and joined to each other by a thick ſtone-wall, which begins near the above rocky valley, and continues, with little interruption, to Fort St. Juan. This wall is within only breaſt-high, but it is higher on the outſide facing the ſea; and from thence to the ſouthward the ſhore is generally inacceſſible, from its being naturally fenced with rocks.

The town of Santa Cruz is large, and contains ſeveral churches, three convents of friars, an hoſpital, and the beſt conſtructed private buildings of any to be found in the Canary Iſlands. It is indeed the capital of them all; for though the epiſcopal ſee and courts of judicature are in the city of Palmas, in Canaria, the governor-general of the iſlands always reſides in Santa Cruz, where a great concourſe of foreigners continually reſort, on account of its being the center of the trade between the Canary Iſlands with Europe and America. The number of inhabitants are ſuppoſed to amount to about five or ſix thouſand. The water drank by them is conveyed into the town in open wooden troughs from a ſpring beyond the above-mentioned valley, and in many houſes are pits of water which ſerve for other purpoſes.

About twelve miles to the ſouthward of Santa Cruz, cloſe to the ſea, is a cave, with a church, or chapel, called Our Lady of Candelaria, in which is a little image of the virgin Mary, about three feet high, holding a green candle in one hand, and in the other an infant Jeſus, who has a gilt bird in each hand. This chapel received its name of Candelaria from its being pretended, that on the eve of the Purification of the Holy Virgin a great number of lights are conſtantly ſeen going in proceſſion round the cave in which the image is placed; and they aſſert, that in the morning drops of wax are ſcattered about the ſea-ſhore. This image is held in the higheſt veneration, on account of the many miracles it is ſaid to have performed, and her chapel is adorned with ſo many ornaments, that it is the richeſt place in all the ſeven iſlands. At a certain ſeaſon of the year moſt of the inhabitants of the iſland go thither in pilgrimage; when troops of young girls march ſinging in an agreeable manner the praiſes of the Virgin, and the miraculous deeds of the image.

On the north-weſt ſide of the iſland is the bay of Adexe, or, as it is pronounced, Adehe, where large ſhips may anchor. On the north-weſt ſide is a haven called Garrachica, once the beſt port in the iſland; but it was deſtroyed in 1704, which the natives call the year of the earthquakes, and filled up by the rivers of burning lava that flowed into it from a volcano; ſo that houſes are now built where ſhips formerly lay at anchor; yet veſſels come there in ſummer.

The above earthquake began on the twenty-fourth of December; and, in the ſpace of three hours, twenty-nine ſhocks were felt. After this they became ſo violent as to rock all the houſes, and oblige the inhabitants to abandon them. The conſternation became univerſal, and the people, with the biſhop at their head, made proceſſions and publick prayers in the open fields. On the thirty-firſt a great light was obſerved on Manja, towards the White Mountains, where the earth opening, two volcanoes were formed, that threw up ſuch heaps of ſtones, as to raiſe two conſiderable mountains; and the combuſtible matter continually thrown up kindled in the neighbourhood above fifty fires. Things remained in this ſituation till the fifth of January, and then the ſun was totally obſcured with clouds of ſmoke and flame, which continually increaſing, augmented the conſternation and terror of the inhabitants. Before night the whole country, for nine miles round, was in flames by the flowing of the liquid fire, with the rapidity of a torrent, into all quarters from another volcano, which had opened by at leaſt thirty different vents within the compaſs of half a mile. The horror of this ſcene was greatly encreaſed by the violence of the ſhocks, which never once remitted, but by their force entirely overthrew ſeveral houſes, and ſhook others to their very foundations; while the wretched inhabitants were again driven defenceleſs and diſmayed into the open fields, where they every moment expected to be ſwallowed up by ſome new gulph. The noiſe of the volcano was heard at ſea at twenty leagues diſtance, where the ſea ſhook with ſuch violence as alarmed the mariners, who at firſt thought the ſhip had ſtruck upon a rock. Mean while a torrent of ſulphur and melted ores of different kinds ruſhed from this laſt volcano towards Guimar, where the houſes and publick buildings were thrown down by the violence of the accompanying ſhocks. On the ſecond of February another volcano broke out even in the town of Guimar, which ſwallowed up a large church. Thus, from the twenty-fourth of December to the twenty-third of February, the people were conſtantly alarmed by continual ſhocks of earthquakes, and the terrible volcanoes that burſt forth in different parts of the iſland.

Garrachica is ſtill a pretty large town, and contains ſeveral churches and convents of both ſexes. It has a ſmall trade for brandy and wine, which are uſually ſent from thence in barks, or large open boats, to Santa Cruz, or Port Orotava. Strong and durable veſſels are alſo built there, ſome of which are of three hundred tons burthen, and upwards.

Six miles to the eaſtward of Garrachica is the town of Port Orotava, which is a good harbour in the ſummer ſeaſon; but in the winter ſhips are often obliged to ſlip their cables and put to ſea, for fear of being ſurprized by a north-weſt wind, which throws in a heavy ſea upon this coaſt. This is a place of conſiderable trade, it having flouriſhed greatly ſince the deſtruction of the harbour of Garrachica. It contains two churches, two convents of friars, two of nuns, and ſome good private buildings. At each end of the town is a black ſandy bay; along the northermoſt is a low ſtone-wall, built to prevent the landing of an enemy: at the other bay is a ſmall caſtle, or fort, for the ſame purpoſe, and at the landing-place between them is a battery of a few cannon; but the beſt defence of this port is the ſurf that continually breaks upon the ſhore.

La Villa de Orotava, which is about three miles within land from Port Orotava, is a large place, and contains ſeveral churches, convents of friars and nuns, with a number of ſtately ſtone buildings belonging to private perſons. A rivulet, which runs through the midſt of the town, ſupplies the inhabitants with water, and refreſhes their gardens and orchards.

About four miles within land from Santa Cruz is the city of St. Chriſtobal de la Laguna, that is, St. Chriſtopher of the Lake. The road to it from Santa Cruz is a pretty ſteep aſcent, till within a ſmall diſtance of the town, which is ſeated in the corner of a plain, about four miles in length, and a mile in breadth. This city is the capital of the iſland, and contains two pariſh-churches, three convents of friars, two of nuns, and three hoſpitals; two of which are for the venereal diſeaſe, and the other for foundlings. The jeſuits have alſo a houſe here, and, beſides theſe publick ſtructures, there are many handſome private buildings. The water drank by the inhabitants is conveyed in troughs to the city from the mountains ſituated to the ſouthward of the plain. In this city there is not the leaſt ſhow of buſineſs, it being chiefly inhabited by the gentry of the iſland, particularly the officers of juſtice, ſuch as the corregidor, and his tiniente, or lieutenant, the regidores, or cavildo, with the judge of the Indies, who preſides in the India-houſe, where all affairs relating to the Weſt India commerce are conducted. Here is likewiſe an office of inquiſition, with its proper officers, ſubject to the tribunal of the Holy office at Gran Canaria: yet the city appears to a ſtranger as if deſolate and uninhabited; for hardly any body can be ſeen in the ſtreets, and graſs grows in the moſt frequented of them.

Behind the city is a laguna, or lake, about half a mile in circumference, from which the city takes its name. It is dry in ſummer, but in winter is full of ſtagnant water. As this city is ſituated on a plain, elevated a conſiderable height above the ſea, it is extremely cold in winter, and expoſed to the winds in all ſeaſons.

From the weſtern extremity of this plain the road deſcends to La Montanza de Centejo, a large village in the mid-way between Santa Cruz and Port Orotava, chiefly inhabited by peaſants.

All

All theſe places are populous, and ſituated at no great diſtance from the ſea, from whence moſt of them may be ſeen; and indeed there are no habitations at a greater diſtance from it than three leagues. The whole iſland continues riſing on all ſides from the ſea till it terminates in the pike, which, as hath been already obſerved, is in the center. The north ſide is the moſt fertile, and aſcends more gradually than the others, particularly a ſpace along the ſhore about three leagues broad, bounded on the ſides by high mountains, or rather cliffs; but upwards from the ſea it riſes like a hanging garden all the way, without any conſiderable interruption of hills or vallies, till you come within a league of the clouds.

In the weſtern border of this ſpace is ſituated a large town, called Realejo, and on the eaſtern La Rambla. Between them ſtand the towns of Orotava and Port Orotava, with a number of detached inhabitants ſcattered about from the ſea-ſhore upwards to the clouds, in or beyond which there are no houſes; yet the clouds are not higher than the middle diſtance between the ſea and the ſummit of the pike. All the fertil ground within a league of the ſea is covered with vines; that of the next league produces corn; and the third ſome corn, woods of cheſnut-trees, and many other trees of different kinds. Above theſe woods are the clouds, which, in fine weather, generally deſcend gradually towards the evening, and reſt upon theſe woods till the morning, when they re-aſcend about a league, and there remain till the ſucceeding evening.

Beſides the towns already mentioned, there are ſeveral others, and many ſmall villages. Indeed the iſland is ſo populous, that when the laſt account was taken, it contained no leſs than ninety-ſix thouſand perſons, and is ſuppoſed to have as many inhabitants as all the reſt of the ſeven iſlands together.

SECT. IX.

A Journey up the Pike of Tenerife; with a conciſe Account of the Weather and Produce of the Iſland.

OUR readers will not be diſpleaſed at ſeeing here a journey up the pike of Tenerife, undertaken by Mr. Glas, from whoſe Hiſtory of the Canary Iſlands we have taken this and many other curious and intereſting particulars, which, we hope, will ſerve to recommend his work to the notice of the public.

In the beginning of the month of September, 1761, at about four in the afternoon, our author ſet out on horſeback, in company with the maſter of a ſhip, to viſit the pike. They had with them a ſervant, a muleteer, and a guide; and, after aſcending about ſix miles, arrived towards ſun-ſet at the moſt diſtant habitation from the ſea, which is in a hollow: here finding an aqueduct of open troughs that convey water down from the head of the hollow, their ſervants watered the cattle, and filled ſome ſmall barrels to ſerve them in their expedition. The gentlemen here alighted, and walking into the hollow, found it very pleaſant, it abounding with many trees that ſent forth an odoriferous ſmell; and near the houſes are ſome fields of maize, or Indian corn.

On their mounting again they travelled for ſome time up a ſteep road, and reached the woods and clouds juſt as it grew dark. They could not miſs their way, the road being bounded on both ſides with trees or buſhes, which were chiefly laurel, ſavine, and bruſhwood. Having travelled about a mile, they came to the upper edge of the wood, above the clouds, where alighting, they made a fire and ſupped; ſoon after which they laid down to ſleep under the buſhes.

About half an hour after ten, the moon ſhining bright, they mounted again, travelling ſlowly two hours through an exceeding bad road, reſembling the ruins of ſtone buildings ſcattered over the fields. After they had got out of this road they came upon ſmall light pumice-ſtone, like ſhingle; upon which they rode at a pretty good pace for near an hour. The air now began to be very ſharp, cold, and piercing, and the wind blew ſtrong from the ſouth-weſtward. Their guide adviſed them to alight here, as the place was convenient, and reſt till four or five in the morning. To this they agreed, and entered a cave, the mouth of which was built up to about a man's height to exclude the cold. Near this place was ſome dry withered retamas, the only ſhrub or vegetable near the cave, and with theſe they made a great fire to warm themſelves, and then fell aſleep; but were ſoon awaked by an itching occaſioned by the cold thin air, want of reſt, and ſleeping in their cloaths. They here paſſed away their time as well as they could; but while they crept ſo near the fire, that one ſide was almoſt ſcorched, the other was benumbed with cold.

At about five in the morning they mounted again, and travelled ſlowly about a mile; for the road was rather too ſteep for travelling quick on horſeback, and their beaſts were now fatigued. At laſt they came among ſome great looſe rocks, where was a kind of cottage built of looſe ſtones, called the Engliſh Pitching-place, probably from ſome of the Engliſh reſting here on their way to viſit the pike; for none take that journey but foreigners, and ſome poor people who earn their bread by gathering brimſtone. Here they again alighted, the remainder of their way being too ſteep for riding, and left one of the ſervants to look after the horſes, while they proceeded on their journey. They walked hard to get themſelves a heat; but were ſoon fatigued by the ſteepneſs of the road, which was looſe and ſandy. On their reaching the top of this hill, they came to a prodigious number of large and looſe rocks, or ſtones, whoſe ſurfaces were flat, and each of them on a medium about ten feet every way. This road was leſs ſteep than the other; but they were obliged to travel a conſiderable way round, to leap over the rocks, which were not cloſe to each other. Among theſe is a cavern, in which is a well or natural reſervoir, into which they deſcended by a ladder placed there by the poor people for that purpoſe. This cavern is very ſpacious, it being almoſt ten yards wide, and twenty in height; but all the bottom, except juſt at the foot of the ladder, is covered with water, which is about two fathoms deep, and was then frozen towards the inner edges of the cave; but when they attempted to drink of it, its exceſſive coldneſs prevented them. After travelling about a quarter or half a mile upon the great ſtones, they reached the bottom of the real pike, or ſugar-loaf, which is exceeding ſteep, and the difficulty of aſcending encreaſed and rendered more fatiguing by the ground being looſe and giving way under their feet; for though this eminence is not above half a mile in height, they were obliged to ſtop and take breath near thirty times; and when they at laſt reached the top, being quite ſpent with fatigue, they lay about a quarter of an hour to reſt themſelves and recover their breath.

When they left the Engliſh Pitching-place in the morning, the ſun was juſt emerging from the clouds, which were ſpread under them at a great diſtance below, and appeared like the ocean. Above the clouds, at a vaſt diſtance to the north, they perceived ſomething black, which they imagined to be the top of the iſland of Madeira, and taking the bearings of it by a pocket compaſs, found it to be exactly in the direction of that iſland from Tenerife; but before they reached the tops of the pike it diſappeared. They ſaw from hence the top of the iſlands of Gran Canaria, Hiero, Palma, and Gomera, which ſeemed to be quite near; but could neither perceive Lancerota nor Fuertaventura, they being not high enough to pierce the clouds.

Having reſted for ſome time, they began to obſerve the top of the pike, which is about an hundred and forty yards in length, and an hundred and ten in breadth. It is hollow, and ſhaped like a bell with the mouth upwards. From the edges of this bell or cauldron, as it is called by the natives, it is about forty yards to the bottom, and in many parts of this hollow, they obſerved ſmoke and ſteams of ſulphur iſſuing forth in puffs; and in particular places the heat of the ground was ſo great, as to penetrate through the ſoles of their ſhoes to their feet. On obſerving ſome ſpots of earth, or ſoft clay, they tried the heat with their fingers; but could not thruſt them in farther than half an inch; for the deeper they went, the hotter it was. They then took their guide's ſtaff, and thruſt it about three inches deep into a hole or porous place, where the ſmoke ſeemed

ed thickeſt; and having held it there about a minute, drew it out, and found it burnt to charcoal. They gathered here many pieces of moſt curious and beautiful brimſtone of all colours, particularly an azure blue, violet, green, yellow, and ſcarlet.

From hence the clouds beneath them, which were at a great diſtance, made a very extraordinary appearance: they ſeemed like the ocean, only the ſurface was not quite ſo blue and ſmooth, but had the reſemblance of white wool; and where this cloudy ocean, as it may be called, touched the mountain, it ſeemed to foam like billows breaking on the ſhore. When they aſcended through the clouds, it was dark; but when they afterwards mounted again, between ten and eleven o'clock, and the moon ſhone bright, the clouds were then below them, and about a mile diſtant. They then miſtook them for the ocean, and wondered at their ſeeing them ſo near; nor did they diſcover their miſtake till the ſun aroſe. When they paſſed through the clouds, in deſcending from the pike, they appeared as a thick fog or miſt, reſembling thoſe frequently ſeen in England; all the trees of the wood and their cloaths were wet with them.

On the top of the pike the air was thin, cold, and piercing, like the ſouth-eaſterly winds felt in the great deſart of Africa. In aſcending the ſugar-loaf, which is very ſteep, their hearts panted and beat violently, and, as hath been already obſerved, they were obliged to reſt above thirty times to take breath; and this was probably as much owing to the thinneſs of the air cauſing a difficulty of reſpiration, as to the uncommon fatigue they ſuffered in climbing the hill. Their guide, who was a thin, active old man, was far from being affected in the ſame manner; but climbed up with eaſe like a goat; for he was one of the poor men who earn their living by gathering brimſtone in the cauldron and other volcanoes, the pike itſelf being no other, though it has not burned for ſome years; for the ſugar-loaf is entirely compoſed of earth mixed with aſhes and calcined ſtones, thrown out of the bowels of the earth, and the great ſquare ſtones before deſcribed, were probably thrown, in ſome eruption, out of the cauldron, or hollow of the pike, when it was a volcano.

Having ſurveyed every thing worthy of notice, they deſcended to the place where they had left their horſes, which took them up only half an hour, though they were about two hours and a half in aſcending. It was then about ten in the morning, and the ſun ſhone ſo exceeding hot, as to oblige them to take ſhelter in the cottage, and being extremely fatigued, they laid down in order to ſleep; but were prevented by the cold, which was ſo intenſe in the ſhade, that they were obliged to kindle a fire to keep themſelves warm.

After they had taken ſome repoſe, they mounted their horſes about noon, and deſcending by the ſame way they went up, came to ſome pines ſituated about two miles above the clouds. Between theſe pines and the pike, no herb, ſhrub, tree, or graſs can grow, except the before-mentioned retamas. At about five in the evening they arrived at Orotava, not having alighted by the way to ſtop, only ſometimes to walk, where the road was too ſteep for riding.

The whole diſtance they rode in the five hours ſpent in coming down from the Engliſh Pitching-place to Orotava, they computed to be about fifteen Engliſh miles, travelling at the rate of three miles an hour. Mr. Glas ſuppoſes, that the perpendicular height of the Engliſh Pitching-place to be about four Engliſh miles, and adding to that a mile of perpendicular height from thence to the pike, obſerves, that the whole will be about five Engliſh miles, and that he is very certain he cannot be miſtaken in this calculation above a mile either way. But we beg leave to obſerve, that Mr. Glas is here probably miſtaken, owing perhaps to his not uſing any inſtruments proper for aſcertaining the exact altitude of this mountain, which, according to this calculation, is much higher than either the Alps, or the higheſt part of the Andes.

The weather in Tenerife is the ſame as in Gran Canaria; but the ſea-breeze generally ſets in at about ten o'clock in the morning on the eaſt and north-eaſt ſides of the iſland, and blows till about five or ſix in the evening, when it falls calm till midnight. The land-wind then begins, and continues till ſeven or eight in the morning, when it is followed by a calm, which laſts till the ſea-breeze returns.

In the bay of Santa Cruz, and on all the eaſt ſide of the iſland, the ſea-breeze commonly blows at eaſt, and the land-wind at weſt. On the north ſide, the ſea-breeze blows at north-eaſt by eaſt, or north-eaſt, and the land-wind directly oppoſite to it; but at Point Nago, where the land ſtretches towards the north-eaſt far into the ſea, there is no land-wind.

It is remarkable, that at the brow of the hill above Santa Cruz, and at the city of Laguna, a freſh gale blows from the north-weſt all the time of the ſea-breeze, which is occaſioned by the mountains almoſt encompaſſing the plain. Theſe being ſo exceeding high on the ſouth ſide of it, as to beat back the ſea-breeze, and throw it againſt the mountains that bound the north ſide of the plain, where finding no paſſage, it veers to the ſouth-eaſt, and there meeting with no reſiſtance, forces its way with great vehemence through the plain; till coming to the brow of the above-mentioned hill, part of the current of air pours down it towards Santa Cruz, advancing within a mile and half of the ſea, where it is checked by the true ſea-breeze.

Yet there is no regular ſea or land-breeze on the ſouth-weſt coaſt, which is ſheltered from the trade or north-eaſterly wind by the immenſe height of the pike, which towers above the region of the wind: hence on that ſide of the iſland, either an eddy wind at ſouth-weſt, or a calm prevails.

The produce of this iſland is nearly the ſame as that of Canaria, only there are more vineyards and leſs corn land. The wines are ſtrong, good, and very fit for exportation, eſpecially into hot climates, by which they are greatly improved. Formerly a great quantity of Canary ſack was made here; but of late years they do not make above fifty pipes in a ſeaſon; for they now uſually gather the grapes when green, and make a dry hard wine of them, which, when about two or three years old, can hardly be diſtinguiſhed from Madeira; but after four years of age it becomes ſo ſweet and mellow, as to reſemble the wine of Malaga in Spain. This, like all the other Canary iſlands, abounds with orchilla weed.

SECT. X.

Of the ancient Inhabitants of Tenerife, their Dreſſes, Cuſtoms, and Manners.

THE ancient natives of Tenerife were generally of a middle ſtature; but thoſe who dwelt on the north ſide of the iſland were not only much fairer, but had hair of a lighter colour than thoſe in the ſouth. Both ſexes frequently anointed their bodies with ſheep's fat. The men wore cloaks of goats ſkins dreſſed, and rendered ſoft with butter: thoſe of the women were longer, and reached down to their feet, and underneath they had petticoats of the ſame ſkins. Their language was entirely different from that uſed in the other iſlands, and was very guttural. They had no iron, nor any other metal; and inſtead of inſtruments made of theſe, uſed a black hard ſtone ſharpened and made fit for killing ſheep and cutting timber. Of theſe alſo they made lancets, and when they were troubled with acute pains, drew blood with them from the part affected.

Among them were artificers, who dreſſed the ſkins of goats, and made garments; carpenters, who wrought in wood; and potters, who made earthen-veſſels: all of whom were paid for their labour in fleſh, barley, or roots.

The inhabitants of Tenerife were very neat and cleanly; they waſhed their hands and faces whenever they aroſe from ſleep, when they ſat down to eat, and after they had eaten. Their food was the fleſh of ſheep and goats roaſted, or boiled, which they ate alone; and not, like the Europeans with bread or roots. They alſo fed upon barley-meal, roaſted and dreſſed with milk and butter.

After

After eating they refrained from drink for about half an hour, from the opinion that drinking cold water immediately after eating warm victuals, ſpoiled their teeth. They had no other cattle but ſheep and goats; nor grain but wheat and barley, beans and peaſe.

The men prepared the ground for ſeed, by breaking it up with a kind of wooden hoes; and the women ſowed the ſeed. When they were in great diſtreſs for want of grain, or the like, they aſſembled with their children and flocks in certain places ſet apart for that purpoſe, where they ſat on the ground in a circle, weeping and making a mournful noiſe, their flocks at the ſame time bleating for want of food; for on theſe occaſions both the men and beaſts were debarred all kind of ſuſtenance.

They married without any regard to kindred, except that of a mother or ſiſter; but no man had more than one wife. They had a cuſtom, that in the houſe, or cave, where the huſband and wife ſlept, no other perſon was allowed to ſleep; yet they did not lie together, but in ſeparate beds, which were made of herbs or graſs covered with goat ſkins, neatly dreſſed and ſewed together, with coverings of the ſame ſkins. They could put away their wives when they pleaſed; but the children of thoſe women who were divorced were eſteemed illegitimate, and could not inherit their fathers effects. When their children were born they were waſhed all over with water by virgins, who were ſet apart for that office, and never allowed to marry. They had a cuſtom among them, that when a man accidentally met a woman alone, or in a ſolitary place, he was not to look at or to ſpeak to her, unleſs ſhe ſpoke firſt, but to turn out of the way; and if he made uſe of any indecent expreſſion, or behaved in an unbecoming manner, he was ſeverely puniſhed.

It was cuſtomary, when one perſon went to the houſe of another, inſtead of entering in, to ſit on a ſtone at the door, and either to whiſtle or ſing till ſomebody came out and deſired him to walk in. Whoever neglected this ceremony, and entered another perſon's houſe without being invited, was liable to puniſhment; this being eſteemed a very extraordinary affront.

It is ſaid, they had a ſurprizing facility in counting the number of their ſheep and goats, when iſſuing tumultuouſly out of a fold, without even pointing to them with their fingers, or moving their lips.

The natives acknowledged a God, whom they called by the names Achguarergenan, Achoran, and Achaman, which ſignify the Suſtainer of the heavens and the earth. They alſo gave him the titles of the Great, the Sublime, and the Suſtainer of all: but they did not worſhip idols, nor had any images of the Deity. They believed that God created them of earth and water, and made as many women as men, giving them cattle, and every thing neceſſary for their ſubſiſtence; but that afterwards, they appearing to him too few, he created more; but to theſe laſt gave nothing; and when they prayed to him for flocks of ſheep, and herds of goats, he bid them go and ſerve the others, who, in return, would give them food. From theſe, they ſaid, were deſcended their ſervants.

The king was obliged to marry a perſon who was his equal; but if ſuch a one could not be found, he took his own ſiſter to wife, for he was not permitted to debaſe his family by a mixture of plebeian blood. In the ſummer ſeaſon the king reſided in the mountains; but in winter near the ſea-ſhore. When he travelled, or went to change his place of reſidence, the elders of his tribe aſſembled, and carried before him a ſtaff and a lance, with a kind of flag upon it, to give notice of the king's approach, that all who were travelling upon the ſame road might pay him the cuſtomary homage, by proſtrating themſelves before him on the ground, wiping the duſt from his feet with the corners of their garments, and kiſſing them.

A few years before the conqueſt of Tenerife was a prince, called Betzenuria, who governed the whole iſland, and had nine ſons, who, upon his death, divided the government equally between them; by which means the iſland became ſeparated into nine kingdoms, eight of which paid homage to Tinobat, the elder brother, who was the moſt powerful, from his poſſeſſing the richeſt and moſt fertile part of the iſland, which is the tract that extends between Orotava and the brow of the hill above the port of Santa Cruz, in which he could raiſe ſeven thouſand fighting men.

The natives had frequent diſputes among themſelves about their flocks and paſtures, which often ended in war. Their offenſive weapons were darts made of pitch-pine ſharpened and hardened in the fire, like thoſe uſed in Gran Canaria: they had alſo a weapon like a ſpear, very ſharp, and were ſo dexterous at throwing theſe, that they ſcarce ever miſſed their mark. At the approach of an enemy they alarmed the country, by making a ſmoke, or by whiſtling, which they repeated from one to another. This laſt method is ſtill in uſe, and may be heard at an almoſt incredible diſtance.

In their wars they were attended by their women, who brought proviſions, carried off the dead, and interred them in caves.

They held their courts of judicature on a large plain, in the midſt of which they placed a high ſquare ſtone, and on each ſide ſeveral others of inferior ſize and height. On the day appointed for holding the court the king, who was always preſent, was ſeated on the high ſtone, and the principal elders of the diſtrict on the ſmaller ones, according to their ſeniority; and in this manner they heard and decided cauſes. When any one was ſentenced to ſuffer corporal puniſhment, he was laid flat on the ground, and the king delivering the ſcepter or ſtaff, which he always carried with him, into the hand of ſome perſon preſent, ordered him to give the offender a number of blows proportioned to his crime, and then take him from his preſence. In caſe of murder the king took away the criminal's cattle and effects, gave them to the relations of the deceaſed, and baniſhed the murderer from that diſtrict; but, at the ſame time, took him under his own protection, that he might be ſafe from the attempts of the friends and relations of the deceaſed. They never puniſhed any perſon with death; for it was a maxim with them, that it belonged to God alone to take away that life he gave.

When any perſon died, they carried the body to a cave, and ſtretching it on a flat ſtone, opened it and took out the bowels, then twice a day waſhed the porous parts, that is, the neck, the arm-pits, behind the ears, the groin, and between the fingers, with cold water: after waſhing it ſufficiently, they anointed thoſe parts with ſheep's butter, and ſprinkled them with a powder made of the duſt of decayed pine-trees, and a kind of bruſh-wood, called by the Spaniards breſſos, and with the powder of pumice-ſtone. They then dried the body, by extracting from it all its moiſture, after which the relations of the deceaſed came and ſwaddled it in dreſſed ſheep or goats ſkins, and girding all tight with long leather thongs, they put it in the cave which had been ſet a part by the deceaſed for his burying-place. The king could only be buried in the cave of his anceſtors, in which the bodies were ſo diſpoſed as to be known again. Particular perſons were ſet apart for the office of embalming; and there were men to embalm the bodies of the men, and women to perform that office for thoſe of their own ſex. During the proceſs, the bodies were watched by the embalmers with the greateſt care to prevent their being devoured by the ravens; the huſband, or wife, of the deceaſed bringing them proviſions, and waiting on them during the time of their watching. It is ſaid that not many years ago, two of theſe embalmed bodies were taken out of a cave; they were entire, and as light as cork; but quite freſh, and without any diſagreeable ſmell. Their teeth and garments were alſo freſh and ſound.

SECT. XI.

Of the Iſland of GOMERA.

Its Situation; a Deſcription of the principal Port and Town; the Produce of the Iſland; and the Perſons, Dreſs, and Manners of the original Inhabitants.

THE middle of this iſland lies ſix leagues to the ſouth-weſt of Point Teno, in Tenerife. The principal town is ſeated cloſe to the ſea-ſhore, in the bottom

of a bay, where ſhips lie land-locked from all winds, except the ſouth-eaſt. On the north ſide of this bay is a cove, where ſhips of any burden may haul cloſe to the ſhore, which is a high perpendicular cliff, and there with ſafety heave down, clean, and repair. From this cove is a path-way along the face of the cliff to the town; but it is ſo narrow that two perſons cannot walk a-breaſt. Near the end of this path-way is a gate, which is always ſhut when it grows dark. About a ſtone's caſt from the beach the principal ſtreet of the town begins, and from thence runs ſtraight within land.

This town is called La Villa de Palmas, or the town of Palms, from the number of palm-trees growing there. There are here a church and convent of friars, with about a hundred and fifty private houſes, moſt of which are ſmall and mean. It is, however, well ſupplied with good water, which the inhabitants draw from wells in every part of the town. During the winter ſeaſon a large rivulet, which then flows from the mountains, diſcharges its waters into the fort; and on the ſouth ſide of its mouth ſtands an old round tower: alſo on the top of the perpendicular cliff on the north ſide is a chapel and a battery of a few pieces of cannon, for the defence of the fort.

Gomera, though ſmall, is a plentiful iſland, many rivulets flowing from the craggy mountains refreſh and give fertility to the narrow valleys, and indeed water may be found in every part of the iſland, by digging to the depth of about five or ſix feet.

The produce of Gomera is much the ſame with that of Teneriſe and Canaria. The inhabitants have generally juſt corn enough for their own uſe, and ſeldom import or export any. In this particular it reſembles Canaria; for it has almoſt every neceſſary within itſelf, and therefore has little need of any thing from abroad; for cattle, fowls, corn, wine, roots, fruit, and honey are here in great plenty; and if there was ſufficient encouragement for the exertion of their induſtry, the natives could eaſily manufacture a ſufficient quantity of wool and raw ſilk to clothe themſelves: here is alſo ſtone, lime, timber, and all the other materials for building, except iron.

The wine of this iſland is in general weak, poor, and ſharp; it is therefore unfit for exportation; yet ſome of it, when two years old, excels the very beſt wine made in Madeira, both in taſte and flavour, though it is as clear as water and as weak as ſmall beer.

Here are the animals common in the reſt of the iſlands, and alſo plenty of deer, originally brought from Barbary. There are likewiſe more mules bred in Gomera than in any of the other Canary Iſlands, and ſome ſnakes; but it does not appear that any of them do the leaſt harm.

The original natives of the iſland of Gomera were of a lively diſpoſition; they were of the middle ſtature, extremely active and dexterous in attacking and defending, and excellent ſlingers of ſtones and darts, to which they were trained from their infancy, it being the common amuſement of the young people to caſt ſmall ſtones and darts at each other; to avoid which they ſeldom moved their feet, but only waved their bodies to and fro; and ſo expert were they at this ſport, that they uſed to catch in their hands the ſtone and darts as they flew in the air.

The Gomerans uſed to dreſs themſelves in a ſort of cloak made of goat-ſkins, which reached to the calf of the leg; but the women were cloathed with a petticoat, and a head-dreſs that hung down to their ſhoulders, both of which were made of goat-ſkin dyed and curiouſly painted. The blue dye they extracted from an herb which they called paſtil, and the red from the root of a tree which they called taginaſte: all between the head-dreſs and petticoat were left bare. When the men had any quarel which was to be decided by a combat, they laid aſide their cloaks, tied a ſort of bandage round their waiſt, and bound their foreheads with a kind of painted turban. The Gomerans wore ſhoes made of hogs-ſkins.

In their combats they uſed the ſame weapons as the natives of the other iſlands, which were ſticks or poles of hard wood, with the ends ſharpened. They have had amongſt them ſeveral men diſtinguiſhed by their bravery, whoſe fame they ſtill celebrate in their ſongs.

SECT. XII.

Of the Iſland of PALMA.

Its Situation and Extent. A Deſcription of a high Mountain, called La Caldera, or the Cauldron. Its Springs and Rivers. Its Volcanoes, Climate, Produce, Ports, and Towns.

THE iſland of Palma is ſituated ſeventeen leagues to the weſt-north-weſt of Teno, the weſt end of Teneriſe, in twenty-eight degrees thirty minutes north latitude, and is only twenty-four miles in length from north to ſouth, and the extreme breadth about eighteen miles.

The ſummit of Palma is, according to Mr. Glas, higher than that of Tenerife; for he reckoned the pike or ſugar-loaf only as a hill placed on the top of the iſland: and he obſerves, that when any one who has never ſeen land of an uncommon height, approaches in clear weather within twelve leagues of the iſlands of Tenerife and Palma, and comes all at once to behold them, his ſurprize will be very great, reſembling that which ſtrikes a perſon who has never ſeen the ocean, till he has all at once a full view of it from the top of an adjacent mountain.

Within land, on the north-eaſt part of the iſland, is a high and ſpacious mountain, ſteep on all ſides. This is called La Caldera, or the Cauldron, from a hollow like that on the pike of Tenerife. The ſummit is about two leagues in circumference, and on the inſide the Cauldron deſcends gradually from thence to the bottom, which is a ſpace of about thirty acres. On the declivity of the inſide ſprings ſeveral rivulets, which joining together at the bottom, iſſue in one ſtream through a paſſage to the outſide of the mountain from which this brook deſcends; and having run ſome diſtance from thence, turns two ſugar-mills. The water of this ſtream is unwholeſome, on account of its being mixed with ſome water of a pernicious quality in the Cauldron; all the inſide of which abounds with herbage, and is covered with palms, pitch-pine, laurel, lignum-rhodium, and retamas; which laſt have in this iſland a yellow bark, and grow to the ſize of large trees; but in the others they are only ſhrubs. The people here take great care not to let the he-goats feed on the leaves of the retama, on account of their breeding a ſtone in the bladder, which kills them.

There are two rivulets which ſpring on the outſide of the Cauldron; one of theſe runs northward to the village of St. Andreas, and turns two ſugar-mills, and the other runs to the town of Santa Cruz, which lies to the eaſtward. Theſe are the only rivulets or ſtreams of any conſequence in the iſland: on which account the natives build tanks, or ſquare reſervoirs with planks of pitch-pine, which they make tight with caulking. Theſe they fill with the torrents of rain-water that in the winter ſeaſon ruſh down from the mountains, and preſerve it for themſelves and cattle: but the ſheep, goats, and hogs, in places at a diſtance from the rivulets, feed almoſt all the year round on the roots of fern and aſphodil, and therefore have little or no need of water, there being moiſture enough in thoſe roots to ſupply the want of that element.

The ſouth quarter of the iſland is moſt deſtitute of water, yet there is a medicinal well of hot water ſo cloſe to the ſea-ſhore, that the tide flows into it at full ſea. And at Uguer is a cave, that has a long narrow entrance, ſo ſtraight that people paſs through it backwards, with the face to the mouth of the cave; but after they have got through this paſſage, they enter a ſpacious grotto, where water diſtils from between the large flakes of ſlate-ſtones that hang from the roof; the leaſt blow given to theſe reſound through the cave with a noiſe like thunder.

There is a mountain in the diſtrict of Tifuya, which appears to have been removed by an earthquake from its original ſituation. The natives have a tradition that the ſpot on which it now ſtands was a plain, and the moſt fertile ſpot in the whole iſland, till it was deſtroyed by the burning lava, and the fall of the mountain.

Indeed, the effects of volcanoes are to be ſeen in almoſt every part of the iſland; for the channels where the

the burning matter, melted ores, and calcined ſtones and aſhes ran, are eaſily diſtinguiſhed.

On the thirteenth of November 1677, a little after ſun-ſet, the earth ſhook for thirteen leagues, with a dreadful noiſe that laſted five days, during which the earth opened in ſeveral places; but the greateſt opening was at Mount aux Chevres, a mile and a half from the ſea, from whence proceeded a great fire which caſt up ſtones and pieces of rock; and in leſs than a quarter of an hour were twenty-eight gaps about the foot of the mountain, which caſt forth flames and abundance of burning ſtones. There was another eruption in 1750, when one of theſe rivers of fire ran down from the mountains towards the town of Santa Cruz, and diſcharged itſelf into the ſea about a mile to the northward of the town: but we do not know that any conſiderable volcano or earthquake has happened ſince, though they have ſometimes ſome ſlight ſhocks.

On viewing Palma at the diſtance of three leagues off at ſea, the mountains ſeem full of gutters or beds formed by torrents of rain water; but theſe only appear little from their height and diſtance; for on approaching near, we find them large vallies, abounding with wood.

The black ſhining ſand uſed to throw upon writing to prevent its blotting, is found in many places on the ſhore of this and the other iſlands. It appears to have been thrown out of volcanoes, and is certainly the moſt perfect iron; for the load-ſtone, on being held near it, will draw up every grain.

The air, weather, and winds are nearly the ſame here as at Tenerife and Canaria, only the weſterly winds and rain are more frequent in Palma, on account of its lying more to the weſtward and northward, and conſequently being not ſo far within the verge of the north-eaſt trade-winds as thoſe iſlands, whence it is more expoſed to variable winds, particularly the ſouth-weſt, which moſt prevails in the latitudes adjacent to thoſe of the north-eaſt trade-winds.

With reſpect to the climate both here, and in Tenerife, Canaria, and Gomera, a perſon will find great difference according as he lives in the mountains, or near the ſea-ſhore. In the months of July, Auguſt, and September, the heat ſeems almoſt intolerable near the ſhore, while there is a calm; but, at the ſame time, the air is quite freſh and pleaſant on the mountains. In the middle of winter the houſes far up the mountains, near the clouds, are extremely cold, and the natives keep fires burning in their habitations all day long; but this is far from being the caſe near the ſea; for there they uſe fires only in their kitchens. For eight months in the year the ſummits of all the Canary iſlands, except Lancerota and Fuertaventura, are generally covered with ſnow.

Formerly the ſummit of Palma abounded with trees; but a great drought, which prevailed in 1545, deſtroyed them all, and though others began to ſpring up ſome time after, they were deſtroyed by the rabbits and other animals, which finding no paſture below, went up there, and devoured all the young trees and herbs; ſo that the upper part of the iſland is at preſent quite bare and deſolate. The rabbits were firſt brought to Palma by Don Pedro Fernandes de Lago, the ſecond lieutenant-general of Tenerife, and have ſince increaſed in a ſurprizing manner. Before the trees and ſhrubs were deſtroyed on the ſummit of the iſland, a great deal of manna fell there, which the natives gathered and ſent to Spain.

The produce of this iſland is nearly the ſame with that of Canaria; but a great quantity of ſugar is made in Palma, particularly on the weſt ſide of the iſland. On the eaſt ſide are produced good wines, which have a different taſte and flavour from thoſe of Tenerife: the dry wine is ſmall bodied, and of a yellow colour. The malvaſia, or ſack, is not ſo luſcious or ſo ſtrong as that of Tenerife; but on its being about three years old, it obtains the rich flavour of a ripe pine-apple. Theſe wines are however very difficult to preſerve, eſpecially when exported to cold climates, where they frequently turn ſour.

All the kinds of fruit that grow in Tenerife and Canaria are found here in greater abundance, ſo that the natives cannot conſume them; but as they have great plenty of ſugar, they make vaſt quantities of ſweet-meats and conſerves, which they export to the reſt of the iſlands, and alſo to ſome parts of the Indies.

The bees produce a great deal of good honey, eſpecially in the hives that are at a great diſtance from vines, and the mocanes, a fruit that reſembles an elder-berry; both theſe having a bad effect on its colour. In Palma is alſo much gum-dragon, and the natives extract great quantities of pitch from the pitch-pine. In time of ſcarcity they make good bread of the roots of fern, which is ſaid to be not inferior to that made of wheat flour; but the fern of Palma is not eſteemed ſo good as that of Gomera.

Though the woods that formerly grew on the ſummit of Palma are all deſtroyed, yet there are many trees in the region of the clouds, and beneath it; ſo that at about two leagues diſtance, the iſland appears like one entire wood. Pine trees grow here to ſuch a ſize, as to be fit for maſts of the larger ſhips; but they are exceeding heavy, and from the ruggedneſs of the roads, the expence of bringing them to the ſhore would be very great.

The chief port in Palma is that of Santa Cruz, on the ſouth-eaſt ſide of the iſland. The road is within a muſket ſhot of the ſhore, where veſſels generally ride in fifteen or twenty fathoms water, and are expoſed to eaſterly winds; yet with good anchors and cables they may ride with great ſafety, in all the winds that blow in this part of the world; for the ground is clean and good, and the great height of the iſland, with the perpendicular rocks that face the road, repel the wind that blows upon it; though ever ſo ſtrong. Santa Cruz is a large town, containing two pariſh churches, ſeveral convents of friars and nuns, with many neat and private buildings, though they are neither ſo good, nor ſo large as thoſe of the city of Palmas in Canaria, or of the towns of Tenerife. Near the mole is a caſtle or battery mounted with ſome pieces of ordnance for the defence of the ſhips in the bay, and to prevent the landing of an enemy. In the midſt of the town, near the great church, is a fountain filled by a rivulet, which ſupplies the inhabitants with plenty of good water.

The next port, named Taſſacorta, lies on the ſouth-weſt of this; but being expoſed to weſterly winds, is little frequented by any other veſſels than boats. It has a village of the ſame name. There are no other towns of any note in the iſland; but many villages, one of the chief of which is St. Andres.

SECT. XIII.

Of the Iſland of HIERRO *or* FERRO.

The French formerly reckoned the Longitude from thence. The Situation and Extent of that Iſland, with a particular Account of a Tree that is continually dropping Water.

THE iſland of Ferro, called by the Spaniards Hierro, and by the French l'Iſle de Fer, is the moſt weſterly iſland of the Canaries. Here the French navigators formerly placed the firſt meridian for reckoning the longitude, as the Dutch did theirs from the Pike of Tenerife: moſt geographers however at preſent reckon the firſt meridian from the capital of their own country; it conveying a more diſtinct idea to an Engliſhman to ſay, that ſuch a place is ſo many degrees eaſt or weſt from London, than to reckon the longitude from a diſtant iſland; and hence the Engliſh geographers now uſually reckon the longitude of places from London, and the French from Paris.

The iſland of Hierro, or Ferro, is about five leagues in breadth and fifteen in circumference. It is ſituated in twenty-ſeven degrees forty-eight minutes north latitude, and in ſeventeen degrees twenty-ſix minutes weſt longitude from London. On all ſides it riſes ſteep and craggy from the ſea for above a league, ſo as to render the aſcent extremely difficult and fatiguing; but after travelling this league, the reſt of the iſland will be found to be tolerably level and fruitful, it abounding in many kinds of trees and ſhrubs, and producing better graſs, herbs,

herbs, and flowers than any of the other iſlands, whence bees thrive and multiply here in a very extraordinary manner, and alſo make excellent honey.

There are only three ſprings in the whole iſland. On account of the ſcarcity of water, it is ſaid that the ſheep, goats, and ſwine of this iſland, do not drink in the ſummer; but digging up the roots of fern, they chew them to quench their thirſt. The great cattle are watered at the above fountains, and at a place where water diſtils from the leaves of a tree. Of this tree many authors have made mention, ſome of whom repreſent it as miraculous; while others deny its very exiſtence; but the author of the Hiſtory of the Diſcovery and Conqueſt of the Canary iſlands gives a particular account of it.

In the cliff or ſteep rocky aſcent by which the whole iſland is ſurrounded, is a narrow gutter which commences at the ſea, and is continued to the ſummit of the cliff, where it joins, or coincides, with a valley terminated by the ſteep front of a rock, on the top of which grows a tree called in the language of the ancient inhabitants garſe, or ſacred, which for many years has been preſerved entire, ſound, and freſh. Its leaves conſtantly diſtil ſo great a quantity of water, that it is ſufficient to furniſh drink to every living creature in Hierro, nature having provided this remedy for the drought of the iſland.

It is diſtinct from other trees, and ſtands by itſelf: its trunk is about twelve ſpans in circumference; its height from the ground to the top of the higheſt branch is forty ſpans, and the circumference of all the branches together is one hundred and twenty feet. The branches are thick and extended, and the loweſt begin about the height of an ell from the ground. Its fruit reſembles an acorn, but taſtes like the kernel of a pine-apple, only it is ſofter and more aromatic; and the leaves reſemble thoſe of the laurel, but are larger, wider, and more curved. Theſe come forth in a perpetual ſucceſſion, whence the tree always remains green. Near it grows a thorn which faſtens on many of its branches, with which it is interwoven, and at a ſmall diſtance are ſome beach trees, breſos, and thorns.

On the north ſide of the trunk are two large tanks or ciſterns of rough ſtone, or rather one ciſtern divided; each half being twenty feet ſquare, and ſixteen ſpans deep. One of theſe contains water for the drinking of the inhabitants, and the other that which they uſe for their cattle, waſhing, and the like purpoſes.

Every morning a cloud or miſt riſes from the ſea, which the ſouth and eaſterly winds force againſt the above-mentioned ſteep cliff; when the cloud having no vent, but by the gutter, gradually aſcends it, and advances ſlowly from thence to the extremity of the valley, and then reſts upon the wide ſpreading branches of the tree, from whence it diſtils in drops during the remainder of the day, in the ſame manner as water drips from the leaves of trees after a heavy ſhower.

This diſtillation is not peculiar to the tree, for the breſos which grow near it alſo drop water; but their leaves being only few and narrow, the quantity is ſo trifling, that though the natives ſave ſome of it, yet they make but little account of any but what diſtils from the tree; which, together with the water of ſome ſprings, is ſufficient to ſerve the natives and their flocks.

This tree yields moſt water in thoſe years when the eaſterly winds have moſt prevailed; for by them alone the clouds or miſts are drawn hither from the ſea. A perſon lives near the ſpot on which the tree grows, who is appointed by the council to take care of it and its water, and is allowed a certain ſalary, with a houſe to live in. He daily diſtributes to each family of the diſtrict ſeven veſſels filled with water, beſides what he gives to the principal perſons of the iſland.

Whether the tree which yields water at preſent be the ſame here deſcribed, Mr. Glas ſays he is unable to determine, but juſtly obſerves, that it is probable there have been a ſucceſſion of them. He himſelf did not ſee this tree, for this is the only iſland of all the Canaries which he did not viſit; but he obſerves, that he has ſailed with the natives of Hierro, who, when queſtioned about the exiſtence of this tree, anſwered in the affirmative; and takes notice, that trees yielding water are not peculiar to this iſland, ſince travellers mention one of the ſame kind in the iſland of St. Thomas, in the gulph of Guinea.

There is ſaid to be no conſiderable town, and only one pariſh church in the whole iſland of Ferro.

SECT. XIV.

Of the original Natives of the Iſland of Hierro, or Ferro; their Dreſs, Manners, and Cuſtoms.

THE natives of Ferro, before that iſland was rendered ſubject to Spain, were of a middle ſtature, and cloathed with the ſkins of beaſts. The men wore a cloak made of three ſheep-ſkins ſewed together with the woolly ſide outwards in ſummer, and next their bodies in winter.

The women alſo wore the ſame kind of cloak, beſides which they had a petticoat, which reached down to the middle of their legs. They ſewed theſe ſkins with thongs cut as fine as thread, and for needles uſed ſmall bones ſharpened. They wore nothing on their heads, and their long hair was made up into a number of ſmall plaits. They had ſhoes made of the raw ſkins of ſheep or goats, and ſome of them were made of thoſe of hogs.

They had a grave turn of mind, for all their ſongs were on ſerious ſubjects, and ſet to ſlow plaintive tunes, to which they danced in a ring, joining hands, and ſometimes jumping up in pairs, ſo regularly, that they ſeemed to be united; a manner of dancing ſtill practiſed in Ferro.

They lived in circular encloſures formed by a ſtone-wall without cement, each having one narrow entrance. On the inſide they placed poles or ſpars againſt the wall, one end reſting on the top, and the other extending a conſiderable diſtance to the ground; and theſe they covered with fern, or branches of trees. Each of theſe incloſures contained about twenty families. A bundle of fern, with goat-ſkins ſpread over it, ſerved them for a bed, and for bed-cloaths and coverings they uſed dreſſed goats-ſkins to keep them from the cold.

When a child was born, before they offered it the breaſt, they gave it fern roots roaſted, bruiſed, and mixed with butter; and at preſent they give them flour and barley meal roaſted, and mixed with bruiſed cheeſe.

The uſual food of the natives was the fleſh of ſheep, goats, and hogs; and as they had no kind of grain, their bread was made of fern roots, which, with milk and butter, was the principal part of their diet.

They all lived under one king, and having never any occaſion to go to war, had no warlike weapons: they indeed uſed to carry long ſtaves; but theſe were only to aſſiſt them in travelling; for the country being ſo rocky, as to make it neceſſary frequently to leap from one ſtone to another, this they performed by means of theſe ſtaves.

Each man had only one wife, and they had no reſtrictions with reſpect to their marriages, except a man's not being allowed to marry his mother or ſiſter; for every man might take the woman he liked beſt, and whoſe conſent he could obtain, without the leaſt regard to rank or nobility. Indeed all, except the king, were in this reſpect upon an equality: the only diſtinction among them conſiſted in the number of their flocks. It was uſual for the man, when he choſe a wife, to make a preſent of cattle to her father, according to his ability, in return for the favour of letting him have his daughter. Even the king received no particular tribute from his ſubjects; but every one made him a preſent of cattle, according to his wealth and pleaſure; for they were not obliged to give him any thing.

When they made a feaſt they killed one or two fat lambs, according to the number of their gueſts: theſe they placed in a veſſel on the ground, ſitting round it in a circle, and never riſing till they had eaten the whole. Theſe feaſts are ſtill continued among their deſcendants.

When a perſon fell ſick, they rubbed his body all over with butter and ſheeps marrow, covering him well up,

to keep him warm; but when a man happened to be wounded, they burned the part affected, and afterwards anointed it with butter. They buried their dead in caves; and if the deceaſed was a man of wealth, they interred him in his cloaths, and put a board at his feet, with the pole with which he uſed to travel at his ſide, and then cloſed the mouth of the cave with ſtones, to prevent his being devoured by the ravens.

They puniſhed no other crimes but thoſe of murder and theft; the murderer was put to death in the ſame manner as he had killed the deceaſed; and the thief, for the firſt offence, was puniſhed with the loſs of one of his eyes, and for the ſecond of the other. This was done that he might not ſee to ſteal any more. A particular perſon was on theſe occaſions ſet apart to perform the office of executioner.

They paid their adorations to two deities, one of whom was male, and the other female. The male was named Eraoranzan, and was worſhipped by the men; the other was called Moneyba, and was worſhipped by the women. They had no images or viſible repreſentations of theſe deities; nor did they ever ſacrifice to them, but only prayed to them in their neceſſities, as when they wanted rain to bring up the graſs for the ſubſiſtence of their cattle. The natives pretended, that when their gods were diſpoſed to do them good, they came to the iſland and took their ſtations on two great rocks, which are in a place to which they gave the name of Ventayca, and which is now called Los Antillos de los Antiguos, where they received the petitions of the people, and afterwards returned to heaven.

SECT. XV.

Of the preſent Natives of Canaria, Tenerife, Palma, Gomera, and Ferro; their Perſons, Dreſs, Food, Buildings, Manners, and Cuſtoms.

WE have already given a deſcription of theſe iſlands, and of the manners of their antient inhabitants, with whom the Spaniards and other Europeans have been ſo long intermixed, that they are become one people. The deſcendants of this mixed nation are at preſent denominated Spaniards, whoſe language is that of the Caſtillian, which the gentry ſpeak in perfection; but the peaſants in the remote parts of the iſlands in an almoſt unintelligible manner; ſo that ſtrangers can ſcarcely underſtand them.

The preſent natives are ſlender, and of the middle ſize; they are pretty well ſhaped, and have good features; but they are more ſwarthy than the inhabitants of the ſouthern parts of Spain: they have, however, fine, large, ſparkling eyes, which give great vivacity to the countenance; but the old people make a very ſhocking appearance.

The men of rank, inſtead of their own hair, wear white perukes, which form a very odd contraſt to their duſky complexions; but they neither put on theſe, their upper coats, or ſwords, but when they walk in proceſſion, pay formal viſits, or go to church on high feſtivals: at all other times they wear a linen night-cap, bordered or ruffled with lace or cambrick, and above it a broad brimmed ſlouched hat; and, inſtead of a coat, a long wide camblet cloak, of a raiſin colour, or black. They generally walk with their hat under their arm, and never wear an upper coat without a ſword.

The dreſs of the peaſants is after the modern faſhion of the Spaniards, which is not unlike the habit of the common people in England, only here the natives, when dreſſed, wear long cloaks inſtead of upper coats; but the peaſants of Canaria, inſtead of the cloak, uſe an upper garment faſtened about the middle by a girdle, or ſaſh. This garment is white, long, and narrow: it has a neck like an Engliſh riding-coat, and is made of the wool of their own ſheep. All the people of low rank in theſe iſlands wear their own black hair, which is generally buſhy: they let it grow to a great length, and tuck the hair of the right ſide of the head behind the right ear.

The women of inferior rank wear on their heads a coarſe linen gauſe, which falls down upon their ſhoulders; and, as they pin it together under their chin, the lower part anſwers the purpoſe of an handkerchief, by covering the neck and breaſt. When they go abroad, they likewiſe wear a broad brimmed ſlouched hat to ſhade their faces from the ſun; and on their ſhoulders a mantle of flannel, baize, or ſaye. Inſtead of ſtays they wear a ſhort cloſe jacket laced before, and have many petticoats, which make them appear very bulky: but the poor who live in towns wear veils, when they walk the ſtreets, made of black ſaye, in the form of two petticoats; and when they go abroad take the upper, and putting it over the head, wrap it ſo cloſe about the face, that no part of it is ſeen, except one eye. Thus they have the privilege of beholding all they meet, without being known; for all their veils are of the ſame ſtuff and colour, only thoſe of the ladies are of ſilk.

Some of the moſt faſhionable ladies in the city of Palmas, in Canaria, and in Santa Cruz, in the iſland of Tenerife, go abroad in their chariots dreſſed after the French and Engliſh mode; but none walk in the ſtreets without veils; yet they wear them ſo open, that any one may ſee the whole face, the neck, and even a part of the breaſt. The young ladies wear no caps, but have their fine long black hair plaited, tucked up behind, and faſtened on the crown of the head by a gold comb. Inſtead of ſtays, they wear ſhort jackets, like the common people, only they are made of finer ſtuff: they have alſo mantles of ſcarlet cloth, or fine white flannel, laced with gold or ſilver; but the moſt expenſive part of their dreſs is their ear-rings, necklaces, and bracelets.

Scarce any are to be ſeen, even among people of the firſt rank of either ſex, who walk with an eaſy and graceful air: this is entirely owing to their going abroad, either covered with long cloaks, or almoſt conſtantly veiled: the men's motions being hid by their cloaks, and the women, not being known, do not care how they walk; and when the men lay their cloaks aſide, and dreſs in upper coats, with their ſwords, canes, and perukes, and their hats under their arm, they make the moſt ſtiff, ridiculous, and aukward appearance imaginable.

Here the inferior people are remarkably louſy, without being even aſhamed of it; for the poor ſit at their doors picking the lice out of one another's heads. The itch too is common among people of all ranks, and they do not even take any pains to cure it. The ſame may be ſaid of the venereal diſeaſe, though this is not quite ſo general as the other.

Gentlemen riſe here by break of day, and uſually go to church ſoon after to hear maſs; at eight or nine in the morning they breakfaſt on chocolate. The ladies ſeldom go to maſs before ten in the forenoon; but the women-ſervants commonly attend it about ſun-riſing. At the elevation of the hoſt, which is generally a little before noon, the bells toll, when all the men, who happen to be within hearing, pull off their hats, and ſay, "I adore "and praiſe thee, body and blood of our Lord Jeſus "Chriſt, ſhed on the tree of the croſs to waſh away the "ſins of the world."

At noon all the natives go home to dinner, and the ſtreet-doors are ſhut till three o'clock. The firſt diſh ſet upon the table in gentlemen's houſes conſiſts of ſoup made of beef, mutton, pork, bacon, potatoes, turneps, carrots, onions, and ſaffron, ſtewed together, with thin ſlices of bread put into the diſh. The ſecond courſe conſiſts of roaſted meat, fowls, &c. The third is the olio, or ingredients of which the ſoup was made. After which comes the deſert, conſiſting of fruit and ſweet-meats. The company drink freely of wine, or wine and water, while at dinner; but have no wine after the cloth is removed. On drinking to each other, they ſay, "Your "health, Sir;" or, "Madam, your health:" and the other anſwers by ſaying, "May you live a thouſand "years;" and ſometimes, "Much good may it do you."

Dinner being over, a large ſhallow ſilver diſh, filled with water, is ſet upon the table; when the whole company, all at once, waſh in it: and then a ſervant, who ſtands at the lower end of the table, cries, "Bleſſed and "praiſed be the moſt holy ſacrament of the altar, and "the clear and pure conception of the moſt holy virgin, "conceived in grace from the firſt inſtant of her natural "exiſtence. Ladies, and gentlemen, much good may "it do you." Then making a low bow to the com-

pany, he retires. They then riſe, and each goes to his apartment, to take a nap for about an hour. This, which is termed the ſieſto, is very beneficial in a warm climate; for after a perſon awakes from it, he finds himſelf greatly refreſhed, and fit to engage in buſineſs with ſpirit.

People of rank ſeldom make an entertainment without having a friar for one of their gueſts, who is uſually confeſſor to ſome of the family, and frequently behaves with great ill manners; yet neither the maſter of the houſe, nor any of the company, chuſe to take much notice of it. Our author was once invited to dine with a gentleman, when a Franciſcan friar was one of the gueſts; but they had ſcarce begun to eat, when the friar aſked him if he was a Chriſtian? He anſwered, that he hoped ſo. He was then deſired to repeat the Apoſtles Creed; but anſwering, that he knew nothing about it, the friar ſtared full in his face, and cried, "O thou black aſs!" Offended at this rudeneſs, he aſked, What he meant by treating him in that manner? when the friar only anſwered by repeating the abuſe; the maſter of the houſe endeavoured, in vain, to perſuade him to give over. But as our author did not at that time underſtand Spaniſh ſo well as to expreſs himſelf fluently, he roſe, and telling the gentleman, that he ſaw he was unable to protect him from inſults at his own table, inſtantly left the houſe.

In the morning and evening viſits they treat with chocolate and ſweet-meats; but in the ſummer evenings with ſnow-water. People ſup between eight and nine, and ſoon after retire to reſt.

The uſual food of the common people is goſſio, fruit, and wine, with ſalt fiſh brought from the coaſt of Barbary. Some think their being ſo ſubject to the itch, is owing to their eating ſo much of this laſt food. In the ſummer ſeaſon freſh fiſh is pretty plentiful, but at other times more ſcarce and dear.

The houſes of people of rank are two ſtories high, and are handſome ſquare buildings, built of ſtone and mortar, with an open court in the middle like our publick inns in England, and like them have balconies running round, which are on a level with the floor of the ſecond ſtory. The ſtreet-door is placed in the middle of the front of the houſe, and within that door is a ſecond, the ſpace between them being the breadth of the rooms of the houſe. The court-yard, which is on the inſide, is large or ſmall according to the ſize of the building, and is uſually paved with flags, pebbles, or other ſtones. In the center of the court is a ſquare or circular ſtone-wall about four feet high, filled with earth, in which are commonly planted orange, banana, or other trees.

All the lower ſtory of each quarter of the houſe conſiſts of ſtore-rooms, or cellars. The ſtairs leading to the ſecond ſtory uſually begin at the right or left hand corner of the entrance of the court, and conſiſt of two flights of ſteps, which lead into the gallery, from which one may enter any room on the ſecond ſtory. The principal apartments are generally in that quarter of the houſe facing the ſtreet, which contains a hall with an apartment at each end. Theſe rooms are the whole breadth of the quarter, and the hall is twice the length of any of the apartments at its extremities. The windows of theſe rooms are formed of wooden lattices, curiouſly wrought, and are all in the outſide wall, none of them looking inwards to the court.

In the middle of the front of ſome great houſes is a balcony on the outſide above the gate, equal with the floor of the ſecond ſtory; and ſome have a gallery which runs from one end of the front to the other, but this is unuſual on the outſide of the houſe.

The apartments are all white-waſhed, and thoſe at the extremities of the great halls, with ſome of the reſt, are lined with fine mats about five feet high, and the floor is ſometimes covered with the ſame. The ſides of the windows of all the rooms are lined with boards to prevent people's cloaths being whitened; for they commonly ſit in the window, there being benches on each ſide of it for that purpoſe; and when the maſter of the houſe intends to ſhow a ſtranger reſpect, he always conducts him to the window.

The walls of the great hall, and thoſe of ſome of the other apartments, are hung with paintings, repreſenting the virgin, the twelve apoſtles, ſaints, and martyrs, uſually drawn as large as the life, and diſtinguiſhed by ſome circumſtance of their hiſtory. Thus St. Peter is uſually repreſented looking at a cock and weeping, and a great bunch of keys always hangs at his girdle. One of their favourite paintings is Anthony preaching to the fiſhes.

They ſeldom uſe curtains to their beds, for theſe they conſider as recepticles for fleas and bugs, which abound here extremely. They chiefly uſe matreſſes ſpread on the floor upon fine mats: beſides the ſheets, there is a blanket, and above that a ſilk quilt. The ſheets, pillows, and quilt, are frequently fringed or pinked, like the ſhrouds uſed for the dead in Europe.

In a particular apartment is a place raiſed a ſtep higher than the floor, covered with mats or carpets; and there the women generally ſit together upon cuſhions, both to receive viſits from their own ſex, and perform their domeſtic offices.

Though the houſes of the peaſants and lower ſort of people are only one ſtory high, they are built of ſtone and lime, and the roofs either thatched or tiled. Theſe are generally neat, clean, and commodious. Indeed there is but little dirt or duſt in theſe iſlands to make them uncleanly; for the ground is moſtly rocky, and, from the almoſt continual fine weather, it is ſeldom wet.

The natives have a great deportment, and at the ſame time great quickneſs and ſenſibility; the women, in particular, are remarkable for the ſprightlineſs and vivacity of their converſation, which is ſaid greatly to exceed that of the Engliſh, French, or other northern nations. The great families in theſe iſlands would be highly offended ſhould any one tell them, they are deſcended from the Moors, or even from the antient inhabitants of theſe iſlands; yet it would not perhaps be difficult to prove, that moſt of their cuſtoms have been handed down to them from thoſe people. The gentry boaſt much of their birth, and indeed they are deſcended from the beſt families in Spain.

The people hold in the greateſt contempt the employment of a butcher, taylor, miller, and porter. It is not indeed very ſurpriſing, that they ſhould not have any great eſteem for the profeſſion of a butcher, or that the employment of a taylor ſhould be conſidered as ſomewhat too effeminate for a man; but it is difficult to imagine, why millers and porters ſhould be deſpiſed, eſpecially the former; but it muſt be conſidered, that the millers here are generally eſteemed great thieves; and as the maſter of every family ſends his own corn to be ground, unleſs it be narrowly watched, the miller will take too much toll. It is ſaid, that when any criminal is to ſuffer death, and the executioner happens to be out of the way, the officers of juſtice have the power of ſeizing the firſt butcher, miller, or porter they can find, and of obliging him to diſcharge that office.

We cannot here forbear mentioning a circumſtance given us by Mr. Glas, who once touching at the iſland of Gomera to procure freſh water, hired ſome poor ragged fiſhermen to fill the water-caſks, and bring them on board; but ſome time after, going to the watering-place to ſee what progreſs they had made, he found the caſks full, and all ready for rolling down to the beach, with the fiſhermen ſtanding by, and talking together, as if they had nothing farther to do. He reprimanded them for their lazineſs in not diſpatching the buſineſs in which he had employed them; when one of them, with a diſdainful air, replied, "What do you take us to be, Sir? "Do you imagine we are porters? No, Sir, we are "ſeamen." Notwithſtanding all his intreaties and promiſes of reward, he was unable to prevail on any of them to roll the caſks to the water-ſide; but was at laſt obliged to hire porters.

Though the gentry of theſe iſlands are uſually poor, yet they are extremely polite and well bred, the very peaſants and labouring people have a conſiderable ſhare of good manners, with little of that ſurly ruſticity which is too common among the lower claſs of people in England; yet they do not ſeem to be abaſhed in the preſence of their ſuperiors. A beggar aſks charity of a gentleman, by ſaying, "For the love of God, Sir, pleaſe to give "me

"me half a rial;" and if the other gives him nothing, he returns, "May your worſhip excuſe me, for the "love of God."

The ſervants and lower people are much addicted to pilfering, for which they are ſeldom puniſhed any other way than by being turned off, beaten, or impriſoned for a ſhort time. Robberies are ſeldom or never committed; but murder is more common than in England; and they have no notion of duels, for they cannot comprehend that a man's having the courage to fight can atone for the injury he has done his antagoniſt, or that it ought to give him a right to do him a greater. When the murderer has killed a man, he flies to a church for refuge, till he can find an opportunity to make his eſcape to another iſland; and if he had been greatly provoked or injured by the deceaſed, and did not kill him in cold blood, every body will be ready to aſſiſt him to eſcape, except the near relations of the perſon murdered; yet quarrels are far from being frequent here, which may be owing to the want of taverns and other public-houſes, to their temperance in drinking, their polite behaviour, and the little intercourſe between them.

The lower people never fight in public; but if one perſon puts another in a violent paſſion, the injured party, if able, takes his revenge in the beſt manner he can, without regard to what is called fair-play, till he thinks he has got ſufficient ſatisfaction.

The people are in general extremely temperate; and was a gentleman ſeen publicly drunk, it would be a laſting ſtain on his reputation. The evidence of a man who can be proved a drunkard, will not be taken in a court of juſtice; hence thoſe who are fond of wine ſhut themſelves up in their bed-chambers, where, when they have drank their fill, they get into bed and ſleep it off.

In theſe iſlands perſons of all ranks are extremely amorous; but their notions of love are ſomewhat romantic, which is perhaps owing to the want of innocent freedom between the ſexes. They do not, however, ſeem to be inclined to jealouſy, any more than the Engliſh or French; and in every country, cuſtom has eſtabliſhed between the ſexes certain bounds of decency and decorum, beyond which no perſon will go, without a bad intention. It is uſual for young people here to fall in love at ſight; and if the parties agree to marry, but find their parents averſe to their union, they acquaint the curate of the pariſh with the affair, who goes to the houſe where the girl lives, and endeavours to perſuade them to agree to her marriage; but if they cannot be induced to give their conſent, he takes her away before their faces, without their being able to hinder him, and either places her in a nunnery, or with ſome of her relations, till he marries them.

It is ſaid not to be uncommon for a lady to ſend to a man an offer of her perſon in an honourable way, when, if he does not think proper to accept the offer, he keeps it ſecret till death: ſhould he do otherwiſe, he would be looked upon by all people in the moſt deſpicable light. Young men are not allowed to court young girls without any intention to marry them; for if a woman can prove that a man has, in any inſtance, endeavoured to engage her affections, ſhe can oblige him to marry her. This, like many other good laws, is abuſed; for looſe women take advantage of it, and frequently lay ſnares to entrap the ſimple and unwary; and ſometimes worthleſs young men form deſigns upon the fortunes of ladies, without having the leaſt regard for their perſons: however, there are not many mercenary lovers in this part of the world, their notions being in general too refined and romantic to admit the idea of that paſſion being made ſubſervient to their ambition or intereſt; and yet there are more unhappy marriages here than in the countries where innocent freedoms being allowed between the ſexes, lovers are not ſo blinded by their paſſions as not to perceive their miſtreſſes are frail and imperfect.

When a man loſes his wife by death, ſome of his relations come to his houſe, and reſide with him ſome time, in order to divert his grief, and do not leave him till another relation comes to relieve the firſt; the ſecond is relieved by a third; and thus they ſucceed each other till the term of a year is expired.

Every one of the Canary Iſlands, and every town and village in them, has a particular ſaint for its patron, whoſe day is celebrated as a feſtival, by a ſermon preached in honour of the ſaint, and a ſervice ſuited to the occaſion. On theſe days the ſtreet near the church is ſtrewed with flowers and leaves, a multitude of wax candles are lighted, and a conſiderable quantity of gunpowder uſed in fireworks.

On the eve of theſe feſtivals is generally held a kind of fair, to which the people of the adjacent country reſort, and ſpend the greateſt part of the night in mirth, and dancing to the ſound of the guittar, accompanied with the voices not only of thoſe who play on that inſtrument, but by thoſe of the dancers.

The dances practiſed here are ſarabands and folias, which are ſlow dances; thoſe which are quick are the canario, firſt uſed by the antient Canarians; the fandango, which is chiefly practiſed by the vulgar; and the zapateo, which nearly reſembles our hornpipe. Some of theſe dances may be termed dramatic, as the men ſing verſes to their partners, who anſwer them in the ſame manner. The natives of theſe iſlands have generally excellent voices, and few of them are unable to play on the guittar.

At the feaſt of the tutelar ſaints of Tenerife, Canaria, and Palma, plays are acted in the ſtreets, for the entertainment of the populace; but the performers not being profeſſed actors, and only ſome of the inhabitants of the place, who ſeem to have a natural turn for acting, they cannot be ſuppoſed to ariſe to any great degree of perfection.

All the eminent families have alſo a particular ſaint, or patron, to whoſe honour they keep a feſtival at a great expence; and, on theſe occaſions, the gentry vie with each other in the ſplendour of their entertainments. The gentry frequently take the air on horſeback; but when the ladies are obliged to travel, they ride on aſſes, and inſtead of a ſaddle they uſe a kind of chair, in which they ſit very commodiouſly. The principal roads are paved with pebble-ſtones, like thoſe uſed in the ſtreets of London. There are a few chariots in the city of Palmas in Canaria, the town of Santa Cruz, and the city of Laguna, in Tenerife: theſe are all drawn by mules; but they are kept rather for ſhew than uſe; for the roads, being ſteep and rocky, are not proper for wheel-carriages.

The diverſions in uſe among the lower claſs of people, beſides dancing, ſinging, and playing on the guittar, are throwing a ball through a ring placed at a great diſtance, cards, wreſtling, and quoits. The peaſants, particularly of Gomera, when they travel have the art of leaping from rock to rock, which is thus performed: the long ſtaff, or pole, uſed on theſe occaſions has an iron ſpike at the end of it; and when a man wants to deſcend from one rock to another, he aims the point of his pole at the place where he intends to alight, and then throws himſelf towards it, pitching the end of the pole ſo as to bring it to a perpendicular, and then ſlides down it to the rock on which it ſtands.

Children are taught in the convents reading, writing, latin, arithmetic, logic, and other branches of philoſophy. The ſcholars read the claſſics; but Greek is never taught here, and is entirely unknown even to the ſtudents in divinity: they are particularly fond of civil law and logic, which laſt is moſt eſteemed.

The natives of theſe iſlands have a genius for poetry, and compoſe verſes of different meaſures, which they ſet to muſic. Some of their ſongs, and other poetical pieces, would be greatly eſteemed in any country where a taſte for poetry prevails. Few of thoſe books which are called prophane, only to diſtinguiſh them from thoſe of a religious kind, are read here, ſince they cannot be imported into the iſland without being firſt examined by the inquiſition, a court with which nobody cares to have any concern. However, the Hiſtory of the Wars in Granada is in every body's hands, and is read by people of all ranks; they have alſo ſome plays, moſt of which are very good ones. But the books moſt read by the laity are the Lives of the Saints and Martyrs, which may be conſidered as a kind of religious romances ſtuffed with legends, and the moſt improbable ſtories. Thomas a Kempis, and the Devout Pilgrim, are in every library, and much admired.

SECT.

SECT. XVI.

Of the Civil Government of Canaria, Tenerife, and Palma; of the eccleſiaſtical Government of all the Iſlands in general; and the Diſeaſes to which the Natives are ſubject.

WE have already deſcribed the government of Lancerota and Fuertaventura, and that of Gomera and Ferro nearly reſembles them; we ſhall now, therefore, proceed to the government of Canaria, Teneriſe, and Palma, which are called the King's Iſlands.

The natives on their ſubmitting to the crown of Spain were ſo far from being deprived of their liberty, that they were put on an equality with their conquerors, in which the Spaniards ſhewed the utmoſt wiſdom and policy; but how they came ſoon after to act in a quite contrary manner in America, is hard to determine. After the conqueſt of the Canary Iſlands, the Spaniards incorporated with the natives in ſuch a manner as to become one people with them, and in conſequence of this political union, the king of Spain is able to raiſe in theſe iſlands more ſoldiers and ſeamen than in any other part of his dominions of three times their extent.

The loweſt officer of juſtice, except the alguazils, is the alcalde, who is a juſtice of peace; and there is one of them in every town or village of note. Theſe magiſtrates are appointed by the royal audience of the city of Palmas, in Canaria: they hold their places only for a certain time, and, in caſes of property, can take cognizance of no diſputes where the value of what is contended for exceeds ſeventeen rials, or ſeven ſhillings ſterling. Over theſe magiſtrates is the alcalde major, who is appointed in the ſame manner as the other, and cannot decide any caſe relating to property that exceeds the ſum of two hundred dollars. From the deciſions of thoſe magiſtrates, appeals lie to the tiniente and corregidor: the firſt of whom is a lawyer, and nominated by the royal audience; but the latter, who is appointed by the king, is not obliged to be a lawyer, yet muſt have a ſecretary, clerk, or aſſiſtant bred to the law.

The corregidor generally holds his place five years, and ſometimes longer. Few of the natives enjoy this honourable office, which is commonly filled by native Spaniards. The proceedings in the corregidor's court, and in that of the tiniente, are the ſame; theſe courts ſeeming to have been originally intended as a check upon each other.

Appeals are made from the corregidor and tiniente to the royal audience of Gran Canaria; a tribunal compoſed of three oidores, or judges, a regent, and fiſcal, who are uſually natives of Spain, and are always appointed by the king. The governor-general is preſident of this court, though he reſides in Tenerife. In criminal cauſes there is no appeal from their determination; but, in matters relating to property, appeals are carried to the council or audience of Seville, in Spain.

The ſtanding forces in the Canary Iſlands amount only to about a hundred and fifty men; but there is a militia, of which the governor-general of the iſlands is always commander in chief, and the officers, as colonels, captains, and ſubalterns, are appointed by the king. There are alſo governors of forts and caſtles, ſome of which are appointed by the king, and others by the twelve regidores of the iſlands, called the cavildo; for ſome of the forts belong to the king, and the reſt are under the direction of the regidores.

The regidores alſo take care of the repairs of the highways, prevent nuiſances, and the plague from being brought into the iſland by ſhipping; for no man is allowed to land in theſe iſlands from any ſhip till the maſter produces a bill of health from the laſt port he left, or till the crew have been properly examined.

The king's revenue ariſes from the following articles: a third of the tithes, which ſcarcely amounts to a tenth part of them, the clergy appropriating almoſt the whole to themſelves. This third part was given by the pope to the king of Spain, in conſideration of his maintaining a perpetual war againſt the infidels.

The ſecond branch of their revenue conſiſts in the monopoly of tobacco and ſnuff, which the king's officers ſell on his account, no other perſons being allowed to deal in thoſe articles.

Another branch of the revenue ariſes from the orchilla weed, all of which in the iſlands of Tenerife, Canaria, and Palma, belong to the king, and is part of his revenue; but the orchilla of the other iſlands belongs to their reſpective proprietors.

The fourth branch conſiſts of the acknowledgment annually paid by the nobility to the king for their titles, which amounts to a mere trifle.

The fifth branch is a duty of ſeven per cent. on imports and exports: and the ſixth duty on the Canary Weſt India commerce. All theſe branches, the ſixth excepted, are ſaid not to bring into the king's treaſury above fifty thouſand pounds per annum, clear of the expences of government and all charges.

With reſpect to the eccleſiaſtical government of the Canary Iſlands in general, it muſt be obſerved, that the biſhop is ſuffragan to the archbiſhop of Seville, in Spain, and has a revenue of ſix thouſand pounds ſterling per annum. He reſides in the city of Palma, in Canaria, where he is treated with as much reſpect and homage as a ſovereign prince.

The ſuperiors of the various orders of friars and nuns reſide in the city of St. Chriſtobal de la Laguna, and are only accountable to the generals of their reſpective orders at Rome.

In each of the iſlands is a houſe belonging to the inquiſition, with its proper officers, in order to prevent all appearance of hereſy or diſreſpect to the clergy. They have power to apprehend and confine ſuſpected perſons, without giving any reaſon for it to the civil magiſtrate; and, after examining them, they are either diſcharged, or ſent to the tribunal at Canaria.

When any foreign ſhips arrive at the iſlands, the firſt time the maſter comes a-ſhore, he is conducted to an officer of the inquiſition, who examines him, whether he has any books or pictures in his ſhip againſt the doctrine or ceremonies of the church of Rome? and he is obliged to ſign a paper, by which he engages, if he has any, not to land or expoſe them to view; and that, while he remains in the country, he will neither ſpeak againſt the Romiſh religion, nor ridicule its rites and ceremonies. As all the natives are zealous members of the Romiſh church, this tribunal has ſeldom an opportunity of exerciſing its extenſive authority.

As the gentry are generally poor, and unable to give fortunes to their younger ſons and daughters, many of the former are educated for the church; and not a few young ladies ſhut themſelves up in convents for life, becauſe they cannot find huſbands ſuitable to their rank, and are unwilling to depend on their elder brothers, or other relations, for ſubſiſtence: others take the ſame ſtep, from their having met with diſappointments in love; and a few, flattered by the nuns and clergy into a high conceit of their own ſanctity, from religious motives, take the veil.

The prieſts are here far from being ſatisfied with their tithes, or the friars with the revenues of their convents, and have therefore found means to load the inhabitants with many impoſitions which, though not eſtabliſhed by law, it would be dangerous for them to preſume to refuſe paying. Thus every fiſhing bark from the coaſt of Barbary is obliged to deliver a certain quantity of fiſh to each convent; and when the Mendicant friars go begging from houſe to houſe, they are liberally ſupplied; and, was any to refuſe giving them alms, they would be marked out as objects of their vengeance, and be expoſed to the inquiſition. In ſhort, all ranks of men, who have any great point in view, take care, in the firſt place, to ſecure in their intereſt the leading men of the clergy; and, when this is accompliſhed, it is eaſy to ſurmount every other obſtacle.

The Catholicks of theſe iſlands ſeem to think, that all excellence is confined to thoſe of their religion; and when they ſee any of a different perſuaſion behave with common decency, they appear greatly ſurpriſed, imagining that thoſe they call heretics differ but little from brutes.

All ſtrangers, who are not of the Romiſh religion, are ſtrongly importuned on their arrival to become proſelytes; and indeed it is not poſſible for a perſon to live in any of the Canary Iſlands, except Tenerife, who is not a member of the church of Rome, and even in Tenerife no profeſſed Jew, Mahometan, or Pagan can be a member of ſociety; nor indeed can any proteſtants, except they are eminent merchants. The clergy are unwilling to meddle with them, and probably have orders from Rome not to diſturb them, leſt it ſhould embroil them with the Engliſh or Dutch. Indeed formerly it was no uncommon thing for the inquiſition to ſeize on the Dutch and Engliſh conſuls.

All the foreigners in theſe iſlands make very juſt complaints of the want of good phyſicians and ſurgeons. The diſeaſes moſt predominant here, beſides the itch and venereal diſorders, which have been mentioned in another place, are the ſpotted fever, the flatos, a windy diſorder affecting the head, ſtomach, and bowels, and the palſey. The ague is ſcarce known in any of the iſlands, except Gomera. A few of the natives are affected with the leproſy, and, as it is thought, incurable, there is an hoſpital at Canaria for the reception of the unhappy ſufferers by that loathſome diſeaſe. A man of fortune is no ſooner found to be a leper, than all his effects are ſeized for the uſe of the hoſpital, without leaving any part for the ſupport of his family; while the poor, who are infected with that diſtemper, are left to ſubſiſt as well as they can, or to periſh in the ſtreets. The ſole judges of the leproſy are the directors of the hoſpital, and from their determination there is no appeal.

SECT. XVII.

Of the Manufactures and Commerce of Canaria, Tenerife, Palma, Gomera, and Ferro; with a particular Account of their Fiſhery on the Coaſt of Barbary; and of the Coin, Weights, and Meaſures uſed in the Canaries.

THE manufactures of theſe iſlands are taffeties, knit ſilk hoſe, ſilk garters, and quilts for beds. In Canaria and Teneriſe courſe linens and gauſe are made of the flax imported from Holland. In Canaria is alſo made white blankets, and coarſe cloths, from the wool of their own ſheep. The reſt of the iſlands alſo make a coarſe kind of cloth, which is worn by the peaſants; but on feſtivals, weddings, &c. the labouring people uſually wear Engliſh coarſe cloth. The exportation of raw ſilk is now prohibited, in order to encourage their ſilk manufactures. In the large towns men are employed in weaving, and as taylors; but in the villages thoſe trades are only exerciſed by the women.

The Commerce of the Canary Iſlands may be divided into, that to Europe, and to the Engliſh colonies in America; that to the Spaniſh Weſt Indies; that carried on between the iſlands themſelves, and the fiſhery on the coaſt of Barbary.

Ferro and Gomera are ſo poor as to be viſited by no ſhips from Europe or America; nor are the natives of thoſe iſlands allowed any ſhare of the Spaniſh Weſt India commerce, they being not entirely under the juriſdiction of the crown of Spain, but ſubject to the count of Gomera, who is their lord and proprietor.

The trade to Europe and the Britiſh American colonies is centred in Tenerife. A few ſhips indeed go to Canaria and Palma; but theſe are not to be compared to the numbers that arrive at Teneriſe. This trade is carried on almoſt entirely in foreign bottoms, eſpecially in Engliſh, the natives being afraid of ſailing in thoſe ſeas where they are in danger of being taken by the corſairs of Algiers, Sallee, and other ports of Barbary. The greateſt part of this trade is the hands of the Iriſh Roman catholic merchants ſettled in Teneriſe, Canaria, and Palma, and the deſcendants of the Iriſh who formerly ſettled there and married Spaniſh wives; and there are no proteſtants who reſide there, except the Engliſh and Dutch conſuls, and two or three merchants who live at Tenerife.

They import from Great Britain to theſe iſlands chiefly woollen goods of various kinds, hats, hardware, red herrings, pilchards, and wheat, when it is ſcarce in the iſlands, with many other articles. The imports from Ireland chiefly conſiſt of beef, pork, pickled herrings, butter, and candles. Linens of all ſorts are imported from Hamburgh and Holland, to a very great amount; as alſo gunpowder, cordage, coarſe flax, and other goods. A conſiderable quantity of bar iron is annually imported from Biſcay.

The imports from Majorca, Italy, Barcelona, Cadiz, and Seville, chiefly conſiſt of velvets, ſilks, oil, ſalt, and cordage made of baſs or ſpartum, with many little articles for the conſumption of the Canary Iſlands and the Spaniſh Weſt Indies. This trade is almoſt entirely carried on in French and Malteſe tartans. The Malteſe veſſels, before they fall to theſe iſlands, make the tour of all the European harbours to the weſtward of Malta, trading from one port to another. From the Mediterranean they go to Cadiz, and from thence to the Canaries, where, beſides the commodities of Italy, France, and Spain, they ſell the cotton manufactures of their own iſland; all cottons imported into the Canary Iſlands, except thoſe from Malta, paying ſuch an exorbitant duty as almoſt amounts to a prohibition. This privilege is enjoyed by the Malteſe, on account of their maintaining a perpetual war againſt the Turks and Moors.

They import from the Britiſh colonies, in America, beef, pork, hams, baccalao or dried cod, rice, bees-wax, deal boards, pipe ſtaves, and, when the crops in the iſlands fail, wheat, flour, and maize.

In return, theſe iſlands export to Great Britain and Ireland wine, orchilla-weed, Campeachy logwood, and a conſiderable quantity of Mexican dollars. To Holland and Hamburgh the ſame goods; but a greater quantity of dollars, and little or no orchilla-weed. To Marſeilles, Malta, Italy, and Spain, the commodities they receive from the Spaniſh Weſt Indies, particularly ſugar, hides, Campeachy logwood, ſome orchilla-weed, and dollars; and to the Britiſh colonies, in America, a great quantity of wines, and nothing elſe.

All theſe goods, whether imported into the Canaries, or exported from thence, pay a duty of ſeven per cent. on the rated value.

The commerce of the Canary Iſlands with the Spaniſh ſettlements in the Weſt Indies is under particular regulations, and no foreigners are permitted to have any ſhare in it; nor are any ſhips ſuffered to ſail to the Spaniſh ports of that part of America from any of the iſlands, except Teneriſe, Canaria, and Palma; and the trade there is confined to the ports of the Havannah, Campeachy and La Guaira on the coaſt of Caraccas, St. Domingo, Porto Rico, and Maracaiva: the three firſt are called the greater ports, and the others the leſſer, becauſe the trade of the latter is very trifling, when compared with that of the former.

In the city of St. Chriſtobal de la Laguna is a judge, a ſecretary, and other officers, who manage every thing relating to this trade; and, before a ſhip takes in her lading for any of theſe ports, ſhe muſt obtain a licence from the judge of the India trade, which is generally granted, if it be her turn; for here all ſhips are regiſtered, and muſt take their turns, though intereſt and money often prevail againſt juſtice.

The trade of the Canaries to the Spaniſh Weſt Indies is confined to their produce, as wines, brandy, almonds, raiſins, figs, &c. of which they can annually ſend one thouſand tons; and are only allowed beſides what is termed a general for each ſhip, which conſiſts of all the kinds of goods thought neceſſary for the uſe of the veſſel, crew, and paſſengers, during the voyage; and is more or leſs extenſive in proportion to the ſize of the ſhip. But tho' they are thus reſtricted by the rules, this trade is extended much farther; and, it is ſaid, they export at leaſt two thouſand tons of the produce of the iſlands, and alſo immenſe quantities of European commodities.

The cargoes brought from the Weſt Indies conſiſt of the commodities of the ports from whence they come, and are chiefly logwood, hides, cacao-nuts, ſugar, and Mexican dollars; all which they are obliged to land at Santa Cruz, in Teneriſe; but cochineal and indigo are prohibited from being landed there. The ſilver they bring is limited to fifty Mexican dollars per ton, accord-

ing to the regiſtered tonnage; yet ſome of theſe ſhips are ſaid to bring home to Tenerife one hundred thouſand dollars.

The ſhips employed in this trade are commonly about two hundred and fifty, or three hundred tons burthen. Some of them are built in the iſlands, and others at the Havannah, or Old Spain. No foreign bottoms can be employed in this trade; for which reaſon the freight from the Canaries to the Weſt Indies is extremely high; for the Canary ſhipping carry ſo many uſeleſs hands, particularly chaplains; lie ſo long in the road of Santa Cruz, waiting their turns; and are at ſuch a vaſt expence of anchors and cables, that the owners cannot afford to take leſs freight for a pipe of wine, from the Canaries to La Guaira, than ten pounds ſterling; and yet the run from Tenerife to that port being all the way before the wind, is uſually performed in leſs than thirty days: yet our author obſerves, that were the natives allowed to employ Engliſh ſhips in this trade, they would ſoon find a ſufficient number ready to carry their wine at the rate of twenty ſhillings for each pipe.

With reſpect to the trade carried on from one iſland to another, it is as follows;

The natives of Canaria export to Tenerife ſome raw and wrought ſilk, coarſe woollen blankets, proviſions of all ſorts, particularly cattle and fowls, orchilla-weed, ſquare flags for pavements, ſome ſalt, and filtering ſtone veſſels for purifying water. In return for theſe commodities, they chiefly receive caſh, and the other produce of the Spaniſh Weſt Indies.

Palma exports to Tenerife boards, pitch, raw ſilk, orchilla-weed, ſugar, almonds, and ſweet-meats; and receives in return European and Weſt India goods.

The natives of Gomera export to Tenerife cattle, brandy, orchilla-weed, a great deal of raw ſilk and ſome wrought, and in return receive European and Weſt India goods.

The inhabitants of Ferro export to Tenerife ſmall cattle, brandy, and orchilla-weed.

Lancerota and Fuertaventura export a great quantity of corn to Tenerife, beſides cattle, fowls, and orchilla-weed; and, in return, generally receive European goods and caſh, with ſome wine. The natives of the ſame iſlands ſend corn to Palma, for which they receive ſugar, wine, caſh, boards, and other timber. The natives of Lancerota alſo export ſalt and ſome dried fiſh to Tenerife and Palma.

All the veſſels employed in this trade are built in the iſlands, and are from twenty to fifty tons burthen; they are about twenty-five in number, and each of them navigated by ten hands, on account of the great labour required in loading and unloading their cargoes.

We now come to the fiſhery carried on by the natives of the Canary Iſlands on the coaſt of Barbary. It employs about thirty veſſels, from fifteen to fifty tons burthen, the ſmalleſt carrying fifteen men, and the largeſt thirty. The owners having fitted out a veſſel for this voyage, put on board a quantity of ſalt ſufficient to cure the fiſh, with bread enough to ſerve the crew till their return. Each man has his own fiſhing tackle, which conſiſts of a few lines, hooks, one or two ſtout fiſhing-rods, a little braſs wire, and a knife for cutting open the fiſh. If any of the crew carry wine, brandy, fleſh-meat, or any other ſtores, it muſt be at his own expence; for the owners furniſh only bread.

This fiſhery is bounded on the north by the ſouthern extremity of Mount Atlas, in the latitude of twenty-nine degrees, and on the ſouth by Cape Blanco, in the latitude twenty degrees thirty minutes, an extent of about ſix hundred miles; in all which tract there is neither town nor village, and but few ſettled habitations. The wandering Arabs who frequent this part of the world live in tents, and have neither barks, boats, nor canoes; and the king of Morocco's cruiſers never venture ſo far to the ſouthward.

The fiſhermen no ſooner arrive on the coaſt, than they endeavour to catch bait, which is done as we do trouts with a fly, only the rod is three times as thick as ours, and does not taper ſo much towards the point. The line is formed of ſix braſs wires twiſted together; the hook is about five inches in length, and is not bearded; the ſhaft is loaded ſo as to lie horizontally on the ſurface of the water, and the hook is covered with a fiſh's ſkin, except where it bends to the point. The fiſhermen getting within a quarter or half a mile of the ſhore, carry ſo much ſail as to cauſe the bark to run about four miles an hour, when two or three men throw their lines over the ſtern, and let the hooks drag along the ſurface of the water. The fiſh taking the hooks for ſmall fiſh, ſnap at them; and they are no ſooner hooked, than the fiſhermen ſwing them into the barks with their rods.

Theſe fiſh, which the Canarians call taſſarte, have no ſcales, and are ſhaped like a mackarel, but are as large as a ſalmon; and they are ſo voracious, as to ſwallow all the hook, notwithſtanding its being ſo large; and was it bearded, it would be impoſſible to extract it, without cutting open the fiſh. Our author obſerves, that he has ſeen three men in the ſtern of a bark catch a hundred and fifty taſſarte in half an hour, and a bark will ſometimes complete her lading with theſe fiſh only. Another ſort of fiſh which they call anhoua is taken in the ſame manner: this is rather bigger than a large mackarel, and alſo ſerves for a bait; as does alſo another fiſh called cavallos, which is ſhaped like a mackarel, but is ſomewhat more flat and broad; it is about a ſpan long, and is catched with an angle-rod and line, with a very ſmall hook, baited with almoſt any thing that comes to hand.

When a bark has obtained a ſufficient ſtock of bait, ſhe leaves her boat with five or ſix men to catch more, and runs out to ſea till ſhe gets into a great depth of water; there ſhe anchors, and all the crew heave their lines and hooks over-board, baited with the above fiſh, in order to catch bream and cod. The lines are loaded ſo as to cauſe the hooks to ſink near the bottom of the ſea, where theſe fiſh ſwim; and when a bark meets with fine weather, and is well provided with bait, ſhe will be able to compleat her cargo in four days.

Theſe people make but one meal in the whole day, which is in the evening, after they have cleaned and ſalted the fiſh they have taken; they then dreſs their ſupper in the following manner. In every bark the crew has a long flat ſtone for a hearth, upon which they light a fire, and hang a large kettle over it, in which they boil ſome fiſh: they then take a platter, with ſome broken biſcuit, onions ſhred ſmall, to which they add pepper and vinegar, and then pour in the broth of the fiſh, which is ſaid to be delicious. Having eaten of this excellent ſoup, they finiſh their meal with roaſted fiſh; for they throw that of which the ſoup was made into the ſea. Soon after this repaſt they lie down to ſleep in the moſt commodious part of the veſſel, for they have no bedding, and about five or ſix in the morning riſe, leave the boat near the ſhore, weigh anchor, and ſtand out to ſea as before, never taſting food before the ſame time the next evening.

Though the bulk of their cargoes conſiſts of large bream, yet they catch many other ſorts. The taſſarte juſt mentioned is a delicious fiſh, which taſtes like a large and a fat mackarel; but, when dried, is not to be diſtinguiſhed from ſalmon. The cod caught here is better than that of Newfoundland: the anhoua is extremely good; the corbino is a large fiſh that weighs about thirty pounds. There are alſo a number of flat fiſh, with many other ſorts.

Theſe fiſh are thus cured; they cut them open, and having thoroughly cleaned and waſhed them, chop off their heads and fins, and pile them up to drain off the water; after which they are ſalted, and ſtowed in bulk in the hold.

"It is ſtrange, ſays Mr. Glas, to think that the Spa-
"niards ſhould want to ſhare the Newfoundland fiſhery
"with the Engliſh, when they have one much better at
"their own doors. I ſay better, for the weather here,
"and every thing elſe, concurs to make it the beſt
"fiſhery in the univerſe. What can be a ſtronger proof
"of this, than the Moors on the continent drying and
"curing all their fiſh without ſalt, or any other proceſs
"than expoſing them to the ſun-beams? for the pure
"wholeſome air of that climate, and the ſtrong northerly
"wind which almoſt conſtantly prevails on this coaſt,
"totally

"totally prevents putrefaction, provided the fish are split "open, well washed, and exposed to the sun until they "are perfectly dry."

The Canarian barks make eight or nine voyages in a year; for having unloaded their cargoes, they leave the fish with their agents to sell them at their leisure, while they go in search of more. They are commonly sold at three half-pence for a pound of thirty-two ounces, which is the weight used here for flesh and fish.

Instead of encouraging this useful and profitable branch of trade, the magistrates take every method to hurt it, by fixing the price of the fish, clogging the trade with unreasonable duties, and forbidding the fishermen to have any intercourse with the Moors on the coast, where they sometimes go to fish, which is a great hardship, as they are frequently obliged, when they meet with bad weather, to go ashore for fewel and water. They, however, privately correspond, to their mutual advantage; for the Canarians give the inhabitants of the desart old ropes, which the latter untwist and spin into yarn or twine, for making fishing-nets: they also give them bread, potatoes, onions, and many kinds of fruit; in return for which the Moors allow them to take wood and water on their coast, whenever they are in want of these necessary articles, and make them presents of ostrich eggs and feathers.

The current coin in the Canaries is the Mexican dollar, and the half, quarter, eighth, and sixteenth parts of a dollar. There is also the provincial rial of plate, which is a small silver piece worth five-pence sterling. The quart, a copper coin of the value of a half-penny, ten of which make a rial of plate. The provincial silver coin is never exported, on account of its passing in the islands for more than its intrinsic value. Accounts are kept in imaginary money, that is, current dollars of ten rials of vellon each. The rial of vellon is equal in value to eight of the above quarts, and the current dollar is exactly three shillings and four-pence; and, therefore, six of them make one pound sterling. Three sixteenths of the Mexican dollar pass for two rials of plate. Little or no gold coin is to be found in these islands.

The pound and smaller weights are nearly the same with ours. The quintal, which is their hundred weight, weighs only a hundred and four pounds. The arroba is twenty-five pounds.

The measures used in the Canaries are the fanega, or hanega, the almud, the liquid arroba, the quartillo, and the var. The fanega is a measure for corn, cacao, salt, and the like, and contains nearly the quantity of two English bushels. Twelve almuds make a fanega. The liquid arroba contains little more than three gallons, and the quartillo is nearly equal to our quart. The var is a measure for cloth, &c. and is somewhat less than the English yard.

We have now concluded our account of these islands, in which we have borrowed much from Mr. Glas, whose History of the Canary Islands must be esteemed both the best and the most entertaining that has been wrote on this subject; and it is a pleasure to us that, in the course of this work, we have an opportunity of doing justice to the merit of authors who have deserved well of their country, and of mankind.

SECT. XVIII.

A concise Description of the Islands called the Salvages; their Situation and Produce.

IT will not be improper, before we describe the Madeiras, to give a concise account of the islands or rocks named the Salvages, which lie between the Canary Islands just described, and Madeira, and are situated twenty-seven leagues north from Point Nago, in Tenerife, in thirty degrees twenty minutes north latitude, and in sixteen degrees twenty-five minutes west longitude from London.

The principal island, which is high and rocky, is about three miles in circumference. Three or four leagues to the south-west of this island is another not unlike the largest Needle rock at the west end of the Isle of Wight. Between these islands are a considerable number of rocks and sands, some above and others under water, which render it dangerous for those unacquainted with these islands to approach them, except on the east side of the great island, which produces nothing but orchilla-weed. Here are great plenty of cormorants, or sea-fowls that nearly resemble them. Some barks and boats belonging to the Canary Islands frequent the Salvages in the summer season, in search of wrecks and those sea-fowls; for they catch the young in their nests, kill and salt them, and then carry them to Tenerife for sale.

The Salvages, though uninhabited, belong to the Portuguese, who consider them as dependant on the island of Madera, and, notwithstanding they scarcely ever visit them, will not allow the Spaniards to gather orchilla-weed there. A few years ago some fishermen went in a bark from Tenerife to these islands, in quest of wrecks; but finding none, went ashore, and gathered about half a ton of orchilla-weed. But this was no sooner known at Madera, than the Portuguese complained of it to the governor-general of the Canary Islands, and would not be satisfied till the master of the bark was thrown into prison, where he remained a long time.

SECT. XIX.

Of the MADERA, *or* MADEIRA *Islands.*

The Situation, Extent, and Produce of Madera; with a Description of Fonchiale, its Capital; and a concise Account of the little Island of Porto Santo.

THE Maderas are two islands, situated to the north of the Salvages, and were thus named from the principal of them, which was called by the Portuguese Madera, signifying a wood or forest, from its being overgrown with trees.

The island of Madera was discovered, according to Mr. Ovington, by an English gentleman in 1344, and was taken by the Portuguese in 1431, when they found it uninhabited; and making a fire to warm themselves, it communicated itself to the trees, which continued burning for several years; but the ashes rendered the soil extremely fertile.

This island is situated under the thirty-second degree twenty-seven minutes north latitude, and extends, according to Lord Anson's Journal, from the eighteenth degree thirty minutes to the nineteenth degree thirty minutes west longitude from London, it being about sixty miles in length, twenty in breadth, and a hundred and forty-four in circumference. It is composed of one continued hill of a considerable height, extending from east to west: the declivity of which, on the south side, is cultivated and interspersed with vineyards; and, in the midst of this slope, the merchants have fixed their country-seats, which help to form a very agreeable prospect.

The air of Madera is more moderate than in the Canary islands, and the soil more fertile in corn, wine, sugar, and fruits; for, as it has five or six rivers, it is better watered than any of those islands. It has also the same cattle, birds, plants, and trees. Here is a perpetual spring, which produces blossoms and fruit throughout the whole year.

It produces plenty of citrons, bananas, peaches, apricots, plums, cherries, figs, and walnuts; with oranges of all sorts, and lemons of a prodigious size. Fruit-trees from Europe thrive here in perfection; and the native are said to make the best sweetmeats of any in the world, and particularly greatly excel in preserving citrons and oranges, and in making marmalade and perfumed pastes, which greatly exceed those of Genoa. The sugar made here is very fine, and has the smell of violets; this, indeed, is said to be the first place in the West where this manufacture was set on foot, and from thence was carried to America: but afterwards the sugar plantations at Brazil prospering extremely, the greatest part of the sugar-canes in this island were pulled up, and vineyards planted in their stead, that produce excellent wines, which, the author of Lord Anson's Voyage observes, seems to be designed by Providence for the refreshment of the inhabitants of the torrid zone.

Of

Of theſe wines there are ſeveral ſorts; one is of the colour of champaign, but is not much valued: another ſort is a white wine, much ſtronger than the former. A third ſort is excellent, and reſembles malmſey, it being of the ſame nature with that which grows in Teneriſe: and another reſembles Alicant wine, but is much inferior to it in taſte, and is never drank alone, but mixed with the other ſorts, to which it gives a colour, and ſtrength to keep. It is obſervable of the Madeira wines, that they are greatly improved by the heat of the ſun, when expoſed to it in the barrel, after the bung is taken out. In the whole iſland they annually make about twenty-eight thouſand pipes, eight thouſand of which are drank there, and the reſt exported, the greateſt part being ſent to the Weſt Indies, eſpecially to Barbadoes.

Among the timber trees are tall and ſtrait cedars, and naſſo-wood, the boards of which are of a bright roſe colour. There are alſo the maſtic and gum-dragon tree. Atkins mentions a curioſity which he found in the gardens of this iſland, called the everlaſting flower; for when plucked, it never fades. It grows like ſage, and the flower reſembles that of camomile. This author ſays, he plucked ſeveral, which a year after appeared as freſh as when firſt gathered.

There is but one conſiderable town in the whole iſland; it is named Fonchiale, and is ſeated on the ſouth part of the iſland at the bottom of a large bay. Towards the ſea it is fortified by a high wall, with a battery of cannon, beſides a caſtle on the Loo, which is a rock ſtanding in the water, at a ſmall diſtance from the ſhore. Fonchiale is the only place of trade, and indeed the only place where it is poſſible for a boat to land. And even here the beach is covered with large ſtones, and a violent ſurf continually beats upon it.

The churches here are well built, beautiful ſtructures, enriched with gilding, fine pictures and plate, and people are ſaid to meet in them upon buſineſs that has little relation to devotion. The town is very populous, but the majority of the inhabitants are not natural born Portugueſe; for there are a great number of Engliſh and French Roman catholics ſettled there, who live after the Portugueſe manner; ſome Engliſh proteſtants, and a prodigious number of negroes and mulattoes, both freemen and ſlaves. The ſtreets are ſtraight, and drawn by a line; the houſes are pretty well built, and the windows have lattice-work inſtead of ſaſhes.

The women, who have no domeſtic chapels, never go to church but on Sundays and holidays; when, if there be ſeveral daughters, they walk two and two before the mother, each having a large thin veil over her face; but their breaſt and ſhoulders are quite bare. By their ſide walks a venerable old man, with a ſtring of beads in his hand, and armed with a ſword and dagger.

The city is the ſee of a biſhop, who has the whole iſland under his ſpiritual juriſdiction, and is ſuffragan to the archbiſhop of Liſbon. Here alſo reſides the governor of the iſland.

There are two other towns, one called Manchico, which has a church named Santa Cruz, or the Holy Croſs, and a convent of Bernardine friars: the other town is named Moncerito. In ſhort, the iſland lately contained thirty-ſix pariſhes, a college and monaſtery of jeſuits, five other monaſteries, eighty-two hermitages, and five hoſpitals. There are ſeveral fine ſeats and caſtles about the country.

Porto Santo, which is generally termed one of the Madeira iſlands, lies to the north-eaſt of Madeira, in the thirty-ſecond degree thirty minutes north latitude, and in the ſixteenth degree five minutes weſt longitude from London, and is only about fifteen miles in circumference. It was diſcovered in the year 1412 by two Portugueſe gentlemen, ſent by prince Henry, ſon to John I. king of Portugal, to double Cape Bajador, in order to make farther diſcoveries; but being ſurpriſed by a violent ſtorm, were driven out to ſea, and, when they gave themſelves over for loſt, had the happineſs to find this iſland, which proving a ſafe aſylum to them, they called it Porto Santo, or the Holy Port. This iſland produces wheat and other corn juſt ſufficient for the ſupport of the inhabitants: here alſo are plenty of oxen, wild hogs, and a vaſt number of rabbits. There are trees which produce the gum called dragons-blood, and likewiſe a little honey and wax, which are extremely good. It has properly no harbour, but there is good mooring in the road, which affords a convenient retreat to ſhips going to Africa, or coming from the Indies; ſo that merchantmen often ſtop there, which affords conſiderable profit to the inhabitants, who are deſcended from the Portugueſe, the iſland being ſubject to Portugal.

CHAP. XVII.

Of BARBARY, including MOROCCO, FEZ, ALGIERS, TUNIS, and TRIPOLY.

SECT. I.

Of BARBARY *in general.*

Its Situation, Extent, Climate, and Seaſons.

WE now proceed to the northern countries of Africa, uſually comprehended under the general name of Barbary, and, from its limits, ſituation, and commerce with Europe, better known than moſt parts of that extenſive continent we have already deſcribed. This country was by turns poſſeſſed by the Carthaginians, Romans, Greeks, Saracens, Vandals, Arabs, Moors, and Turks; beſides the various attempts made by the Spaniards, Portugueſe, and the European nations who have formed ſettlements in ſome parts of this coaſt, which ſtretches from eaſt to weſt near two thouſand miles in length, and in ſome places ſeven hundred and fifty in breadth. It was known to the antients by the name of Mauritania, Numidia, Africa Proper, and Lybia; and is the beſt country in all Africa, except Egypt and the country about the Cape of Good Hope.

Barbary begins on the weſt at Mount Atlas, extending north-eaſtward along the coaſt of the Atlantic Ocean to Cape Spartel, and then bending eaſtward, forms the ſouth coaſt of the Streights of Gibraltar, and afterwards the ſouth coaſt of the Mediterranean as far as the city of Alexandria, which is the weſtern boundary of Egypt, where that country joins to Barbary. Both coaſts, whether that waſhed by the Atlantic Ocean, or by the Mediterranean, are extremely fertile in corn and paſtures; the former being watered by many large and ſmall rivers, which flow from Mount Atlas, and diſcharge themſelves into the ocean; while the other extends along the declivity of a vaſt range of mountains, ſome of them of a conſiderable height, and ſpread in depth above forty leagues into the inland country: all of them watered by a multitude of rivers, which, after a long courſe, and various windings, through a vaſt variety of pleaſant and fertile vallies, diſcharge themſelves into the Mediterranean.

The climate of this extenſive country is, during a great part of the year, neither extremely hot, nor very cold. There are, however, great quantities of ſnow in winter, and both Atlas and ſome other of the mountains have their tops covered with it all the year round.

Winter begins here about the middle of October, when the weather is frequently very ſharp. The rains uſually begin about the end of the month, and laſt till the end of January, and ſometimes longer; but how

Hour East from London.

ſevere ſoever the weather may be in the morning, the afternoons are commonly warm enough to diſpenſe with a fire. In February the air becomes milder, and the weather uſually changes three or four times in a day.

During the ſpring, which begins about the end of February, the weather is for the moſt part ſerene, except from the latter end of April to that of May, when kind refreſhing ſhowers begin to fall in great plenty, which, warmed by the moderate rays of the ſun, bring the produce of the earth to a gradual maturity; ſo that by the latter end of May, ripe figs and cherries are gathered in Tunis, Algiers, and ſome parts of Morocco. By the middle of July their apples, pears, and plums, are in full maturity; and grapes, with all the latter fruits, are gathered by the latter end of September. Theſe are more or leſs plentiful, according to the quantity of rain that has fallen from the twenty-fifth of April to the twenty-fifth of May; on which account this rain is ſtiled naiſan, or water ſent from heaven; and the people ſave a quantity of it in veſſels for uſe.

Their ſummer begins on the twenty-eighth of May, and laſts till the twenty-ſixth of Auguſt; during which the heat is ſo exceſſive as to be dangerous, eſpecially if they have great rains in June and July, when the atmoſphere becomes ſo hot as to cauſe malignant fevers, and other diſeaſes of the peſtilential kind, which carry off a prodigious number of people for want of proper caution in preventing, or ſufficient ſkill in curing of them. This is chiefly owing to a religious prejudice deeply rooted in the mind of every Mahometan, who imagines that all ſuch ſublunary diſaſters are pre-ordered by an unerring and unalterable decree of the Divine Providence; ſo that every precaution uſed either to prevent or avoid, and every remedy uſed againſt them, are not only thought fruitleſs, but impious. This notion has, however, been in ſome meaſure exploded among the more ſenſible part of the inhabitants of the coaſt, by their frequent commerce with the Chriſtians; but the reſt ſtill eſteem it the greateſt impiety to go a ſtep out of their way to avoid the plague, or to ſue any remedy againſt it.

Autumn begins on the twenty-ſeventh of Auguſt, when a ſenſible diminution of the heat begins to be felt. Winter begins on the ſeventeenth of November, and ends on the ſixteenth of February, when the people begin to plow and ſow their low lands; but that work is performed on the high lands and mountainous parts a month ſooner. They ſuppoſe the year to have forty days of exceſſive hot weather, and as many of exceſſive cold: the former begins about the twelfth of June, and the latter about the twelfth of December. At the two equinoxes they regulate all affairs relating to agriculture and navigation, and have many perſons among them who are very expert in directing and eſtabliſhing ſettled rules for both, though they can neither write nor read.

The natives of Barbary mention three winds which are dangerous and detrimental to them: theſe are the eaſt, ſouth-eaſt, and ſouth; and all of them are moſt prejudicial in the months of May and June, in which they ſeldom fail of blaſting a great deal of fruit, and burning up the grain, to which the fogs and miſts that uſually reign at thoſe times greatly contribute. During the latter end of autumn, the whole winter, and the beginning of ſpring, they are much expoſed to violent rains, ſnow, hail, thunder, and lightning. Thoſe who inhabit the high lands, eſpecially along the ridge of mountains of the great Atlas, reckon but two ſeaſons in the year, winter and ſummer, the former of which laſts from October to April, during which ſuch quantities of ſnow fall in the night, that they are frequently obliged in the morning to remove it with ſhovels from the doors. During their ſummer, which laſts from April to September, the vallies are exceſſive pleaſant; but the higher grounds more temperate and agreeable, and the tops of the mountains are not warm enough to melt away the winter ſnow.

SECT. II.

Of the Vegetables, Beaſts, Reptiles, Birds, and flying Inſects of Barbary in general.

BARBARY produces ſeveral kinds of grain, beſides all that are found in Europe, except oats, particularly rice, a white ſort of millet, and ſeveral ſorts of pulſe unknown in England. The Moors and Arabs ſtill follow the primitive cuſtoms obſerved in the Eaſt of treading out their corn, after which it is only winnowed by throwing it into the wind with ſhovels.

Dr. Shaw obſerves, that in Barbary all kinds of proviſions are extremely cheap; and that you may purchaſe a large piece of bread, a bundle of turnips, or a ſmall baſket of fruit, for the ſix hundredth and ninety-ſixth part of a dollar, of three ſhillings and ſix-pence ſterling. Fowls are frequently bought for three half-pence a piece, a ſheep for three ſhillings and ſix-pence, and a cow and calf for a guinea. One year with another the people can purchaſe a buſhel of the beſt wheat for fifteen or eighteen pence. The inhabitants of theſe countries, as well as the Eaſtern nations in general, are great eaters of bread, and three perſons in four live entirely upon it, or upon ſuch food as is made of wheat and barley-flour.

All the fruits in Europe, beſides thoſe found in Egypt, are produced here, except the hazel-nut, the filbert, the gooſeberry, and currant-tree. Their gardens are, however, laid out without the leaſt method and deſign, and are a confuſed intermixture of trees with beds of turnips, cabbages, beans, and ſometimes wheat and barley diſperſed among them. Parterres and fine walks would be conſidered as the loſs of ſo much ſoil and labour, and new improvements regarded as ſo many deviations from the practice of their anceſtors, which they think they ought to follow with the utmoſt reverence.

The beaſts of burthen in this extenſive country are, camels, a few dromedaries, horſes, which are ſaid to have lately much degenerated, aſſes, mules, and a creature called the kumrah, which, Dr. Shaw ſays, is a little ſerviceable beaſt of burthen, begot between an aſs and a cow; it is ſingle hoofed like the aſs, but in every other reſpect different from it; the ſkin being ſleeker, and the tail and head, though without horns, reſembling that of a cow.

The cows of this country are ſmall, ſlender, and afford but little milk. Whence Abdy Baſha, dey of Algiers, and all his miniſters, were greatly ſurpriſed, when told by admiral Cavendiſh, that he had an Hampſhire cow on board the Canterbury, then in the road of Algiers, that every day gave a gallon of milk, which is as much as half a dozen of the beſt Barbary cows yield in the ſame time; beſides theſe cattle always loſe their calves and their milk together.

The dairies are ſupplied by the ſheep and goats, the cheeſe being chiefly made of their milk. Inſtead of rennet, they, during the ſummer, make uſe of the flowers of the great-headed thiſtle, or wild artichoke, to turn the milk. The curds are put into ſmall baſkets of ruſhes or palmetta leaves, and afterwards bound and preſſed. Theſe cheeſes are generally of the ſhape and ſize of a penny-loaf. Their butter has neither the ſubſtance nor the rich taſte of ours, and is only made by putting their cream into goat's-ſkin, which being ſuſpended from one ſide of the tent to the other, and preſſed to and fro, ſoon occaſions the ſeparation of the butter from the whey.

The ſheep are of two kinds: one of them, common all over the Levant, is diſtinguiſhed by its having a large broad tail, and is of the ſame ſpecies as that we have already deſcribed in treating of Syria. Thoſe of the other ſpecies are almoſt as tall as our fallow-deer, and, excepting the head, are not much different from them in ſhape; but their fleſh is dry, and their fleeces as coarſe and hairy as thoſe of the goats. It is obſervable, that a gelding among the horſes, an ox among the horned cattle, or a weather among the ſheep, is ſeldom or never known in this country; for thoſe males that are more than ſufficient for the preſervation of the ſpecies, have, when they are about three months old, their teſtacles only ſqueezed, the Mahometans thinking it an act of great cruelty to caſtrate any but their own ſpecies.

Of thoſe cattle that are not naturally tame are a kind of wild cows, which are remarkable for having a rounder turn of body, a flatter face, with horns bending more towards each other than the tame cattle. They are nearly of the ſize and colour of the red deer. The young calves of this ſpecies quickly grow tame, and herd with other cattle.

The lerwee, the moſt timorous ſpecies of the goat kind, is ſo fearful, that when purſued it will precipitate itſelf down rocks and precipices. It is of the ſize of a heifer, but the body is more rounded, and it has a tuft of ſhagged hair on the neck and knees: it is of the colour of red deer; but the horns, which are above a foot long, are wrinkled and turned back like thoſe of the goat. There are alſo ſeveral ſpecies of the antelope and deer-kind.

Among the ravenous beaſts are the lion and the panther, and in ſome parts of Barbary the tyger. Some authors pretend, that the women may without danger be familiar with the lion, and that upon taking up a ſtick he will immediately fly from the flocks they are attending. This may perhaps be the caſe when the lion is fatiated with food; for then they loſe their fierceneſs ſo far that, the Arabs ſay, a woman may ſeize their prey, and reſcue it out of their jaws. But it much oftener happens, that, for want of other food, they devour women as well as men. They are indeed moſt afraid of fire, and yet, notwithſtanding the precautions taken by the Arabs in this reſpect, and the barking of their dogs all night, thoſe ravenous beaſts frequently outbrave theſe terrors, and leaping into the midſt of the circle encloſed by their tents, bring out a ſheep or a goat alive. If theſe ravages are repeated, the Arabs, obſerving where they enter, dig a pit, and covering it over ſlightly with cedars, or ſmall branches of trees, frequently catch them, and feed on their fleſh, which is much eſteemed, it having the taſte of veal.

The dubbah is, next to the lion and panther, the fierceſt of the wild beaſts of Barbary. It is of the ſize of a wolf; but has a flatter body, and naturally limps upon its hinder right leg; notwithſtanding which, it is tolerably ſwift. Its neck is ſo ſtiff, that in looking behind, or ſnatching obliquely at any object, it is obliged to move its whole body. It is of a dun or reddiſh buff colour, with ſome tranſverſe ſtreaks of a dark brown. It has a mane near a ſpan long, and its feet, which are well armed with claws, ſerve to dig up the roots of plants, and ſometimes the graves of the dead.

An animal which Dr. Shaw calls the faadh has ſpots like the leopard, but the ſkin is coarſer and of a deeper colour, and the animal is not naturally ſo fierce. The Arabs imagine that it is begot by a lion and a leopardeſs.

There are alſo two other animals marked like the leopard, but their ſpots are generally of a darker colour, and the fur ſofter and ſomewhat longer. One of the cat kind is about a third leſs than a full grown leopard, and may be taken for a ſpecies of the lynx. The other has a ſmall pointed head, with the feet, teeth, and ſome other parts reſembling thoſe of the weaſel. The body is only about a foot long, and is round and ſlender, with a regular ſucceſſion of black and white ringlets upon the tail.

Both the jackall, and an animal called the black-eared cat, are ſuppoſed to find out prey for the lion, and are thence called the lion's provider, though it may be much queſtioned whether any ſuch friendly intercourſe ſubſiſts between animals ſo different in their natures. Indeed in the night-time theſe, with other beaſts, prowl about in ſearch of prey, and have often been ſeen in the morning devouring ſuch carcaſes as the lion is ſuppoſed to have fed upon the night before. This, and the promiſcuous noiſe made by the jackall and the lion, are ſaid to be the only circumſtances in favour of this opinion. The lion is ſuppoſed to feed chiefly on the wild boar, who ſometimes defends himſelf with ſuch courage, that the carcaſſes of both have been found dead, lying together, covered with blood, and dreadfully mangled.

Barbary alſo produces bears, porcupines, foxes, apes, hares, rabbits, ferrets, weaſels, and moles; with cameleons, and ſeveral kinds of lizards.

The moſt remarkable of the ſerpent kind is the thaibanne, ſome of which are ſaid to be three or four yards long, and the people make purſes of their ſkins. The zurreike is about fifteen inches long, ſlender, and remarkable for darting along with great ſwiftneſs; but the moſt malignant of this tribe is the leffah, which appears to be the burning dipſas of the antients, and ſeldom exceeds a foot in length.

Among the birds are the rhaad, which is of two ſpecies, the ſmaller is of the ſize of an ordinary pullet, but the larger is almoſt as big as a capon, and differs from the leſſer in having a black head with a tuft of dark blue feathers immediately below it. The belly of both are white, the back and wings are of a buff colour, ſpotted with brown; but the tail is lighter, and marked all along with black tranſverſe ſtreaks.

The kitawiah frequents the moſt barren, as the rhaad does the moſt fertile parts of theſe countries. In its ſhape and ſize it reſembles a dove, and has ſhort feathered feet; but the body is of a livid colour, ſpotted with black; the belly is blackiſh, and upon the throat is a creſcent of a beautiful yellow. The tip of each feather of the tail has a white ſpot, and the middle one is long and pointed. The fleſh of both this bird and the rhaad has an agreeable taſte, and is eaſy of digeſtion.

The ſhagaray is of the ſize and ſhape of the jay, but has a ſmaller bill, and ſhorter legs. The body is browniſh, the head, neck, and belly, of a light green, and on the wings and tail are rings of a deep blue.

The houbaara is as large as a capon, and of a light dun colour, marked all over with ſtreaks of brown. The wings are black, with a white ſpot in the middle, and the feathers of the neck are remarkable for their length, and for being erected when it is attacked or provoked; the bill is flat like the ſtarlings, and near an inch and a half long. There are alſo partridges, quails, and ſeveral other wild birds. Among the birds of prey are eagles, and ſeveral kinds of hawks. With reſpect to the ſmaller birds, the green thruſh is not inferior to the American birds in the richneſs of its plumage: the head, neck, and back, are of a light green, the breaſt white and ſpotted, the wings of a lark colour, the rump of a beautiful yellow, and the extremities of the wings and tail are alſo tipt with yellow. This bird only appears in the ſummer months.

Among the ſmall birds with thick bills is the capſa ſparrow, which is of the ſize of a common houſe-ſparrow; it is of a lark colour, but the breaſt, which is ſomewhat lighter, ſhines like that of a pigeon. This bird is remarkable for the ſweetneſs of his note, which infinitely exceeds that of the Canary bird or nightingale, but is of ſo delicate a nature as immediately to languiſh and pine away on its being removed into a different climate. Here are alſo ſeveral kinds of water fowl, beſides thoſe known in England.

The flying inſects are very numerous; among theſe is a curious ſpecies of the butterfly, which is near four inches from the tip of one wing to that of the other, and beautifully ſtreaked with murrey and yellow, except the edges of the lower wings, which being indented, and ending in a narrow ſtrip, or lappet, an inch in length, are elegantly bordered with yellow, and near the tail is a ſpot of carnation.

SECT. III.

Of the Natives of Barbary in general.

THIS country is chiefly inhabited by three different ſorts of people: the Moors, who are the original inhabitants; the Arabs, who had over-run this country; and the deſcendents of the Turks, who made themſelves maſters of ſome of the beſt provinces, and rendered the kingdoms of Algiers, Tunis, and Tripoly, tributary to them; beſides a variety of foreign nations, as Chriſtians, Jews, and others, and an innumerable multitude of renegadoes, who, to free themſelves from ſlavery, or from avaricious views, have renounced their faith.

The greateſt part of the Moors are involved in ignorance, ſuperſtition, and lewdneſs, many of them of the moſt unnatural kind; and are ſaid to be treacherous, fraudulent, and deceitful. Indeed it muſt be confeſſed, the cruel oppreſſions they ſuffer under their tyrannical governments have greatly contributed to their degeneracy; and one can hardly imagine a more abject and miſerable condition than theirs ſeems to be, when it is conſidered that they are cruſhed on the one hand by a heavy load of taxes

taxes, and treated with the utmoſt cruelty by their governors, and on the other expoſed to the inroads of the Arabs, who ſtrip them of the ſmall pittance they are able to lay up; whence they dare not provide more than is barely ſufficient to ſerve them the year round, leſt their plenty ſhould induce thoſe freebooters to viſit them the oftener, or their Mooriſh landlords to raiſe their rents. Hence if, from an unexpected good crop, they obtain more corn than they want, they take the utmoſt pains to conceal it, by burying it under ground, or ſtowing it in caverns: whence they are in no leſs danger of being baſtinadoed, and even tortured by both, to oblige them to diſcover it. Thus, to avoid the cruel oppreſſions of the one, and the inſults and ravages of the other, they are contented to purchaſe their eaſe and ſafety by the moſt pinching penury.

Can we imagine a ſituation more adapted to depreſs the human mind, or render mankind completely miſerable? But it is far from producing this effect; from their unparalleled patience, under theſe various branches of what others would eſteem the greateſt wretchedneſs, they enjoy a tolerable ſhare of happineſs; for peace and contentment reign in every family; and what appears very aſtoniſhing, is, that their oppreſſion and miſery has not yet driven them to coin or adopt into their language any phraſes or expreſſions of impatience, diſcontent, or repining at their unhappy condition, much leſs of curſes and imprecations againſt the authors of their diſtreſs; and though nothing is more common from the mouths of renegadoes and profligate Chriſtian ſlaves, they ſeldom fail to rebuke them with marks of abhorrence.

On ſeeing a circle of them ſitting at the doors of their poor cots, with naked bodies and empty bellies, ſome either ſmoaking or telling merry tales, others ſinging or dancing, and when weary lying ſupinely on the ground, one would conclude them to be a happy, though a lazy people. From this diſpoſition to be pleaſed with the rank in which they are placed, ariſes another virtue; they ſeldom quarrel or fight among themſelves, and when they do, uſe no other weapons than their fiſts, and the battle laſts no longer than the heat of paſſion.

The people we have here deſcribed are chiefly the Moors that live at large in the country, who, like ſome of the Arabs, are employed in agriculture and the breeding of cattle; but thoſe who live in the ſea-port towns along the coaſt follow a variety of trades and manufactures, and even carry on ſome commerce by ſea and land: but though theſe are leſs poor, they are equally oppreſſed with taxes, and, if poſſible, more cruelly treated by their lordly maſters; for the leaſt mark of diſreſpect to the meaneſt ſoldier, or the vileſt officer, is ſufficient to procure them, if poor, the chaſtiſement of the baſtinado; or a heavy fine, if they have any thing to pay.

Of the Arabs we have already given a particular account in treating of Arabia, and ſhall be obliged to take notice of ſome particularities relating to thoſe of the countries we ſhall ſoon deſcribe.

As to the Turks, theſe are by far the feweſt in number; they are alſo the worſt, and, except in their ſurpriſing power, the moſt contemptible of the three; theſe being a wretched crew of indigent, ragged, looſe, thieviſh, and idle fellows, inliſted in and about Conſtantinople, and ſent into Barbary once in three years to recruit the ſoldiery. Theſe wretches being furniſhed with a gun, a ſword, and other arms, are incorporated into ſome regiment, and inſtantly obtain a vote and ſhare in the government; and from thence are raiſed from one poſt to another, till they obtain thoſe of admiral, vizier, and even bey; in all which they treat with inſupportable inſolence and tyranny their Mooriſh vaſſals, the wealthieſt of whom tremble at the ſight of a Turkiſh common ſoldier.

SECT. IV.

Of the Kingdom of Morocco, *including that of* Fez.

Its Situation, Extent, Diviſion, Climate, Rivers, and the Fertility of the Country.

THE kingdoms of Fez and Morocco, which now compoſe one empire, were once a part of the antient Mauritania, and are ſituated on the moſt weſtern borders of Barbary, they being bounded on that ſide by the Atlantic Ocean; on the eaſt by the river Mulvya, which ſeparates them from Algiers; on the north by the Streights of Gibraltar and the Mediterranean ſea; and on the ſouth by the river Sus, which divides Morocco from the province of Darha, and by part of the kingdom of Tafilet; the whole empire extending from twenty-eight to thirty-ſix degrees of north latitude, and from the fourth to the eleventh degree of weſt longitude from London. Its greateſt length, in a direct line from north to ſouth, is above five hundred miles, but in breadth it does not much exceed two hundred and ſixty.

Each of theſe kingdoms ſtill retains its antient name, though both the empire and emperors are chiefly called by that of Morocco, which is the moſt conſiderable.

This empire, or kingdom, is thrown into three grand diviſions, Fez, Morocco Proper, and Sus; beſides the kingdom of Tafilet and the large province of Geſula, both which are ſubject to the emperor.

The climate is almoſt every where hot, and much more ſo to the ſouth, yet it is generally healthier than that of Algiers or Tunis, it being plentifully diverſified, and the air rendered more moderate by its mountains and plains, and cooled by ſea-breezes from the Atlantic Ocean. The great Mount Atlas, which ſurrounds it on the ſouth like a creſcent, has, as hath been already obſerved, its ſummits covered with ſnow, and even in the vallies it ſometimes freezes in the night during the winter ſeaſon; but the ſnow that falls there is commonly melted away with the next day's ſun. Their rainy ſeaſon generally begins about October; but if it continues too long in the ſummer, it ſeldom fails of producing peſtilential fevers. The north-weſt winds, which begin to blow about March, ſometimes prove ſo ſharp and violent, as to injure the fruits and other produce of the earth. In other reſpects the inhabitants enjoy a clear and ſerene ſky, and a wholeſome air.

The country in general is well watered with ſprings and very conſiderable rivers, the largeſt of which have their ſources on Mount Atlas, and, after winding ſome hundreds of miles, diſcharge themſelves either into the Atlantic Ocean, or into the Mediterranean. The principal of theſe rivers are, firſt, the Mulvya, Marmol, or Mullooyah, which divides the kingdom of Fez from Algiers. It ſprings from the foot of Mount Atlas, in the province of Chaus, runs through that deſart, and between thoſe of Garret and Angued, then winding round the mountain of the Benizeti falls into the Mediterranean. The Taga ſprings from the ſame mount, and diſcharges itſelf into the Mediterranean nearer to the Streights of Gibraltar. Theſe two are the only rivers of note which fall into that ſea, and the laſt is only remarkable for a city of its name built on its banks.

Thoſe that fall into the Atlantic Ocean are the Cebu, or Sebou, which runs from Mount Atlas, and in its courſe paſſes between two ſteep rocks of a prodigious height, falling into the ſea near Mamor. The mountaineers convey themſelves from the top of one of the rocks to the other over the dreadful chaſm through which this river paſſes, in a very ſingular and hazardous manner. They ſeat themſelves in a ſtrong baſket, big enough to hold about ten perſons, and which runs by a pully along a ſtout cable, faſtened at both ends to two beams fixed in the rock, and this is drawn by the people on the oppoſite ſide; ſo that if the baſket, or any of the tackle, happen to break, as it has ſometimes done, they fall into the river from the height of above fifteen hundred fathoms. This river abounds with moſt excellent fiſh, which the emperor farms out for about twenty thouſand ducats a year.

The next in rank is the Ommirabih, generally called the Marbea, which has its ſpring head on Mount Magrau, one of the heads of Atlas, near the confines of Fez; whence it runs through ſeveral plains and narrow val i , and then diſcharges itſelf into the ocean, forming a capacious bay on the eaſt ſide of Azamor: it alſo abounds in fiſh.

The Tenſift is a deep and large river, which ſprings from the heights of Atlas near the town of Animmey, and running through Morocco, enters the ocean near the

the port of Saffi. It receives a conſiderable number of other rivers in its courſe, and is for the moſt part very deep, though in many places it is fordable during the ſummer ſeaſon, and has in the neighbourhood of the city of Morocco an handſome ſtone bridge of fifteen arches, built by the great Almanzor, eſteemed one of the nobleſt ſtructures in all Africa.

The laſt river of note is the Sus, which gives its name to the province through which it paſſes, in its courſe from the Atlas to the Atlantic Ocean, and is its ſouthern boundary. This river is very large, and is by the inhabitants cut into a multitude of canals, which render the province the moſt fruitful of any in this empire. Each ſide of its banks is variegated with rich corn and paſture-lands, gardens, and orchards: it alſo turns a great number of ſugar-mills; ſo that the inhabitants are numerous, and ſome of them wealthy.

There are beſides theſe ſix principal rivers a prodigious number that fall into them, ſome of which are alſo cut into a variety of channels, and greatly enrich the lands on both ſides; but have little elſe remarkable.

The lands in general are ſo good, that were they cultivated with more induſtry, they might be made to yield moſt of the products of other parts of the world, and in as great plenty: but this cannot be expected in a country which groans under the moſt deſpotic tyranny. It is commonly computed that the land of Morocco is capable of producing an hundred times more than is conſumed by the inhabitants, and will yield two or three crops in a year; yet it almoſt every where lies waſte, and without a proprietor, except about three or four leagues round their cities and great towns. The northern parts produce moſt corn, oil, wine, fruits, wax, honey, ſilk, and the fineſt wool; and the ſouthern, dates, ſugar, cotton, indigo, variety of gums, and ginger.

SECT. V.

A Deſcription of the City of Morocco.

THE city of Morocco, from its agreeable ſituation, and the number and variety of its noble edifices, was once eſteemed not only the capital of the empire, but the richeſt and moſt conſiderable town in all Africa. It is conveniently ſituated between two rivers, the Nephtis and the Agmed, and upon that of the Tenſift, and ſtands on a ſpacious plain about fifty miles in length, ſixty miles north of Mount Atlas, and a hundred and ſeventy to the eaſt of the Atlantic Ocean. Morocco is encompaſſed with high ſtone-walls, the cement of which is ſo hard as to ſtrike fire; and though the city has been frequently beſieged and plundered, there is not the leaſt ſign of a breach to be ſeen in them. Theſe walls are flanked with ſtrong and lofty towers, with baſtions and other works, and alſo encompaſſed with a broad and deep ditch. They have twenty-four gates, which retain ſome ſigns of their former ſtrength and beauty; but the houſes, which once amounted to a hundred thouſand, are dwindled to leſs than one-third of that number; the ground on which they ſtood in ſome places lying waſte, and in others being turned into gardens, orchards, and corn-fields. Though many noble ſtructures are fallen to ruins, there ſtill remain in that part which is inhabited many ſtately buildings, particularly the royal palace, three magnificent moſques, and a few baths and hoſpitals.

The Al Caſſava, within which is the imperial palace, is a very large fortreſs on the ſouth ſide of the city, capable of containing within its walls above four thouſand houſes. Theſe walls are high, ſtrong, flanked with lofty towers, and ſurrounded with a good ditch; they have two gates, one to the ſouth, facing the adjacent country, and the other on the north, next the city; both of them guarded by a company of ſoldiers, to prevent the Chriſtian ſlaves going out without their keepers. This laſt gate faces a ſtraight and handſome ſtreet, at the end of which ſtands, in the center of a ſpacious court, a magnificent moſque, erected by Abdalmumem, king of the Almohedes; but being too low for its bulk, was raiſed fifty cubits higher by his grandſon Almanzor, who alſo built its great tower, or ſteeple, which is only to be equalled in height and beauty by thoſe of Rabet, in the kingdom of Tremeſen, and of Seville, in Spain, which were the works of the ſame architect. This noble ſtructure was alſo embelliſhed with carvings of jaſper, marble, and other coſtly ſtones; which, together with the noble gates of the cathedral of Seville, covered with relievo in braſs, that conqueror cauſed to be brought from Spain to enrich this new fabric. On the top of the above-mentioned tower were fixed on an iron ſpike four large balls of copper, plated ſo thick with gold, that they were thought to be made of that rich metal. Theſe were of different ſizes, the largeſt capable of containing eight ſacks, the ſecond four, the third two, and the uppermoſt one ſack of wheat; but Muley Iſhmael took them down, and had them put in his treaſury.

Under the floor of this extenſive moſque is a deep vault, of the ſame length and breadth with the building, in which is depoſited an immenſe quantity of corn belonging to the king; but it was originally deſigned for a capacious ciſtern to receive the rain-water that fell upon the leads, and was conveyed into it by leaden pipes. The battlements of the tower are of an amazing height, and from thence ariſes a ſpire of about ſeventy feet, on the top of which were fixed the above-mentioned balls.

But to return to the palace: before the removal of the court to Mequinez, the royal apartments, and thoſe for the king's wives and concubines, the ſtate-chambers, and the halls of audience, were extremely magnificent; and we are told, that the pillars, cielings, and mouldings were all richly gilt.

The gardens, though far from being regularly deſigned, had ſomething uncommonly grand and noble, they being adorned with terraces, fountains, ſpacious fiſh-ponds, and rich pavilions, ſhaded from the heat of the ſun by delightful groves of fragrant trees: but in the midſt of this ſplendour were the remains of other noble buildings, which, before the removal of the court, were ſuffered to run to decay; and of four hundred aqueducts, ſome were broke down, and others ſhamefully neglected.

In the firſt court of the royal palace, the apartments, though erected in the Moreſco ſtile, appeared with ſurpriſing grandeur, adorned with baſons and fountains of the fineſt marble, and moſt curious workmanſhip, ſhaded with citron, orange, and lemon-trees. The next court was embelliſhed with galleries and colonades of white marble, ſo exquiſitely wrought, that ſome of the niceſt judges in architecture among the Europeans have beheld them with the greateſt admiration, even in their decaying ſtate. In this court alſo ſtood a great number of marble vaſes and baſons full of water, in which the Moors made frequent ablutions before prayer. The ſtables for camels, dromedaries, horſes, and mules, were extremely ſplendid. Near them were two granaries, each of which was capable of containing thirty thouſand loads of corn: theſe were two ſtories high, the lower for wheat, and the upper for oats and barley, which were conveyed on mules, by an eaſy aſcent, to the top of the building, and thence thrown by trap-doors into their proper chambers; whence they were diſtributed with the ſame eaſe, by proper conduits, into the ſtables and mangers.

The gardens at the farther end of the caſtle towards the country, and the park almoſt contiguous to them, ſhewed ſome eminent tokens of their former elegance. When Mouquet was there, theſe gardens had a prodigious variety of fruit and other trees, ſhrubs, and flowers; and were adorned with a noble ſquare, railed in with a marble baluſtrade: in the center ſtood a column, on which was placed a lion, both of the ſame ſtone. This lion threw from his mouth a fine ſtream of water into a large baſon within the rails, on the four corners of which were four leopards of white marble, beautifully ſpotted with round ſpots of green natural to the ſtone. In the park were to be ſeen a variety of wild beaſts, as elephants, lions, tygers, leopards, &c. which were kept in buildings prepared for their reception.

At a ſmall diſtance from the palace ſtands the quarter of the Jews, incloſed within its own walls, which have but one gate, and that is guarded by the Moors. We learn from Mouquet, that when he was there, four thouſand of thoſe people lived within that precinct. The

foreign agents, and even ambaſſadors, alſo chooſe to reſide there, rather than in any other part of the city; but the Chriſtian merchants commonly live near the Cuſtom-houſe, which is about three miles from the palace. The Jews have always been burthened with very heavy taxes, notwithſtanding which many of them are very rich; but it is their conſtant policy in all theſe deſpotic governments to make the meaneſt appearance in their dreſs and houſes, to avoid their being ſtill more oppreſſed; even the natural ſubjects of the kingdom are obliged to do the ſame to prevent their becoming a prey to the avarice of the monarch, or his miniſters. Hence the houſes of all the middling and common people in every part of the city, that is ſtill inhabited, make a miſerable appearance. Indeed thoſe of the alcades, nobles, military officers, and courtiers, are ſtrong, well built, and lofty, encompaſſed with walls, and flat on the top, where they uſually ſpend the evening in freſco, after the African manner.

The river Teniſt, which runs through the city, has a handſome bridge over it, and turns a variety of mills on its banks. From this river water is conveyed into all the houſes and gardens.

SECT. VII.

Of the moſt conſiderable Cities in the Kingdom of Fez; particularly of the City of Fez, its antient Capital, Mequinez, the preſent Capital of the whole Empire, Sallee, Majagan, Tangier, Ceuta, and Tetuan.

THE city of Fez was formerly eſteemed the next in dignity, it being the capital of the once powerful kingdom of the ſame name, and is divided into the Old and New City. The firſt is moſt worthy of notice, it being near nine miles in compaſs, and one of the moſt populous cities in all Africa. Old Fez is ſituated on the declivity of two mountains, the valley lying between them, and is ſurrounded by a ſtrong wall of ſquare ſtone, flanked with towers. The houſes are ſquare, terraſſed on the top, without any windows fronting the ſtreet. Thoſe of the wealthy inhabitants, and alſo the colleges, moſques, baths, and hoſpitals, have ſpacious courts adorned within with galleries, fountains, baſons of fine marble, and fiſh-ponds, and are ſhaded with lemon and orange trees, which are loaded with fruit throughout the year. Theſe ſtructures are plentifully ſupplied with water from the river Fez, which here divides itſelf into ſix branches, and turns about four hundred mills.

The city has ſeven gates, but no ſuburbs: the ſtreets are narrow, but moſtly ſtraight, and are ſhut up at night with gates placed at the end of them; ſo that no people can go out after that time, except upon extraordinary occaſions.

The moſques are ſaid to amount to five hundred, fifty of which are of the firſt rank; among theſe one exceeds all the reſt, and, including the college and cloiſter belonging to it, is near a mile and a half in compaſs. It has thirty ſtately gates: its roof is a hundred and fifty cubits in length, and eighty in breadth, divided into ſeventeen great domes, beſides a conſiderable number of inferior ones, and the whole ſupported by fifteen hundred pillars of white marble; every dome is adorned with lamps of a large ſize, and curiouſly wrought. There are ſaid to be four hundred ciſterns in the cloiſter, to which the people repair to make their uſual ablutions before prayer. Within the buildings of this moſque is a ſpacious college, in which divinity, philoſophy, and other ſciences, are taught by their moſt learned men, the chief of whom is choſen preſident over the reſt, and raiſed to the dignity of grand mufti. In this college is alſo one of the largeſt libraries in all Africa.

The inhabitants of this city are ſaid to amount to three hundred thouſand, beſides the merchants and other foreigners. The principal magiſtrate, who is ſtiled provoſt of the merchants, has ſeveral inferior magiſtrates under him, and uſually reſides in one of the moſt populous ſtreets, that he may be near at hand to puniſh all delinquents. This magiſtrate is choſen from among the citizens. There is alſo a governor appointed by the king, who has a cady, or judge, under him, to try criminal cauſes. When a perſon is condemned to ſuffer death, if he be a plebeian, he is led through the chief ſtreets of the city to the place of execution, with his hands tied behind him, and is obliged to proclaim as he goes his crime and puniſhment; and when he comes to the gallows, he is hung up by the feet, and has his throat cut; but if he be a perſon of high rank, his throat is cut beforehand, and the hangman, marching before the body, proclaims his crime. A man guilty of murder is conducted to the neareſt relation of the deceaſed, who may either condemn him to ſuffer what death he pleaſes, or compound with him for a ſum of money. But if he denies the crime, he is either baſtinadoed or ſcourged in ſo cruel a manner, that he commonly dies under the executioner's hands.

As Fez is the common emporium of all Barbary, to which all commodities are brought and exchanged, the ſtreets ſwarm with merchants and tradeſmen. The goods imported chiefly conſiſt of ſpices, vermillion, cochineal, braſs, iron, ſteel, wire, arms, ammunition, drugs, watches, ſmall looking-glaſſes, quickſilver, opium, tartar, aloes, allum, Engliſh woollen and linen cloths, muſlins, calicoes, fuſtians, ſilks of all ſorts, brocades, damaſks, velvets, red woollen caps, toys of all ſorts, earthen-ware, combs, and paper.

The exports conſiſt in hides, and all ſorts of leather, particularly the Morocco, which is the manufacture of the country, wool, furs, ſkins, cotton and flax, cloth of the ſame materials, horſes, oſtrich feathers, potaſhes, almonds, dates, raiſins, figs, olives, honey, ſilk of their own manufacture, gold duſt and ducats, of both which the Jews have the ſole brokerage.

Mequinez, the preſent capital of the empire, is ſituated in the kingdom of Fez, on the river Sebu, or Sabro, in a ſpacious and delightful plain, ſixty-ſix leagues to the weſtward of Fez, and three to the eaſt of Sallee. This city is ſorrounded with high walls, at the foot of which are pleaſant gardens. It has many moſques, colleges, baths, and other public buildings; and it has a continual market, to which the Arabs reſort from all parts to ſell their honey, wax, butter, dates, and other commodities.

The palace is about four miles in circumference, and is almoſt ſquare. It ſtands on even ground, and has no hill near it. The buildings are of rich mortar, without either brick or ſtone, except for pillars and arches; and the mortar ſo well wrought, that the walls reſemble one entire piece of terrace: they are formed in wooden caſes, within which the mortar is rammed down by the Chriſtian ſlaves, much in the ſame manner as the paviours among us drive down the ſtones; they all raiſe together heavy pieces of wood, and keep time in their ſtrokes. Theſe wooden caſes are built higher as the wall riſes; and when they are finiſhed, and dry enough to ſtand firmly without them, are removed. The whole building is exceeding maſſy, and the outer wall, which ſurrounds the whole, is twenty-five feet thick.

Mr. Windus, a gentleman in the retinue of Charles Stewart, Eſq; ambaſſador to the emperor of Morocco in the year 1720, attended his excellency to ſee the palace, when they were firſt ſhewn ſome large rooms full of men and boys making ſaddles, ſtocks for guns, ſcabbards for ſcymetars, and other things. From thence they paſſed through ſeveral large neat buildings, and at length entered the moſt inward and beautiful part of the palace, which has a garden in the middle, planted round with cypreſs and other trees. All the columns of this building, which form a colonade of vaſt length, are of marble, and ſaid to be antient Roman pillars brought thither from Sallee; the arches and doors of the apartments are finely adorned.

From thence they were conducted to another neat regular building, with piazzas all round. The area was checquer-work, and in the middle was a row of marble baſons at certain diſtances, with little channels cut in ſtone, conveying water from one to the other; and here is a magazine and treaſury. They afterwards viſited the inſide of an apartment, where one of the queens formerly lived. They alſo ſaw the baths, and ſome beautiful cobahs, belonging to that apartment. Theſe cobahs

are lofty and magnificent rooms, each covered with a dome painted with a ſky blue, adorned with ſtars, and a golden ſun in the middle of curious workmanſhip.

From thence they were led through ſeveral other buildings, conſiſting for the moſt part of oblong ſquares, with piazzas, under which the doors enter into the lodgings, which are generally ground rooms. The doors of each building are all of one ſize and form, finely inlaid, and ſome of them gilt. In one of theſe ſquares was a fountain, with channels of marble, that formed a neat labyrinth.

The quarter of the Jews is in the heart of the city; and, in order for their ſecurity, they are allowed the privilege of ſhutting up their gates at night. They are, however, abuſed and inſulted by the Moors as they go along the ſtreets, who ſometimes call them cuckolds and dogs, and even pelt them with dirt. The noblemen ſometimes laſh them ſeverely with their whips, if they dare to come in their way as they ride along; and, as a ſtill greater mark of contempt, they are not ſuffered to go out of their quarter with either ſhoes or boots, but muſt be bare-footed and bare-legged. All this they endure with ſingular patience, it being death for them to lift up their hand againſt a Moor.

Cloſe to Mequinez, on the north-weſt ſide, and only divided from it by a road, ſtands a large negro town, that takes as much ground as the city; but the houſes are neither ſo high, nor ſo well built.

Sallee is ſituated on the banks of the river Buragra, which divides it into two parts; the northern, called by us Sallee, and by the natives Sela, is encompaſſed by a ſtrong wall about ſix fathoms high, and a yard in thickneſs, on the top of which are battlements, flanked with towers of a conſiderable height and ſtrength. The ſouthern part, which is on the oppoſite ſide of the river, is called Rabat, or Ravat, and is of much greater extent; the high walls with which it is ſurrounded encloſing a great number of gardens, orchards, and corn-fields ſo extenſive, that wheat may be ſown in them ſufficient to ſerve fifteen thouſand men. On the ſouth-eaſt-quarter ſtands a lofty tower, from which ſhips may be ſeen at a great diſtance; but it is now much lower than it was at firſt. This is owing to a clap of thunder which ſtruck off a part of the top, and cauſed a wide rent on the ſouth ſide, which runs from the top to the bottom. This tower is fifty feet ſquare, and is built of ſtone, joined by a ſtrong cement. It ſtill ſerves for a land-mark in the day-time, and for a light-houſe in the night; and under it are the two docks which belong to the town, the one for building of ſhips, and the other for them to winter in.

The harbour is large, but ſhallow, and ſeldom riſes above twelve feet at high water; ſo that the corſairs which belong to this city are obliged to put into the iſland of Fedal, which lies at a ſmall diſtance from it. This harbour is eſteemed one of the beſt in the country; and yet, on account of a bar that lies acroſs it, ſhips of the ſmalleſt draught are forced to unload and take out their guns before they can get into it. It is now defended by two caſtles, the old and the new; one ſtands at the mouth of the river, where the walls are built on rocks, and are ſo high as to ſhelter the governor's houſe from cannon-ſhot. Its fortifications are very irregular, and within the walls, which are moſtly of ſquare ſtone, is a fort juſt before the principal gate, that commands the whole town. Next to the ſea-ſide, facing the bar, is a baſtion mounted with five pieces of cannon, to ſecure the veſſels that lie at anchor in the road.

The new caſtle is ſeated on the weſt ſide, and is a ſquare building flanked with towers and battlements like the walls of the city. A communication is preſerved between one caſtle and the other by means of a high wall built upon arches, under which the people paſs and repaſs to and from the ſtrand. The king ſends thither a governor, who has a council choſen from among the citizens. All merchandize imported or exported pay a tenth part of their value to the government; but the chief wealth of the place ariſes from the plunder taken by the Sallee rovers, or pirates, which make prizes of all Chriſtian ſhips that come in their way, except there be a treaty to the contrary.

Mazagan is ſituated about ten leagues to the ſouth-ſouth-weſt of Sallee, and is a ſtrong well-built town in the hands of the Portugueſe, who keep a good garriſon in it to prevent the Moors retaking it from them. It is ſurrounded with a ſtrong wall, ſo thick that ſix horſemen may ride abreaſt upon it all round the city, and is well furniſhed with cannon. The greateſt inconvenience is the pirates often intercepting the proviſions ſent to the garriſon, which obliges them, in return, to make incurſions againſt the neighbouring Arabs to obtain ſubſiſtence.

Tangier is ſituated about two miles within the Streights of Gibraltar. This town was antiently called Tingis, and was the capital of Mauritania Tingitana. It is ſituated in thirty-five degrees forty minutes north latitude, in a fine bay, and is ſaid by the African fabuliſts to have excelled all the cities upon earth in ſize and magnificence, and to have been ſurrounded by walls of braſs. It had, however, many handſome edifices and palaces; but being taken by the Portugueſe about the year 1471, or 1473, became more conſiderable for its ſtrength than its beauty. The Portugueſe at length finding the expence of keeping it greatly exceeded the advantages they reaped from it, readily gave it to the Engliſh, as a part of the dowry of the princeſs Catharine of Portugal, upon her marriage with king Charles II. who, at an immenſe expence, rendered it one of the ſtrongeſt places on all that coaſt; and built a deep mole, which ran three hundred fathoms into the ſea. But finding it too chargeable to keep, and the parliament refuſing to vote him the ſums he demanded for its maintenance, he cauſed all the fortifications to be blown up in 1684, ſince which time the Moors have endeavoured to repeople it, but have not yet been able to render it more than a mean fiſhing town.

Ceuta is as conſiderable for its advantageous ſituation at the entrance of the Mediterranean, as for the beauty of its public buildings, and the ſtrength of its walls and bulwarks, by which, and a good garriſon, it held out an obſtinate blockade againſt an army of Moors. It is ſituated on a riſing ground at the foot of the mountain of Apes, which projects into the Streights, and forms the neareſt point to the Spaniſh coaſt. It is ſtill a conſiderable place and a biſhop's ſee, and has both a good palace and a noble cathedral.

Twenty-one miles to the ſouth of Ceuta is the city of Tetuan, which ſtands upon the riſing of a rocky hill on the Streights mouth; but is neither large nor ſtrong, it being only ſurrounded by a wall made of mud and mortar, framed in wooden caſes, and dried in the ſun. It does not contain above eight hundred houſes; but the inhabitants, by piracy, and a good trade for raiſins, honey, wax, and leather, are generally in pretty good circumſtances, though they dare not let it be known, leſt the government ſhould fleece and oppreſs them.

The ſhops, which are very ſmall, have no doors; but the maſter, having opened the ſhutters, jumps in, and ſits croſs-legged upon a place raiſed about the height of a counter. The goods are diſpoſed round about him in drawers, which he can for the moſt part reach, without moving out of his place, his cuſtomers ſtanding in the ſtreet while they are ſerved.

The chief ſtrength of the city conſiſts in a garriſon of about five hundred men, and four hundred horſe. The port is defended by a ſquare caſtle, flanked with towers of the ſame materials with the town walls, and in time of danger can entertain a garriſon of five hundred men. This harbour affords a ſafe ſhelter to the corſairs, who reſort thither in great numbers to take in proviſions; on which account the Spaniards attempted to choak up the mouth of the river, by ſinking veſſels loaded with ſtones; but the Moors found means to open it again.

In the heart of the city is a large dungeon, in which they lock up the Chriſtian ſlaves at night. Theſe are very numerous, and uſed with as much ſeverity as in any part of Barbary. The inhabitants are chiefly the deſcendants of the Moors and Jews, who were driven from Spain, the latter of whom carry on a conſiderable commerce.

The houſes are kept ſo continually white-waſhed on the outſide, as well as within, that the eyes of the beholders

holders are dazzled by the reflection of the ſun. The baſha's palace is both a curious and magnificent ſtructure; as is likewiſe his villa, about two miles out of town. The moſques, and other public ſtructures, make a noble appearance, though built in the Moreſco taſte.

The Jews of this city are computed to amount to about five thouſand, and are allowed to make wine and brandy. They have ſeven ſynagogues, and yet are ſaid to have no more than a hundred and ſeventy houſes.

The city is ſurrounded with a fine country covered with gardens, orchards, and villas; and on an adjacent eminence is a ſpacious burying-ground, adorned with ſuch a variety of cupolas, pyramids, and other monuments, that at a diſtance it reſembles a fine city in miniature. If to this be added its proſpect towards the ſea, and of the adjacent hills and plains, and the courteouſneſs and affability of the people, which exceeds that even in the moſt celebrated capital of this empire, we ſhall not ſcruple to acknowledge this to be one of the moſt agreeable cities in all Barbary.

SECT. VIII.

Of the Province of Suz; with a conciſe Account of the Cities of Meſſa, Teſſut, Tagoſt, Tarudant, and Tedſi.

AS we have now taken a view of the principal cities of Morocco and Fez, we ſhall ſay ſomething of Suz, or Sus. The province of Suz is interſected by ſeveral ridges of Mount Atlas, from which many ſprings flow, and render the country fruitful in corn, rice, ſugar, dates, vines, and indigo. The river Suz, like the Nile in Egypt, overflows all the low lands, and, by having canals cut from it, enriches all the country through which it paſſes. This, and the inferior rivers, turn a great number of ſugar and corn-mills; and the indigo, which grows wild in all the low grounds, is of a very bright colour, and is prepared and exported in great quantities. The inhabitants, who are chiefly Berebers, are diſtinguiſhed by their induſtry; and many of them who live in towns become wealthy, and are much more polite than the natives of Fez and Morocco: but the cities of this province are neither conſiderable for their ſtrength, ſize, nor beauty.

The city of Meſſa is ſeated on the river Suz, where it diſcharges itſelf into the ſea, and is divided into three diſtinct quarters about a mile diſtant from each other, and each quarter encloſed by its own walls. The inhabitants cultivate the adjacent lands, which are fertilized by the overflowing of the Suz; but when it fails to riſe above its banks, the natives are obliged to live chiefly on dates, which are here much coarſer than in other parts of Africa. As the river forms no harbour, the natives have little or no foreign commerce; and the ſhore being flat and ſhallow, whales are ſometimes caſt upon it.

About three or four miles from Meſſa, on the ſame river, ſtands Teſſut, or Teceut, which, like the former, is divided into three parts; but is much larger and more populous. In the center is erected a ſtately moſque, through which runs a branch of the river. Teſſut is ſuppoſed to contain four thouſand families, moſt of which are induſtrious and in good circumſtances; for the ſugar manufactory flouriſhes here, and the fineſt Morocco leather is dreſſed in this place, and exported from thence in great quantities.

Tagoaſt, or Tagoſt, the largeſt city in the province, is built in a ſpacious and fertile plain, and was ſurrounded with walls, which are now decayed. It is ſaid to contain eight thouſand families, four hundred of which are Jews; and though the reſt are Mahometans, they nevertheleſs preſerve a kind of religious veneration for St. Auſtin, who, they ſay, was born there. It enjoys two markets in a week, to which the Arabs and Moors reſort with their commodities, and the negroes to buy cloth.

Tarudant is ſituated near the Atlantic Ocean, in latitude thirty degrees, and, though a ſmall place, is in a flouriſhing condition, and carries on a conſiderable commerce with the Berebers, who reſort to its markets. Its buildings are handſome, and the adjacent plains fertile. It was once the reſidence of its own princes, who adorned it with handſome edifices, as it is now that of the governors of the province.

Tedſi is a conſiderable town, which chiefly ſubſiſts by the cultivation of ſugar, and contains about five hundred inhabitants. Its market on Mondays is reſorted to by merchants from many diſtant parts of Barbary, and even from Nigritia. Its trade conſiſts in cattle, leather, linen and woollen cloths, ſugar, wax, honey, butter, and iron tools. The Jews are here rich and numerous, and the people of the town are much commended for their courteous behaviour to ſtrangers.

SECT. IX.

A conciſe Deſcription of Tafilet and Geſula.

WE ſhall now give a conciſe account of Tafilet, which was once a kingdom of itſelf, though now ſubject to Morocco. This kingdom has its name from its capital, and is a long tract of dry and barren ground, which runs almoſt eaſt and weſt, it being bounded on the north by Fez and Tremeſen; on the ſouth by Zahara, or the Deſart; on the eaſt by the country of the Berebers; and on the weſt by Morocco and Suz. Its extent, including the provinces of Itaat, Darha, Sakrah, and Tuet, is very conſiderable, and variouſly computed; but the country is, for the moſt part, ſo hot and ſandy, that it produces little corn and fruit. The only place where they can raiſe barley is along the banks of the river, and even there it grows in ſmall quantities; ſo that none but perſons of diſtinction are able to purchaſe it, while the common people live chiefly upon dates and the fleſh of camels, both which are here in great plenty: yet indigo grows without art or culture, and yields a more vivid and laſting blue than that produced in our American plantations. They have abundance of oſtriches of a prodigious ſize, the fleſh of which they eat. The chief commerce of the natives of Tafilet, beſides the indigo abovementioned, conſiſts in their dates, and in a ſort of leather made of the hides of a creature called the dantos. They alſo make a ſort of ſtriped ſilk of various colours, much uſed by the Moors and negroes; alſo fine caſſocks and caps for the men, veils for the women, curious carpets, and the like.

The king, or emperor of Morocco, among his other titles, takes that of lord of Tafilet and Darha, and frequently permits the prince, whom he ſends thither governor, to take that of king of Tafilet.

The city of Tafilet, which is the capital of this kingdom, is ſeated on the river of the ſame name, and has a ſtrong caſtle, ſuppoſed to have been built by the Berebers, who have here the name of Fitelis, and are induſtrious, and rich in camels, horſes, and other cattle. This city is reſorted to by merchants, not only from ſeveral parts of Barbary, but even from Europe. The people are affable and civil to ſtrangers, but the Arabs are much addicted to ſuperſtition.

Adjoining to this kingdom is Geſula, which is alſo ſubject to Morocco, and is bounded by Tafilet on the eaſt, by Darha on the ſouth, by Suz on the weſt, and by Morocco on the north; but its extent and boundaries are too uncertain to be determined with any degree of exactneſs.

Though the country is moſtly dry and barren, it has many mines of copper and iron, which are worked by the natives, who alſo fabricate thoſe metals into all the utenſils uſed in Barbary; and theſe they exchange for horſes, linen and woollen cloths, ſpices, and the other commodities they want, either by carrying them into other parts of Barbary, or by the frequent fairs they hold in their plains, or in their large towns, ſome of which contain a thouſand houſes, or more. They have one fair in particular, kept in a large plain, that laſts two months, to which ſtrangers reſort from moſt parts of Barbary and Nigritia; and, it is ſaid, that though theſe ſtrangers amount to at leaſt ten thouſand perſons, beſides their ſervants and cattle, they are all maintained at the public expence, there being perſons appointed to dreſs their proviſions, and to furniſh them with all other neceſſaries, which is done without tumult or diſturbance. Two captains,

tains, with a ſufficient body of ſoldiers, prevent all diſorders; and if a thief be taken, he is immediately put to death, and his fleſh thrown to the dogs.

They have a remarkable cuſtom, which is, that let them be at war with whomſoever they will, they obſerve a truce three days in the week with all ſtrangers, for the encouragement of trade; and this is likewiſe done during the two months of the above fair.

This country produces very little wheat, but plenty of barley, dates, good paſture, and variety of cattle. The inhabitants are ſaid to be ſo numerous, as to be able to bring ſixty thouſand men into the field. Their dreſs is only a ſhort ſtriped woollen or linen jacket, with half ſleeves, over which they throw a long coat or gown of coarſe woollen cloth, under which hangs either a dagger, or a ſhort two-edged ſword. Their other weapons, when at war, are the ſcimitar, ſpear, and ſhort gun.

A part of this country was once conquered by the Portugueſe; but the natives ſoon recovered their liberty, which they enjoyed till they were ſubdued by the emperor of Morocco.

SECT. X.

Of the different Inhabitants of Morocco. Their Perſons, Dreſs, Entertainments, Manners, and Cuſtoms.

THE inhabitants of this empire are compoſed of a mixture of different nations, particularly of the Moors, who are chiefly the deſcendants of thoſe who were driven out of Spain; and, though poor and oppreſſed, are very numerous, eſpecially on the ſea-coaſt; but they have no trading veſſels, nor carry on any immediate commerce with foreign nations. Theſe are ſaid to be covetous, ſuperſtitious, great cheats, jealous, vindictive, and treacherous.

The Berebers, or, as they ſtile themſelves, the antient natives, are people who ſtill follow their own cuſtoms, uſe their antient language, and live in huts on the mountains, for the ſake of enjoying their liberty, they having never yet been entirely ſubdued.

The Arabs are here very numerous, and range from place to place with their herds, cultivate the plains, and ſow corn on the moſt fertile ſpots. Theſe are equally fond of liberty; and, though they pay a kind of tribute, live under cheyks of their own race and chooſing. Some of their tribes live rather upon plunder than induſtry, and cannot eaſily be ſuppreſſed, as they generally live in ſome of the moſt inacceſſible parts of the mountains, from which they make their excurſions into the low lands, and attack the caravans who come in their way.

The Jews were alſo for the moſt part obliged to fly out of Spain and Portugal; and, though they have a very bad character, are ſuffered to be the chief traders, factors, minters, and bankers in the empire; and it is ſaid, that, by their frauds and impoſitions, they make themſelves ample amends for the heavy taxes with which they are loaded.

The renegadoes, though leſs numerous than in Algiers and Tunis, yet make a diſtinct claſs of people; but are almoſt as much deteſted by the reſt of the inhabitants as by the Chriſtians. Theſe guard the gates of the royal palaces and fortified places; and ſome of them are diſtributed among the governors of the provinces, who are to employ them as occaſion offers.

The ſlaves make another conſiderable claſs; they are here alſo very numerous, and are much more inhumanly treated than in Algiers and Tunis. Theſe all belong to the king, who cauſes them to be employed in the hardeſt labour, and the vileſt offices, almoſt without intermiſſion. The poor pittance allowed them daily conſiſts of a pound cake of coarſe barley-bread, dipped in a little oil, which they are ſometimes forced to put in their mouths with one hand, while the other is employed in ſome painful drudgery. Their dreſs conſiſts of a long coarſe woollen coat, with a hood, which ſerves them for cap, ſhirt, coat, and breeches. In this wretched ſituation they are harneſſed in carts with mules and aſſes, and more unmercifully laſhed for the leaſt inadvertency or intermiſſion of their labour, though perhaps ſolely owing to their ſtrength being quite exhauſted by hunger, thirſt, and fatigue. Their lodging at night is a ſubterraneous dungeon, about ten yards in diameter, into which they deſcend by a rope-ladder, which is afterwards drawn up, and the mouth of the priſon covered with an iron grate. In ſhort, theſe cruel wretches take a ſingular pleaſure in tormenting theſe unhappy people: they, however, except thoſe that are married from hard labour, a favour which is indulged the women, on account of their breeding and nurſing a new brood of ſlaves; but theſe are neither better fed, clothed, or lodged than the reſt.

The language of this country is the Arabeſk, or modern Arabic, which is ſpoken not only in all the cities, towns, villages, and tents of this empire, but is underſtood throughout all Barbary, and indeed throughout the Turkiſh dominions.

The dreſs of the people of Morocco is not ungraceful. The men wear ſhort ſhirts, with very broad ſleeves that ſometimes hang down; but are more frequently tucked up to keep them cool. They have linen breeches tied about their waiſt next their ſkin. Over their ſhirt they wear a cloth-veſt, or waiſtcoat, very ſhort, made to ſit cloſe to the body, and faſtened with ſmall buttons and loops ſet cloſe together, which is often embroidered with gold or ſilver thread. Round the waiſt they tie a ſcarf of ſilk or ſtuff, in which they ſtick large knives, with the handles either of ſome valuable metal or ivory inlaid, and the ſheaths are tipt with ſilver. Their outer garment is either the alhague, or the albornooce; the former is a piece of fine white woollen ſtuff, five or ſix yards in length, and about one and a half broad, which they wrap round them above and below their arms, a dreſs which reſembles the drapery of antique figures: the albornooce is either made of cloth or woollen ſtuff napped, and has ſome reſemblance to a ſhort cloak; but is joined a little way before, from the neck downwards, having two or three rows of ſhort ſtripes worked in the ſtuff, and fringed at the ends: the bottom and ſides are edged with a deep fringe, and at the neck behind there hangs a peaked cowl, with a toſſel at the end. With this cowl they can cover their heads to keep off the weather. On their heads, which they always keep ſhaved, they wear a little red cap, which they make into a turban by rolling muſlin about it; but when they go into the country they wear a handſome cane hat, to keep off the ſun. The alcaides have a broad leather belt, embroidered with gold, in which they hang their ſcimitars. They all go bare-legged, but wear ſlippers of red or yellow leather, without heels.

The Moors in general dreſs after this manner, without any other difference than in the richneſs and fineneſs of the ſtuffs, only the upper garment worn by the poor is a coarſe, thick, woollen cloth, with holes at the top to put their arms through, inſtead of ſleeves: this reaches to their knees, and hangs looſe about their bodies.

Whenever the women go abroad, they dreſs nearly like the men, their upper garment being the alhague juſt mentioned, with which they cover their heads, bringing it down over their foreheads cloſe to their eyes, and underneath tie a piece of white cloth to hide the lower part of the face. The alhague covers all but their legs, which, when they are at home, or viſit from the tops of their houſes, are generally naked; only ſome ladies of ſuperior rank have their drawers ſo long that they reach to their feet, and hang in great looſe folds about their legs. They wear the ſame kind of ſlippers as the men. Within doors they have only a ſingle binder about their foreheads, and their hair hangs behind in two large plaits at full length. They alſo wear at home a veſt open from the boſom to the waiſt, to ſhew their embroidered ſmocks, and faſten large pieces of muſlin to the ſleeves of their veſt, which hang down very low, in the manner of ruffles. They wear a ſhort petticoat over their drawers, have large earrings in their ears, with bracelets on their arms and legs.

The women are remarkable for their fine eyes, and ſome of them have very beautiful ſkins, which Mr. Windus, one of the Engliſh ambaſſador's retinue, in the year 1720, ſays they had ſometimes an opportunity of obſerving; and though a man might live a year in one of their towns without ſeeing the face of a Mooriſh woman in the ſtreets, yet when theſe Engliſh gentlemen met them in the fields, or ſaw them on the houſe-tops, if none of the

Moors were in ſight, they would unveil, and laugh till the appearance of one obliged them to conceal their faces again.

The above author obſerves, that the men are of a ſwarthy complexion, intermixed with a race of well-looking men, ſomewhat fairer than the reſt. They are generally luſty, ſtrong-limbed, active, laborious, and enduring with ſurpriſing reſolution the heats of ſummer and the cold rains of winter. Thus a meſſenger will go from Tetuan to Mequinez, which is a hundred and fifty miles, for a Barbary ducat, of the value of three ſhillings and ſix-pence; and when caught in a ſtorm of rain, will only look out for a buſh or high ſtone, and ſitting down on his hams, with his back towards it, remain in that poſture the whole night; or, if the weather be fair, will wrap himſelf up in his cloaths, and paſs the night ſleeping on the graſs. 'Tis ſaid that the moſt famous footmen will go a hundred and eighty miles in three days. They ſwim the rivers, even in the depth of winter, if not deterred by the rapidity of the current; and when they take a journey of ſeven or eight days, carry only a little meal and a few raiſins or figs in a ſmall goat's ſkin. They have no poſts for carrying letters in this country; the uſual way of ſending them being by footmen, who are almoſt as expeditious as horſes: nor have they any kind of wheel-carriage; for they remove their light goods from place to place on horſes, but make uſe of camels when they carry to a conſiderable diſtance, great quantities of corn, hides, or the like.

Their viſits are generally ſhort, and laſt no longer than the buſineſs which occaſions them requires; the viſitor being only treated with coffee, or ſherbet, and a pipe of tobacco, except on particular occaſions. The women have their peculiar apartments, where they receive their female viſitors; and from which even their huſbands are excluded.

When a Moor is diſpoſed to give an entertainment to his neighbours, his women go to the top of the houſe, where they continue till the gueſts are gone. Their entertainments generally conſiſt of cuſcuſu, which is thus made: they put fine flour into a large flat pan, and moiſtening it with water, roll it up into ſmall balls. Theſe they put into a kind of cullender, that ſerves for the cover of a pot, in which meat and fowls are ſtewing; whence it receives the heat and ſteam. As ſoon as it is enough, it is put into a diſh, and ſtrong broth being poured over it, they put in the meat and fowls, and ſerve it up. Their diſhes are either pewter or earthen-ware, wide at the top and narrow at the bottom, ſomewhat like a high crowned hat turned with the crown downwards.

They ſit croſs-legged on the floor, placing their diſhes on a large piece of Morocco leather, that ſerves both for table and table-cloth. While they eat a ſervant ſtands by with a great bowl of water in one hand, and a narrow long piece of blue linen in the other, to wipe their right hands, with which they pull the victuals to pieces, it being generally ſtewed to rags. They never uſe the left hand in eating, becauſe that is always uſed on neceſſary and leſs cleanly occaſions.

They eat without ſpeaking, and after their meals drink water or ſherbet, their religion forbidding them the uſe of wine and all other intoxicating liquors; yet moſt of them will get drunk with ſtrong drink of any kind, if they can get it. They are ſo very fond of butter-milk, which is their chief deſert, that when they would ſpeak of the extraordinary ſweetneſs of any thing, they compare it with that. A large black pitcher of it is uſually brought in with a wooden ladle, which is preſented to the moſt conſiderable perſon, and from him it paſſes ſeveral times round the company.

They bury their butter in the ground to make it keep, and do not diſlike it when it is three or four years old.

They alſo wrap up the cauls, ſuet, and fat of cows, ſheep, and goats, in great rolls, which in winter are ſold to the poor inſtead of butter. Their bread is, however, extremely cheap and good.

When they are in their houſes they are always ſitting or lying on mats; and if they ever go out on foot, it is never farther than to make a viſit, unleſs their buſineſs requires it; but they daily ſpend five or ſix hours before their doors, ſitting on their hams, for they think it extremely ridiculous for any one to walk up and down a room: "Why, ſay they, ſhould a man remove from "one end of the room to the other, without apparent "cauſe? Cannot he as well ſtay where he is, as go "to the other end, meerly to come back again?"

It is here reckoned ſo ſhameful a thing for a man to make water in a ſtanding poſture, that thoſe who are found guilty of it are excluded from being evidence in any trial. Whether this be in order to prevent any drop of their urine falling upon their cloaths, which they eſteem a legal defilement, is not eaſily determined; they are, however, very careful to ſquat down, like the females, whenever they make this evacution.

The women in labour have alſo a ſtrange ſuperſtitious cuſtom of ſending to a ſchool for five little boys, four of whom are directed to hold the four corners of a cloth, in each of which an egg is tied, and running with it through the ſtreets, ſing prayers alternately; upon which the Moors come out of their houſes with botties or pitchers of water, which they pour into the middle of the cloth; and by this means they expect to have an eaſy and quick delivery.

SECT. XI.

Of the Government of Morocco, the deſpotic Power of the Emperor, his Titles, Laws, Revenue, Navy, Land-Forces, Manner of making War, and the Puniſhments inflicted on Criminals.

THERE is not, perhaps, upon earth a more deſpotic government than that of Morocco: for their religion, laws, antient cuſtoms, and inbred prejudices, all conſpire to render the monarch abſolute, and to confirm the ſubjects in the moſt abſolute ſlavery. The king, or emperor, who has the title of ſharif, is not only allowed to have an uncontroulable property and power over the lives and fortunes of his ſubjects, but even over their conſciences too, he being the only perſon who, as the ſucceſſor of Mahomet, ſets up for being the principal interpreter of the Koran, and appoints all the judges under him. Whenever therefore any of his laws are enacted and proclaimed, as they are commonly done by his governors in all places of his dominions, that none may plead ignorance, they are every where received with an implicit and religious ſubmiſſion. His ſubjects are even bred up with a notion, that thoſe that die in the execution of his commands are immediately admitted into Paradiſe; and thoſe that have the honour to die by his hand, to a ſtill greater degree of happineſs there. Whence it is not ſurpriſing that we find on the one ſide ſuch cruelty, oppreſſion, and tyranny; and on the other ſuch paſſive ſubmiſſion and abject ſlavery.

When the honourable Charles Stuart, ambaſſador from England, appeared before the emperor of Morocco, he was mounted on a black horſe, which the negroes fanned, and beat off the flies with cloths, while an umbrella was kept conſtantly twirling over the emperor's head, to produce a little wind; the man that carried it taking care to move as the horſe did, that the ſun might not ſhine upon him. His dreſs differed little from that of his baſhas; but the hilt of his ſcimitar was of gold, ſet with large emeralds; his ſaddle was covered with ſcarlet cloth, embroidered with gold, with one piſtol in a cloth caſe on the left ſide. His baſhas proſtrated themſelves before him, kiſſed the ground, and riſing, went up to him and kiſſed his feet: which they all do very often when he talks to them, and then retire backwards into their places.

The emperor treated the ambaſſador with great civility; he was named Muley Abdallah, and was eighty-ſeven years of age, about fifty of which he had ſpent on the throne: but though his behaviour to the Engliſh was full of civility, our author obſerves, he might juſtly be termed a monſter in the human form, and one of the moſt bloody tyrants that ever plagued mankind; for his life was one continued ſcene of exactions, murders, and the moſt horrid acts of cruelty, daily exerciſed on his ſlaves and his wretched ſubjects: yet this monſter was eſteemed a ſaint; he was continually proſtrating himſelf on the

earth,

earth, to offer up his petitions to heaven, and perpetually exerciſing wanton acts of inhumanity. By his four wives, and the many thouſand women he had had in his ſeraglio, during his long reign, he is ſaid to have had ſeven hundred ſons able to mount a horſe; but the number of his daughters is unknown.

On the ambaſſador's going to viſit one of the emperor's ſons, the prince received him ſitting on a ſilk carpet, wrought with gold in large flowers. He had two black boys fanning him, one of them dreſſed in a veſt of black and white flowered velvet, the other's was of yellow velvet ſpeckled with black. The prince's garment was of rich cloth of gold. The Engliſh had chairs brought them, and ſat down for ſome time, the ambaſſador talking to the prince by one of the captives, who reſted himſelf on his hands and knees at the threſhold of the door; and, when he ſpoke to the prince, proſtrated himſelf almoſt cloſe to the ground.

The tyranny of the emperors of Morocco is chiefly exerciſed on the Moors and ſlaves; for the Arabs, who pay an involuntary tribute, are not to be treated with ſuch rigour. The zeal and attachment of the negroes who enjoy the principal power at court, entitle them to better treatment. During the laſt reign they gained a great aſcendency from Muley Iſhmael's mother being a negro. Theſe are better ſoldiers than the Moors; and the tyrant who raiſes them to the higheſt poſt of truſt and authority, commits his perſon, treaſure, and concubines to their care; and encourages them, by his own example, to tyrannize over and oppreſs the natives.

The emperor has here eſtabliſhed a branch of deſpotiſm, which renders him extremely powerful and formidable; that is, his being the ſole heir to all his ſubjects, in virtue of which he ſeizes on all their effects, and makes only ſuch proviſion for their families as he thinks proper; frequently leaving them entirely deſtitute of ſupport. To preſerve, however, ſome ſpecious ſhadow of juſtice, he allows the mufti a kind of ſuperiority in ſpirituals, and the meaneſt ſubject the power of ſummoning him before the mufti's tribunal; but the danger of ſuch an attempt, which would probably be no leſs than death, is alone ſufficient to deter any man from it.

The titles aſſumed by the emperors of Morocco are thoſe of moſt gracious, mighty, and noble emperor of Africa, king of Fez and Morocco, Tafilet, Suz, Dahra, and all the Algarbe and its territories in Africa; grand ſharif, or xarif, (that is ſucceſſor, or vicegerent) of the great prophet Mahomet.

The judges are either ſpiritual or temporal, or rather eccleſiaſtical and military: the mufti and cadis are judges in all religious and civil affairs; and the baſhas, governors, alcaides, and other military officers, of thoſe affairs that relate to the ſtate and the army. Theſe are all the moſt obſequious ſlaves to their prince, and the moſt rapacious tyrants to his ſubjects; for from them they can obtain neither juſtice nor favour, without a bribe. Indeed it cannot be otherwiſe in an arbitrary government, where the higheſt poſts are bought of the prince at a moſt extravagant rate, and only enjoyed by paying an exorbitant tribute to him; and bribing the courtiers about the monarch's perſon to prevent their being ſupplanted by ſlanderers, or higher bidders.

Another very conſiderable branch of the revenue ariſes from the piratical trade, which brings the greater ſums into the emperor's treaſury, as he is at no expence, either in fitting out veſſels, or maintaining the men, and yet has a tenth both of all the cargo and of all the captives: beſides which he obtains all the reſt by paying fifty crowns per head; by which means he engroſſes all the ſlaves, whoſe ranſom he fixes at a very high rate; and, while they ſtay, has all the profit of their labour, without allowing them any other maintenance than a little bread and oil; nor any other aſſiſtance, when ſick, than what medicines they receive gratis from a Spaniſh convent, which he tolerates, and which is forced to pay him an annual preſent for that toleration, beſides furniſhing the court with medicines, and the ſlaves who are unable to work with lodging and diet.

Another branch of his revenue conſiſts in the tenth part of all cattle, corn, fruit, honey, wax, hides, and other produce, which is exacted of the Arabs and Rebers, as well as of the natives, and are farmed by his baſhas, governors, and alcaides.

The Jews and Chriſtians alſo pay a capitation; the former of ſix crowns per head on all males from fifteen years and upwards, beſides arbitrary impoſts and fines. That on the Chriſtians for the liberty of trading in his dominions riſes and falls according to their number, and the commerce they carry on; and when once ſettled there, they cannot leave the country without forfeiting all their debts and effects to the crown.

The duties on imports and exports is another branch of his income; but as the trade of Morocco is not very conſiderable, the amount of it cannot be great. Indeed conſul Hatfield has computed the whole annual revenue to amount to no more than five hundred quintals of ſilver, each quintal, or hundred weight, worth ſomewhat above three hundred and thirty pounds ſterling; ſo that the whole, according to him, amounts to no more than one hundred ſixty-five thouſand pounds, a very ſmall revenue for ſo large an empire; but the prince has little occaſion for money, ſince he has almoſt every thing without it; beſides, the neceſſaries and luxuries of life are exceeding cheap.

The navy of Morocco is in the utmoſt degree inconſiderable; in Mr. Braithwait's time, it conſiſted only of two ſhips of twenty guns each, the largeſt not above two hundred tons burthen; a French brigantine they had lately taken, and a few row veſſels; yet with theſe well manned, they made a great number of prizes. It is a ſingular happineſs to the Chriſtian traders, that in this whole empire there is not one good harbour, that of Sallee, which is the beſt, being almoſt dry at low water, and has beſides a very inconvenient bar, which prevents ſhips of any burthen from entering; for had they better ports, they might be induced to make a greater figure at ſea. They alſo want timber for building of ſhips, and tackle for rigging them, with which, as well as with powder and ſhot, they are furniſhed by England and Holland. So little formidable are they at ſea, that about forty years ago a ſmall Engliſh frigate of twenty guns, with an active commander, by taking ſome of their ſhips, and running others aſhore, ſtruck ſuch terror among them, that the name of captain Delgarno, like that of ſome other warriors of diſtinguiſhed bravery, was uſed by the women of Salle and Mamora to ſtill their peeviſh children.

The land forces, among which are the greateſt part of the renegadoes, are diſperſed in diſtant parts, to garriſon the caſtles and forts on the frontiers. The pay of theſe foot ſoldiers is no more than about three ſhillings and four-pence a month, with a ſmall allowance of flour; and they appear half naked, and half ſtarved. The Moors are neither much better paid, nor equipped; but the choiceſt troops, both of horſe and foot, are the negroes, who being brought hither from the other ſide of the river Senegal when young, are trained up for the army, and commonly make the beſt ſoldiers. Theſe are computed to amount, including both horſe and foot, to about forty thouſand, and the Moors are pretty near as many. Theſe laſt forces are, however, neither raiſed, paid, nor armed at the emperor's expence; but upon any expedition are ſent to him by the alcaides, every one of which is obliged to furniſh his particular quota, according to the extent of his government; every town and village being obliged to maintain a number proportionable to its bigneſs, to be ready to march ready armed upon the firſt notice.

Their martial ſkill and diſcipline is amazingly rude and imperfect, except in their dexterity in riding and horſemanſhip. When they engage an enemy, they place the horſe on the two wings, and the foot in the center, in the form of a creſcent, and where the ground will allow it, the infantry are never more than two ranks deep; but theſe have neither diſcipline nor order, and are in ſuch dread of the cavalry of the enemy, that five hundred foot will be put to flight by fifty horſemen. They at beſt make but a poor figure in the field; for the only mark of courage they ſhew, is their beginning the attack with a loud ſhout, which is followed by a ſhort ejaculatory prayer for victory. The cavalry neareſt to the emperor chiefly conſiſts of negroes armed with guns, piſtols,

piſtols, and ſcymiters, and that fartheſt from him only with muſquets and lances. The infantry are variouſly armed, ſome with guns, others with bows, ſlings, broad ſwords, ſhort pikes, and clubs. With theſe weapons they engage the enemy with a kind of enthuſiaſtic fury, rather than like a well diſciplined army; but if they meet with a brave oppoſition, or an unexpected repulſe, are eaſily routed; and when this is the caſe, are with great difficulty rallied again; eſpecially if the enemy be of the ſame religion as themſelves.

The Arabs and Berebers are ſeldom called in as auxiliaries; becauſe being under a forced ſubjection, they cannot be ſafely truſted. They are, however, required to furniſh the emperor's troops with corn, barley, cattle, butter, oil, honey, &c. wherever they encamp. The Arabs, who are very numerous, and at the ſame time brave and fond of liberty, would ſoon ſhake off the yoke, were they not kept under by the want of good arms.

The puniſhments inflicted on criminals are the ſame as thoſe we ſhall find deſcribed in other parts of Barbary, except ſuch as flow from the arbitrary ſentence of their monarchs, as ſawing aſunder, either length or croſs-wiſe; burning by ſlow fires, and other inſtances of cruelty, that fill the mind with horror at the bare repetition; eſpecially as they are frequently inflicted on the innocent, and are the effects of jealouſy, revenge, detraction, and frequently of drunkenneſs or diſappointment. The renegadoes on attempting to return to Chriſtianity, are ſtripped quite naked, and anointed all over with tallow, and having a chain faſtened about their loins, are dragged from priſon to the place of execution, and there burned.

SECT. XII.

Of the Religion, Superſtitions and Ignorance of the people of Morocco.

THE eſtabliſhed religion both among the Moors and Arabs is the Mahometan, of the ſect of Melech. The Moors are in particular extremely ſuperſtitious, and expreſs a more than common abhorrence againſt all Chriſtians, to whom they uſually give the name of dogs. They on particular days are ſaid to place a variety of proviſions on the tombs of their deceaſed relations; and bury with them gold, ſilver, jewels, and other treaſures, to enable them to live the more at their eaſe in the other world. But theſe are rather Pagan than Mahometan ſuperſtitions. They are alſo ſaid to dig their graves narrow at the top, and broad at the bottom, in order to give the deceaſed more room, and greater facility in gathering up their bones at the reſurrection; on which account they never inter two perſons in one grave. They pay a great veneration to theſe ſepulchres, embelliſhing them with tomb-ſtones, cupolas and other ornaments, forbidding all Chriſtians to approach them. Every Friday, which is their ſabbath, theſe ſepulchres are crowded with men and women in a blue dreſs; but moſtly by the latter, they being allowed to repair thither to pay their tribute of tears and prayers for the dead; and by prieſts, who have generally cells in the neighbourhood of the burying places, which are out of town, and for a little money join their devotions with a ſeeming zeal and fervency.

In their moſques they behave with great decency, and ſeeming devotion; and if a man be convicted of having abſented himſelf from them during eight days, he is for the firſt fault rendered incapable of being a witneſs in any court of judicature, is fined for the ſecond, and burnt as a heretic for the third: but as for the women, they are never permitted to enter them, they being obliged to pray at home, or at the ſepulchres juſt mentioned.

They allow ſalvation for all of what nation or religion ſoever that die before they are fifteen years of age; but to none beyond it, except to the Mahometans of their own ſect. They, like the other Mahometans, reckon ideots and madmen among their ſaints of the firſt claſs, and build chapels to them after their death, which are viſited with great devotion, and are eſteemed ſanctuaries for all crimes, except treaſon. As the Koran forbids all games of chance, that prohibition is ſo ſtrictly obſerved in Morocco, that the people of all ranks content themſelves with playing at cheſs, draughts, and the like games, and expreſs the utmoſt abhorrence for cards, dice, &c. and if any perſon has loſt his money at any game and complains of it to the cady, he will order it to be immediately reſtored to him, and the winner to be baſtinadoed or fined. Indeed they uſually play only for a treat of coffee, or ſome other trifle.

They ſuffer neither Chriſtians nor Jews to enter into their moſques, or to have any carnal converſation with their women; and if any of them are found guilty of either, they muſt turn Mahometans, or be burned or impaled alive. They are ſtrict obſervers of their ramadan or lent; and the very corſairs, though the baſeſt villains under the ſun, will keep this long faſt on ſhip-board, and if a renegado is found to neglect it, he is puniſhed with one or two hundred blows on the ſoles of his feet.

It muſt, however, be acknowledged, that they pay the utmoſt regard to the name of God, and expreſs great abhorrence of the impious cuſtom ſo much in vogue among many who call themſelves Chriſtians, of ſwearing upon the moſt trivial occaſions, which the greateſt reſentment cannot provoke them to, much leſs to uſe blaſphemous and indecent expreſſions, in ſpeaking of the Supreme Being. Nor are they ever guilty of duelling or murder; they never kill but in war; for their religion allows of no pardon for murder, and it is with the utmoſt reluctance that they ever engage in battle with thoſe of their own religion.

They are no leſs commendable for their obſervance of ſome of the ſocial duties. Their reſpect and obedience to their parents, ſuperiors, and even a younger brother to an elder, is very remarkable; for before them, they neither dare to ſit or ſpeak without being bid. They are extremely jealous of the honour of their wives, and impatient of the leaſt blemiſh, or ſuſpicion that is caſt upon it. They are moderate in their eating, and with reſpect to drinking wine and other intoxicating liquors, it is forbidden by their law; and though this prohibition is perhaps the leaſt obſerved, many even of their great men indulging themſelves with drinking them privately. However, thoſe perſons, of whatever rank, who abſtain from them, and regale themſelves only with coffee, ſherbet, and ſuch ſober liquors, are the moſt eſteemed.

The prieſts and doctors of the law are the only perſons of any learning, though a few of the people can read, write, and caſt accounts; even theſe are much neglected by their princes and nobles, many of whom, like the late emperor Muley Iſhmael, can neither write nor read. The people are, however, fond of the pretended ſcience of aſtrology, and place great confidence in charms. There are, however, ſome regular ſchools in all their cities and great towns, for teaching children to read, write, and caſt accounts; but all the books they are taught conſiſt only of ſome ſhort catechiſms, and the Koran. When a boy has once gone through the laſt, he is handſomely dreſſed, ſet upon a horſe, and led in triumph through the town by the reſt of the ſchool boys.

SECT. XIII.

Of the Trade and Coins of Morocco.

THE commerce carried on here is almoſt entirely confined to the Jews and Chriſtians; the Moors neither underſtand it, nor have any trading veſſels of their own; whence the whole navigation is carried on by European ſhips, chiefly thoſe belonging to the Engliſh and French; but this trade is not a fourth part ſo extenſive as it might be.

The principal goods exported are elephants teeth, oſtrich feathers, copper, tin, wool, hides, honey, wax, dates, raiſins, olives, almonds, gum-arabic, ſandrac, and fine mats.

The

The uſual imports are arms, bullets, gun-powder, hard ware, iron in bars, lead, linen and woollen cloths, all which formerly paid a duty of ten per cent. but now only eight; beſides which the ſhips trading to Morocco pay a barrel of gunpowder for entrance, with twelve more for loading and anchorage, and twelve to the captain of the port. Yet veſſels ſailing to and from Gibraltar, pay but half that duty, this being an indulgence granted by the late Muley Iſhmael, who had a particular regard for the Engliſh, more than for any other Europeans. The Engliſh and French conſulage is eight dollars, and every French and Spaniſh ſhip pays three more to the hoſpital or convent of Spaniſh friars, founded there for the benefit of Chriſtian ſlaves. But what is extremely detrimental to their commerce, is their diſhoneſty; for they are ſaid to cheat all the ſtrangers they can, both in their weights and meaſures, particularly in their ſilver coin, which beſides its wear, is generally clipped by the Jews; ſo that if a man does not carry a pair of ſcales in his pocket, he is ſure to be cheated.

They alſo carry on a conſiderable trade by land by their caravans, which ſet out twice a year from Fez to Mecca and Medina, and carry variety of their woollen manufactures, ſome of which are very fine and beautiful; beſides Morocco leather, cochineal, indigo, and oſtrich feathers: in return for which they bring ſilks, muſlins, and a variety of drugs. They likewiſe ſend large caravans into Nigritia, conſiſting of many thouſand camels, which the length of the way and the difficulty of the paſſage, through deſarts void of proviſions and water, render abſolutely neceſſary, every other camel being loaded with water and proviſions: the others carry ſilk and woollen goods, oil, ſalt, beads, &c. which they exchange with the natives for negro ſlaves, oſtrich feathers, ivory, and gold duſt.

The coin of Morocco is of three ſorts, the loweſt, called a fluce, is a ſmall piece of copper a little leſs than a farthing; twenty of theſe make a blankit, which is a ſmall ſilver coin worth about two-pence Engliſh. This laſt is moſt in uſe, and for want of being milled is ſo liable to be clipt by the Jews, that if care be not taken to weigh them, one is ſure to be a loſer; for though both the Jews and Moors will uſe their utmoſt endeavours to put them off, yet if they be light they will refuſe to take them, except by weight, in order to be melted again; for the Jews being both clippers and coiners, get conſiderably by both. They alſo exchange good money for bad; for which, beſides the payment of the difference, they extort an extravagant premium. This renders trading very troubleſome, becauſe if one of theſe pieces be but cracked it will be refuſed; and yet large payments are generally made in that coin, gold being very ſcarce.

The only gold coin current in this country is the ducat, which is not unlike that of Hungary, and is worth about nine ſhillings ſterling; and three of them make a moidore. Merchants accounts are kept by ounces, each of which contains four blankits, and four of theſe laſt make a ducat accompt, or, as they ſtile it, a metical. But in payments to the government they require no leſs than ſeventeen and a half for a gold ducat. Theſe laſt ounces and ducats, or meticals, are imaginary. With reſpect to the three real ſpecies above-mentioned, the Mahometan religion not permitting them to bear the effigy of the prince, or of any other perſon, they are only ſtamped with ſome Arabic characters.

With reſpect to gold or ſilver foreign coin, it is only valued according to its weight, and as if it was to be melted. The Jews here make a conſiderable profit, not only in the exchange of it, but in leſſening and even debaſing it, which renders it dangerous to take any from them without the touch-ſtone and the ſcales.

SECT. XIV.

Of the Kingdom of ALGIERS.

Its Situation, Extent, Provinces, Soil, and Climate.

WE now come to the kingdom of Algiers, which is bounded on the north by the Mediterranean ſea; on the eaſt by the river Zaine, the antient Tuſca, which ſeparates it from Tunis; on the ſouth by the Zahara, or the Deſart; and on the weſt by the village of Twunt, and the mountains of Trara, which ſeparate it from Morocco; extending in length, according to Dr. Shaw, from ſixteen minutes weſt longitude from London to the river Zaine in nine degrees ſixteen minutes eaſt, or four hundred and ſixty miles. To the weſt it is generally about ſixty miles broad, but the eaſtern part is no where leſs than a hundred miles in breadth.

This country is at preſent divided into three provinces, that of Tremeſen, or Tlemſen, to the weſt; the province of Titterie, which lies to the ſouth; and Conſtantia, which lies to the eaſt. Each of theſe provinces is governed by a bey, or viceroy, appointed and removed at pleaſure by the dey of Algiers.

The remarkable chain of mountains, ſometimes placed between this country and the Zahara, and at others reckoned within the dominions of Algiers, is thought to be a continuation of Mount Atlas; though theſe mountains are far from being ſo high as they have been repreſented by the antients; for the above excellent author obſerves, that thoſe parts which he has ſeen are nearly equal to ſome of the moſt lofty mountains in our iſland; and he queſtions whether they are any where ſo high as the Alps or the Appenines. "If you form, ſays he, "the idea of a number of hills of the perpendicular "height of four, five, or ſix hundred yards, with an "eaſy aſcent, adorned with groves of fruit and foreſt-"trees, riſing ſucceſſively one behind another, with here "and there a rocky precipice, and place upon its ſide or "ſummit a village, encompaſſed with a mud-wall, you "will have a juſt and lively idea of one of theſe mountains, and will have no occaſion to heighten the pic-"ture with the imaginary nocturnal flames, the melo-"dious ſounds, or the laſcivious revels of the fictitious "beings attributed to them by the antients."

Twunt and the mountains of Trara form the weſtern confines of the province of Tremeſen, as the river Maſaffran, at near two hundred miles diſtance, bounds it to the eaſt. This province is almoſt equally diſtributed into mountains and valleys. Twunt, the frontier village of the Algerines, is ſituated about four leagues to the ſouth-weſt of Cape Hone, and is defended by a ſmall fort. This Cape is the largeſt and one of the moſt conſpicuous promontories to the eaſtward of the river Malva.

The climate of Algiers is for the moſt part ſo moderate, that the country enjoys a conſtant verdure, the leaves of the trees being neither parched by the heat of ſummer nor nipt by the cold of winter. They begin to bud in February; in April the fruit is in its full ſize, and moſt of it is ripe in May. The grapes are fit to gather in June; and their figs, olives, and nuts in Auguſt: but this is not every where the caſe, for the ſoil differs greatly, ſome parts being exceſſively hot, dry, and barren; and on that account lie uncultivated, the inhabitants in general being very negligent about agriculture: other parts, eſpecially the mountainous places of Tenez, Bugia, and Algiers Proper, are fertile in corn and other grain, and variety of fruits; others afford plenty of excellent paſturage, eſpecially the northern coaſt of Tremeſen; while the ſouthern ſide, and other parts at a diſtance from the ſea-coaſt, being wild and barren, harbour a great variety of wild beaſts, as lions, tygers, buffaloes, wild boars, ſtags, porcupines, oſtriches, and wild fowl; on which account they have few towns, and thoſe but thinly peopled, when compared with the cities near the ſea; yet being advantageouſly ſituated for an inland trade, carry on a conſiderable commerce with Biledulgerid, and other countries to the ſouth.

SECT. XV.

A Deſcription of the principal Places in the Weſtern Government of Algiers; particularly the Cities of Tremeſen, Oran, Arzew, Moſtagan, and Tenez.

WE ſhall begin in the weſtern government of Algiers with the deſcription of Tremeſen, or, according to the pronounciation of the Moors and Arabs, Tlemſen, which is ſituated on the ſouthern part of the province of the

the ſame name, in thirty-four degrees forty minutes north latitude, and in three degrees ten minutes weſt longitude, about thirty miles from the ſea, and ninety ſouth-weſt of the city of Oran. It is ſeated on a riſing ground below a range of rocky precipices, upon the firſt ridge of which is a long narrow piece of level ground, watered by many ſprings, which, uniting their ſtreams, fall in a variety of caſcades, on their deſcent towards the city; the weſtermoſt of theſe rivulets turning a variety of mills.

Tremeſen is ſurrounded by a ſtrong wall, forty cubits high, flanked with towers, and made of mortar compoſed of lime, ſand, and ſmall pebbles, which being well tempered and wrought in a frame, in the ſame manner as thoſe deſcribed at Mequinez, have acquired a ſolidity and ſtrength not inferior to that of ſtone. The gates of the city, which are five in number, have draw-bridges before them, with other fortifications; and it is alſo defended by a ſpacious caſtle, built in the modern way with courts, halls, and convenient barracks for the janizaries. In the city is a large reſervoir of water, conducted thither by a ſubterraneous channel, and from thence the uſual demands of the city are ſupplied; for which purpoſe the water is conducted from thence to the caſtle, the moſques, and other places.

In the weſt part of the city is a ſquare baſon, of Mooriſh workmanſhip, two hundred yards long, and about half as broad; in which, according to a tradition of the inhabitants, the kings of Tremeſen took the diverſion of ſailing; while, at the ſame time, their ſubjects were taught the art of navigation: but it appears more probable, that this baſon was deſigned as a reſervoir in caſe of a ſiege, and to preſerve at all other times a quantity of water ſufficient to refreſh and fertilize the fine gardens and plantations below the city.

Tremeſen, while it was the capital of the kingdom, was divided into ſeveral wards, or partitions, by ſtrong walls, in order, perhaps, the better to put a ſtop to any inteſtine commotion, or to prolong a ſiege. There were two of theſe diviſions in the time of Edreſi, each of which might be conſidered as a diſtinct city, theſe being of an oblong ſquare figure, incloſed by a wall of the ſame ſtructure with that of the city. In the year 1562 Tremeſen contained no leſs than twenty-five thouſand well built houſes, with large ſtreets, and a multitude of fine public buildings; particularly five large colleges, beſides baths, hoſpitals, &c. But, about the year 1670, Haſſan, dey of Algiers, laid the greateſt part of the city in ruins, as a puniſhment for the diſaffection of its inhabitants; ſo that now ſcarcely a ſixth part remains of this famous metropolis, which was about four miles in circumference. Out of a hundred and fifty moſques there remain no more than eight, each of which has a tower of the Doric order, adorned with marble columns; and of a hundred and ſixty public baths, only four are now remaining. The Jews had ten ſynagogues, but all of them are gone to decay; and among the ruins are ſeveral ſhafts of pillars and other fragments of Roman antiquities.

The firſt town on the coaſt worthy of notice, on proceeding from the dominions of Morocco, is the city of Oran, the reſidence of a bey. This was formerly a place of great reſort, and contained ſix thouſand houſes, chiefly inhabited by clothiers and weavers; and thither came the Venetian, Genoeſe, and Catalonian merchants, for the ſake of trade. It is ſituated in the thirty-ſeventh degree forty minutes north latitude, and had ſeveral noble moſques, beſides caravanſeras, hoſpitals, baths, and other public buildings; but it is now much reduced from its antient extent and grandeur, and is no more than about a mile in compaſs.

It is ſituated on the ſea-coaſt upon the declivity, and near the foot, of a high mountain, on the ſummit of which are two caſtles. Within half a furlong of this mountain is another caſtle, in a ſituation ſomewhat higher than the two former, with a large valley between them; whence their reſpective ridges are ſo remarkably diſunited, that they not only form a moſt convenient land-mark, but render all the approaches from the latter to the former impracticable. To the ſouth and ſouth-eaſt two other caſtles are erected upon the ſame level with the lower part of the town, but ſeparated from it by a deep winding valley, which ſerves as a natural trench to the ſouth ſide of the city. In the upper part of this valley is a ſpring of excellent water, which, forming a rivulet, adapts its courſe to the ſeveral windings of the valley, and, paſſing under the walls, plentifully ſupplies the city with water. At every opening of this valley appears a proſpect perfectly romantic, conſiſting of the intermingled view of precipices, plantations of orange-trees, and rills of water trickling down from the rocks, and forming cool and delightful retreats. Near this fine ſpring is another caſtle, which is alſo an important defence to the city. Three of theſe caſtles are regular poligons; but the higheſt upon the ridge, and the eaſtermoſt of thoſe before the town, are built like our old Engliſh caſtles, with battlements and loop-holes.

Oran has only two gates, and both of theſe open into the valley. The neareſt to the port is named the Gate of the ſea, and has over it a large ſquare tower, which upon occaſion might be converted into a fort. Adjoining to the upper gate is an oblong battery; and a citadel, raiſed on the higheſt part of the city towards the north-weſt, has all its angles mounted with cannon, while the lower and oppoſite corner is defended by a regular baſtion.

This city was taken by the Spaniards in the year 1505, after which they built ſeveral beautiful churches and other edifices in the Roman ſtile; and alſo imitated the Romans in carving upon the friezes, and other convenient places, inſcriptions in their own language in large characters: but after this city had continued in the poſſeſſion of the Spaniards above two hundred years, it was retaken by the Algerines in the year 1708.

At the diſtance of three miles from Oran is Arzew, the antient Arſenaria, behind which the country extends in rich champain grounds; but on the other ſide is a view of the ſea from precipices that are a natural ſafe-guard to the place. The water now uſed by the inhabitants is drawn from wells below theſe precipices; but being beneath the ſurface of the ſea, it is brackiſh. In order to procure the advantage of freſh water, the antient city was erected on ciſterns cut in the rock, which received that which fell in rains; but though theſe reſervoirs ſtill ſubſiſt, they are applied to a very different uſe, and ſerve the inhabitants as caves to dwell in. Some ruins of the antient city are ſtill to be ſeen; capitals, ſhafts, and baſes of columns being ſcattered about. Dr. Shaw obſerves, that a well wrought Corinthian capital of Parian marble, when he was there, ſupported a ſmith's anvil; and that he accidentally diſcovered a beautiful Moſaic pavement through the rents of a ragged carpet ſpread over it; and that there is here alſo a ſepulchral chamber, fifteen feet ſquare, built plain, without niches or any other ornaments, though there are ſeveral Latin inſcriptions in Roman capitals on the walls.

At the diſtance of five miles to the ſouthward of Arzew is a large ſpace of ground filled with pits, from which the neighbouring people are ſupplied with ſalt. Theſe ſalt-pits take up an area of about ſix miles in compaſs, ſurrounded with mountains. This ſpace is in winter a lake, but in ſummer the water is exhaled by the heat of the ſun, and the ſalt left behind chryſtallized. This commodity, from the facility of digging it, and the ſhortneſs of carriage to the adjacent port, would, under any other government, be an invaluable branch of trade, the pits being inexhauſtible.

About ſixty miles to the eaſt of Oran is Moſtagan, or Moſtagannin, which is built in the form of a theatre, with a full proſpect of the ſea; and on every other ſide is ſurrounded with hills, which hang over it. In one of the vacant ſpaces, about the middle of the town, are the remains of an old Mooriſh caſtle, which from its form, appears to have been built before the invention of fire-arms. The north-weſt corner of the city, which overlooks the park, is encompaſſed with a wall of hewn-ſtone, and has another caſtle built in a more regular manner, and defended by a Turkiſh garriſon. But theſe being over-looked by the adjacent hills, the chief ſecurity of the place lies in the citadel, which, being erected upon one of the juſt mentioned eminences, commands both the city and the adjacent country. The town is well ſupplied with water, and its haven is ſafe and commodious. Behind it runs Mount Magaraba, which is ſo called from the Magarabas, its inhabitants, who are de-

ſcended from the Berebers. This mount extends about thirty miles from eaſt to weſt along the coaſt of the Mediterranean. Theſe Magarabas live in tents, feed a great quantity of flocks, and annually pay ten thouſand crowns to the dey of Algiers.

About fifty miles to the eaſt of Moſtagan, is the city of Tenez, ſituated at the foot of a hill, and about a league from the ſea, where it has a convenient port. This city with its territory were once ſubject to the kings of Tremiſen; but the inhabitants taking advantage of the inteſtine broils by which that kingdom was divided, choſe a king of their own: yet they enjoyed their independence but a ſhort time; for their little ſtate became ſoon after a prey to the Algerines, who have kept a ſtrong garriſon in it ever ſince. The governor reſides in the caſtle, which was once the royal palace. The adjacent territory is very fertile in corn, fruits, and paſturage, and produces honey and wax.

Still farther to the eaſtward is the city of Sherſhel, the inhabitants of which are famous for making earthen veſſels, ſteel and ſuch hard-ware as is wanted by the neighbouring Arabs. It only conſiſts of low tiled houſes, and is a mile in circumference, though it was once the ſeat of one of the petty kings of the country. It is ſituated amidſt the ruins of a city that was once little inferior in extent to Carthage. Theſe ruins are a proof of its former magnificence; for they abound with fine capitals, the ſhafts of columns, capacious ciſterns, and beautiful Moſaic pavements. The water of the river Haſhem, as it is now called, was conveyed thither through a large and noble aqueduct, little inferior to that of Carthage, in the loftineſs and ſtrength of its arches, ſeveral fragments of which are to be found among the neighbouring mountains and vallies, and are inconteſtible proofs of the grandeur and beauty of the workmanſhip. Two conduits were alſo brought from the mountains to the ſouth and ſouth-weſt; theſe ſtill ſubſiſt, and as they furniſh Sherſhel with excellent water, while that of the wells are brackiſh, they may be conſidered as two legacies of ineſtimable value, left to the inhabitants of this town by the ancients.

The ſituation of this place was nobly adapted to anſwer the purpoſes of ſtrength and beauty. It was ſecured from the incroachment of the ſea by a wall near forty feet high, ſupported by buttreſſes, and winding near two miles along the ſeveral creeks of the ſea-ſhore. The city was on a level for two furlongs within this wall, and afterwards gradually roſe for the ſpace of a mile, to a conſiderable height, extending over a variety of ſmall hills and vallies.

This ancient city appears, by many circumſtances, to have been the Julia Cæſaria of the Romans, which was the ſee of a biſhop. The inhabitants have a tradition, that the city was deſtroyed by an earthquake, and that the port, which was once large and commodious, was reduced to its preſent wretched ſtate, by the arſenal, and the other adjacent buildings being thrown into it by the concuſſions. The Cothon, which had a communication with the weſtern part of the port, affords a proof of the truth of this tradition; for when the ſea is low and calm, there are diſcovered all over the area, maſſy pillars, and pieces of great walls, that can ſcarcely be conceived to come there by any other means than by ſome violent ſhocks of an earthquake. Indeed, no place could be better contrived for the ſafety of their veſſels than this Cothon, which was fifty yards ſquare, and in every part of it ſecure from the wind, the ſwell and the current of the ſea, which are troubleſome enough in the port.

The country round the city is extremely fertile, and well watered by ſeveral brooks. On the banks of one of them is an old ruined town, under a high rocky precipice, and at ſome diſtance near theſe ſprings, the Algerines have a fortreſs, in which is a garriſon of Moors and Arabs.

SECT. XVI.

Of the Southern Province named Tittere, with a particular Deſcription of the city of Algiers.

TITTERE, the ſouthern province of Algiers, is much inferior to the weſtern in extent, it being ſcarce ſixty miles either in breadth or length. The ſea coaſt to the breadth of five or ſix leagues chiefly abounds in rich champain ground, behind which is a range of rugged mountains, that run almoſt in a direct line through a great part of the province, and beyond them are extenſive plains. In this province is ſituated Algiers, the capital of the kingdom, in the thirty-ſixth degree thirty minutes north latitude, which has for ſeveral ages braved the reſentment of the greateſt powers in Chriſtendom; though it is not much above a mile and a half in circumference; but little as it is, it is ſaid to contain a hundred thouſand Mahometans, fifteen thouſand Jews, and two thouſand Chriſtian ſlaves.

It is waſhed on the north, and north-eaſt ſide by the Mediterranean, over which it has a full proſpect, it being built on the declivity of a hill, upon which the houſes riſe ſo gradually above each other, that there is ſcarce one in the city that has not a view of the ſea, and from thence it affords a beautiful proſpect, from the advantage of that declivity, and the whiteneſs of the terraſſes. The walls of the upper part of the city are thirty feet in height, and forty at the lower end towards the ſea. They are twelve feet thick, and flanked with ſquare towers, but all of them ſo decayed as to be of little defence, except where they are ſtrengthened by additional fortifications. The ditch with which they are ſurrounded was twenty feet wide, and ſeven deep; but it is now almoſt filled up with mud.

The city has ſix gates kept open, each of them guarded by ſome out-works, and there have been others which are now walled up. The citadel, which is built upon the higheſt part of the city at the weſtern angle, is of an octagonal figure, and each of the ſides in view has port-holes or embraſures.

The whole city is over-looked by a ridge of hills on the weſtern ſide, which run almoſt on a level with the uppermoſt gate, and upon it are erected two ſtrong forts; one of which is called, from its five acute angles, the Star-caſtle, and commands the Sandy-bay, and the mouth of the river Elved. The other, called the Emperor's caſtle, ſtands at half a mile diſtance from the upper gate, and has the command both of the Star-fort, and of the whole ridge, as well as of the Sandy-bay, and the mouth of the river Rebat, on the ſouth ſide of the city.

The city is much better fortified on the ſea-ſide. The mole was the work of Cheredin, the ſon of Barbaroſſa. Before his time the port lay open, and rather reſembled a road than a harbour; but he no ſooner became maſter of the place, than he employed all the Chriſtian ſlaves in building the mole, which they completed in three years time. It extends from one of the extremities of the ſmall iſland that faces the town, in the form of a large ſemi-circle, to the mole gate; and from the other extremity of the iſland towards the walls of the town, leaving a handſome opening into the haven, where the largeſt veſſels may ride in ſafety, from the violence of the waves. This is defended at one angle by an old round caſtle built by the Spaniards, when they were maſters of the place, and now called the Fanal Caſtle, or Light Houſe Fort. It is ſeated on the ſolid rock, and a fire is carefully kept in it for the ſecurity of the ſhips: it has three batteries of fine cannon.

At the ſouth end of the iſland is another fort, conſiſting of three batteries to defend the entrance of the harbour, which according to Dr. Shaw is of an oblong figure, one hundred and thirty fathoms in length, about eighty in breadth, and fifteen in depth. The above batteries that guard its entrance, are ſaid to be bomb-proof. They have each of them their lower embraſures mounted with thirty-ſix pounders. However, as none of the fortifications are aſſiſted with either mines or outworks, and as the ſoldiers who are to guard and defend them, cannot be kept to any regular courſe of duty and attendance, a few reſolute battalions, protected by a ſmall ſquadron of ſhips, it is ſaid, might ſoon make themſelves maſters of the ſtrongeſt of them. The embraſures of the caſtle and batteries have all braſs guns in good order. The battery of the Mole-gate, at the eaſt angle of the city, is mounted with long pieces of ordnance, one of which, our author thinks, hath ſeven cylinders,

each of them three inches in diameter. Half a furlong to the weſt-ſouth-weſt of the harbour is the battery of Fiſher's Gate, or the Gate of the Sea, which conſiſts of a double row of cannon, and commands the entrance into the port, and the road before it.

There is but one handſome ſtreet in the city, which reaches from the weſt to the eaſt end, and is in ſome parts wider than in others; but in all much broader than any of the reſt. It has on the wideſt part the houſes of the chief merchants, handſome ſhops, and a market for corn and proviſions. All the other ſtreets are ſo narrow, that two perſons can hardly walk a-breaſt, and the middle being much lower than the ſides, added to the uſual naſtineſs of theſe ſtreets or lanes, renders it very diſagreeable to walk through them, eſpecially as camels, horſes, mules, and aſſes, are continually paſſing and repaſſing, to which one muſt give way at the firſt warning, by ſqueezing up cloſe to the houſes. It is ſtill more dangerous to meet with a Turkiſh ſoldier in theſe ſtreets; for the wealthieſt Chriſtian muſt take care to give him the way, and ſtand cloſe till he has paſſed by, or be in danger of feeling ſome ſhocking effect of his brutal reſentment. The narrowneſs of theſe ſtreets is commonly thought to be deſigned as a ſhelter from the heat; it may alſo be occaſioned by the frequency of the earthquakes, in order to prevent their falling, ſince the fronts of moſt of them are ſupported by pieces of timber, extending a-croſs the ſtreets from one to the other.

The houſes are computed to amount to about fifteen thouſand, and are built of brick or ſtone, round a ſquare court. They are obliged to white-waſh them, both on the inſide and without, once a year; but commonly do it againſt the approach of their grand feſtivals. The moſt magnificent of all is the dey's palace, which ſtands in the heart of the city. This is a ſpacious and ſtately edifice; the front, which faces the inner court, being ſurrounded with two noble galleries, one over the other, ſupported with marble pillars, and has two ſpacious halls, in one of which the dowan or divan meets every Sunday, Monday, and Tueſday. The barracks for the Turkiſh ſoldiers are very handſome ſtructures, kept clean, at the charge of the government, by the ſlaves that attend them. Every barrack contains ſix hundred Turkiſh ſoldiers, each of whom has an apartment allotted him, and all the courts of theſe barracks have fountains to waſh in, before they go to prayers.

The married men, who are moſtly renegadoes, are, however, excluded the benefit of theſe barracks, and obliged to provide themſelves lodgings at their own expence, in ſome other parts of the town; as are likewiſe the ſingle men who will not conform to the regulations obſerved in theſe public buildings. In either caſe they are obliged to hire private houſes, or to take up their quarters in one of the four albergas or fondaias of the town.

Theſe are large ſtructures belonging to private perſons, conſiſting of ſeveral courts, in which are warehouſes and a variety of apartments to let, and are much frequented by the Levantine merchants; for neither Algiers, nor any other town in the kingdom, has either inns, taverns, or public places for the accommodation of ſtrangers, like the caravanſeras in Turkey. The few Chriſtians who reſort thither either lodge with ſome perſons to whom they are recommended, or with the conſul of their nation, who is always ready to accommodate them with an apartment in his own houſe, or at his table, if they are perſons of diſtinction. As to the Greeks, and other mean travellers, there are plenty of cooks-ſhops and public taverns kept by the ſlaves of the deylik, for their accommodation. The Jews alſo keep ſuch houſes and apartments to let, for the uſe of thoſe of their nation.

Their moſques are ſo numerous, that they are ſaid to amount to about a hundred and ſeven; ſome of theſe are handſome ſtructures; and as they are chiefly ſituated near the ſea-ſide, they make a very fine ſhew, and greatly add to the beautiful proſpect of the city. The baths are alſo very numerous, the Turks reſorting to them not only before the time of their five daily prayers, but whenever their affairs will permit. Some are large and handſome, finely paved with marble, and elegantly furniſhed; others are ſmall and mean, ſuited to the lower rank; but they are all built much after the ſame manner. The women have alſo their particular baths, attended by perſons of their own ſex, into which no man is allowed to enter upon any pretence whatever.

Beſides theſe public baths they have ſix other buildings, called baſios, which are little better than ſtinking priſons, wherein they lock up the ſlaves at night. In each of theſe the poor wretches have a chapel for the free exerciſe of their religion; and every ſlave is allowed three ſmall loaves, and a little matraſs and rug for his bed. To theſe baſios they muſt all repair at a ſtated hour in the evening, and the next morning they are again let out to go to their reſpective labours.

There are alſo ſome handſome edifices without the walls of the city, which add to the beauty of the proſpect on viewing it from the ſea; as the hall where the officers of the marine hold their aſſemblies, at the foot of the mole; and a great number of tombs belonging to men of eminence, ſome of which are very neat, and moſt of them are adorned with chapels and oratories, which are reſorted to by men and women every Friday.

Algiers had formerly neither wells nor fountains, their only water being the rain which they ſave in ciſterns. However, in the laſt century, a Moor, driven thither from Spain, diſcovered a way of conveying as much of it, by the help of two aqueducts, as ſupply a hundred fountains at proper diſtances from each other. This water, which is allowed to be excellent, is brought thither by a long courſe of pipes and conduits, from a great variety of rivulets that have their ſources on the adjacent mountains. Theſe pipes likewiſe ſupply the country ſeats, and the adjoining orchards and gardens.

The territory about Algiers is very fertile, and the hills and vallies beautified with groves, gardens, and country-ſeats, to which the rich retire during the ſummer ſeaſon. Theſe villas are ſmall white houſes, ſhaded with a variety of fruit-trees and other verdure, and watered by a multitude of fountains, which afford ſingular pleaſure and benefit in theſe hot countries, as by this means every thing is kept conſtantly green. The people are too negligent to prune their trees; they even ſuffer their vines to run up to the top of the moſt lofty of them, and extend themſelves from one tree to another, by which means they indeed form natural and delightful bowers; but would yield much better fruit were they frequently pruned. The ſame may be ſaid of their citron, orange, and other fruit-trees, which, though they are very numerous, never come to that perfection as thoſe cultivated by ſtrangers, particularly by the European conſuls, at whoſe villas the trees produce much more excellent fruit than thoſe which belong to the natives.

SECT. XVII.

Of Conſtantina, the eaſtern Province of Algiers; with a Deſcription of the Cities of Bugia, Bona, Hippo, Conſtantina, the Inchanted Baths, and the Mountains of Aureſs.

THE eaſtern province of Algiers, diſtinguiſhed by the name of Conſtantina, is nearly equal in extent to the other two, for it is two hundred and thirty miles long, and about a hundred broad. The ſea-coaſt is rocky almoſt through its whole extent.

The firſt town worthy of notice on the weſt is that of Bugia. The port is larger than either that of Oran or Arzew, though it is formed like theirs by a narrow neck of land running out with the ſea, a great part of which was once faced with a wall of hewn-ſtone, and there was likewiſe an aqueduct for bringing freſh water to the fort; but at preſent both the wall, the aqueduct, and the baſons into which the water flowed, are deſtroyed.

The town of Bugia is built upon the ruins of the antient city, at the foot of a high mountain. Beſides the caſtle which commands the city, there are two others at the bottom of the mountain for the ſecurity of the port, and upon the walls of one of them are ſtill remaining the marks of a cannon ball fired againſt it by admiral Spragg, in his famous expedition againſt this place.

This

This town is defended by a garriſon, notwithſtanding which the neighbouring Arabs lay it in a manner under perpetual blockade. However, the inhabitants carry on a conſiderable trade in plough-ſhares, mattocks, and other utenſils, which they forge out of the iron ore dug out of the neighbouring mountains; great quantities of wax and oil are alſo brought there every market-day by the Arabs, and ſhipped off for Europe and the Levant. Yet theſe laſt raiſe ſtrange diſturbances in the town every market-day: every thing indeed is tranſacted with the utmoſt tranquility while the market continues; but it is no ſooner over than the whole place is in an uproar, and the day is ſeldom concluded without ſome flagrant inſtance of rapine and barbarity.

At a conſiderable diſtance to the eaſt ſtands the city of Bona, on the ſouth-eaſt ſide of a hill, on the top of which the Algerines have a caſtle and garriſon. Beſides the capacious road which lies before it to the eaſt, this city had formerly a ſmall convenient port under its very walls to the ſouthward; but by the conſtant diſcharge of ballaſt into the one, and the neglect of cleanſing the other, both are daily rendered leſs ſafe and commodious; yet a conſiderable quantity of hides, wool, corn, and wax, are annually exported from thence.

A mile farther to the ſouth are the ruins of the antient Hippo, called Hippo Regius, from its being one of the royal cities of the Numidian kings; it having the advantage of great ſtrength, and of being commodiouſly ſituated both for commerce and for hunting. It enjoys a healthful air, and affords ſo fine a proſpect, that at one view the eye takes in the ſpacious harbour, a number of mountains covered with trees, and plains finely watered. The ruins of the city take up about a mile and a half in compaſs, and chiefly conſiſt of large broken walls and ciſterns. St. Auguſtine was biſhop of this city, and the Moors ſhew a part of the ruins which they ſay belonged to his convent.

At a ſmall diſtance to the eaſt of Cape Roſa is a baſtion on a ſmall creek, and the ruins of a fort which once belonged to a French factory; but the unhealthineſs of the place, from the neighbouring ponds and marſhes, obliged them to remove to La Celle, another creek three leagues farther to the eaſt, where they have a magnificent houſe and garden, a company of ſoldiers, a conſiderable quantity of arms, and ſome pieces of ordnance. They command the trade of the whole country, and beſides a coral fiſhery, which they carry on here, wherein they employ three hundred men, they monopolize the trade of hides, wool, corn, and wax at Bona and other places. For theſe privileges they annually pay the dey of Algiers, the magiſtrates of Bona, and the chiefs of the neighbouring Arabs, thirty thouſand dollars, or about five thouſand guineas.

Among the mountains of Beni Abbeſs, in this province, is a narrow winding defile, which, for near half a mile, extends between precipices that riſe to a great height on each ſide. At every winding a rock, which originally went acroſs it, and ſeparated one valley from another, is cut in the form of a door-caſe, ſix or ſeven feet wide; and theſe are named by the Turks, The Gates of Iron. Few perſons can paſs them without horror, and a handful of men might defend the paſs againſt a numerous army.

At the diſtance of ſix miles to the ſouth-ſouth-eaſt is another dangerous paſs, named the Acaba, or the Aſcent; this being the reverſe of the former, the road extending along a narrow ridge, with precipices and deep valleys on each ſide. Here the leaſt deviation from the beaten-path expoſes the traveller to the danger of being daſhed to pieces by falling to the bottom; yet the common road from the city of Algiers to the eaſtward lies through the above paſs and over this ridge.

Conſtantina, or Cirta, as it was antiently called, is ſituated forty-eight miles from the ſea, and was both one of the principal, as well as one of the ſtrongeſt cities of Numidia. The greateſt part of it has been built on a rock that may be termed a peninſular promontory, inacceſſable on all ſides, except towards the ſouth-weſt. This is computed to be above a mile in circuit, ending to the northward in a perpendicular precipice, at leaſt a hundred fathoms deep. On that ſide is a beautiful landſcape of a great variety of mountains, vales, and rivers, extending to a great diſtance. To the eaſtward the view is bounded by a range of rocks much higher than the city; but towards the ſouth-eaſt the country is more open, and the proſpect is terminated by diſtinct mountains. On that ſide the eminence is ſeparated from the neighbouring plains by a deep narrow valley, perpendicular on both ſides, where the river Rummel conveys its ſtream, over which was formerly a bridge of admirable workmanſhip. To the ſouth-weſt is a neck of land about half a furlong broad, near which ſtood the principal gate of the city: this is entirely covered with broken walls, ciſterns, and other ruins, that are continued quite down to the river, and are from thence extended along a narrow piece of plain ground that runs parallel with the valley already mentioned. This was the ſituation of the antient Cirta; but the preſent city is entirely confined to the eminence which Dr. Shaw has termed the peninſular promontory.

Among the ruins ſcattered over this place, there are ſtill remaining, near the center of the city, a ſet of ciſterns, which receive the water conveyed thither by an aqueduct: theſe are about twenty in number, forming an area fifty yards ſquare. This aqueduct, though in a more ruinous condition than the ciſterns, demonſtrates the public ſpirit of the inhabitants of Cirta, in erecting a ſtructure that required ſuch an immenſe quantity of materials.

Near the brink of the precipice to the north are the remains of a magnificent edifice, in which the Turkiſh garriſon is now lodged. Four baſes, each ſeven feet in diameter, with their pedeſtals, are yet ſtanding, and ſeem to have belonged to a portico; theſe are a black ſtone little inferior to marble. The ſide-poſts of the principal gates of the city are of a beautiful reddiſh marble, and are neatly moulded and pannelled. An altar of white marble alſo forms part of a neighbouring wall. The gate towards the ſouth-eaſt reſembles the other, though it is much ſmaller, and leads to the bridge built over this part of the valley. This bridge was a fine piece of workmanſhip. The gallery and the piers of the arches were adorned with cornices and feſtoons, oxes-heads and garlands, and the keys of the arches are embelliſhed with caducei and other ornaments. Between the two principal arches is the figure of a woman treading upon two elephants, with a large ſcollop-ſhell for her canopy. This is well executed in a bold relief. The elephants, which ſtand with their faces turned towards each other, twiſt their trunks together; and the woman, who is dreſſed in her hair, with a cloſe-bodied garment like an Engliſh riding-habit, raiſes up her petticoats with her right hand, looking ſcornfully at the city. This group, in any other ſituation, might be ſuppoſed to belong to ſome fountain; theſe being ſometimes ornamented with ſuch wanton deſigns.

The river Rummel begins to turn to the northward juſt below the bridge, and continues that courſe through a ſubterranean paſſage in the rocks, which ſeems to have been an extraordinary proviſion of nature for the reception of this river, that muſt otherwiſe have formed a prodigious lake, and have laid a great part of the neighbouring country under water, before it found a paſſage to the ſea. This river falls from its ſubterranean cavity in a large cataract, a quarter of a mile to the eaſtward of a place called Seedy Meemon.

Amidſt the ruins to the ſouth-weſt of the bridge is a great part of a triumphal arch, named The Caſtle of the Giant. All the mouldings and friezes are embelliſhed with the figures of battle-axes, flowers, and other ornaments. On each ſide of the grand arch, which is between two ſmaller ones, are pilaſters of the Corinthian order, pannelled like the ſide-poſts of the city-gates, in a taſte that ſeems peculiar to this city.

At the diſtance of ſome leagues to the eaſt of Conſtantina are the Inchanted Baths, ſituated on a low ground ſurrounded with mountains. There are here ſeveral ſprings of an intenſe heat, and at a ſmall diſtance are others extremely cold. The hot ſprings have a ſtrong ſulphureous ſteam; and Dr. Shaw obſerves, that their heat is ſo great

as to boil a large piece of mutton very tender in a quarter of an hour, and that the rocky ground over which the water runs is, for the ſpace of an hundred feet, in a manner calcined by it. The ſame author adds, that theſe rocks being originally ſoft and uniform, the water, by making every way equal impreſſions, leaves them in the ſhape of cones and hemiſpheres; which being ſix feet high, and nearly of the ſame diameter, the Arabs believe to be the tents of their predeceſſors metamorphoſed into ſtone. But where theſe rocks, beſides their uſual chalky ſubſtance, alſo contain ſome layers of a harder matter not ſo eaſily diſſolved, there appears a confuſion of traces and channels, forming figures, which the Arabs diſtinguiſh into camels, horſes, and ſheep; with men, women, and children, whom they ſuppoſe to have undergone the ſame fate with their habitations.

There are here alſo other natural curioſities; for the chalky ſtone diſſolving into a fine impalpable powder, and being carried along with the ſtream, ſometimes clings to the twigs, ſtraws, and other bodies in its way; and immediately hardening and ſhooting into a bright fibrous ſubſtance, like the aſbeſtos, forms itſelf at the ſame time into a variety of glittering figures and beautiful chryſtallizations.

To the ſouthward of Conſtantina are the mountains of Aureſs. Theſe are a knot of eminences running into one another, with ſeveral little plains and vallies between them. Both the higher and lower parts are in general extremely fertile, and eſteemed the garden of Algiers. They are about a hundred and thirty miles in compaſs, and over them are ſpread a number of ruins, the moſt remarkable of which are thoſe of Lerba, or Tezzoute, the Lambeſe of the antients. Theſe ruins are near three leagues in compaſs; and, among others, conſiſt of the magnificent remains of ſeveral of the gates of that city: theſe, according to a tradition of the Arabs, were forty in number; and the city could ſend forty thouſand men out of each. There are ſtill to be ſeen the frontiſpiece of a beautiful temple of the Ionic order, dedicated to Æſculapius; part of an amphitheatre; a ſmall, but elegant mauſoleum, erected in the form of a dome, ſupported by Corinthian columns. Theſe, and other ſtructures of the like kind, are a ſufficient proof of the ancient ſplendor of this city.

It is very remarkable, that the natives of the mountains of Aureſs have a very different complexion and mien from their neighbours; for they are ſo far from being ſwarthy, that they are fair and ruddy; and their hair, which among the Arabs of the other mountains is dark, is with them of a deep yellow.

SECT. XVIII.

Of the different Inhabitants of Algiers; with their Perſons, Dreſs, Manners, and Cuſtoms.

THE Algerines who inhabit the ſea-coaſt are a mixture of various nations; but are for the moſt part Moors, driven thither from Catalonia, Arragon, and other parts of Spain. Here are alſo many Turks beſides thoſe in the army, whom poverty ſends hither from the Levant to ſeek their fortunes. The Jews alſo ſwarm along the coaſt; and there are a great number of Chriſtian priſoners taken at ſea, and brought hither to be ſold for ſlaves. There are alſo other Chriſtians who are free, and trade unmoleſted with the reſt of the inhabitants.

The Berebers are ſome of the moſt ancient people of theſe parts, and are ſuppoſed to be deſcended from the Sabeans, who came hither from Arabia Felix, under the conduct of one of their princes. Theſe are diſperſed all over Barbary, and divided into a multitude of tribes, under their reſpective chiefs, moſt of whom inhabit the mountainous countries; ſome live in tents, or portable huts, and range from place to place, while others are ſcattered in villages; yet they have for the moſt part kept themſelves from being intermixed with other nations. Theſe are eſteemed the richeſt, go better cloathed, and carry on a much larger traffic in cattle, hides, iron, wax, and other commodities.

The moſt numerous of the inhabitants are the Moors and Arabs. The Moors, who are thus called from Mauritania, their ancient country, are of two ſorts, thoſe who inhabit the cities and towns, and carry on ſome commerce, either by land or ſea, bearing offices in relation to the concerns of their own nation, under the commiſſion of the dey, beys, or agas of the places where they live; ſome follow trades and manufactures; others are farmers, gardeners, and graſiers; and having houſes and lands of their own, may be ſtiled the citizens of Algiers. Many of theſe grow ſo rich, as to purchaſe eſtates and ſhares in the ſhips that cruiſe abroad.

The other ſort of Moors are of the wandering kind, without lands or patrimony, and are in all reſpects very poor. Theſe are divided into a prodigious number of tribes, diſtinguiſhed either by the names of their chiefs, or the places of their abode, or by both. Each forms a kind of itinerant village, or adowar, as they term it, and every family lives in a particular tent or portable hut. Each of theſe adowars has a cheyk, or chief, who, in conjunction with his aſſiſtance, govern the whole community with great equity and tenderneſs. They live ſolely on the produce of ſuch lands as they farm from the other Moors, and pay their rent in kind, whether in corn, fruit, herbs, honey, and wax, ſelling the remainder to the inhabitants of the neighbouring towns. They are ſkilful in the choice of the moſt advantageous ſoil for every ſeaſon, and take great care to avoid the neighbourhood of the Turkiſh troops. Each adowar pays the dey a tax in proportion to the number of its families, their chief being anſwerable to him; and the whole community for each individual.

As theſe wandering Moors are ſcattered over all this part of Africa, it will be proper here to take ſome notice of their manners, religion, and cuſtoms. Their dreſs conſiſts in a haik, or coarſe piece of cloth four or five ells long, which they wrap about their ſhoulders; this hangs down to their ankles, and to this they add a cap of the ſame cloth. The dreſs of the cheyk is a ſhirt and a cloak all of one piece, which comes down to the calf of the leg. On the upper part of the cloak is a hood of a finer ſort of cloth. Both the boys and girls go quite naked, till they are about ſeven or eight years of age, when they tie a rag or two about them. Their mothers carry them while they ſuck, and have often two in a bag tied behind their backs when they go to fetch wood or water; but theſe children are generally ſo ſtrong, that they begin to walk when ſix months old.

The Mooriſh women dreſs in only a piece of woollen ſtuff, which covers their bodies from the ſhoulders down to the knees. They wear their hair braided, and adorn it with bugles, coral, glaſs, fiſhes teeth, and other baubles; and on their legs and arms wear bracelets of horn or ivory. Their cheeks, foreheads, arms, fingers-ends, and legs, are embelliſhed with black ſpots from their very infancy, which is done by pricking thoſe places with a needle, and then rubbing them with a black powder. Their complexion is in general very ſwarthy, but their conſtitution robuſt and lively; they marry while very young, the boys at fourteen or fifteen, and the daughters at nine or ten years of age; and as they are generally very fruitful, it is not uncommon to ſee them ſuckling their children at ten or eleven.

When a youth has obtained the parent's conſent to have his daughter, he brings the number of cattle agreed upon to her father's hut, where ſhe, without any reluctance, receives him for her ſpouſe; when ſome of the by-ſtanders aſking what his bride coſt him, he anſwers, "A virtuous "and induſtrious woman cannot be bought too dear." After the mutual congratulations, the young women of the adowar are invited to the marriage-feaſt, and the bride being ſet upon the bridegroom's horſe, is carried to his tent, amidſt the acclamations of the people; and being arrived at the entrance, is offered a mixture of milk and honey; and while ſhe drinks, the reſt of the company ſing an epithalamium, concluding with their good wiſhes to the new-married couple. The bride then alighting, her companions put a ſtick into her hand, which ſhe thruſts as far as ſhe is able into the ground, ſaying, As the ſtick cannot be removed without force, ſo neither

will ſhe quit her huſband, except he forces her from him. Before ſhe is admitted into the tent, he places his flock before her, which ſhe muſt lead to ſome neighbouring paſture; by which ſhe is informed, that he expects her to labour, and to take care of his flocks and family.

Upon her return, ſhe and her retinue are admitted. The feaſt begins and ends with ſinging and dancing, which are continued till the evening, when the bride being preſented to her huſband, the company take their leave. She is afterwards to wear a veil over her face during a whole month, and not to ſtir out of the tent till that term is expired, from which time ſhe enters into that branch of the family œconomy that is allotted to the reſt of the married women.

Theſe wandering Moors are generally ſtrong, warlike, and ſkilful horſemen; they value themſelves on not being confined to towns like the other Moors, whom they regard as ſlaves always at the mercy of the Turks: ſo that if they receive any inſult or ill uſage from the Turkiſh aga, they inſtantly return it in a hoſtile manner, till the town Moors, who are unable to ſubſiſt without being ſupplied with proviſions from them, have mediated a peace between them. To keep up this martial ſpirit, the chief perſons of every adowar meet in a circle round their cheyk, every evening, to diſcuſs public affairs; after which they perform their uſual exerciſes on horſeback, in which they are ſo dextrous, that they can take up any thing from the ground with their lance in full ſpeed. Their uſual weapons are a broad cutlaſs, which hangs juſt below the left elbow, and a ſhort lance, which they always carry in their hand.

Theſe wandering Moors are generally ſo addicted to robbery, that it is dangerous travelling at a diſtance from the towns without a guard, or at leaſt a marabut, that is, one of their prieſts, or monks; for as they conſider themſelves as the original proprietors of the country, and not only as diſpoſſeſſed by the reſt of the inhabitants, but reduced by them to the loweſt ſtate of poverty, they make no ſcruple to plunder all they meet, by way of reprizal.

The other conſiderable nation ſcattered through all the provinces, not only of the Algerine dominions, but through the other parts of Barbary, is that of the Arabs, which is a mixture of many tribes deſcended from the Mahometan Arabians, who once over-run this part of Africa, from which being driven by the Turks, they fled to the mountainous parts to ſave themſelves, their cattle, and effects, where they have ever ſince enjoyed their liberty; and, by their labour and induſtry, have improved theſe barren and deſart lands into pleaſant and fertile territories. They are divided into a multitude of little governments, under their reſpective chiefs, and value themſelves highly on their having preſerved their blood untainted by a mixture with other nations, expreſſing the utmoſt contempt for thoſe who, preferring their ancient habitations in cities and towns, ſubmitted to a foreign yoke, whom they therefore in deriſion call citizens and courtiers; and, from their having intermarried with ſtrangers, are eſteemed by them no better than Moors. Indeed the Algerines, who make no diſtinction between theſe two ſorts of Arabs, any more than they do between the wandering and city Moors, call them all four by the common name of Moors, an inaccuracy in which they have been imitated by ſeveral European writers, who, confounding the various nations, ſeem to make no diſtinction between the Turks, Moors, and Arabians of this part of Barbary.

When the Turks firſt ſubdued this country, they were ſo little acquainted with the mountainous and deſart parts of it, that they gave the Arabs an opportunity of ſeizing upon the paſſes that led to the kingdoms of Fez and Tunis; but afterwards raiſing fortifications on the moſt advantageous poſts, they in a ſhort time obliged them either to retire, or ſubmit; which was the more eaſily accompliſhed, as they had the uſe of fire-arms, which were unknown to the Arabs; and as their ſtrength was increaſed by the arrival of many thouſands of Moors and Jews, who came thither from Spain. Hence many of the Arabs rather choſe to become tributary to them, than to abandon their old habitations; while others, ſcorning a foreign yoke, retired into the more inacceſſible parts of the kingdom, and lived free from tribute; and a third part compromiſed matters with the new conquerors, by entering into a mutual obligation of not moleſting each other. Theſe two laſt, however, ſtand in little or no awe of the Algerine government, which, on account of their martial ſpirit, and happy ſituation, dares not venture to give them any moleſtation; for whenever ſuch attempts are made, either upon their freedom or effects, they immediately conceal their corn and other proviſions in ſome ſpacious caves in the rocks, and drive their cattle towards Biledulgerid, or ſome inacceſſible mountainous parts, when they not only bid them defiance, but plague them by their frequent incurſions.

There is another ſort of theſe Arabs that wander along the banks of ſeveral rivers of Algiers, and never take the trouble of tilling the ground, but range in ſearch of paſture, and live chiefly upon the plunder; not only of villages, but of towns and cities.

Several clans of the Arabs go bare-headed all the year round, like Maſſiniſſa of old, binding their temples only with a narrow fillet, to prevent their hair being troubleſome; but ſome of the richer clans wear, like the Turks and Moors, a ſmall cap of ſcarlet woollen cloth of the manufacture of the country, round the bottom of which is folded the turban. The Arabs wear a looſe garment like that worn by the wandering Moors, and above it alſo a cloak called a burnooſe, which is wove in one piece with a kind of hood for the head; it is tight about the neck, and widens below: but they only wear this in rainy and cold weather. Some of them wear next their ſkins a cloſe-bodied frock, or tunic, with or without ſleeves, which, as well as the looſe garment above it, is girded about their bodies. Their girdles are uſually of worſted, wove into a variety of figures, and made to wrap ſeveral times round their bodies: one end, being doubled and ſewed along the edges, ſerves for a purſe. In this girdle the Turks and Arabs fix their knives and poniards; while the writers diſtinguiſh themſelves by having an inkhorn, the badge of their office, ſuſpended in a like ſituation.

The dreſs of the Turks of this kingdom is plain and light, eſpecially among the common people: but perſons of diſtinction affect a more ſumptuous apparel, not unlike that worn in Turky; it being moſtly of fine cloth or ſilk: their veſts are richly flowered, their turbans very expenſive and curiouſly done up, and their legs are covered with boots of fine ſhining leather.

The garments worn by the women differ only from thoſe of the men, in their lightneſs and length, their ſhifts and veſts reaching down to their feet. Their hair is generally tied behind, and adorned either with jewels or leſs expenſive ornaments, according to their rank and circumſtances, over which they wear a cap of ſilk or linen. They are likewiſe fond of adorning their necks, arms, and wriſts, with collars and bracelets ſet with jewels, and theirs ears with large pendants. When they go abroad, they uſually throw a thin linen veil over their faces: this they faſten to their girdle, and wrap an upper garment over their uſual dreſs; ſo that they are commonly known only by the ſlaves by whom they are attended. Thoſe of a higher rank are conveyed about in litters made of oſier twigs, and covered with a thin painted cloth; but ſo low, that they muſt ſit croſs-legged upon them, yet wide enough to contain two perſons in that poſture: thus they can ſee without being ſeen, and travel free from wind, duſt, and rain; as well as from the too great heat of the ſun.

None but the viceroy, ſome of his principal officers, and the chief members of the divan, are allowed to ride on horſeback; at leaſt in the metropolis and other places of concourſe: the reſt muſt either ride on aſſes, or walk.

The Chriſtians who are free are allowed to wear their own country dreſs; but the ſlaves, who are much more numerous, have nothing but a coarſe grey ſuit, and a ſeaman's cap.

The ſharifs, who are deſcended from Mahomet, have the privilege of diſtinguiſhing themſelves by the colour of their turbans, which are of green ſilk; the pilgrims who have performed their voyage to Mecca, and are eſteemed hadgies, or ſaints, likewiſe diſtinguiſh themſelves by their dreſs.

As for the common people, they wear a linen pair of drawers over their ſhirts, and an open white woollen jacket, with a kind of hood behind; and ſome wrap themſelves up, eſpecially when they go abroad, in a black mantle that reaches down to their heels.

SECT. XIX.

Of the Government of Algiers, the Election of the Dey, and the different Orders of which the Divan is compoſed. The Manner of knowing the Opinion of the Divan. The Revenue of the Dey; his Forces; the Manner in which they march and engage an Enemy. Of the Power of the Algerines at Sea; and the Regulations with reſpect to their Ships.

THE government of Algiers is conducted by the dey and a common-council, compoſed of thirty yiah baſhas; and, upon ſome emergencies, the mufti, the cady, and ſometimes the ſoldiery, are called in to give their votes. Affairs of moment are ſometimes agreed upon by this aſſembly, before they paſs into laws, and the dey is entruſted with the execution of them; but lately little account has been made of this body, which is at preſent only convened to give their conſent to what has been before concerted between the dey and his favourites.

The dey is choſen out of the army, the moſt inferior perſon of which having an equal right to that dignity with the higheſt, every bold and aſpiring ſoldier, though but lately taken from the plough, may be conſidered as heir apparent to the throne. Indeed they are not aſhamed to own the meanneſs of their extraction. Dr. Shaw obſerves, that Mahomet Baſha, who was dey when he was at Algiers, in a diſpute with a deputy conſul of a neighbouring nation, freely mentioned the meanneſs of his birth: "My mother, ſaid he, ſold ſheeps trotters, "and my father neats tongues; but they would have "been aſhamed to have expoſed to ſale ſo worthleſs a "tongue as thine."

He who aſpires to this high rank ſeldom waits till ſickneſs or age has removed the preſent poſſeſſor; it is enough if he be able to protect himſelf with the ſame ſcymetar which he boldly ſheathes in the bowels of his predeceſſor; for ſcarcely one in ten of them dies in his bed. Even the few who have had a more peaceful exit, cannot be ſaid to have owed it to the high regard the army had for them; but rather to their good fortune or foreſight in nipping a new inſurrection in the bud, before the conſpirators could put their deſigns in execution. Neither their mal-adminiſtration, tyranny, or avarice, ſerve to haſten their ruin; nor can the contrary amiable qualities prevent it. The want of ſucceſs in an enterprize, though ever ſo wiſely concerted and carried on, is a ſufficient crime with theſe ſuperſtitious and mutinous troops to cauſe an inſurrection, and coſt the moſt ſagacious dey, or officer, his life: nay, they are often ſlain from no other motive, than a deſire of change, blown up by ſome bold aſpirer to the ſupreme power. This, however, helps to keep up the ſhew of a divan, which might otherwiſe have been aboliſhed; and the deys are frequently obliged to aſſemble, and conſult them on important affairs, merely to ſcreen themſelves from popular diſcontents; though in reality the chief members being for the moſt part his creatures, he may be ſaid to act with a deſpotic authority, there being no appeal from this ſupreme tribunal. This factious humour, however, ſeems to be ſomewhat allayed by the many ſeaſonable executions that have been made of theſe aſpiring members. The grand ſignior, however, ſtill ſtiles the dey his viceroy, or baſha, as he does the people his ſubjects, and claims the right of approving or diſapproving of his election; though he has ſeldom ventured to diſannul it, for fear of loſing the ſhadow of authority he claims over them.

As the loweſt perſon, as well as the higheſt, has a right to vote in the election of a dey, and as there are uſually ſeveral candidates for that dignity, the election is ſeldom carried on without ſome tumult, if not blood-ſhed; but when the choice is fixed, the perſon elected is ſaluted by the words, Alla batik, that is, God bleſs, or proſper you; and immediately after he is inveſted with the caftan, or inſignia of ſovereignty; while the cady, or chief judge, addreſſes him in a congratulatory ſpeech, that is generally cloſed with a pathetic exhortation to this purpoſe: That as it has now pleaſed the Almighty to raiſe him to the ſupreme dignity of the kingdom, it is his duty to govern it with juſtice and equity, to preſerve the rights and liberties of his new ſubjects, and to take the utmoſt care to promote their ſafety and welfare.

The officer next in power and dignity to the dey is the aga, or general of the janizaries, who is one of the oldeſt officers in the army: he enjoys his poſt only two months, and is then ſucceeded by the chiah, or next ſenior officer, or eldeſt yiah baſha. During thoſe two months, the keys of the metropolis are in his cuſtody; all military orders are iſſued in his name, and the ſentence of the dey, upon any offending ſoldier, whether only corporal or capital, is executed in the court of his palace. He has no ſooner ſerved this ſhort office, than he is conſidered as ſuperannuated; yet regularly receives his pay, like all the reſt of the ſoldiers [illegible]ths, and is exempt from all farth[illegible]es, except giving his advice at the grand council, to which he has a right to come whenever he pleaſes, though he has no vote in it.

The next in dignity is the ſecretary of ſtate, who regiſters all the public acts; and next to him are thirty chiah baſhas, or chief colonels, under the aga, who ſit next to him in the ſame gallery in the divan. Out of this claſs are commonly choſen thoſe ſent on embaſſies into foreign countries, or to convey the dey's orders throughout the province of Algiers. Next to them are eight hundred bolluk baſhas, or eldeſt captains, who are raiſed to the rank of chiah baſhas according to their ſeniority. The oldak baſhas, or lieutenants, who are the next in rank, amount to four hundred, and are regularly raiſed to the poſt of captains, and to other employments in the ſtate, according to their abilities. Theſe, by way of diſtinction, wear a leather ſtrap hanging down behind to the middle of their backs. One rule is ſtrictly obſerved in riſing to the above offices; this is the right of ſeniority, one ſingle infringement of which would cauſe a revolt, and endanger, if not coſt the life of the dey. This ſeniority, however, is not that of age, but of ſtanding; and yet, with the dey's permiſſion, may be purchaſed by a junior, in which caſe the latter deſcends to the rank of the former.

The other military officers of note are the purveyors of the army; the peys, who are the four eldeſt ſoldiers, and neareſt to preferment; the ſoulaks, who are the eight next in ſeniority to them, and are part of the dey's bodyguard: theſe all march before him when he takes the field, and are diſtinguiſhed by their carbines, gilt ſcymetars, and a braſs gun on their caps. The kayts, or Turkiſh ſoldiers, each band of whom has the government of one or more Mooriſh adowars, and collects the taxes for the dey; and the ſagiards, who are Turkiſh lancemen, a hundred of whom attend the army. To theſe may be added, the three beys, or governors, of the three great provinces. All theſe officers compoſe the great council; but none of an inferior rank to the thirty chiah baſhas, have a right to ſit in the gallery next after the dey; the reſt are obliged to ſtand in the hall or council-chamber, with their arms a-croſs, and as much as poſſible without motion; nor are they permitted to enter it with any offenſive weapon. Thoſe who have any ſuit or affairs to tranſact with the divan muſt ſtand without the gates, let the weather be ever ſo bad; but they are generally preſented with coffee by ſome of the chiahs, or inferior officers, till they are diſpatched.

The manner of knowing the opinion of the divan is ſomewhat ſingular. The aga, or preſident, firſt propoſes the queſtion, which is immediately repeated with a loud voice by chiah baſhas, and from them echoed again by four inferior officers, and then is repeated from one member of the divan to another, with ſtrange geſtures and contortions; and when they do not approve the queſtion, with a moſt hideous noiſe from all, by which the aga eaſily concludes to which ſide the majority is inclined, and proclaims it accordingly. Hence the deys have of late years taken great pains to ſuppreſs thoſe whom they knew to be ill affected to their meaſures, and to ſummon as few as poſſible,

poſſible, beſides their own creatures. It has alſo been lately cuſtomary with them, immediately after their election, to cauſe all the officers of the divan, who had oppoſed it, to be ſtrangled, and to fill up the vacancies with thoſe who had been moſt zealous in promoting it; by which means the far greateſt part of that ſupreme court becomes entirely devoted to his will.

The dey of Algiers pays no other revenue to the Porte than that of a certain number of handſome youths, and ſome other preſents annually ſent thither. His income is variouſly computed, and probably riſes and falls according to the opportunities he has of fleecing and oppreſſing both the natives and foreigners: and, according to Dr. Shaw, the taxes of the whole kingdom bring into the treaſury no more than three hundred thouſand dollars; but he ſuppoſes, that the eighth part of the prizes, the effects of thoſe perſons who die without children, added to the yearly contributions raiſed by the government, preſents from foreigners, fines, and oppreſſions, bring in as much more.

The whole force of Algiers, conſiſting of Turks and Cologlies, who are the ſons of ſuch ſoldiers as have been permitted to marry at Algiers, is, according to the lateſt and moſt accurate writers, computed at about ſix thouſand five hundred, two thouſand of whom are ſuppoſed to be old and excuſed from duty; and of the four thouſand five hundred, two thouſand are conſtantly employed in their garriſons; while the reſt are either to arm out their cruizers, or form the three flying camps ſent every ſummer to collect the taxes. To theſe Turkiſh troops may be added about two hundred Mooriſh horſe and foot, kept in conſtant pay; but, being the hereditary enemies of the Turks, are conſidered as adding but little to the ſtrength of the government. This extenſive country is indeed kept in obedience leſs by force of arms, than by carefully obſerving the old political maxim, "Divide and "command;" for there being continual jealouſies and diſputes between the Arabian tribes, the provincial viceroys have nothing to do but to keep up the ferment, and at proper times throw in new matter for diſcord. Thus, by playing one tribe againſt another, they are able to maintain their ground againſt all oppoſition.

The diſcipline of the Turkiſh ſoldiery, in time of war, is commonly ſtrict and ſevere; and in one particular is highly commendable, that is, in expreſsly forbidding all kind of plundering during an engagement; which law is ſo ſtrictly obſerved, that they leave that to the Moors and ſlaves, as being beneath the dignity of a Turkiſh ſoldier.

They have, like the Europeans, their cavalry, infantry, and artillery. The army is commanded by the aga of the janizaries. All the officers and ſoldiers of the infantry march on foot, except the bey, aga, and chiah; each ſoldier carrying only his ſabre and muſket, without any other incumbrance, the ſtate furniſhing horſes for carrying their proviſions, baggage, and tents, each of which holds twenty men. The order of marching is regulated by the commanding officers, till they enter an enemy's country; when the bey, having ordered the horſe and foot to unite, forms them into ſquadrons and battalions, each under its proper officers and ſtandards. The van is compoſed of a body of infantry; the wings of two ſquadrons, a little towards the rear: the reſt of the infantry in two files, with the baggage in the middle; and two ſquadrons, forming two wings, behind; with a ſmall battalion of foot which forms the rear.

When they engage, the baggage being left under a ſtrong guard, a large body of infantry leads the van, with two wings of cavalry, ſupported by others at ſome diſtance. The main body makes the center, behind which both the horſe and foot retreat to rally, and out of it freſh men are draughted to reinforce the van.

They fight more deſperately againſt the Chriſtians than againſt any other enemy, becauſe thoſe who are taken priſoners are never exchanged or redeemed; but being looked upon as dead to the ſtate, their effects are ſeized, if they have neither children nor brothers to claim them.

The Algerines are indeed more formidable at ſea than any other power along the coaſts of Barbary; and though the commanders of their ſhips are not allowed any concern in the affairs of ſtate, or in the election of the dey, yet they are held in great eſteem. Their navy, however, ſeldom exceeds twenty ſhips, only one of which belongs to the government, and is aſſigned to the admiral; this is ſtiled the deylik, or royal ſhip, and has her particular ſtore-houſes: all the reſt belong to private perſons, and have likewiſe their ſtore-houſes well provided, the captains never failing to ſtrip their prizes of all the conveniencies they find in them. Indeed it is no wonder that a people who look upon all the reſt of the world as their tributaries or ſlaves, ſhould be ſo addicted to piracy, and treat their captives with ſuch arrogance and inhumanity.

The captains of theſe ſhips have commonly a ſhare in thoſe they command, if they are not the ſole owners, and accordingly may fit them out when they will, and cruize where they pleaſe; but are obliged, when required, to attend the ſervice of the ſtate, in tranſporting men or proviſions, or in ſailing on any particular cruize; and all this at the expence of the owners. They have alſo an aga bachi, or ſome old experienced officer, appointed by the dey; and without the conſent of this officer they can neither give chace nor return, nor even puniſh their ſailors. On their returning to port, this aga makes his report how the captain has behaved; who, if found guilty of any miſdemeanor, is ſure of being chaſtiſed. The captain muſt alſo give an account of his ſucceſs to the government, which claims an eighth part of all the prizes, ſlaves, and cargo; the reſt being divided among the proprietors and ſhip's company, in ſuch proportions as are agreed upon between them. Whatever is found on board theſe prizes that will fit their purpoſe, they make uſe of, without troubling themſelves whether it be of the ſame ſize as the reſt; for they give themſelves little concern about the proportions of their yards, cables, or anchors; and range their guns without regard to their ſize. They have neither hammocks nor cheſts on board, nor any other food but biſket, rice, and water.

The naval force of Algiers is ſaid to have been for a conſiderable number of years on the decline. In the year 1732 they had only ſix capital ſhips, from thirty-ſix to fifty guns, beſides brigantines and row-boats; and, at the ſame time, had not half that number of brave and experienced captains. A general peace with the three trading nations, and the impoſſibility of keeping up a proper diſcipline, where every private ſeaman diſputes authority with his officer, are ſome of the principal reaſons why ſo ſmall a number of veſſels are ſometimes fitted out, and why ſo few perſons of courage are willing to command them.

SECT. XX.

The Manner in which Cauſes are tried, and Criminals puniſhed in Algiers; with the Treatment of the Slaves.

IN the diſtribution of juſtice the cady is judge. He is generally educated in the ſeminaries of Conſtantinople, or Grand Cairo, where, 'tis ſaid, the Roman codes and pandects, tranſlated into the Arabic tongue, are taught and explained: he is obliged to attend once or twice a day at the courts of juſtice, where he determines the ſuits that are brought before him; but as he is generally ſuppoſed guilty of receiving bribes, all affairs of moment are laid before the dey; or, in his abſence, before the treaſurer, or other principal officer of the regency, who ſits in the gate of the palace for that purpoſe.

All the formality uſed in the divan, and other courts, is hearing the complaint and witneſſes, immediately after which they proceed to give ſentence, there being neither counſellors nor attornies to retard the adminiſtration of juſtice. When the women have any ſuit to them, they come veiled, crying aloud, and often repeating the words Char Alla, that is, Juſtice in God's name; and theſe are generally accompanied with a crowd of their own ſex, to back the petition with their joint outcries.

Juſtice is, however, adminiſtered in the moſt venal manner, with reſpect to the puniſhment of offenders; and more particularly when theſe are the Turkiſh ſoldiers, who behave with the greateſt inſolence, and commit acts

of violence with impunity; for they ſeldom ſuffer death for any crimes except that of rebellion, in which caſe they are commonly ſtrangled with a bow-ſtring. For ſome ſmaller offences they are either baſtinadoed, fined, or their pay ſtopped; and, if officers, are reduced to the rank of common ſoldiers, whence they may gradually riſe to their former ſtations.

For clipping or debaſing the public coin, the old Egyptian puniſhment is inflicted, which is cutting off the hands.

If a Jew or Chriſtian is guilty of murder, or any other capital crime, he is burnt alive without the gates of the city; but for the ſame crimes the Moors and Arabs are either impaled, hung up by the neck over the battlements of the city, or thrown upon hooks fixed in the walls below; where they ſometimes hang thirty or forty hours in the moſt dreadful agonies, before they expire.

Moors found guilty of robbery or burglary have their right hand cut off, and hung about their necks; and are made to ride through the city on an aſs, with their faces towards the tail.

The Jews and Chriſtians for certain offences, as ſpeaking againſt Mahomet and his religion, muſt either turn Mahometans, or be impaled; which is certainly one of the greateſt indignities and barbarities that can be offered to a human being. The patient is laid on his face, and a ſtake, made ſharp at one end, and about eight or nine feet long, is forced up his fundament; and then taking him by the legs, they draw on his body, till the point of the ſtake appears at his ſhoulders; after which they erect the ſtake, and faſten it in a hole dug in the ground.

The ancient inhuman cuſtom of ſawing in ſunder is ſtill retained: this is done by laying the condemned perſon between two boards of the ſame length and breadth, and beginning to ſaw at the head.

Small offences are puniſhed with the baſtinado, which is given either upon the belly, back, or ſoles of the feet, according to the nature of the crime, or the arbitrary will of the cady, or judge, who alſo appoints the number of ſtrokes to be given with ſticks of the thickneſs of one's little finger; and theſe ſtrokes ſometimes amount to two or three hundred; but the number may be leſſened, either by the influence of a bribe, or the interpoſition of friends. But though the offender frequently dies for want of one of theſe powerful advocates, yet this puniſhment is neither reckoned capital, nor is the judge called to an account for cauſing it to be inflicted in that inhuman degree.

In caſes of debt, the debtor is uſually detained in priſon till the chouſes, or bailiffs, have ſeized upon, and ſold his effects: when, if the ſale amounts to more than the debt, the overplus is returned to the priſoner; or if it comes ſhort, he is releaſed, and no future demands are made upon him.

When the women offend, they are not expoſed to the populace, but ſent to a private houſe of correction; or if the crime be capital, they are tied up in a ſack, carried out to the ſea, and drowned.

Having given the puniſhments inflicted on malefactors, we ſhall conclude this ſection with their treatment of the Chriſtian ſlaves, who, though innocent, may be ſaid to be under a perpetual ſtate of puniſhment.

As ſoon as theſe ſlaves are made priſoners, the corſairs make a ſtrict enquiry into their country, condition, and quality, which is often done by baſtinadoing them to extort a true confeſſion; after which, having ſtripped them almoſt naked, they are brought to the palace of the dey, to which the European conſuls repair, in order to examine whether any of them belong to their reſpective nations; and if any were only paſſengers, to reclaim them. But if it be proved that they have ſerved for pay to any nation at war with Algiers, they cannot be releaſed without paying their full ranſom. Of theſe the dey has the choice of every eighth man, and chuſes thoſe who have ſome uſeful trades or profeſſions, as ſurgeons mates, carpenters, &c. becauſe they ſell for a great price; and if of quality, for a ſtill greater. The reſt, who are left to the owners and captors, are carried to the beſiſtan, or ſlave-market, where a price is ſet upon them according to their profeſſion, age, ſtrength, and ability. From thence they are led to the court before the dey's palace, where they are ſold by auction; and whatever is bid above the price ſet upon them, belongs to the government.

Theſe unhappy men have then an iron ring put round one of their ancles, and a long or ſhort chain faſtened to it, according as they imagine them more or leſs inclined to attempt their eſcape: but if any of theſe can procure a little money from their friends, or by way of charity, they are allowed to keep wine cellars; but muſt pay a certain tribute to the dey, according to the quantity they ſell; by which means many of them grow rich enough in time to purchaſe their liberty; though, beſides their tribute to the dey, they are obliged to contribute towards the maintenance of their poor ſick brethren, and of the Chriſtian chapels allowed for their uſe. As for the reſt, who have neither trades, nor can put themſelves in any way of living, they are uſed with very great ſeverity; they fare and work hard all day, and at night are locked up in public priſons, where they lie on the bare ground, without any other covering than the ſky, whence they are ſometimes almoſt ſtifled in mud and water. In the cities and towns they are put to the loweſt and hardeſt kinds of labour; in the country they are ſometimes made to draw the plough inſtead of horſes and oxen; and in all other reſpects, are treated with ſuch inhumanity, as would be ſeverely puniſhed, if exerciſed on the loweſt rank of brutes. The women ſlaves are treated with leſs ſeverity, and, if handſome and witty, are commonly made concubines, and ſometimes gain a perfect aſcendency over their maſters; but if any of them refuſe to comply, they ſpare neither threats nor cruelty to force them to it; and if application be made to the government in their behalf, the common anſwer is, that they are their maſter's property, and he is at liberty to put them to what uſe he thinks proper. Thoſe who want youth and beauty, are uſually conſigned to ſome of the lower offices of the family, and are liable to be ſeverely chaſtiſed for every ſlight miſcarriage, eſpecially in point of cleanlineſs, which they, in common with the Turks, affect to a very high degree, both with reſpect to their cloaths, proviſions, utenſils, and furniture.

The popiſh prieſts and monks who are ſlaves, are generally uſed with more gentleneſs, on account of their being better ſupplied with money, by which they procure an exemption from labour and other hardſhips; but whenever any Chriſtian prince declares war againſt the Algerines, they are the firſt who become the victims of their cruelty and reſentment.

SECT. XXI.

Of the Religion and Superſtition of the Algerines, the Education of the Children, and their Ignorance in the Sciences. Their Trades, Commerce, and Coin.

THE Algerine religion differs only from the Turkiſh in their cheriſhing a great variety of ſuperſtitions. Thus they hang the figure of an open hand round the neck of their children, as a counter-charm againſt an evil eye; and both the Turks and Moors paint it upon their ſhips and houſes. The people who are grown up always carry about them ſome paragraph of the Koran, which they place upon their breaſt, or ſew under their caps, to prevent faſcination and witchcraft, and to ſecure themſelves from ſickneſs and misfortunes. Theſe charms they eſteem ſo univerſal, that they alſo hang them to the necks of their cattle, horſes, and other beaſts of burthen.

An opinion prevails over all Barbary, that many diſeaſes proceed from ſome offence given to the Jenoune, a ſort of beings placed by the Mahometans between the angels and the devils. Theſe are ſuppoſed to frequent ſhades and fountains, and to aſſume the bodies of worms, toads, and other little animals, which being always in their way, are every moment liable to be moleſted and hurt. When any one is therefore maimed or ſickly, he fancies that he has injured one of theſe beings; on which the women ſkilled in theſe ceremonies go upon a Wedneſday, with frankincenſe and other perfumes, to ſome neighbouring ſpring, and there ſacrifice a cock or a hen, a ram or an ewe, according to the quality and ſex of the

patient, and the nature of the diſeaſe, a female being ſacrificed for one of the male ſex, and a male for the women.

The Algerines have three principal officers who preſide over all religious matters; theſe are the mufti, or high prieſt; the cady, or chief judge in eccleſiaſtical cauſes, and ſuch other matters as the civil and military power turns over to him; and the grand marabut, who is at the head of his order, which conſiſts of a kind of eremitical monks in ſuch high veneration, that they bear an extraordinary ſway, not only in moſt private families, but even in the government. Theſe three officers have their ſeats in the great divan next under the dey, and on his right hand, where they are allowed to give their opinion in all difficult and important affairs of ſtate; but have not the liberty of voting with the reſt of the members. As to religious affairs they are uſually referred to them, and their deciſions, if unanimous, are eſteemed binding, and no longer to be diſputed.

The people have a great veneration for the marabuts, who are uſually perſons of a rigid auſtere life, continually employing themſelves either in counting over their beads, or in prayer and meditation. Their chaplet uſually conſiſts of ninety-nine beads; on touching each of which, they either ſay, "God is great, God be praiſed, or God "forgive me." This kind of ſainthip uſually goes by ſucceſſion, and the ſon, if he can behave with equal gravity, is intitled to the ſame eſteem and reverence with the father. Some of them pretend to ſee viſions, and to converſe with the Deity, while others are ſuppoſed to work miracles. Dr. Shaw ſays, that Seedy Muſtafa, caliph of the weſtern province, told him, that a neighbouring marabut had a ſolid iron bar, which, upon command, would give the ſame report, and do as much execution as a piece of cannon; and that once the whole Algerine army, on the dey's demanding too exorbitant a tax from the Arabs under his protection, were put to flight by the miracle: yet, notwithſtanding the frequency, as they pretended, of the experiment, neither the arguments urged by that divine on the merit of convincing a Chriſtian, nor the ſollicitations of the company, could prevail ſo far as to have the experiment tried before him; for the marabut had too much policy to hazard his reputation by putting it to the proof. At Seteef that learned gentleman ſaw a marabut famous for vomiting fire; but though he was at firſt greatly ſurpriſed at ſeeing his mouth ſuddenly in a blaze, and at the violent agonies he counterfeited at the ſame time, he afterwards plainly perceived that it was all a trick, and that the flames and ſmoke with which he was ſurrounded, aroſe from ſome tow and ſulphur which he contrived to ſet on fire under his burnooſe.

The roving and unſettled life of the Arabs, and the perpetual grievances the Moors frequently ſuffer from the Turks, prevent either of them enjoying that liberty and ſecurity which give birth and encouragement to learning; hence the knowledge of philoſophy, mathematics, and medicine, which once flouriſhed among the Arabs, are now loſt, and there are ſcarce any traces of them remaining.

The ſons of the Moors and Turks are ſent to ſchool at about ſix years of age, when they are taught to read and write for the value of about a penny a week. Each boy, inſtead of paper, has a piece of thin ſquare board, ſlightly dawbed over with whiting; and on this he makes his letters, which may be wiped off or renewed at pleaſure. On his having made ſome progreſs in the Koran, he is initiated in the ſeveral ceremonies and myſteries of religion: and when a boy has diſtinguiſhed himſelf in any branch of learning, he is dreſſed in a ſplendid habit, mounted upon a horſe richly capariſoned, and, as hath been already mentioned in treating of Morocco, is conducted, amidſt the huzzas of his ſchool-fellows, through the ſtreets, while his friends and relations aſſemble to congratulate his parents, and to load him with gifts. The boys, after being three or four years at ſchool, are put to trades, or enrolled in the army, where moſt of them ſoon forget all they have learned at ſchool.

While the reverend divine we have ſo often quoted, was chaplain at Algiers, he endeavoured to become acquainted with the perſons moſt diſtinguiſhed for their learning; and though from their natural ſhyneſs to ſtrangers, and contempt of the Chriſtians, it is difficult to cultivate a real friendſhip with them, yet he ſoon found that their chief aſtronomer, who regulates and ſuperintends the hours of prayer, had not the ſkill to make a ſun-dial: that the whole art of navigation, as practiſed at Algiers and Tunis, only conſiſts in what is termed pricking of a chart, and diſtinguiſhing the eight principal points of the compaſs; and that even chemiſtry, once the favourite ſcience of theſe people, is at preſent only applied to diſtilling a little roſe water. The phyſicians chiefly ſtudy the Spaniſh edition of Dioſcorides; but they oftener conſult the figures of plants and animals than their uſes. Notwithſtanding this, theſe people are naturally ſubtle and ingenious, and only want time, application, and encouragement, to cultivate and improve their faculties.

As the Mahometans are generally predeſtinarians, they pay little regard to medicine, and uſually either leave the diſorder to contend with nature, or make uſe of charms and incantations. Yet in all diſtempers they reſort to bagnios, and there are a few other remedies in general uſe. Thus a dram or two of the root of round birthwort is an eſtabliſhed remedy for the cholic; in pleuritic and rheumatic caſes, they make ſeveral punctures on the part affected with a red-hot iron, repeating the operation according to the violence of the diſeaſe, and the ſtrength of the patient. The prickly pear roaſted in the embers is applied hot for the cure of bruiſes, ſwellings, and inflammations. They pour freſh butter almoſt boiling hot into all ſimple gun-ſhot wounds, and ſome of them inoculate for the ſmall-pox; though this practice is not much in reputation in this part of Barbary, and they tell a number of ſtories to diſcourage the uſe of it. They have few compound medicines; however, they uſe a mixture of myrrh, aloes, ſaffron, and ſyrrup of myrtle-berries, which is frequently found effectual in the cure of the plague.

Our author was ſometimes favoured with the ſight of their ancient kalendars, in which the ſun's place, the ſemi-diurnal and nocturnal arch, the length of the twilight, with the ſeveral hours of prayer for each day in the month, are calculated to a minute, and beautifully wrote in proper columns; but theſe are as little conſulted as their ancient mathematical inſtruments, of which they know not the uſe: thus, if the cloudineſs of the weather prevents their adjuſting their large and ſmall hour-glaſſes to ſome inaccurate meridian lines they have made for that purpoſe, their times for devotion, which ſhould be punctual to a minute, are entirely left to the will and pleaſure of their cryers; for public clocks are not allowed in this country, which is perhaps owing to the great averſion of the Mahometans to bells.

Though their anceſtors were alſo diſtinguiſhed for their ſkill in arithmetic and algebra, not one in twenty thouſand appears to be at preſent acquainted with the firſt operations in theſe branches of mathematics; yet the merchants are frequently very dexterous in the addition and ſubſtraction of large ſums by memory, and have alſo a very ſingular method of numeration, by putting their hands into each other's ſleeves, and touching one another with this or that finger, or a particular joint, each denoting a determined ſum or number; thus, without moving their lips, or giving the leaſt intimation to the by-ſtander, they conclude bargains of the greateſt value.

Though piracy ſeems to ſuit beſt with the temper of the Algerines, they ſuffer free Chriſtians, Jews, either natives or foreigners, Arabians and Moors, to exerciſe a fair commerce both by ſea and land, and to carry on trades and manufactures in ſilk, cotton, wool, leather, and other commodities, which are moſtly conducted by Spaniards ſettled in Algiers, eſpecially about the metropolis. Carpets are another manufacture of this country, though they are greatly inferior to thoſe of Turky for beauty and fineneſs; but being both cheaper and ſofter, are preferred by the people to lie upon. There are likewiſe at Algiers looms for velvet, taffeties, and other wrought ſilks, and a coarſe ſort of linen is made in moſt parts of the kingdom, of which Suſa produces the fineſt. Theſe manufactures are chiefly conſumed at home,

ſome

ſome of them, eſpecially thoſe of ſilk and linen, being ſo inconſiderable, that they are obliged to ſupply the want of a ſufficient quantity by importing them from Europe and the Levant. The people ſend few of their commodities to foreign markets, their oil, wax, corn, and pulſe, being barely ſufficient to ſupply the country, though before the city of Oran became ſubject to Spain, the merchants have been known to ſhip off from the various ports of Barbary, ſeven or eight thouſand tons of corn in one year. The conſumption of oil, which is here very plentiful, is alſo ſo conſiderable in this country, that it is ſeldom permitted to be ſhipped off for Europe: ſo that their exports chiefly conſiſt in oſtriches feathers, wax, hides, wool, copper, rugs, ſilk-ſaſhes, embroidered handkerchiefs, Chriſtian ſlaves, and dates.

The goods imported, whether merchandize or prizes, chiefly conſiſt in gold and ſilver ſtuffs, damaſks, linen and woollen cloths and ſtuffs, cotton raw and ſpun, tin, iron, plated braſs, lead, quick-ſilver, cordage, ſail-cloth, bullets, cochineal, tartar, alum, rice, ſugar, honey, wax, ſpices, aloes, opium, aniſe and cummin-ſeed, ſoap, copperas, arſenic, brazil, logwood, vermillion, gum-lack, ſulphur, maſtic, ſarſaparilla, aſpic, frankincenſe, galls, paper, combs, cards old and new, and dried fruits. But though there is a conſtant demand for all theſe commodities, yet a ſmall quantity of them is imported by the merchants, on account of the frequent exactions and heavy duties to which they are ſubject, and the precariouſneſs of payment; on which account thoſe who want any of them will wait in hopes to meet with them on board ſome prize; for they are chiefly ſupplied with them by the corſairs. It is a misfortune that both the manufacturers and ſhop-keepers, which laſt are chiefly Moors and Jews, are ſeverely treated by the government, and frequently fined for even pretended faults, which renders them ſo poor, that it often puts them upon cheating their cuſtomers, either in their weights or meaſures, though if they are diſcovered, they are ſure of being treated with the utmoſt ſeverity, either by a heavy fine, corporal puniſhment, or with death.

The coin in uſe here is moſtly foreign, their own being only of three kinds, viz. the barba, of copper, ſix of which were formerly worth an aſper; but is now of only half that value.

The aſper is a ſmall ſquare piece of ſilver, and both this and the former has Arabic characters ſtamped on each ſide. Fifteen of theſe aſpers are of the value of a Spaniſh ryal, and twenty-four of a dapta, which is worth about a crown. Theſe are all the pieces of money coined in the city of Algiers.

They have likewiſe three ſorts of gold coin; but theſe are only coined at Tremeſen, viz. the rupee, worth thirty-five aſpers; the median, and the dian, or zian, worth a hundred aſpers. This laſt was the ancient coin of the kings of Tremeſen, on which account that province has the ſole privilege of coining theſe pieces.

Beſides theſe, there are the Turkiſh ſultanin of gold, which is worth about a ducat; the moticales of Fez, of the value of about one ſhilling and ten-pence; Spaniſh ryals, French crowns, Hungarian ducats, and other European money, are alſo current among them, though they have no fixed ſtandard.

SECT. XXII.

Of the Kingdom of TUNIS.

Its Situation, Extent, Diviſions, Rivers, and Iſlands; of the Mountain of Zawan or Zagoan, and of the Climate of Tunis in general.

THIS kingdom, which once comprehended the provinces of Conſtantina, Bugia, Tunis, Tripoli, and Zaab, or Ezzab, is bounded by the Mediterranean on the north and eaſt; by the kingdom of Algiers on the weſt; and by Tripoli, with part of Biledulgerid, on the ſouth; extending from the iſland of Jerba in thirty-three degrees thirty minutes to Cape Serra, in thirty-ſeven degrees twelve minutes north latitude, it being two hundred and twenty miles in length from north to ſouth, and a hundred and ſeventy in breadth from eaſt to weſt; the city of Sbekka, the fartheſt city to the weſt, being ſituated in eight degrees, and Clybea, the fartheſt to the eaſt, in eleven degrees twenty minutes eaſt longitude.

This country, which was once divided into provinces, is now under the immediate inſpection of the bey, and is only diſtinguiſhed into the ſummer and winter circuits, which the bey takes in perſon through his dominions at thoſe ſeaſons with a flying camp; in the ſummer ſeaſon traverſing the fertile country near Keff and Baijah, and the diſtricts between Cairwan and Jereede, and in the winter proceeding through the reſt of the country.

The ſummer circuit, or northern diſtrict, is much better inhabited than any of the neighbouring kingdoms of the ſame ſize, and is by far the moſt pleaſant and fertile; and as it has a great number of cities, towns, and villages, has the fineſt appearance of affluence, proſperity, and chearfulneſs, which doubtleſs proceeds from the mildneſs of its government, and its being freer from tyranny and oppreſſion. Its fertility is, however, interrupted by ſeveral hills, plains, and marſhes, diſperſed over it, that will admit of little cultivation, nor ſcarce any manner of improvement.

The principal rivers of this circuit are, the Zaine, which divides Tunis from Algiers; the Mejerda, uſually called Megerada; the famous Bagrada of the antients, on the banks of which Regulus is ſaid to have killed a monſtrous ſerpent. The Miliana, ſuppoſed to be the Catada of the antients, is remarkable for its forming the bay of Tunis, and having that metropolis ſituated at its mouth; the Gabbs, or Caps, ſuppoſed to be the Triton of the antients, which riſes only three or four leagues to the ſouth-ſouth-weſt of the city of its name, and falls into the ſea to the northward of the old city, forming the ground on which it was built into a kind of peninſula; and the Mejerdah, or Old Bagrada, which is the moſt conſiderable of the whole kingdom.

A ſmall iſland oppoſite to the mouth of the river Zaine, is in the poſſeſſion of the Genoeſe, who pay an annual rent to the regency; but the coral-fiſhery, which was their chief inducement for making this ſettlement, failing conſiderably, it is probable they will not long keep poſſeſſion of it, if they have not already abandoned it. They have, however, erected a fort for their protection againſt any ſurprize from the neighbouring Arabs on the continent, and from the inſults of the cruiſing veſſels of Algiers and Tripoli.

The other iſlands belonging to this ſtate are, Cape Negro, which is ſituated about five leagues to the north-eaſt of Tabarka, and has a ſettlement of the French African company, who pay a conſiderable ſum of money to Tunis for the liberty they enjoy at La Calle, though that place is under the Algerine government, and for keeping up a fort here to protect them from the inſults of the neighbouring Arabs.

Six miles to the north of Cape Negro is Jalta, the Galata, or Calathe, of the antients. This is a high rocky iſland, which has a very dangerous ſhoal. The Cani are two flat contiguous iſlands, where the Italian row-boats frequently lie in wait for the Tuniſeens. Theſe lie four leagues to the north-north-weſt of Cape Pilloe, and nearly in the mid-way to Cape Blanco; and four leagues beyond Cape Negro to the northward are the Three Brothers, which are three rocky iſlands near the continent, about half way to Cape Blanco.

The principal mountain of this kingdom is the Zowan, or Zagoan, whoſe ſummit affords a proſpect of the greateſt part of the kingdom. It is remarkable for a town of its name which ſtands at the foot of it, in great repute for dying ſcarlet caps, and for bleaching of linen; great quantities of both being daily brought thither from all parts of the kingdom. The ſtream which ſerves for that purpoſe, and runs from the top of the mountain, was formerly carried by a noble conduit to Carthage. Over the fountain was built a temple, the ruins of which are ſtill to be ſeen. It has alſo on its declivity and about its foot ſeveral Roman antiquities, as the remains of towns, caſtles, forts, and inſcriptions cut in marble. This moun-

tain ſtands about a league and a half to the ſouth-ſouth-eaſt of the city of Tunis, and is moſtly barren and deſart, except a few ſpots which produce barley; but it has proper places where the people place a vaſt number of bee-hives.

This country is for the moſt part healthy and fertile, only in the ſouth there are many ſandy and barren deſarts, and there the heat is exceſſive; hence, though the winds which blow from the ſea are very refreſhing, thoſe which proceed from theſe deſarts are quite ſuffocating, eſpecially as they moſtly blow in July and Auguſt, and will continue five, ſix, or more days in the ſame corner; ſo that the inhabitants are obliged to water the flooring of their houſes to cool them. This wind is likewiſe apt to blow after the winter ſolſtice, and then, if there be any ſnow on the ground, which is ſeldom the caſe, it quickly thaws and diſappears. The ſea-winds from the north and the weſt-north-weſt, bring dry weather in ſummer, and rain in winter; but both the eaſterly and ſoutherly winds are for the moſt part dry, though in moſt ſeaſons they are attended with thick clouds.

Their firſt rains commonly fall in September, and ſometimes not till October; ſoon after which the Arabians break the ground, ſow their corn, and about three weeks after plant their beans, lentils, and chick-peaſe. If they have any rain in April, as they uſually have, they reckon their crop ſecure. Their harveſt commonly begins in May, or in the beginning of June. Their ploughed lands are generally ſo light, that a pair of oxen may eaſily plough an acre in a day; and the quantity of ſeed, whether of wheat or barley, is about two buſhels and a half to an acre, which one year with another yield about tenfold, and in ſome diſtricts much more. The Tuniſeens are much more addicted to agriculture than their neighbours the Algerines, and are for making the moſt of every inch of ground.

The ſtory they tell of Mahomet, bey of Tunis, ſhews the high opinion they have of agriculture. This prince having been dethroned by his ſubjects, applied to Ibrahim Hojah, dey of Algiers, who engaged to reſtore him to his throne, on condition of his diſcovering to him the grand ſecret of the philoſopher's-ſtone, which he had the reputation of being maſter of; and, on his promiſing to fulfil this condition, he reſtored to him the government of Tunis. Mahomet then ſent to the dey, with great pomp and ceremony, a multitude of plough-ſhares and mattocs; intimating to the Algerine prince, that the wealth of his country was to ariſe from a diligent attendance on the cultivation of the earth; and that the only philoſopher's ſtone he could acquaint him with, was the art of converting a good crop into gold.

Eight leagues to the weſtward of Carvan are the ruins of Truzza, where are ſeveral vaulted chambers perpetually filled with ſulphureous ſteams, much frequented by the Arabs for the uſe of ſweating.

This kingdom and the reſt of Barbary are very ſubject to earthquakes, which is eaſily accounted for from the great number of hot ſprings and ſulphureous caverns, which are a proof of their being an almoſt inexhauſtible ſtore of nitre, ſulphur, and other inflammable bodies in the earth, ſufficient to cauſe thoſe frequent and violent concuſſions. Theſe earthquakes commonly happen after ſome great rains, at the end of the ſummer or in autumn, and will extend themſelves a great way into the ſea, where they have been felt when the depth of water has exceeded two hundred fathoms.

Among the natural curioſities of Tunis are ſeveral ſalt lakes, and a mountain of ſalt named Jibbel Haddeſſa, which is hard and ſolid like a ſtone, of a reddiſh or purple colour, and bitter to the taſte; but being waſhed down the precipices by the rain and dews, becomes ſoft and white as ſnow, and loſes all its bitterneſs. There are other mountains whoſe ſalt is of a bluiſh colour, and, without undergoing ſuch accidental purifications, are very palatable.

SECT. XXIII.

Of the principal Towns of the Kingdom of Tunis; particularly Bizerta, Tunis, Nabel, the Colonia Neapolis of Ptolemy, Suſa, Cairwan, or Carvan, Media, or Mehedia, Urbs, or Tuberbo, Bayjak, or Beja, Forreanah, &c.

WE ſhall now deſcribe the principal cities and towns of this part of Barbary. At the bottom of a large gulph is Bizerta, which is pleaſantly ſituated on a canal, between an extenſive lake and the ſea, in thirty-ſeven degrees twenty minutes north latitude, two hundred and forty miles to the weſt of the city of Algiers, and thirty-ſeven miles to the north-weſt of Tunis. This town, which is about a mile round, is defended by ſeveral caſtles and batteries, the principal of which are towards the ſea, from which the lake is continually receiving a briſk ſtream, or diſcharging one into it; the waters flowing into the lake when the wind is northerly, and returning back into the ſea when it blows from the ſouth. The channel between the lake and the ſea was the antient port of Hippo, which is ſtill capable of receiving ſmall veſſels, but was once the ſafeſt and moſt beautiful haven on this coaſt; and there are ſtill ſome traces of a large pier, which extended a conſiderable way into the ſea, to break the force of the north-eaſt winds.

The gulph of Bizerta, the Sinus Hipponenſis of the antients, is a beautiful ſandy inlet, near four leagues in diameter. As the ground is low, the eye penetrates through delightful groves of olive trees far into the country, and the proſpect is bounded by a high rocky ſhore. Were proper encouragement to be given to trade and induſtry, Bizerta might be rendered a town of great wealth, it abounding with corn, pulſe, fiſh, fruit, oil, cotton, and many other productions.

On the ſide of a ſpacious navigable baſon, formed by the Mejerdah, lies Porto Farino, which was once a conſiderable city, but is now greatly decayed. It is chiefly remarkable for its beautiful cothon, where the Tuniſeens keep their navy.

Tunis, the Tunes of the antients, and the capital of the kingdom, is ſituated in latitude thirty-ſix degrees twenty-ſix minutes, and in ten degrees fifteen minutes eaſt longitude from London, on the weſtern bank of the channel of Goletta, in the form of an oblong ſquare, about a mile in length; but the whole town, with the ſuburbs included, does not exceed three miles in compaſs, though ſome authors have, without any foundation, given it a much larger circuit. It is not ſo populous as Algiers, nor are the houſes ſo handſome and ſpacious. The lakes and marſhes with which it is ſurrounded might probably render its ſituation leſs healthy, was not the moiſture of the air corrected by the great quantity of maſtic, myrtle, roſemary, and other aromatic plants, with which their ovens and bagnios are daily heated, and that frequently communicate a fragrance to the air. The want of ſweet water is one of the greateſt diſadvantages under which the inhabitants labour; for the brackiſhneſs of their well-water, and the ſcarcity of their ciſterns, oblige them to fetch a great part of what they drink from ſome places about a mile diſtant; but, except this inconvenience, no place enjoys a greater plenty of all the neceſſaries of life: for, beſides ſhips continually bringing new ſupplies of proviſions, their gardens abound with variety of fruit-trees, as palms, citrons, dates, lemons, and olives; which laſt grow in ſuch abundance about a league diſtant round the city, that they ſupply not only the inhatants but ſtrangers with oil, and even with charcoal, that being the only wood they have to make it with.

They have their wheat chiefly from Urbs, Bugia, and other neighbouring places; and this they grind with a hand-mill; and having ſifted it through a fine ſieve, make of it fine cakes, and a flat kind of vermicelli; but this is only in uſe among the wealthy, the poor being forced to feed upon barley-meal, which they make into a kind of dumplings, and eat in oil or butter mixed with vinegar or lemon juice; but thoſe who are very poor only ſtir it in water, and eat it raw, without any other preparation. However, they have plenty of honey, and fruits of all ſorts pretty cheap.

Their principal ſtreets of Tunis are large and croſſed by narrow lanes at proper diſtances, and the houſes are chiefly built with ſtone; but are meaner than thoſe of Algiers, they being but one ſtory high, and flat at the top. There are

but few grand buildings, the chief of theſe are the great moſque, and the bey's palace. The gates of the city are five in number, but none of them are very handſome. Without the walls are the Turkiſh ſepulchres, which are placed round the city, and are adorned with marble tombs, oratories, flower-pots, and other embelliſhments.

The bey's palace is the moſt magnificent edifice in the city. It has four noble gates, one at each front, and high turrets at each of the four corners; the courts are ſpacious, the galleries lofty and richly adorned, and the halls and apartments are very ſplendid, particularly that called the treaſury, in which, among other things of value, is kept the book of their law written by Ali Mohadian, a celebrated doctor, from whom the beys boaſt that they are deſcended; and, in virtue of that deſcent, ſet up for the ſole judges of all controverſies about religion. The gardens are alſo very large, but not elegant.

The chief moſque juſt mentioned is built in the Turkiſh taſte, and has nothing remarkable, except its extraordinary ſize and ſtately tower, which, next to that of Fez, is allowed to be the higheſt in all Africa.

Near the midſt of the city is a piazza of great extent, which once contained no leſs than three thouſand woollen and linen drapers ſhops, handſomely built, and was furniſhed with a great variety of thoſe goods, beſides a conſiderable number of others belonging to the druggiſts, and other trades and manufactures. Indeed the chief manufactures of this city are thoſe of linen and woollen; for both which it has been long famous, on account of the peculiar way the women had of letting down their ſpindles from the top of their houſes quite to the ground, the weight of which is ſuppoſed to make the yarn finer and ſmoother.

The baths of this city, for both ſexes, are very numerous; and, though inferior in ſize and beauty to thoſe of Fez and Algiers, yet people are here more handſomely treated, and better accommodated, notwithſtanding the city being deſtitute of running water. Both theſe are chiefly furniſhed with that element from the ciſterns on the top of the houſes, which receive the rain water; and a certain quantity is let down from every houſe, by pipes, into one or two public reſervoirs; from which this and the other exigencies of the city are ſupplied, though not in ſuch a quantity as to permit the inhabitants to beſtow any of it in watering or cleaning the ſtreets, which, on that account, are always either duſty or dirty: ſo that it is very unpleaſant walking in them, eſpecially as their houſes have no windows in the front, which has the appearance of walking between two dead walls.

Here are alſo ſeveral colleges and ſchools, in which are many of their learned men and doctors of their law, part of whom are maintained at the public expence, and part by begging; but all of them are held in high eſteem, as the favourites of heaven. The janizaries have very handſome barracks, like thoſe of Algiers; and their aga, or chief, a palace, to which they repair for orders. The merchants and tradeſmen have a kind of public exchange, and the cuſtom-houſe officers a large cuſtom-houſe. There is alſo an arſenal and dock, ſeated upon the bank of the canal, in which they have materials ſufficient for building ſeveral galleys.

On the oppoſite ſide is the fort of Goletta already mentioned, and about two leagues diſtant from it is another caſtle built on a ſmall iſland in the lake; but as there is little probability of the town being attacked on that ſide, this fortification has been long neglected. The principal fortification belonging to the city is the caſtle, which is ſituated on an eminence that commands the whole; it makes a very good appearance at a diſtance, and has ſome cannon mounted before the gate: but the jealouſy of the government is carried to ſuch an exceſs, that it is very dangerous for a Chriſtian to view it too attentively; and it is much the ſafeſt way to paſs by it as faſt as one can.

Nabel, the Colonia Neapolis of Ptolemy, is ſituated in a low ground, a mile and a half from the ſea ſhore, about a furlong to the weſtward of the antient Neapolis, and about nine miles to the eaſt of Tunis. It is ſtill a thriving town, and has been long famed for its potteries; the reſt of its inhabitants are huſbandmen. Here are many inſcriptions upon ſtones, ſix feet in length, and three in breadth; but they are ſo defaced and filled up with rubbiſh and mortar, as to be unintelligible. On the bank of a little brook that runs through the old city is a block of white marble, on which is curiouſly carved a wolf in baſſo relievo.

Hamamet, a ſmall but opulent city, is compactly built upon a low promontory, and is well fortified by nature. Some columns and blocks of marble are here to be met with; theſe are ruins brought from the neighbouring places. This city is ſuppoſed to take its name from the number of wild pigeons bred in the cliffs of the adjacent mountains.

Suſa, or Souſa, is a conſiderable trading city, and the chief mart for oil; beſides which it carries on a flouriſhing trade in linen, a great deal of which is manufactured here; with wax, honey, and ſeveral ſorts of pickled fiſh, eſpecially that called tunny. The town ſtands upon a high rock, and was once very ſtrong, populous, and wealthy. It is ſtill the reſidence of the Turkiſh baſhaws. The port is commodious and ſafe. The inhabitants, who are chiefly ſeamen, are civil to ſtrangers; beſides theſe, there are many merchants and tradeſmen in the woollen way, who carry on a commerce with Turky and other parts of the Levant.

Eight leagues to the weſtward of Suſa is Kairwan, vulgarly called Carvan, the Vico Auguſti of the antients. This is a walled city, and the ſecond in the kingdom for trade and the number of its inhabitants. It is ſituated in a barren plain, and at the diſtance of half a furlong from the walls is a pond and a capacious ciſtern, built to receive the rain-water; but the former, which is chiefly for the uſe of the cattle, drying up, or putrifying in the heat of ſummer, cauſes agues and other diſtempers. Here are ſome fine remains of the antient architecture; and the great moſque, eſteemed the moſt magnificent and the moſt ſacred in all Barbary, is ſupported by an almoſt incredible number of granite columns, which the inhabitants ſay amount to five hundred; two of which are of ſo fine and lively a red, with little white ſpots, that they are eſteemed ineſtimable, and the whole ſtructure the moſt magnificent in all Africa.

Media, or Mehedia, is ſituated on a ſmall peninſula on the eaſtern coaſt of the kingdom, and appears to have been formerly a place of conſiderable ſtrength, though it is not above two hundred and thirty paces in breadth towards the land ſide; but widens on approaching the ſea. The port, with an area of about a hundred paces ſquare, lies within the walls of the city, with the mouth of it opening towards the ſouth; but it is now ſo ſhallow, that it can hardly receive the ſmalleſt veſſels. The walls which ſurrounded the place were ſtrong and lofty, flanked with ſix ſtately towers, beſides others of a ſmaller ſize; but all of them were very ſtrong and high, and had ſmall gates plated with iron, but ſo low, that a man could not go in or out without ſtooping, and each of theſe were a kind of ſeparate fortreſs. But of all the ſix, one which faced the eaſt, and was the only gate on the land ſide, was built with ſurpriſing ſtrength, having under it a vaulted arch ſeventy feet long, guarded by ſix ſtrong gates, one within another; ſome covered with plated iron, and others made of croſs iron bars rivetted together, with retreats and port-culiſſes all of the ſame metal and form. Theſe fortifications were erected by Mehedi, the firſt caliph of Kayrwan, who took no leſs pains in beautifying the city with noble buildings, if they were really his: but this a late judicious author much queſtions, from there being ſomething too polite and regular in the ſeveral capitals, entablatures, and other pieces of antient maſonry, defaced as they now are, to imagine the founder of them to have been an Arabian. However, there is but little of its former ſplendour left, except the walls, and ſome other ſtructures which are run to decay.

Monaſteer, an antient city of Carthaginian or Roman extraction, received its modern name from a monaſtery of Auguſtine friars in its neighbourhood. It is now a neat thriving city, ſituated on the extremity of a cape, and encompaſſed by ſtrong walls.

At the diſtance of ſix leagues to the weſt of Tunis is ſituated Urbs, or Tuberbo, the Tuburbum Minus of the antients, a ſmall town on the banks of the Mejerdah,

inhabited by Andaluſian Moors. Mahomet, a late bey of this kingdom, planted in this neighbourhood a great variety of fruit-trees, placing each ſpecies in a ſeparate grove: thus the citron trees are all placed by themſelves, without being mixed with the orange or the lime; and where you gather the peach or apricot, you are not to expect the pear or apple. In the adjacent valley the ſame public ſpirited prince erected, out of the ruins of an antient amphitheatre, a large maſſy bridge, or dam, with ſluices and flood-gates to raiſe the Mejerdah to a proper height, for the refreſhing of his plantations: but this was too laudable a work for it to laſt long in Barbary, and therefore it has been entirely broken down and deſtroyed.

The city of Bayjah, or Beja, the Vecca of Salluſt, is a place of great trade, and the chief mart for corn in the whole kingdom. It is built on the declivity of a hill, and has the convenience of being well watered. On the higheſt part of the city is a citadel of no great ſtrength, and on the walls, which are raiſed out of the antient materials, are ſeveral inſcriptions. In the plains that lie before the city, a public fair is kept every ſummer on the banks of the Mejerdah, to which the moſt diſtant Arabian tribes reſort with their families and flocks.

Ferreanah is thought, from its lonely ſituation and other circumſtances, to be the Thala of Salluſt, and was once the largeſt city of Bizacium; though it has no other remains of its antient grandeur, but ſome granite and other columns, which the Arabs have left ſtanding on their pedeſtals. It has been extremely well watered; for, beſides a conſiderable brook which runs under the walls, the city has had ſeveral wells, ſurrounded with a corridore, and vaulted over with a cupola. This, with the goodneſs of the air, are the only benefits this city can urge in favour of its ſituation; for, except a ſmall extent of ground to the ſouthward, which the inhabitants cultivate by ſupplying it, at proper times, with the water of the rivulet, the reſt of the adjacent country is dry, barren, and inhoſpitable. The proſpect to the weſtward is terminated by ſome naked precipices: and, where the eye is at liberty to wander through a valley between ſome narrow cliffs, you are entertained with no other view than of a deſart ſcorched up with perpetual drought, and glowing with the ardent beams of the ſun.

Twelve leagues to the eaſtward of Feereanah is Gaſa, the antient Capſa, which is ſituated on a riſing ground, almoſt encloſed with mountains; but the landſcape is more gay and verdant than that about the laſt mentioned city, from the proſpect it affords of palm, olive, piſtachio, and other fruit-trees. However, this agreeable ſcene is of ſmall extent, and only ſerves to refreſh the eye in the more diſtant proſpect of an interchange of barren hills and vallies. Theſe trees are watered by two ſprings, one of which riſes within the citadel, and the other in the center of the city. The latter is probably the fountain mentioned by Salluſt, and was formerly covered with a cupola: it is ſtill walled round, and diſcharges itſelf into a baſon, which was perhaps originally deſigned for a bath. Theſe two ſprings unite their ſtreams before they leave the city, forming a pretty large brook, which, from the quantity of water, and the rapidity of the ſtream, might continue its courſe to a great diſtance, did not the inhabitants conſtantly uſe it in ſupplying their plantations. In the walls of ſome private houſes, and more eſpecially in thoſe of the citadel, which is a ſlight modern building, is a great confuſion of columns of granite, entablatures, and altars, which, when entire, and in their proper ſituations, muſt have been great ornaments to the city.

SECT. XXIV.

Of the Roman and other Antiquities to be found in the Kingdoms of Tunis.

FROM the account we have given of the principal towns of Tunis, it appears that this country abounds with Roman and other antiquities; and we ſhall now add to thoſe we have already mentioned, others of a more extraordinary nature. The Rev. and learned Dr. Shaw ſays, it is difficult to fix the exact ſituation of the antient city of Utica, except we allow that the ſea has been driven back three or four miles by the eaſterly winds, and the increaſe of the mud, which is probably the caſe; and then it may be juſtly placed at Boſhater, where are many traces of buildings of great extent and magnificence, as walls, ciſterns, and a large aqueduct. Theſe ruins lie about twenty-ſeven Roman miles from Carthage, and behind them we are entertained with a view of the large fields which the Romans have rendered famous by their military exploits.

The celebrated city of Carthage has not much better ſupported itſelf againſt the encroachments cauſed by the north-eaſt winds, and the mud thrown out by the Mejerdah, which has ſtopped up the antient harbour, and rendered it almoſt as far diſtant from the ſea as Utica. The greateſt part of Carthage ſtood upon three hills, inferior in elevation to thoſe on which Rome was built. Upon a place which overlooks the ſouth-eaſt ſhore is the area of a ſpacious room, with ſeveral ſmaller near it: ſome of them have teſſelated pavements, but neither the deſign nor the execution are very extraordinary. In rowing along the ſhore, the common ſewers are ſeen in ſeveral places, which, as they were originally well built and cemented, time has not in the leaſt impaired. Except theſe, the ciſterns have ſuffered leaſt by the ruin of the city; for, beſides thoſe which belonged to particular houſes, there were two ſets for public uſe: the largeſt, which was the grand reſervoir, and received the water of the aqueduct, lay near the weſt wall of the city, and conſiſted of more than twenty contiguous ciſterns, each about a hundred feet long and thirty broad. The ſmaller ciſtern is in a higher ſituation near the cothon, it being contrived to collect the rain water that fell upon the top of it, and upon ſome adjacent pavements made for that purpoſe. This, however, might be repaired with little expence, the ſmall earthen pipes through which the water was conveyed wanting only to be cleaned.

No other remains of the grandeur and magnificence of this ancient city, the rival of Rome, are now to be ſeen. We find no ſuperb pieces of architecture; no triumphal arches: no columns of porphyry or granite; no curious entablatures: all the broken walls and ſtructures now to be ſeen, being erected either in the Gothic manner, or by the later inhabitants. However, the ruins of the celebrated aqueduct that conveyed the water into the great ciſterns, may be traced to the diſtance of at leaſt fifty miles. This was a very expenſive work, and that part of it which extends along the peninſula, was beautifully faced with ſtone. Dr. Shaw obſerves, that at Arriana, a ſmall village to the northward of Tunis, are ſeveral entire arches, which he found to be ſeventy feet high, and ſupported by piers ſixteen feet ſquare. The water channel above theſe arches was vaulted over, and plaiſtered with a ſtrong cement: a man of the ordinary ſize may walk upright in it, and at certain diſtances holes are left open both for the admiſſion of freſh air, and the convenience of cleaning it. A temple was erected at Zowan, and at Zungar, over the fountains by which this aqueduct was ſupplied with water; that of Zungar appears to have been of the Corinthian order, and ends very beautifully in a dome that has three niches, and extends over the fountain. In theſe niches were probably ſtatues of water-nymphs, or other deities.

Farther to the eaſt is the ſanctuary of Seedy Doude, which takes its name from David, or as they pronounce it Doude, a Mooriſh ſaint, whoſe ſepulchre is here ſhewn five yards long. Yet this ſtructure appears to be part of a Roman Prætorium, from the contiguous Moſaic pavements, all of them executed with the greateſt ſymmetry and exactneſs: the figures are horſes, trees, birds, and fiſhes, beautifully inlaid in ſuch a variety of colours, that they even appear more gay and lively than many tolerable paintings. The horſe, the inſignia of the Carthaginians, is repreſented in the bold poſture in which it appears upon the African medals; the birds are the hawk and the partridge; the fiſhes the gilt-head and the mullet; and the trees the palm and the olive. The deſigner perhaps, intending to point out the ſtrength, the diverſions, the fiſhery, and the plenty of dates and olives,

olives, for which this country has always been famous.

Six miles farther to the eaſt is Lowbareah, the Aquilaria of the ancients, where Curio landed the troops that were afterwards cut to pieces by Sabura. There are here ſeveral fragments of antiquities; but none of them very remarkable, except a ſurprizing cavern; for from the ſea ſhore to this village, which is about half a mile diſtant from it, is a mountain hollowed with great art, from the level of the ſea to the height of twenty or thirty feet, with large pillars and arches, which have been left ſtanding at proper diſtances to ſupport the roof. Theſe are the quarries mentioned by Strabo, from whence the buildings of Carthage, Utica, and many other neighbouring cities, might receive their materials. Our author remarks, that as this mountain is all over ſhaded with trees; as the arches below lie open to the ſea, with a large cliff on each ſide, and oppoſite to it is placed the iſland of Ægimurus; while ſprings are perpetually trickling down the rocks, and ſeats are raiſed for the weary labourer, there is ſcarce any doubt but that this is the cave placed by Virgil ſome where in this gulph, though ſome have thought his deſcription merely the work of imagination.

The amphitheatre of Jemme, the Tiſtra of Cæſar, is a noble piece of antiquity, originally conſiſting of ſixty-four arches, and four orders of columns. The upper order, ſuppoſed to be no more than an Attic, has ſuffered greatly from the Arabs, and in a late revolt of thoſe people, who uſed this place as a fortreſs, Mahomet bey blew up four of the arches from top to bottom, otherwiſe nothing can appear more entire and beautiful, particularly on the outſide; and within, the platform of the ſeats, with the galleries leading to them, are ſtill ſtanding. The arena is nearly circular, and in the center of it is a deep well of hewn ſtone, where the pillar that ſupported the velum, or awning, may be ſuppoſed to have been fixed.

Beſides this noble ſtructure, there are ſtill to be ſeen many other antiquities; as a variety of columns, altars with defaced inſcriptions, trunks of marble ſtatues, one of which is of the coloſſal kind in armour, and another is of a naked Venus, in the attitude and dimenſions of the Medicean, both by good maſters: but their heads broken off. Not inferior to this, are the triumphal arches of Spaitla, the ancient Sufetula, which is of the Corinthian order, conſiſting of one large arch, and a ſmaller one on each ſide, with the fragment of an inſcription upon it. From thence all along to the city, which is at about a furlong diſtance, is a pavement of large black ſtones, with a parapet wall on each ſide. At the end of this pavement you paſs through a beautiful portico, built in the ſame manner with the triumphal arch. This leads into a ſpacious court, where are the ruins of three contiguous temples; but the roof, porticos and fronts are broken down, though all the other walls, with their pediments and entablatures, remain entire.

Upon an eminence ſix leagues to the weſt-ſouth-weſt of Spaitla, is Caſſareen. The river Derb runs winding below it, and upon a precipice that hangs over that river, is a triumphal arch, more remarkable for the quantity and value of the materials, than for the beauty and elegance of the deſign. It conſiſts of only one large arch, with an Attic ſtructure above it, that has ſome ornaments, reſembling the Corinthian, upon the entablature; but the pilaſters are entirely Gothic; yet notwithſtanding the rudeneſs of the workmanſhip, and the oddneſs of the ſituation, it has an inſcription, in which Manlius Felix, the founder, is gratefully commemorated. In the plains below the city are many mauſolea, upon one of which is an elegy in hexameter and pentameter verſes.

Upon the ſea-coaſt, about two leagues weſt-by-ſouth of Hamamel, is the Menara, a mauſoleum erected in the form of a cylindrical pedeſtal, near ſixty feet in diameter, with a vault underneath. On the top of this ſtructure, juſt above the cornice, are placed ſeveral ſmall altars, which the Moors ſuppoſe to have been deſigned for ſo many lamps for the direction of marines. All theſe altars had inſcriptions, three of which are ſtill legible, one of them has theſe words; *L. Æmilio Africano Avunculo*; another, *C. Suellio Pontiano Patrueli*; and the other, *Vitellio Quarto Patr.*

There are alſo a variety of theſe mauſolea at Hydra, ſome of a round, others of an octagon form; others again ſquare, with a niche on one of the ſides, or a wide open place like a balcony on the top, all of them ſupported by four, ſix, or eight columns, and well preſerved; only their inſcriptions are defaced by time, or by the malice of the Arabs.

It is perhaps impoſſible to conclude this ſection; with words more applicable to the ſubject, than a paſſage in the preface to the travels of the learned author we have ſo often quoted. "A traveller, ſays he, can ſcarce fail of "falling into a ſerious train of thought, when he "obſerves ſuch large ſcenes of ruins and deſolation, as "are ſeen in theſe countries. He is ſtruck with the "ſolitude of the few domes and porticoes that are left "ſtanding, which hiſtory tells him were crouded with "inhabitants; where Syphax, and Maſſiniſſa, Scipio "and Cæſar: where the orthodox Chriſtians and the "Arians, the Saracens and the Turks, have in their "turns given laws. Every pile, every heap of ruins "points out to him the weakneſs and inſtability of all "human art and contrivance, reminding him of the "many thouſands that lie buried below, now loſt in "oblivion, and forgotten to the world."

SECT. XXV.

Of the Perſons, Cuſtoms, Manners, and Buildings of the Tuniſeens, particularly of the Turks, Moors, and Arabs; with many Cuſtoms that are agreeable to the Practice of the moſt early Ages.

THE Tuniſeens in general, and particularly the inhabitants of the metropolis, are like thoſe of Algiers, a mixture of Turks, Moors, Arabs, Jews, Chriſtian merchants, and ſlaves; with this remarkable difference, that they are here more polite and civilized, and entirely free from that haughtineſs, inſolence and cruelty for which the reſt of the people in Barbary are juſtly branded. They are in general much more kind and humane to their ſlaves, though they treat the knights of Malta, who are reduced to that condition with greater ſeverity, chiefly to oblige them to purchaſe their freedom at a dearer rate: for beſides the iron ſhackle which all are obliged to wear about their ankles, they have a huge heavy chain faſtened to it, which commonly weighs twenty-five pounds, and which they are obliged, either to twiſt about their legs, though it is then very troubleſome to walk with; or to hang it to their girdle by a hook, which cauſes a pain in the ſide; or elſe to hang it over their ſhoulder. They were formerly put to the hardeſt labours, ſuch as carrying of ſand, ſtone, and mortar for the builders, on which account they were obliged to write to Malta as ſoon as poſſible for their ranſom. The Malteſe, on the other hand, were no ſooner informed of their ill treatment, than they ordered all their Turkiſh ſlaves to be cruelly baſtinadoed by way of return. In conſequence of which theſe were obliged to write to the Tuniſeens, that if they continued to make the Malteſe ſlaves work at Tunis, they ſhould be cudgelled to death at Malta; and this at length put an end to this additional hardſhip.

The Tuniſeens are, in other reſpects, very courteous to ſtrangers, and all affairs with the regency are tranſacted in a very friendly manner. The conſuls that reſide at Tunis are treated with greater affablility and condeſcenſion, juſtice, and diſpatch, than in any other court on theſe coaſts. Indeed, this nation ha, for many years been more intent upon trade, and the improvement of manufactures, than upon plundering and cruiſing; on which account the people have juſtly obtained the character of not living like their neighbours, in a perpetual open war with the Chriſtian power; but of cultivating their friendſhip, and readily joining in their alliances.

The

The greateſt part of the Mooriſh women here would be eſteemed beauties even in England, and their children have the fineſt complexions of any nation whatſoever; but the boys are ſo expoſed to the ſun, that they ſoon attain the ſwarthineſs of the Arab; but as the girls keep more at home, they preſerve their beauty till they are thirty, when they are generally paſt child-bearing. One of theſe girls is ſometimes a mother at eleven, and a grandmother at twenty-two; and, as they generally live as long as the Europeans, they ſometimes live to ſee their children of many generations.

The dreſs of the Tuniſeens of both ſexes is alſo neater and more genteel, though nearly of the ſame faſhion with that of the Algerines. The citizens of both ſexes conſtantly wear drawers, eſpecially when they go abroad, or receive viſits. The virgins are, however, diſtinguiſhed from the matrons, by having theirs made of needle-work, ſtriped ſilk, or linen; but when the women are at home, or in private, they lay aſide their hykes, and ſometimes their tunics, and, inſtead of drawers, bind only a towel about their loins. The ladies affect to have their hair hang down to the ground, which they collect into one lock upon the hinder part of the head, binding, and plaiting it with ribbons; but where nature has been leſs liberal, they ſupply the defect by adding artificial to the natural locks. The hair being thus adorned, they tie cloſe together above the lock the ſeveral corners of a triangular piece of linen, worked with the needle in a variety of figures. Thoſe of ſuperior fortune wear what is called a ſarmah, which is nearly of the ſame ſhape as the other head-dreſs; but is made of thin flexible plates of gold or ſilver, cut through, and engraved in the manner of lace; and the dreſs is compleated by a handkerchief of ſilk, gauze, crape, or painted linen, bound cloſe about the ſarmah, and negligently falling upon the lock.

But none of theſe ladies think themſelves completely adorned, till they have tinged the eye-laſhes and the edges of their eye-lids with the powder of lead ore. This operation is performed by dipping a wooden bodkin, of the thickneſs of a quill, into the powder of lead ore, and drawing it under the eye-lids over the ball of the eye, which communicates to the eyes a blackneſs that is thought to add great beauty to perſons of all complexions. "This practice, ſays the learned Dr. Shaw, is of great "antiquity; for we find that when Jezebel is ſaid, in "2 Kings ix. 30. to have painted her face, the original "words are, She ſet off her eyes with the powder of "lead ore." The ſame author has proved, that this kind of ornament was alſo in uſe among the antient Greeks and Romans; and, in the courſe of this work, we have ſhewn, that it is not only ſtill practiſed in Barbary, but in Turky in Aſia, and other countries in the Eaſt.

The women of Tunis are not only handſomer and more neat, but more familiar than in the other parts of Barbary; they, indeed, put on their veils when they go abroad; but are allowed to be ſeen, and to converſe with ſtrangers, their huſbands being leſs inclined to jealouſy than the other Africans. The ladies of fortune are very fond of rich ornaments and perfumes, and are very conſtant in viſiting the public baths belonging to their own ſex; on which account the ſhops of the druggiſts and apothecaries are ſeldom ſhut before midnight, that being their chief time for bathing; in which they uſe a conſiderable quantity of odoriferous drugs and rich perfumes.

The men, as well as the women, reſort much to theſe baths, their religion obliging them to uſe frequent waſhings, particularly before the hours of public prayers, after every trifling defilement, and more particularly after the matrimonial intercourſe.

The merchants, officers, doctors, and ſcholars, when they go abroad, appear neatly dreſſed; but have ſuch a ſedate gravity, and good manners, that, though their ſtreets are crowded with people, one may go from one end of the city of Tunis to the other, without fear of being inſulted by the Turks, as one is ſure to be at Algiers. Indeed the Tuniſeens do not allow of many public mean taverns being kept by their ſlaves, as is done at Algiers, and thoſe they have are better regulated; whence thoſe very ſlaves are allowed to chaſtiſe even a Turk, if he drinks too much, or behaves inſolently; and even to pull off and keep his turban, till he has paid his reckoning. They ſell none but white wine, which the country produces in great plenty, and is very cheap and good; but, to render it more intoxicating, they commonly mix quick lime with it. It is cuſtomary in the taverns at Tunis, if a perſon calls for a quart of wine, to ſet before him three or four diſhes of meat, or fiſh, with a ſallad, and other ſauce; and when he goes away, he pays only for the wine at a common price.

Though many of the Tuniſeens allow themſelves the uſe of wine, yet few drink it to exceſs; and ſome are ſtill ſo ſtrict as to refrain from it entirely, and inſtead of that pernicious liquor, as they call it, make uſe of a compound drug, to which they give the name of harix, or, according to others, laiſis; an ounce of which will inſpire them with ſuch ſurpriſing gaiety and intrepidity, that nothing can ruffle their mirth, or give them either fear or diſcontent. This compoſition, they ſay, they learned from the Turks, and, from its effects, it ſeems to be of the nature of opium, and is probably a mixture of that with other drugs.

The Turks and Moors are every where early riſers, and conſtantly attend the public devotions at break of day; after which each perſon is employed in his proper trade or buſineſs till ten in the morning, the uſual time of dining; they return again to buſineſs till the afternoon prayers, when all kind of work ceaſes, and their ſhops are ſhut up. The ſupper generally follows the prayers of of ſun-ſet, and then repeating the ſame at the ſetting of the watch, when it begins to be dark, they go to bed immediately after.

Some of the graver people, who have no conſtant employment, ſpend the day either in converſing with one another in the barbers ſhops, in the bazar, or at the coffee-houſe: but a great part of the Turkiſh and Mooriſh youth, with many of the unmarried ſoldiers, attend their concubines with wine and muſic into the fields, or make merry at one of the public taverns.

As to the Arabs, their lives are one continued round of idleneſs or diverſions. When they are not called abroad by any paſtime, they ſpend the day in loitering at home, ſmoaking their pipes, and repoſing themſelves under ſome neighbouring ſhade. They have not the leaſt reliſh for domeſtic pleaſures, and are ſeldom known to converſe with their wives, or to play with their children. The Arab places his higheſt ſatisfaction in his horſe, and is ſeldom in high ſpirits but when hunting or riding at full ſpeed. The eaſtern nations are in general very dexterous at this exerciſe. At the hunting of the lion a whole diſtrict is ſummoned to appear, when forming themſelves into a circle, they at firſt encloſe a ſpace three or four miles in compaſs, according to the number of the people and the nature of the ground. The footmen advancing firſt ruſh into the thickets with their dogs and lances to rouſe the game, while the horſemen keeping a little behind, are always ready to ſally on the wild beaſts. Thus they proceed, contracting the circle, till they at laſt either meet together, or find diverſion. The accidental paſtime on theſe occaſions is ſometimes very diverting; for the various animals within the circle being thus driven together, the people ſeldom fail of having a variety of agreeable chaces after hares, leopards, hyenas, jackalls, and other wild beaſts.

Hawking is another of the principal diverſions of the Arabs and gentry of the kingdom of Tunis, where the woods afford a great variety of hawks and falcons. Thoſe who take delight in fowling, inſtead of ſpringing the game with dogs, ſhade themſelves with a piece of canvas ſtretched upon two reads, and painted with the figure of a leopard. The fowler thus concealed walks through the breaks and avenues, looking through ſome holes a little below the top of the ſcreen to obſerve what paſſes before him. The partridges and ſome other birds, on the approach of the canvas, are obſerved to covey together, though they were before at ſome diſtance from each other; and the woodcock, quail, and ſome other birds that uſually feed in flock, will, on ſeeing it, ſtand ſtill with a look of aſtoniſhment. The ſportſman has by this means an opportunity of coming near them, when reſting the ſkreen upon the ground, and directing the muzzle of his piece through one of the holes, he ſhoots at a

whole covey at once. The Arabs have likewiſe another method of catching partridges; for obſerving that after their being haſtily ſprung two or three times, they become fatigued and languid, they then run in upon them, and knock them down with their zerwatties, which are ſhort ſticks bound round with iron, or inlaid with braſs or pewter. Thoſe Arabs who are not maſters of a gun make uſe of theſe both for offenſive and defenſive weapons.

The Bedoweens, a name given to the Arabs who live in tents, ſtill retain many of the cuſtoms we read of in ſacred and profane hiſtory; for except their religion, they are the ſame people they were two or three thouſand years ago. Upon meeting each other, they ſtill make uſe of the primitive ſalutation, "Peace be unto thee." The inferiors ſhew their deference and reſpect to their ſuperiors, by kiſſing their feet, knees, or garments, while the children, or kinsfolk, pay the ſame reſpect to the heads of their parents, and aged relations. In ſaluting each other, they clap their right hand on their breaſt, while thoſe who are more intimately acquainted, or are of an equal age or dignity, mutually kiſs the hand, head, or ſhoulder; and, at their great ſolemnities, the wife alſo compliments her huſband by kiſſing his hand.

Perſons of the higheſt character, like the antient patriarchs and the heroes of Homer, perform what we ſhould term menial offices. The greateſt prince, when viſited by a ſtranger, is not aſhamed to fetch a lamb from his flock and kill it, while the princeſs makes haſte to prepare her fire and kettle, and then dreſſes it. The cuſtom of walking either bare-foot, or with ſandals, renders the compliment of waſhing the ſtrangers feet ſtill neceſſary: this is done by the maſter of the family, who firſt preſents himſelf, and is always the moſt officious in this act of kindneſs. When his entertainment is ready, he would think it a ſhame to ſit down with his gueſts; inſtead of which he ſtands all the time, and waits upon them: yet, notwithſtanding this reſpect, thoſe are ſometimes overtaken and robbed in the morning, by the very perſons who entertained them with ſuch hoſpitality the night before.

The reſpect paid by the polite nations of Europe to the female ſex, is in this country conſidered as abſurd infringements of that law of nature which aſſigns the preeminence to man: for the wives are only conſidered as a ſuperior claſs of ſervants, who are yet to have the greateſt ſhare of toil and labour. While the lazy huſbands take their repoſe under ſome neighbouring ſhade, and the young men and maidens attend the flocks, the wives are all day either employed at grinding at the mill, dreſſing proviſions, or working at their looms; and, to conclude the day, they ſtill, as in ancient times, take a pitcher, or goats-skin, and tying their ſucking children to their backs, trudge two or three miles to fetch water: yet, notwithſtanding all this buſineſs, neither theſe country ladies, nor thoſe of ſtill higher rank in the cities, will lay aſide any of their ornaments, neither their noſe-jewels, their bracelets for their arms and legs, or their ear-rings, all of which are very cumberſome; nor will they omit tinging their eyes with lead ore; ſo prevalent is cuſtom, and ſo fond are even the ladies in Barbary of appearing in the faſhion.

The method of building both in Barbary and the Levant ſeems alſo to have continued the ſame from the moſt early ages. Their houſes are ſquare buildings, with flat roofs, ſurrounding a court, where alone they are ornamented. Indeed large doors, ſpacious rooms, marble pavements, and cloiſtered courts, with fountains ſometimes playing in the midſt, are well adapted to the heat of the climate.

On leaving the ſtreets, which are generally narrow, with a range of ſhops on each ſide, and entering one of the principal houſes, you firſt paſs through a porch, or gate-way, with benches on each ſide, where the maſter of the family receives viſits and diſpatches buſineſs, few perſons, even among the neareſt relations, being admitted any farther, except upon extraordinary occaſions: from hence you paſs into the court, which lying open to the weather, is, according to the ability of the owner, either paved with marble, or ſuch coarſer materials as are proper for carrying off the water. When a number of people are to be admitted, as upon the circumciſion of a child, or the celebration of a marriage, they are ſeldom received into any of the rooms, but only into this court, which is then covered with mats and carpets for their more commodious entertainment; and, to ſhelter them from the heat of the weather, a kind of veil is expanded upon ropes from one ſide of the parapet wall or lattice of the flat roof to the other. To this covering, which may be folded or unfolded at pleaſure, Dr. Shaw remarks, that the Pſalmiſt ſeems to allude, in that beautiful expreſſion, "Thou ſpreadeſt out the heavens like a curtain."

This court is uſually ſurrounded with as many cloiſters above each other as the houſe is ſtories high, with either a baluſtrade, or lattice-work round thoſe above, to prevent any perſons from falling down. You are conducted from the cloiſter and galleries into large ſpacious chambers of the ſame length with the court; but they have ſeldom or never any communication with each other, and one of theſe rooms frequently ſerves a whole family, particularly when many perſons join in the rent of a houſe; hence the cities of Barbary are extremely populous in proportion to their extent.

Their moſques are built exactly in the form of our churches, only inſtead of pews the floor is covered with mats. Near the middle a pulpit is erected, from whence the Mufti, or one of the Imans, every Friday explains a part of the Koran, and exhorts the people to piety and good works.

Near all the cities and villages is a large ſpot of ground, in which they bury the dead. Every family has a particular part of it walled in like a garden, in which the bones of their anceſtors have, for many generations, remained undiſturbed. In theſe encloſures the graves are all ſeparate and diſtinct, each having a ſtone placed upright both at the head and feet, while the intermediate ſpace is either planted with flowers, bordered round with ſtone, or paved all over with tiles. The graves of perſons of diſtinction are diſtinguiſhed by their having a ſquare room with a cupola built over them; which being conſtantly kept clean, white-waſhed, and beautified, they to this day continue, as our author remarks, an excellent comment upon the expreſſion of our Saviour, where he compares the hypocrites to whited ſepulchres, which appear outwardly beautiful, but are within full of dead mens bones and all uncleanneſs, Matth. xxiii. 27.

It is worthy of obſervation, with reſpect to theſe ſeveral ſtructures, that where extraordinary ſtrength is required, the plaiſter and cement are, to all appearance, of the ſame conſiſtence and compoſition with thoſe of the antients. Thus our author obſerves, that the ciſterns built by Sultan ben Eglib, in ſeveral parts of the kingdom of Tunis, are of equal ſolidity with the famous ones at Carthage, and continue as firm and compact, unleſs where they have been deſignedly broken, as if they were but juſt finiſhed. The compoſition is made in the following manner:

They take two parts of wood-aſhes, three of lime, and one of fine ſand, which, after being well ſifted and mixed together, they beat inceſſantly for three days and nights with wooden malſets, ſprinkling them alternately, and at proper times with a little oil and water, till they become of a due conſiſtence. This compoſition is chiefly uſed in their ciſterns, arches, and terraces: but the pipes of their aqueducts are joined with tow and lime beat together with oil only, without any mixture of water. Both theſe compoſitions ſoon aſſume the hardneſs of ſtone, and ſuffer no water to pervade them.

The ingenious and learned divine we have ſo often quoted, and from whom we have borrowed the above article, alſo obſerves, that, inſtead of common glue, the joyners frequently uſe a preparation of cheeſe, which is firſt to be pounded with a little water in a mortar, till the wheyie matter is waſhed out. When this is done, they pound it again with a ſmall quantity of fine lime, and apply it afterwards as quick as poſſible to ſuch boards as are to be joined together; which, after the cement becomes dry, it is ſaid, will not be ſeparated even by water itſelf.

We ſhall now take a view of the habitations of the Bedoweens and Kabyles, the former the inhabitants of

the plains, and the latter of the mountains. The tents of the Bedoweens, which are of an oblong figure, and reſemble the hull of a ſhip turned upſide down, are covered with a coarſe hair-cloth, and differ in ſize, in proportion to the number of perſons who live in them. Some of them are ſupported by a pole eight or ten feet high, and others by two or three poles of the ſame length, while a curtain, placed upon occaſion at each of theſe diviſions, ſeparates the whole into ſeveral apartments; and theſe poles being covered with hooks, the Arabs hang upon them their cloaths, ſaddles, baſkets, and warlike inſtruments. They take their reſt by lying upon a mat, or carpet, wrapped in their hykes, which have been already deſcribed in treating of Algiers, and have neither bed, mattreſs, nor pillow. When there are a number of theſe tents together, they are uſually placed in a circle, and in the night the cattle are incloſed in the area in the middle, to ſecure them from the wild beaſts. In ſhort, Virgil's deſcription of their manner of living and decamping is as juſtly drawn, as if he had but lately made his obſervations.

The villages of the Kabyles conſiſt of a number of cottages, built either with bricks dried in the ſun, with the materials of ſome ancient ruins, or with hurdles daubed over with mud; while the roofs are covered with ſtraw, or turf, ſupported by reeds, or the branches of trees. In the largeſt of them there is ſeldom more than one room, which not only ſerves for a kitchen, dining-room, and bed-chamber, but one corner of it is reſerved for their foals, calves, and kids. In theſe huts the women make their blankets called hykes, and the goats hair cloth for their tents; but, inſtead of weaving them with a ſhuttle, they conduct every thread of the woof with their fingers.

SECT. XXVI.

Of the Government, Laws, Commerce, and Language of the Tuniſeens.

THE government of Tunis is at preſent, like that of Algiers, entirely deſpotic; but with this difference, that the dignity of Dey of Algiers is elective, while that of the Bey of Tunis it not only hereditary, but he has the power of nominating which of his ſons he chooſes for his ſucceſſor; or, if he thinks none of them worthy of that honour, he may chooſe either a brother or a nephew to ſucceed him in the throne.

The Beys are alſo equally independent both of the Grand Seignior and the Divan. They were indeed once under the protection of the former; but the rapacious extortions and tyranny of the baſhas in a manner obliged them to ſhake off their yoke, and form a government of their own, which was ſettled in ſuch a manner, that their Deys, as they were then called, could do nothing without the conſent of the divan: but they at length found means to rid themſelves alſo of this uneaſy clog, tho' the government ſtill retains a ſhadow of both; for the Porte has ſtill a baſha who reſides here; but his power and influence are ſo inconſiderable, that he only ſerves to remind the Tuniſeens of their being once ſubject to the Grand Seignior, or at moſt to prevent the regency taking any meaſures prejudicial to his intereſt. As to the divan, it being chiefly compoſed of the friends and creatures of the Bey, they are rather aſſembled to give a forced approbation to his reſolutions, than for him to conſult them about their juſtice and expediency.

When this new form of government was firſt eſtabliſhed, the Deyſhip, as hath been already intimated, was the ſupreme dignity, and the Beys, who were the next in rank, were entirely ſubordinate; but having ſince built their power on the ruin of the Dey's, they have by degrees raiſed themſelves to their preſent independency; and, by making the office of Bey hereditary, have endeavoured to prevent thoſe frequent depoſitions, rebellions, and maſſacres, which are too common in an elective monarchy. They have, however, been unable to prevent jealouſies and cabals, or to hinder the ſons rebelling againſt their fathers, or againſt ſuch of their brothers as are nominated to ſucceed them; whence the dignity of Bey oftener falls to the ſhare of that ſon who has had the addreſs to form the ſtrongeſt party, than to him who has been appointed by his father, or is moſt worthy to fill the throne. Thus, whenever, this office becomes vacant, it is ſeldom filled up again without much bloodſhed, rapine, and violence.

The dignity of Dey is now dwindled to ſuch a degree, that he who enjoys it has ſcarce half the ſhare in the government, which the beys poſſeſſed when they held the next rank under it; for theſe were then appointed governors of the provinces, where they lived in great ſtate and grandeur, gaining immenſe wealth by oppreſſing their fellow ſubjects, and by ſinking a conſiderable part of the revenue into their own coffers: whereas the Bey, by dividing the kingdom into two circuits, and collecting the revenue in perſon, at the head of his flying camp, has at once ſtripped them of the greateſt branch of their wealth, grandeur, and authority, and left them only a mere dependence on the favour of the Bey. Both the Deys and the Divan took great umbrage at this exceſs of power, and much more on their entailing the royal dignity on their deſcendants, and rendering it ſtill more ſecure to them by the alliances they contracted with the Arabian princes, their near neighbours; but the noble and united ſtruggles they made to ſhake off this new and irkſome yoke, inſtead of meeting with the ſucceſs they expected, ſerved rather to render it more heavy and durable.

The Bey, however, ſhews a great indifference to all the grandeur of ſtate, and is contented with ſecuring to him and his deſcendants the privilege of reigning with an uncontrouled ſway. He has indeed very powerful reaſons to prevent his making ſuch a ſplendid figure as would rather create envy and jealouſy, than awe and regard, either from his ſubjects, eſpecially the Moors and Arabs, or from his neighbours, and more particularly the Dey of Algiers.

What the revenues and land-forces of the Bey of Tunis are, is not eaſy to gueſs, the former chiefly conſiſting in the tribute which the Moors and Arabs pay, and in the cuſtoms ariſing from imports and exports, both of which are in a conſtant fluctuation; for both the Moors and Arabs frequently find means of eluding the payment of their taxes. The forces of the Bey chiefly conſiſt of renegadoes and a few militia, the latter of whom are chiefly kept in their garriſons and ſea-ports; but are neither ſo well-paid nor diſciplined as thoſe of Algiers. The renegado ſoldiers, who chiefly compoſe the Bey's guard and the garriſon of his capitol, are indeed better maintained and cloathed. Beſides theſe the Bey can, upon all emergencies, command a powerful army of Moors and Arabs, both horſe and foot; but can have no great dependence on their fidelity.

Their ſhips are alſo much inferior to what might be expected from ſuch a maritime trading nation. Thoſe that belong to the government are ſeldom more than four, and all of them poorly rigged, the largeſt carrying no more than forty guns: beſide theſe they have about thirty galliots, which carry from twenty to a hundred and twenty men; theſe are generally commanded by a renegado, and manned partly by ſome of the ſame people, and partly by Turks and Couloglies, or the ſons of married ſoldiers. The Chriſtian ſlaves work the ſhip, and thoſe of the Mahometan religion are only concerned in the fighting part. The four great ſhips ſet out on a cruiſe, and are ſupplied with biſcuit, oil, butter, and vinegar, by the Bey; but as theſe proviſions are inſufficient, their captains, for two piaſters more from every Turk, enlarge the allowance.

Other galliots are alſo fitted out by private owners, who cruize at their own expence, pay the ſhip's crew, defray other charges, and are allowed the ſole property of the prizes they take, except ſuch perquiſites as the Bey reſerves for himſelf.

When any of the government ſhips bring in a prize, the hull of the veſſel and half the cargo, after the ſhip's expence has been deducted, belong to the Bey; and the other half is divided between the rais, or captain, and the company. The rais has ſix ſhares, the under rais four, the maſter two, the cockſwain two, and each private

private man has half a ſhare. With reſpect to the ſlaves, the Bey, beſides his half, has the privilege of buying the reſt at a hundred piaſters per head, though he ſeldom fails of ſelling them for three or four hundred; only every tenth head belongs to the divan.

A Chriſtian merchantman, on entering the road of Tunis, hoiſts his colours, and ſalutes the caſtle of Goletta with three guns, and then the maſter goes aſhore to inform the Aga whence he comes. But when a man of war belonging to one of the Chriſtian powers comes in, he anchors at a farther diſtance from the caſtle than the merchantmen, and is firſt ſaluted from it according to his rate, which he returns with the ſame number of guns. While he ſtays, a flag is hoiſted at the houſe of the conſul belonging to his nation, and all the merchantmen of the ſame country keep their colours flying. The man of war is no ſooner arrived, than the conſul is obliged to give notice of it to the Bey, who inſtantly orders all the ſlaves to be ſhut up, leſt any of them ſhould find means to get on board; in which caſe there would be no reclaiming them. At the departure of a ſhip of war, the Bey commonly ſends the captain the uſual preſents of oxen, ſheep, poultry, and other refreſhments.

All trading veſſels which load or unload in this kingdom, are obliged to pay anchorage, which amounts to ſeventeen piaſters, and alſo for loading and unloading. The average on ſhips loading being part of the public revenue, riſes and falls according to the exigencies of the ſtate. This duty, which ran high in the year 1733, amounted to twenty piaſters for every ſhip, whether loading or unloading. To theſe may be added, the duty of two per cent. called the conſulage, on every cargo taken on board at Tunis, and is for the ſalary of the conſul and other officers. The paſſports granted to French captains are, at the deſire of their own crown, limited to three years; at the end of which they are to appear before an admiralty-court in France, under ſevere penalties, before they renew it: but thoſe granted to the Engliſh extend to fourteen years, without their being confined to the above-mentioned obligation.

All public conventions and inſtruments are written in the Arabic tongue, which, from the introduction of the Turkiſh religion into Barbary, and the intercourſe with the Moors, is much corrupted from its antient energy and elegance. The public commerce is generally carried on by the help of the Lingua Franca.

The great number of renegadoes from France, Spain, and Italy, which are here much encouraged, on account of their abilities, uſefulneſs, and profeſſed hatred to all Chriſtians, have likewiſe rendered their languages ſo familiar in theſe parts, eſpecially in Tunis, that it would be dangerous to talk of ſtate affairs in any of them before either the Turks or Moors. Many of theſe renegadoes find means to raiſe themſelves to the moſt conſiderable employments, and gain immenſe riches.

The Jews alſo ſwarm in this kingdom, on account of their uſefulneſs and commerce, and live after their own manner in their ſeparate quarters. There are computed to be no leſs than nine or ten thouſand in the city of Tunis, many of whom carry on a very conſiderable commerce; and as they are much addicted to cheat in their weights and meaſures, to make fraudulent bankruptcies, and alſo to adulterate gold duſt and other commodities, they are generally more ſeverely puniſhed or fined than any other foreigners; eſpecially if they are caught in diminiſhing or counterfeiting the coin, which is much the ſame here as at Algiers.

The puniſhments inflicted on criminals are much the ſame at Tunis as at Algiers, only their ſuperſtition has dictated a different method of putting to death thoſe renegadoes who turn Chriſtians. Their cruelty is here extremely dreadful, for they either wrap them up in a cloth dipped in melted pitch, and then ſet it on fire; or elſe put them to a more lingering death, by encloſing the whole body, except the head, and rubbing that and the face with honey, which expoſes them to the bite and ſtings of waſps and other inſects, by which they are tortured ſeveral days and nights before they expire.

They alſo puniſh with inhuman cruelty the ſlaves who attempt to run away, eſpecially ſuch as kill their Mahometan maſters; for this laſt offence they break the offender's arms and legs, tie him to a horſe's tail, and drag him thro' all the ſtreets; after which, if he be ſtill alive, they give his body to the Franks or European Chriſtians; but the boys frequently take the body out of the executioner's hands, in ſpight of the mezoar, or ſub-baſha; and having dragged it about ſome time longer, roaſt it with ſtraw, and, after many other indignities, at laſt throw it into ſome ditch, from whence it is fetched by the Franks in order to be interred.

Tunis exports to France, Morocco ſkins, hides, wool, corn, oil, beans, lentils, and wax; and receives in exchange Languedoc cloths, Spaniſh wool, iron, ſteel, hardware, paper, brandy, wine, pepper, cloves, ſugar, and vermillion. The Italian trade is carried on entirely by the Jews, who ſend the ſame commodities as to France, and import from thence gold and ſilver tiſſue, Spaniſh cloths, damaſks, and ſeveral ſorts of ſilk and woollen ſtuffs. The Moors and Turks export to the Levant gold duſt, chequins, woollen ſtuffs, bales of caps, and lead; and bring in return ſilks, calicoes, iron, vermillion, and allum. They vend much the ſame kind of commodities into Egypt; but the oil that is carried thither muſt be put up in jars, and not in caſks, the greateſt part of it being deſigned for the lamps of Mecca and Medina; and the Arabians would think it polluted, as the caſks might formerly have contained wine. From thence they export in exchange rice, linen, flax, cotton, and coffee.

The number of French ſhips freighted at Tunis by the Turks, Moors, and Jews, are ſaid to amount annually to no leſs than a hundred and fifty to the Levant, and fifty for France and Italy; but as for thoſe of the Engliſh, their number is quite uncertain.

One conſiderable branch of the commerce of Tunis conſiſts in the caravan veſſels which trade to the Levant, not only on account of the half average they pay to the ſtate, but of the vaſt concourſe of people they occaſion, and the tax on paſſports; but the moſt conſiderable of all the caravans are thoſe from Sallee and the Cadenſis; the firſt of which arrives about three weeks before the faſt of Ramadan, and enriches the Tuniſeens with gold duſt and chequins to the value of a hundred thouſand pounds ſterling. The Cadenſian, which comes in twice a year, alſo brings plenty of gold duſt, beſides a conſiderable number of negroes, which they exchange for cloths, Venice glaſſes, coral, wire, paper, &c.

In moſt other reſpects, the commerce of the Tuniſeens is carried on much after the ſame manner as that of Algiers, with this advantage, that foreigners are uſed with much greater equity and humanity. The Engliſh, French, Dutch, Imperialiſts, and Genoeſe, have their conſuls, who are likewiſe treated with much greater reſpect. They have not only fine houſes in the metropolis, but handſome villas, or country ſeats, in its neighbourhood; and in both they live in a ſplendid manner. The duty of two per cent. on all the veſſels that take their cargo on board at Tunis, which ſerves for their's and their officers ſalaries, is collected by a merchant of the greateſt reputation, who paſſes his account every year before the conſul, chancellor, and four other merchants.

SECT. XXVII.

Of the Kingdom of TRIPOLI, *or* TRIPOLY, *including* BARCA.

Its Situation and Extent; with a Deſcription of the Gulph of Sidra.

THOUGH this ſtate is tributary to the Porte, and under its protection, it aſſumes the name of a kingdom; the grand ſeignior being always fond of multiplying theſe titles, in order to ſwell the pomp and grandeur of his own. It receives its name from that of its metropolis, which is ſtiled New Tripoli, to diſtinguiſh it from a much more antient city in Phœnicia, which ſtill retains its former name.

The kingdom of Tripoli, including the deſart of Barca, and the reſt of Barbary, is bounded on the eaſt by Egypt, on the north by the Mediterranean ſea, on the weſt by Tunis, and on the ſouth by Nubia and unknown parts of Africa, extending from ten degrees thirty minutes to thirty

thirty degrees eaſt longitude from London, which, with the windings of the coaſt, give it an extent of above twelve hundred miles in length: but as to its breadth from north to ſouth, it varies very much, it extending in ſome places a hundred, and in others three hundred miles from north to ſouth.

The coaſt affords no natural curioſity, except the gulph of Sidra, which has its name from a ſmall iſland at the bottom of it. It was antiently called the Syrtis Magna, to diſtinguiſh it from a ſmaller one on the coaſt of Tunis, and its being more dangerous to mariners, from its drawing with greater violence, and the ſands being deeper. But few rivers diſcharge themſelves into it, and thoſe are of no great note: nor are the Magra, Ruſalmabes, Caſarnacar, and others, that empty themſelves into the Mediterranean, of greater conſequence, except their ſerving to nouriſh an infinite number of palm-trees by their being diſtributed into canals, without which it would be impoſſible for them to grow in the ſandy deſarts.

This country is at preſent divided into maritime and inland: the inhabitants of the former live chiefly upon commerce and the piratical trade, and the latter for the moſt part on plunder and robbery. Each of theſe diviſions has ſome cities and towns, with a much larger number of villages, which lie chiefly ſcattered through the latter; but moſt of them are very poor and thinly inhabited, the country being almoſt every where ſandy and barren. Indeed, all the cities and towns worthy of notice are ſituated along the coaſt. Of the moſt conſiderable of theſe we ſhall give ſome account, the reſt being either gone to ruin, and entirely depopulated, or inhabited only by a few fiſhermen, people who burn lime, the makers of pot-aſhes, and a few labourers, all reduced to extreme poverty through the exactions of the government, or the frequent depredations of the Arabs.

SECT. XXVIII.

A Deſcription of the City of Tripoly, or Tripoli, the Capital of the Kingdom; and particularly of an antient triumphal Arch in that City.

TRIPOLI, the metropolis of this kingdom, is ſituated in fourteen degrees thirty minutes eaſt longitude from London, and in thirty-three degrees five minutes north latitude, and was once divided into two parts, the Old and the New. The former was the native place of the emperor Severus, and is ſuppoſed to have been built by the Romans; after which it was conquered by the Vandals, and at laſt deſtroyed by the Mahometans; ſince which time it has never recovered itſelf, or if it did, has been ſuffered to run to decay, and is now almoſt gone to ruin. The latter, which is ſituated at a ſmall diſtance from it, is of no great extent; but is populous and in a flouriſhing condition. It ſtands on a ſandy ground by the ſea-ſhore, and is encompaſſed with high walls and ſtrong ramparts, flanked with pyramidical towers, but has no ditch. It has only two gates, one on the ſouth towards the country, and the other on the north fronting the ſea, where the city ſpreads itſelf in the form of a creſcent, near a ſpacious and commodious haven. The point to the eaſt is little elſe beſides a group of rocks, on which are to be ſeen ſome antient forts, which are now run to decay; but that to the weſtward is defended by a ſtrong caſtle, encompaſſed with fortifications in the modern taſte, and defended by ſome large cannon.

New Tripoli is ſuppoſed to have been built by the natives, who gave it the name of Tarabilis, or Trebilis, whence the Latins call it Tripolis. According to ſome authors it was formerly a place of very great trade, on account of its neighbourhood to Numidia, Tunis, and other conſiderable places; and was therefore reſorted to by veſſels from Malta, Venice, Sicily, Marſeilles, and other ports, it having one of the moſt commodious havens along the whole coaſt till you come to Alexandria; and by this means it became ſo opulent, that it abounded with fine moſques, hoſpitals, and other public buildings, and being filled with rich merchants, excelled Tunis both in wealth and beauty. It now indeed retains but few traces of its antient ſplendour, it having little elſe to invite the eye but the diſtant proſpect; for the houſes within the city are low and mean, dirty and irregular; yet it has ſome monuments, which remove all doubt of its having once made a much more noble appearance, particularly a triumphal arch, one half of which lies buried in the ſand; but what is ſeen above it is a ſufficient proof of its former grandeur.

This triumphal arch is the only antiquity to be met with in this country; and even this would have been long ago deſtroyed, had it not been for a tradition which paſſes among the inhabitants, that the very attempt to demoliſh it would infallibly be attended by ſome dreadful misfortune. In confirmation of this they ſhew a ſtone half looſened from the reſt, and confidently aſſert, that a prince having begun to remove ſome of the ſtones, the workmen were at firſt frighted by a terrible earthquake; but ſtill perſiſting in their work, in ſpight of this ſupernatural warning, they were all buried under a prodigious cloud of ſand. It is probable ſome magnificent ſtructure was erected near this elegant arch, ſince one cannot dig near it far under ground, without finding ſome of the largeſt pieces of marble that are any where to be met with.

The architecture and baſſo relievos in this famous work are finely executed. The four corners of the building are ſupported by an equal number of pilaſters adorned with vine leaves. Over each of the four gates is a triumphal chariot, in one of which is repreſented Alexander drawn by two ſphinxes, with ſome ſlaves under it.

The inſcriptions over the gates are all worn out, except one on the north ſide, which is ſtill legible. The ſtones of this ſtructure are all of fine marble, between five and ſix feet thick, and are faſtened to each other by iron cramps, without either mortar or cement.

We need not, however, wonder at the decay of this city; as it labours under two great inconveniences; the firſt is the want of ſweet water, here being neither rivers, ſprings, nor any other means of ſupplying it with that neceſſary element, but reſervoirs for ſaving the rain; the ſecond inconvenience is the great ſcarcity of corn, and the other produce of the earth, the city being ſurrounded for ſeveral miles together on the land-ſide with a dry ſandy ſoil. This, ſome authors maintain, was formerly arable and fertile ground, that produced great abundance of corn and other grain, till being overflowed by the ſea, it left thoſe vaſt quantities of ſand which now cover the whole ſurface of the earth, and render it incapable of producing any thing but palm trees, which are ſaid to grow in great plenty, notwithſtanding the barrenneſs and dryneſs of the ſoil, and yield the moſt delightful dates, which is a conſiderable part of their food; beſides theſe they have the lotus, a fruit reckoned finer than dates; and as the natives make from it a moſt excellent wine, this plant ſerves them both for meat and drink.

Near the city walls is a famous burying-ground, in which are found coffins, urns, medals, and other curious relics of antiquity. The Franciſcan friars have here a handſome church, convent, and hoſpital; the laſt of which is the more neceſſary, as the city is ſo often, and ſo ſeverely, viſited by the plague. Other orders of monks have been likewiſe ſettled there, but have ſince been obliged to abandon it. The country is, however, adorned with a multiplicity of handſome villas, the gardens of which are chiefly cultivated by Chriſtian ſlaves. It is obſervable, with reſpect to thoſe unhappy wretches, that there is only a very ſmall number of them here, when compared with the many thouſands in the cities of Algiers and Tunis, whence they are locked up at night in one ſingle bagnio. The people juſt keep a ſufficient number to cultivate their gardens and ſerve them in the loweſt offices, and ſell all the reſt.

The people here carry on a great trade in linen cloth, great quantities of which are made by the inhabitants; but their chief dependance is on their corſairs, and thoſe of other nations which reſort to this city; they indeed keep only ſix or ſeven at moſt, yet theſe are ſo deſperate and make ſuch advantage of their ſituation, by being within reach of thoſe merchant-ſhips which trade into Egypt, Italy, and the Archipelago, that they greatly infeſt thoſe ſeas, and do much miſchief.

SECT.

SECT. XXIX.

A Deſcription of the Towns of El Hammah, Zara, or Zoara, and of the Towns and Diſtrict of Derne and Meſrata.

EL Hammah, an antient town long gone to decay, is ſituated in thirty-four degrees, north latitude, and is only remarkable for its Roman walls of ſquare ſtones, and ſome inſcriptions mentioned by Leo Africanus and Dapper, but now ſo defaced as not to be read, and for its hot ſulphureous ſprings, which are conveyed to it by an old aqueduct. It is now a poor miſerable town, only inhabited by a few huſbandmen and fiſhermen, and thoſe who ſeek for a better livelihood from the piratical trade.

Zara, or Zoara, another ruinous town, encompaſſed by an old decayed wall, and ſeated near the ſea, about thirteen leagues from the iſland of Jerba, or Jerbis. It is at preſent inhabited only by poor people, who live either by burning quick-lime and pot-aſhes, or follow the piratical and fining trade. All theſe ſtand on the eaſtern coaſt of the gulph of Sidra: thoſe that are within it, and on its eaſtern ſide, are in a ſtill more ruinous condition. What has moſt contributed to this and to the deſtruction of their piratical trade, on which, like their neighbours, they chiefly ſubſiſted, is their being ſo near to the iſland of Malta; which being conveniently ſituated oppoſite to the coaſt, the knights of that iſland have conſtantly watched them, and, by ſuppreſſing their frequent excurſions, oblige them to apply to fiſhing, and to cultivate as much land about thoſe towns as will juſt ſerve them from hand to mouth.

The only place worthy of notice on the weſt ſide of the above gulph is Derne, now a ſmall town. It ſtands about half a mile from the ſea, and is ſurrounded with fine ſprings of ſweet water, one of which runs through the town, and others round the walls, and therefore its territory is ſtill capable of bearing corn and garden-ſtuff; but it is ſo poorly inhabited, that little advantage is obtained from it. This town is ſtill the capital of a diſtrict of its own name, which extends from Cape Bomb on the eaſt to the gulph of Bengaſi, which is above three hundred miles; but is chiefly inhabited by wandering Arabs, who are ſaid to amount to thirty thouſand families, that pay a ſmall tribute to the Bey of Tripoli. This tract is almoſt every where covered with a plant or ſhrub that bears a thick downy leaf, with branches of yellow flowers, and not only keeps green, but bloſſoms during the greateſt part of the year. The bees chiefly feed upon this flower, which gives an excellent taſte to their honey.

On the weſtern ſide of the gulph of Sidra is alſo the diſtrict of Meſrata, which contains the country antiently called Cyrenaica and Pentapolis, from its then having five cities; but is now called Meſrata, from its capital. It has ſome towns and villages, both on the ſea-ſide and within land, that trade with the Chriſtians for European commodities, which they ſell to the negroes, and exchange for ſlaves, muſk, and civet, which they carry into Turkey. The inhabitants were formerly rich and warlike, impatient of the yoke of the Tuniſeens, as they are now of that of the Tripolitans. They can muſter about ten thouſand men fit to bear arms, and are often at war with the Arabs.

The other countries within land are ſtill more deſart and void of towns; they are inhabited by much the ſame people with the two laſt mentioned, live after the ſame manner, and are perpetually endeavouring to free themſelves from the tribute exacted from them. The land is for the moſt part dry, barren, and covered with ſuch light ſand, that one cannot travel through it without ſometimes ſinking into it above the middle; ſo that were it not for the abundance of dates that grow there, and for ſome mountains that afford paſture for their cattle, it would be impoſſible to ſubſiſt.

SECT. XXX.

Of the Deſart of Barca, its Situation and Extent, and the Manners of the Inhabitants.

THE deſart of Barca, ſituated between Egypt and what is more properly called the kingdom of Tripoli, is in breadth from north to ſouth about thirty leagues; but its confines on the ſouth ſide muſt be acknowledged to be very uncertain.

This country is for the moſt part, eſpecially in the middle, nothing more than a tract of dry and barren ſands, on which account the Arabs, its principal inhabitants, ſtile it The deſart or road of whirlwinds. It almoſt every where labours under a great ſcarcity of water; and, except in the neighbourhood of the towns and villages, where the earth produces a ſmall quantity of grain, as corn, millet, and ſome maize, the reſt is in a manner uncultivated. Even of the ſmall quantity of corn produced in the few ſpots capable of cultivation, the poor inhabitants are obliged to exchange a part with their indigent neighbours for dates, ſheep, and camels; theſe laſt they ſtand in greater need of than they, on account of their great ſcarcity of graſs, and other proper food.

The moſt deſart and dangerous canton of all is that in which the temple of Jupiter Ammon antiently ſtood, which, though in other reſpects pleaſantly ſituated, was encompaſſed a great way round with ſuch quick and burning ſands, as have always been detrimental to travellers, not only as they ſink under their feet, but, being light and heated by the rays of the ſun, are eaſily raiſed by every breath of wind, which, if it happens to be in their faces, almoſt burns out their eyes, and ſtifles them for want of breath; and, if vehement, often overwhelms whole caravans. The ſad cataſtrophe of Cambyſes and his army in his bold attempt againſt that temple and oracle, as well as Alexander's more ſucceſsful, though difficult expedition thither, are well known. Upon the whole, the country may be juſtly termed ſo wild a deſart, that there is no travelling through it without the direction of the ſtars, or the help of a compaſs; and though it was once the thorough-fare for the caravans from Barbary to Mecca, yet it has been ſince ſo infeſted with wild Arabs, that thoſe caravans are obliged to travel a hundred and fifty miles about to avoid being plundered.

Some of the French geographers divide the country of Barca into what they term the kingdom, and the deſart; the former of which has ſome conſiderable ports, towns, and villages, and is under the protection of the Porte, and governed by a Cady who reſides at Tripoli; but other authors call the coaſt, the eaſtern ſhore of Tripoli: it is, however, more commonly known by the name of Derne, from one of its moſt conſiderable towns and ports; beſides which it has ſeveral others, and the ruins of many more, now reduced to poor villages; but what condition they are in, or by whom they are governed, is not known. Indeed the maritime towns are probably under the protection of the Porte; but whether under the government of the Baſha of Tripoli or Egypt, or whether they have formed themſelves into independent ſtates, like thoſe of Tunis and Algiers, is not eaſy to determine.

The inhabitants of the maritime towns are more civilized and converſable than thoſe of the inland country, and have imbibed notions of humanity and juſtice, while the people who live in the deſart appear in many reſpects ſavages, and, like other wild Arabs, ſubſiſt by robbery and plunder.

It was indeed by the Arabs that this tract, till then a continued barren deſart, was firſt inhabited; theſe, at their firſt coming into it, ſettled in the beſt cantons; but as they multiplied, and the ſeveral tribes engaged in frequent wars againſt each other, the ſtrongeſt drove the weakeſt out of the beſt ſpots, and ſent them to wander in the deſart parts, where they live in the moſt abject and miſerable condition, the country yielding little food and no raiment. Hence they are repreſented as being the moſt diſagreeable of all the Arabs, their bodies having ſcarcely any thing but ſkin and bones, their faces are meagre, their looks fierce and ravenous, and their garb, which is what they commonly take from the paſſengers and pilgrims who travel through thoſe parts, is tattered with long wearing, while the pooreſt have ſcarcely a rag to wrap round their waiſts. It is no wonder that theſe are ſaid to be the moſt reſolute and expert robbers and plunderers; but both frequently yield them ſo miſerable a harveſt, that neceſſity forces them to make excurſions as far as into Numidia, Libya, and other ſouthern parts, to obtain freſh ſupplies. Hardened by indigence, they

they are ſaid to commit the greateſt cruelties on thoſe that fall into their hands, making them drink warm milk, and then hanging them up by the feet, and ſhaking them in order to make them bring up any ſmall coin they have ſwallowed, in order to conceal it from them; they even rake in their excrements, in hopes of finding ſomething to recompenſe their trouble; it being uſual for the merchants and pilgrims who travel through this deſart, to take that method to ſave what ſmall gold they carry about them; and whether any be found ſo concealed or not, they conſtantly ſtrip them of all they have, even to the laſt rag of their cloaths.

SECT. XXXI.

Of the Government and Power of Tripoli: the Taxes laid on the Inhabitants, and their Commerce.

AS the government, laws, religion, and cuſtoms of Tripoli are nearly the ſame with thoſe of Algiers and Tunis, we ſhall not tire our readers with a needleſs repetition of them. It is ſufficient to obſerve, that the Beys of Tripoli are not mere titular vaſſals to the Porte, like the governments we have been deſcribing, but are really under a kind of ſubjection, and pay an annual tribute to the Grand Seignior. This, joined to the other exigencies of the regency, the avarice of the Turkiſh Baſhas ſent thither from Conſtantinople, and the general decay of commerce, obliges them to load the ſubjects with ſuch heavy taxes and extortions, as hath reduced the greateſt part of the people to the loweſt degree of indigence.

The public revenues, like thoſe of which we have already treated, ariſe chiefly from their corſairs, who are very few; and beſides theſe they have only common ſmall gallies, poorly manned and equipped. Another branch of the revenue ariſes from the duties on imports and exports, and from the taxes laid on the Jews, which are extremely high. Theſe people are very numerous, and carry on the greateſt ſhare of the Italian commerce. The natives alſo, though ever ſo poor, muſt pay a part of the produce of their ground or other manufactures. The Moors and Arabs in the country are alſo heavily taxed, and among them the Bey ſends his flying camp of janizaries, and ſometimes goes himſelf at the head of them, to levy the impoſitions laid upon them: for both the Arabs and Moors are equally reſtive and impatient under the Turkiſh yoke, and are kept ſo poor, that nothing but force, and ſometimes exemplary ſeverity, can extort it from them.

The Bey, by receiving the protection of the Porte, ſtill keeps up a kind of deſpotic power; for as he is generaliſſimo of all the forces, by appointing the officers who act in all capacities under him, he has obtained ſuch an abſolute power over the Divan, that it is now continued only as a matter of form, the members having nothing to do but to approve and ratify whatever he is pleaſed to lay before them; nor does the Porte, or its Baſha, give themſelves the leaſt concern about the government; for, provided he does but punctually pay his tribute to the one, and ſatisfy the avarice of the other, they leave him to govern the reſt in as arbitrary and tyrannical a manner as he chooſes.

As to the commerce of Tripoli, it chiefly conſiſts either of ſuch ſlaves as are taken by their corſairs, or ſuch as they traffic for with their neighbours; the greateſt part of both they ſend into Turky, where they can diſpoſe of them to the beſt advantage. The next branch is that of aſhes, which they buy from the Arabians, and ſell to the Europeans to make glaſs and ſoap. The reſt of their traffic is ſo inconſiderable as to be unworthy of notice.

It is obſervable, that the regency are here more ſcrupulous obſervers of their treaties with other nations, and puniſh the breach of them with greater ſeverity than any of their neighbours: this punctuality, whether it proceeds from real probity, or a conſciouſneſs of their own weakneſs, is, nevertheleſs, of no ſmall advantage to the navigation of the commercial nations.

SECT. XXXII.

Of the Manner of travelling in Barbary.

THE account of the manner of travelling through Barbary, as given us by the learned Dr. Shaw, will ſerve as a ſummary of the manners of the people, the climate, and ſtate of the country.

In the ſeveral maritime towns of Barbary and the Levant, where Britiſh factories are eſtabliſhed, our author was entertained with extraordinary marks of generoſity and friendſhip, having the uſe not only of their houſes, but of their horſes, their janizaries, and ſervants. In the inland towns and villages there is generally a houſe ſet apart for the reception of ſtrangers, with a proper officer to attend it, where perſons are lodged and entertained for one night in the beſt manner the place will afford, at the expence of the community: but, except at theſe, and the places before-mentioned, there are no houſes of entertainment throughout this extenſive country; yet, were travellers to furniſh themſelves with tents, it would not only be attended with expence and trouble, but might raiſe the ſuſpicion of the Arabs of their being perſons of rank and fortune, and conſequently too rich and tempting a booty to be ſuffered to eſcape. If, therefore, in the courſe of their travels they do not fall in with the hovels of the Kabyles, or the encampments of the Arabs, they can have nothing to protect them from the ſcorching heat of the ſun by day, or the cold of the night, unleſs they have the happineſs to find a grove of trees, the ſhelf of a rock, or a cave.

When they are ſo fortunate to find an encampment of the Arabs, they are entertained one night on free coſt, and furniſhed with a ſufficient quantity of proviſions for themſelves and their horſes. Upon their arrival they are generally preſented with a bowl of milk, and a baſket of figs, dates, raiſins, or other dried fruit; the maſter of the tent where they lodge then fetches them, according to the number of their company, either a kid, a goat, a ſheep, or lamb, half of which is inſtantly boiled by his wife, and ſerved up with cuſcuſu; and the reſt is uſually roaſted, and ſerved for their breakfaſt or dinner the next day.

But though the tents of the wandering Arabs may ſhelter them from the weather, they have their inconveniences; for, beſides the fleas and lice, which are here in all their quarters, the apprehenſions of being bit or ſtung by the viper, the ſcorpion, or the venomous ſpider, ſeldom fails, in ſome parts of theſe countries, to interrupt the repoſe ſo grateful to a weary traveller. They are no leſs diſturbed by the calves, kids, and other young cattle, that are every night tied up in the tents, to prevent their ſucking their dams; for the cords being generally made of looſe ſpun yarn, they frequently break looſe, and trample over them.

When they are entertained in a courteous manner, which is not always the caſe, they may highly pleaſe the maſter of the tent by giving him either a knife, a couple of flints, or a little Engliſh gunpowder; which being much ſtronger than theirs, they highly eſteem, and keep it to ſerve as priming for their fire-arms; and the wife will return a thouſand thanks for a pair of ſciſſars, a ſkean of thread, or a large needle, which are extraordinary rarities.

Our author ſays, that during the exceſſive heats of ſummer, and particularly when they were afraid of meeting with a party of the Arab free-booters, they travelled in the night, which, according to an Arabian proverb, having no eyes, few of them dare venture abroad, from their not knowing into what dangers and ambuſcades they may fall. Our travellers had then frequent reaſon to call to mind the words of the Pſalmiſt. "Thou makeſt darkneſs that it may be night, wherein "all the beaſts of the foreſt do move; the lions roaring "after their prey": for leopards, hyænas, and a variety of ravenous beaſts then call to, and anſwer each other; the different ſexes by this means, perhaps, finding out and correſponding with their mates; and theſe ſounds awfully

awfully breaking in upon the ſolitude, deſtroy the ideas of that ſafety they endeavoured to find by travelling at that ſeaſon.

They did not always take ſtages of the ſame length; for while under the apprehenſion of danger, they travelled through all the bye-paths known to their conductors, ſometimes for twelve or fifteen miles together, without reſting; but an ordinary day's journey, excluſive of the time taken up in making obſervations, ſeldom exceeded eight or nine hours. They conſtantly roſe at break of day, and ſetting forward with the ſun, travelled till the middle of the afternoon, when they began to look out for the encampments of the Arabs, who, to prevent ſuch parties coming to live upon them, chooſe ſuch places as are leaſt conſpicuous: and, indeed, unleſs they diſcovered the ſmoke of their tents, and the barking of their dogs, or obſerved ſome of their flocks, it was with difficulty they were able to find them, and all their labour was frequently ineffectual. When they came up with them, they were accommodated as hath been already mentioned, for one night; and if in travelling the next day,

——— They chanc'd to find
A new repaſt, or an untaſted ſpring,
They bleſt their ſtars, and thought it luxury.
ADDISON.

The beſt method to prevent falling into their hands, is for a traveller to be always dreſſed in the habit of the country; for the Arabs are jealous and inquiſitive, ſuſpecting every ſtranger to be a ſpy ſent to take a ſurvey of thoſe lands, which they are taught to fear will one time or other be reſtored to the Chriſtians.

SECT. XXXIII.

Of the Bombardment of the City of Tripoli by the French; the Peace to which the Tripolitans were obliged to conſent; and an Abſtract of the Treaty which that Nation concluded with England.

THE bombardment of Tripoli being one of the lateſt and principal events in the hiſtory of that ſtate, we ſhall here give it our readers, and ſhall add an abſtract of the treaty of peace concluded between the Tripolitans and Engliſh; which will enable the reader to form a juſt idea of the footing on which the Tripolitans ſtand with the European and Chriſtian powers, particularly England and France.

The dreadful execution we are going to mention was cauſed by a capture made by a Tripolitan corſair of a ſhip under French colours, and thoſe people detaining a great number of French ſubjects in a ſtate of ſlavery, upon the reſtitution of both which the French conſul had in vain inſiſted. Lewis XIV. who was no leſs ſevere in puniſhing the breach of faith in others, than famous for his diſregard to it himſelf, highly reſented this treatment, and ordered all his captains who cruiſed in thoſe ſeas to make repriſals.

Accordingly the marquis D'Anfreville, who was ſent by commodore Du Queſne to convoy two prizes he had taken at the iſland of Hiero, on the north coaſt of Sicily, meeting with ſix veſſels belonging to Tripoli, immediately attacked them; three of them, however, making all the ſail they could, were ſo happy as to get out of the reach of his guns; while the other three venturing to ſtand the engagement, were at length much ſhattered, and glad to eſcape to the iſland of Chios, in order to refit.

Commodore Du Queſne, being informed of what had paſſed, followed them thither with a ſquadron of ſeven ſhips; but, before he began any hoſtilities, ſent to acquaint the Aga who commanded in that place, "that "he came as a friend, and had expreſs orders to come "in queſt of ſome Tripolitan pirates, who, by the tenor "of the treaties then in force, were ſtiled rebellious "ſubjects, and given up to the juſt vengeance of the "emperor of France." The Tripolitans, however, being at that time maſters of the port and city, this ſpecious declaration did not meet with the favourable anſwer he expected; upon which drawing nearer to the place, he began to cannonade it with great fury. The Tripolitans, who were then employed in refitting their ſhattered veſſels, ſwam with all poſſible haſte to the two forts belonging to the town. Du Queſne tried in vain to enter the port, he being prevented by a ſtrong ſtoccado, which they had laid in his way. A furious combat enſued, which laſted three hours and a half, the caſtle all the while diſcharging their artillery at his ſquadron, which in their turn threw ſeven thouſand bombs, few of which failed of making ſome execution, either on the Tripolitan ſhips or the city; where a great number of houſes were either thrown down or much ſhattered, and many of the inhabitants killed or wounded. The next day the city ſent to demand a parley, and promiſed either to oblige the Tripolitans to accept of a peace, or to drive them out of the port: but Du Queſne, inſtead of giving any anſwer to their propoſals, removed farther off, in order to block up the corſairs more effectually.

This affair ſoon reached the Ottoman court, and the complaints made of it both to the Grand Seignior and Divan, ſo greatly exaſperated them againſt the French, that their ambaſſador at that court, who had expreſs orders not to recede in the leaſt from his maſters pretenſions, found it difficult to maintain his honour and intereſt, and was forced to make uſe of all his politics, bribes, and cabals, to prevent a rupture between the two crowns. But at length, after a long and ſtrenuous conteſt, it was agreed,

That all the French ſlaves who had ſailed from Conſtantinople, ſince the year 1681, either in Tripolitan corſairs, or other veſſels, ſhould be ſet at liberty.

That the ſhip of captain Cruvilier, which they had taken under the French flag, and carrid to Chios, ſhould be reſtored, with all its artillery, arms, rigging, &c.

That no Tripolitan ſhip ſhould pretend to viſit any trading veſſels under French colours, in caſe they were provided with paſſports from the French admiral.

That all ſtrangers on board any French veſſel ſhould paſs free and unmoleſted; and likewiſe all Frenchmen who ſhould be found on board any other veſſel, even thoſe of an enemy.

That no French prizes, or priſoners, ſhould be ſold in any port belonging to Tripoli; and that no corſair belonging to that kingdom ſhould take any prize within a leſs diſtance than ten leagues of the French coaſt.

The Tripolitans, however, rejected theſe articles with the utmoſt indignation. This Lewis expected, and the next year, on the 15th of June, 1685, the marſhal d'Etrees, vice-admiral of France, appeared before their capital at the head of his fleet, where being joined by the marquis of Anfreville and captain Neſmond, they anchored within a league of the walls of the city, where they formed their line of battle. On the 22d the bombardiers got all the mortars ready, while the ſhallops belonging to the men of war anchored within gun-ſhot of the town, and about eight at night began the attack. Mr. Tourville, who had the command, ordered three armed gallies before the port, to prevent any obſtruction from the enemy. At about ten o'clock they began to throw ſome bombs into the place with great ſucceſs, without any moleſtation from the Tripolitan ſloops all that night, though they had kept a conſtant firing of their muſquetry, the two foregoing nights, on the bombardiers, when they were at a farther diſtance. By ſix the next morning the French had thrown five hundred bombs into the place. They reſumed the fire on the night following about midnight, and made ſuch terrible execution, that they could ſee the ſpreading flames in ſeveral parts of the town, without receiving one ſhot from it; and the next day the marſhal d'Etrees cauſed the port every where to be ſounded, in ſpight of all their fire, in order to diſcover a proper place for raiſing a freſh battery, which might deſtroy both the town and its fortifications. In the mean while ſome of the bombs falling on a place where the people were aſſembled, killed about thirty or forty of them, and threw the whole city into the utmoſt conſternation, the people filling the air with the moſt dreadful cries. At length finding

finding the French bent on their deſtruction, they diſpatched a herald to the marſhal to obtain a peace upon his own terms. They choſe for this purpoſe a venerable old man, aged ninety-four, who being introduced to the vice-admiral addreſſed him to the following effect: "I am the unfortunate Trik, the father-in-law "of Baba Haſſan, and was driven out of Algiers after "I had reigned as Dey twenty-four years, and always "behaved as a true friend to the French. I am now "ſent by the divan of Tripoli to know your demands, "and to mediate a peace between you and them." The vice-admiral anſwered in terms that expreſſed his ſatisfaction, and having told him the motives that had induced the king his maſter to begin the war againſt the Tripolitans, propoſed the moſt effectual means of putting an end to it, promiſing him, at the ſame time, a ceſſation of hoſtilities till the next day, that they might have time to determine on the articles that he ſhould ſend them. Trik aſſured him that no time ſhould be loſt, the city being wholly inclined to peace; and leaving one of the principal members, who had accompanied him, as an hoſtage, returned with Mr. Raymond, a major of the French army, and Mr. La Croix, who was to ſerve as interpreter.

Theſe met with a civil reception, and the next day the articles were read before the divan, the principal of which were that they ſhould pay two hundred thouſand crowns as an equivalent for all the captures they had made of French merchant-men, and that they ſhould alſo reſtore all the Chriſtian captives they had taken fighting under French colours. The firſt was greatly excepted againſt, on account of the impoſſibility of raiſing ſo large a ſum; but, after ſome debates, they agreed to pay down five hundred thouſand livres, and to releaſe all the French captives. As to the money, they promiſed that one part of it ſhould be ſent that very night, and the remainder within twenty days. This term the vice-admiral reduced to fifteen, on condition of their furniſhing his fleet with a daily ſupply of horned cattle for their maintenance, and that of the ſlaves. As to the Chriſtian captives, they engaged to releaſe two hundred of them, which they ſaid were all they then had within the city and its neighbourhood; and as to the four hundred more which were then rowing in the ſeven gallies belonging to that ſtate, and then in the ſervice of the Grand Seignior againſt the Venetians, they would ſend ten of their principal citizens as hoſtages for their releaſe upon the return of thoſe veſſels.

An hundred and eighty of the former were accordingly reſtored the very next morning, with two other hoſtages for the remainder; but they raiſed ſeveral difficulties about the payment of the ſum agreed on; yet not being able to obtain any abatement on any pretence, and being on the contrary threatened by the marſhal with freſh ſhowers of his deſtructive bombs, the Dey was under the neceſſity, not only of laying a tax on the citizens, but even of ordering the heads of five ringleaders of the malcontents to be ſtruck off. This execution, added to the admiral's menaces, ſtruck ſuch terror into the mutineers, that the next morning, when they had agreed to pay a hundred and fifty thouſand livres, they brought in a ſmall part of it in coin, and the reſt in ingots, rings, bracelets, necklaces, gold chains, diamonds, pearls, and other jewels, which, they ſaid, they were obliged to ſtrip their wives of; and at the ſame time releaſed a merchant-ſhip from Marſeilles, which they had taken a little before. They did not, however, complete the payment of the ſtipulated ſum till the ninth of July following, when they had ſtripped the Jewiſh ſynagogue of all its rich lamps, the janizaries of their mitred caps, their horſes of their richeſt harneſs, and their grand ſtandard of its gilt ſilver ball; the admiral proteſting that he would not ſign the peace till the ſum was fully paid, and threatning the citizens with a freſh bombardment at every delay.

At length Mr. La Croix the interpreter, having tranſlated the articles of peace into the Turkiſh language, went in and read them before the Dey and divan, where being ſolemnly ſigned and ſealed, public notice was given of it by a double diſcharge of twenty-five cannon, the one to expreſs their joy, and the other to return thanks to the marſhal d'Etrees for the ſervices he had done the republic, which beſides the above ſum, exacted with ſuch rigour, conſiſted in deſtroying a number of houſes, and the death of three hundred perſons buried under the ruins. The regency then begged that a conſul might be appointed to reſide at Tripoli, which was readily granted, and Mr. Martinel was nominated to that office. Upon his coming to the houſe appointed for his reſidence, the French flag was hoiſted on the top of it, and ſaluted by a third diſcharge of the ſame number of cannon. Thus ended this dreadful expedition, to the great ſatisfaction of the French monarch and his trading ſubjects to thoſe parts.

We ſhall conclude this account of Tripoli with a treaty of peace and commerce concluded by the regency of that piratical ſtate with our vice-admiral Baker in the year 1716, in which the Engliſh are immediately concerned, eſpecially the commercial part of the nation.

Articles of peace and commerce between his moſt ſacred majeſty George I. &c. and the moſt excellent lords Mahamed Bey, Yuſef Dey, the divan, and the reſt of the officers and people of the city and kingdom of Tripoli, renewed, concluded, and ratified, on the nineteenth of July, A. D. 1716, by John Baker, Eſq; vice-admiral, &c.

I. That from this time forward, for ever, there ſhall be a true and inviolable peace between the moſt ſerene king of Great Britain and the moſt illuſtrious lords and governors of the city and kingdom of Tripoli, in Barbary; and therefore, if the ſhips and ſubjects of either party ſhall happen to meet at ſea, or elſewhere, they ſhall ſhew all poſſible reſpect and friendſhip.

II. That all merchantſhips belonging to the dominions of Great Britain ſhall pay no more than three per cent. cuſtom for all the goods they ſhall ſell in this kingdom; and for thoſe they ſhall not ſell, they ſhall be permitted freely to take them again on board their ſhips, without paying any duty.

III. That all their ſhips and other veſſels belonging to the ſubjects of Great Britain, and to the city and kingdom of Tripoli, ſhall freely paſs the ſeas, and traffic where they pleaſe, without any ſearch or moleſtation from each other; and that all perſons and paſſengers of whatever country, and all money, goods, and merchandize belonging to any other people on board any of the ſaid ſhips or veſſels, ſhall be entirely free, and not ſtopped, taken, or plundered, or receive any damage from either party.

IV. That the ſhips of Tripoli meeting with any merchant ſhips or veſſels of the ſubjects of the king of Great Britian, not being in any ſeas belonging to his majeſty's dominions, may ſend on broad one ſingle boat with two ſitters, who ſhall enter ſuch merchant ſhips or veſſels; and then, upon their producing to them a paſs under the hand and ſeal of the commiſſioners of the admiralty, the ſaid boat ſhall depart, and the veſſels freely proceed on their voyage: and though the commanders of ſuch merchant ſhips produce no ſuch paſs, yet if the major part of the ſhips or veſſels company be ſubjects of the king of Great Britian, the boat ſhall immediately depart. And, on the other hand, if any of the ſhips of war or other veſſels of his ſaid majeſty meet with any veſſels belonging to Tripoli, and their commanders ſhall produce a paſs ſigned by the governors of Tripoli, and a certificate from the Engliſh conſul there; or if the major part of the veſſels company be Turks, Moors, or ſlaves belonging to Tripoli, they ſhall be freely allowed to proceed on their voyage.

V. That no commander or other perſon of any ſhip or veſſel of Tripoli ſhall take out of any veſſel belonging to his majeſty's ſubjects any perſon, or perſons, to carry them to be examined, or upon any other pretence.

VI. That no ſhip belonging to the king of Great Britain, or to any of his ſubjects wrecked on any part of the coaſt belonging to Tripoli, ſhall become a prize; that neither the goods ſhall be ſeized, nor the men made ſlaves; but that all the ſubjects of Tripoli ſhall uſe their utmoſt endeavours to ſave the men and their effects.

VII. That

VII. That no veſſel of Tripoli ſhall be delivered up or permitted to go to any other place at enmity with the king of Great Britain, to be made uſe of as a corſair againſt his majeſty's ſubjects.

VIII. That if any veſſel belonging to Tunis, Algiers, Tetuan, Sallee, or any other place at war with the king of Great Britain, bring any veſſels belonging to his majeſty's ſubjects to Tripoli, or to any port of that kingdom, the governors there ſhall not permit them to be ſold within the territories of Tripoli.

IX. That if any of the king of Great Britain's ſubjects happen to die in Tripoli, or any of its territories, his goods or money ſhall not be ſeized, but ſhall remain with the Engliſh conſul.

X. That neither the conſul, nor any other Britiſh ſubject, ſhall be bound to pay the debts of any other ſubjects of Great Britain, unleſs they become ſurety for them by a public act.

XI. That the ſubjects of his Britannic majeſty in Tripoli, or its territories, ſhall, in matters of controverſy, be liable to no other juriſdiction but that of the Dey or Divan; except the difference be between themſelves, in which caſe they ſhall be liable to no other determination than that of the conſul.

XII. That if any ſubject of his Britannic majeſty in any part of the kingdom of Tripoli ſhall happen to ſtrike, wound, or kill a Turk or Moor, if he be taken, he ſhall be puniſhed with no greater ſeverity than a Turk for the like offence; but if he eſcape, neither the Engliſh conſul, nor any other Britiſh ſubject, ſhall be in any manner queſtioned or troubled on that account.

XIII. That the Engliſh conſul reſiding at Tripoli, ſhall always enjoy the entire freedom and ſafety of his perſon and eſtate, and ſhall be allowed to chooſe his own interpreter and broker. He may freely go on board any ſhip in the roads as often as he pleaſes; he may have the liberty of the country; he ſhall be allowed a place of worſhip, and no perſon ſhall injure him in word or deed.

XIV. That not only during the continuance of this peace and friendſhip, but alſo if any breach or war ſhould hereafter happen between his Britannic majeſty and the kingdom of Tripoli, the conſul, and all the king of Great Britain's other ſubjects in the dominions of Tripoli, ſhall at all times have full and abſolute liberty to depart, and to go into their own or any other country, in any ſhip or veſſel they ſhall think fit; and to take with them all their effects, goods, families, and ſervants, though born in the country, without any moleſtation or hindrance.

XV. That no ſubject of his Britannic majeſty while a paſſenger from, or to, any port, ſhall be moleſted, though he be in a ſhip or veſſel at war with Tripoli.

XVI. That if any of his Britannic majeſty's ſhips of war come to Tripoli, or to any other place of that kingdom with any prize, they ſhall have liberty to ſell or diſpoſe of it at pleaſure, without any moleſtation. That theſe ſhips ſhall not be obliged to pay any cuſtoms whatever; and that if they ſhall want proviſions, victuals, or any other things, they may freely buy them at the market-price.

XVII. That when any of his Britannic majeſty's ſhips of war appear before Tripoli, upon notice given to the Engliſh conſul, or by the commander to the chief governor of Tripoli, public proclamation ſhall be immediately made to ſecure the Chriſtian captives, and if after that, any Chriſtians eſcape on board any of thoſe ſhips of war, they ſhall not be required back, nor ſhall the conſul or commander, or any other Britiſh ſubject, be obliged to pay for thoſe eſcaped Chriſtians.

XVIII. That all the merchant ſhips coming to the city or kingdom of Tripoli, though not belonging to Great-Britain, may freely put themſelves under the protection of the Britiſh conſul in ſelling and diſpoſing of their goods and merchandize, if they think proper, without any moleſtation.

XIX. That all Britiſh ſhips of war carrying his majeſty's flag, upon their appearing before the city of Tripoli, ſhall be ſaluted with twenty-ſeven pieces of cannon fired from the caſtle, and that the ſhips ſhall return the ſame number.

XX. That no merchant ſhip belonging to Great-Britain, or to any other nation, under the protection of the Britiſh conſul, ſhall be detained in the port of Tripoli, and hindered from proceeding to ſea longer than three days, under the pretence of arming the ſhips of war of this government, or any other pretence whatſoever.

XXI. That no Britiſh ſubject ſhall be permitted to turn Mahometan in the city and kingdom of Tripoli, unleſs he voluntarily appears before the Dey or Governor, with the Engliſh conſul's interpreter, thrice in twenty-four hours, and every time declares his reſolution to become Mahometan.

XXII. That his Britannic Majeſty's conſul reſiding in Tripoli, ſhall at all times have liberty to put up the Britiſh flag on the top of his houſe, and to continue it there diſplayed as long as he pleaſes; and the Britiſh conſul ſhall have the like liberty of putting up and diſplaying that flag in his boat when he paſſes on the water, and no man is to diſturb, oppoſe, or injure him in doing it.

XXIII. That from this time forward for ever, the iſland of Minorca, and the city of Gibraltar, ſhall be eſteemed in every reſpect by the government of Tripoli a part of his Britannic majeſty's dominions, and the inhabitants thereof ſhall be deemed his natural ſubjects, as if they had been born in Great-Britain; and they with their ſhips carrying Britiſh colours, ſhall be permitted freely to trade in any part of the kingdom of Tripoli; and ſhall paſs without any moleſtation, either on the ſeas or otherwiſe, in the ſame manner, and with the ſame freedom and privileges, as have been ſtipulated in this and all former treaties in behalf of the Britiſh nation and ſubjects.

XXIV. And whereas in the treaty concluded in the reign of king Charles II. in the year 1676, by Sir John Narborough, an article was inſerted, by which the ſhips of Tripoli were excluded cruiſing before or in ſight of the port of Tangier, which then belonged to his majeſty, it is now ratified and concluded, that none of the ſhips or veſſels belonging to Tripoli ſhall cruize, or look for prizes, before, or in ſight of Gibraltar, and the iſland of Minorca, to diſturb or moleſt their commerce in any manner whatſoever.

XXV. That all and every article in this treaty, ſhall be inviolably kept and obſerved between his ſacred Britiſh majeſty, and the moſt illuſtrious lords, &c. of the city and kingdom of Tripoli; and all other matters, not particularly expreſſed in this treaty, and provided for in any former, ſhall ſtill remain in full force, and ſhall be eſteemed the ſame as if inſerted here.

Dated in the preſence of Almighty God, in the city of Tripoli, on the nineteenth of June, 1716 of the Chriſtian æra, and of the Mahometan Hejira 1128.

The ſame year a treaty of peace was concluded with Tunis to the ſame purpoſe; only there are one or two articles of a different nature, particularly the following, which is worthy of notice.

It is agreed, concluded, and eſtabliſhed, that at whatſoever time it ſhall pleaſe the government of Tunis to reduce the cuſtoms of the French to leſs than they pay at preſent, it ſhall always be obſerved, that the Britiſh cuſtoms ſhall be two per cent. leſs than any agreement that ſhall for the future be made by the French, or than ſhall be paid by the ſubjects of France.

And that in caſe any Britiſh ſhip or ſhips ſhall import into that kingdom of Tunis any naval or warlike ſtores, or any kind of proviſions, they ſhall pay no duty or cuſtom whatſoever.

We have only to add, that, with reſpect to Barbary in general, all that country capable of cultivation, was once extremely populous. Carthage, the rival of Rome, acquired immenſe wealth by commerce, and planted different nations. Its wars and its deſtruction form a remarkable period in hiſtory.

This extenſive country, where Chriſtianity is now deſpiſed, and its profeſſors taken captive by the Mahometan pirates, and reduced to the loweſt degree of ſlavery,

was once Chriſtian. Indeed it early embraced Chriſtianity; and in the third and fourth centuries there were ſeveral hundred biſhoprics, of which the archbiſhop of Carthage was primate, and the celebrated St. Cyprian, Tertulian, St. Auſtin, and many others celebrated in eccleſiaſtical hiſtory, adorned this church.

SECT. XXXIV.

Of the Revolutions of Barbary in general, concluding with Reflections on thoſe pyratical States.

WE ſhall conclude this account of Barbary with a conciſe hiſtory of the ſtates on the coaſt, and ſome reflections on their pyratical trade, extracted from the Modern Univerſal Hiſtory.

The coaſt of Barbary was probably firſt planted by the Egyptians. The Phenicians afterwards ſent colonies thither, and built Utica and Carthage. The Carthaginians ſoon became powerful and wealthy by trade, and finding the country divided into a great many little kingdoms and ſtates, either ſubdued or made the princes on that coaſt their tributaries, who being weary of their yoke, were glad of the opportunity of aſſiſting the Romans in ſubduing Carthage. The Romans remained ſovereigns of the coaſt of Barbary, 'till the Vandals, in the fifth century, reduced it under their dominion.

The Roman, or rather the Grecian emperors, having ſome time after recovered the coaſt of Barbary from the Vandals, it remained under their dominion till the Saracen caliphs, the ſucceſſors of Mahomet, made an entire conqueſt of all the north of Africa in the ſeventh century, and divided the country among their chiefs, of whom the ſovereign of Morocco was the moſt conſiderable, poſſeſſing the north-weſt part of that country, which in the Roman diviſion obtained the name of Mauritania Tingitana, from Tingis or Tangir, the capital, and is now ſtiled the empire of Morocco, comprehending the kingdoms or provinces of Fez and Morocco. The emperors of theſe territories are almoſt always at war with the Spaniards and Portugueſe. In the eighth century their anceſtors made a conqueſt of the greateſt part of Spain; but after the loſs of Granada, which happened about the year 1492, they were diſpoſſeſſed of this country; and Ferdinand and Iſabella, who were then upon the throne of Spain, obliged them to renounce their religion, or tranſport themſelves to the coaſt of Africa. Thoſe who made choice of the alternative of going into exile, to revenge themſelves on the Spaniards, and ſupply their neceſſities, confederated with the Mahometan princes on the coaſt of Barbary, and having fitted out little fleets of cruiſing veſſels, took all the Spaniſh merchant ſhips they met with at ſea, and being well acquainted with the country, landed in Spain, and brought away multitudes of Spaniards, and made ſlaves of them. The Spaniards hereupon aſſembled a fleet of men of war, invaded Barbary, and having taken Oran, and many other places on the coaſt of Algiers, were in a fair way of making an intire conqueſt of that country. In this diſtreſs the African princes applied to that famous Turkiſh rover, Barbaroſſa, deſiring his aſſiſtance againſt the Chriſtians. He very readily complied with their requeſt, but had no ſooner repulſed their enemies, than he uſurped the government of Algiers, and treated the people who called him in as ſlaves; as his brother Heyradin Barbaroſſa afterwards did the people of Tunis; and a third obtained the government of Tripoli by the like means. In theſe uſurpations they were ſupported by the Grand Seignior, who claimed the ſovereignty of the whole coaſt, and for ſome time they were eſteemed the ſubjects of Turky, and governed by Turkiſh baſhas, or viceroys; but each of theſe ſtates, or rather the military men, at length took upon them to elect a ſovereign out of their own body, and render themſelves independent of the Turkiſh empire. The Grand Seignior has not now ſo much as a baſha or officer at Algiers; but the Dey acts as an abſolute prince, and is only liable to be depoſed by the ſoldiery that advanced him. At Tunis and Tripoli he has ſtill baſhas, who are ſome check upon the Deys, and have a ſmall tribute paid them. All of them, however, in caſe of emergency, claim the protection of the Ottoman court, and they ſtill continue to prey upon the Spaniards, having never been at peace with them ſince the loſs of Granada. They make prize alſo of all other Chriſtian ſhips that have Spaniſh goods or paſſengers on board, and indeed of all others that are not at peace with them. The Turks of Algiers, Tunis, and Tripoli, are an abandoned race, conſiſting of pyrates, banditti, and the very refuſe of Turky, who have been forced to leave their ſeveral countries to avoid the puniſhment of their crimes.

The Mahometans, wherever they are eſtabliſhed, eſpecially thoſe of them who partake of the genius and diſpoſition of the Turks, have very little inclination to the arts of induſtry. This evidently appears in the inhabitants of thoſe parts we have been now deſcribing on the African ſea-coaſt. Being a rapacious and tyrannical people, diſdaining all induſtry and labour, neglecting all culture and improvement, it made them thieves and robbers, as naturally as idleneſs makes beggars; and, being trained to rapine and ſpoil, when they were no longer able to plunder and deſtroy the fruitful plains of Valentia, Granada, and Andaluſia, they fell to roving upon the ſea. They built ſhips, or rather ſeized them from others, and ravaged the neighbouring coaſts, landing in the night, ſurpriſing, and carrying away the poor country people out of their beds into ſlavery. This was their firſt occupation, and this naturally made pyrates of them; for, not being content with mere landing and plundering the ſea-coaſts of Spain, by degrees, being grown powerful and rich, and made bold and audacious by their ſucceſs, they armed their ſhips, and began to attack, firſt the Spaniards upon the high ſeas, and then all the Chriſtian nations in Europe, wherever they could find them. Thus this deteſtable practice of roving and robbing began. What magnitude they are ſince arrived to, what miſchief they have brought upon the trading part of the world, how powerful they are grown, and how they are erected into ſtates and governments, nay, into kingdoms, and, as they would be called, empires; for the kings of Fez and Morocco call themſelves emperors, and how they are, to the diſgrace of all Chriſtian powers, treated with as ſuch, is well known from the hiſtories of thoſe nations who have been at any time embroiled with them.

The firſt Chriſtian prince, who, reſenting the inſolence of theſe barbarians, and diſdaining to make peace with them, reſolved their deſtruction, was the emperor Charles V. he was moved with a generous compaſſion for the many thouſands of miſerable Chriſtians who were, at that time, kept among them in ſlavery; and, from a benevolent principle of ſetting the Chriſtian world free from the terror of ſuch barbarians, he undertook ſingly and without the aſſiſtance of any other nation, to fall upon them with all his power. In this war, had he been joined by the French and Engliſh, and the Hans-towns, (as for the Dutch they were not then a nation) he might have cleared the country; at leaſt, he might have cleared the ſea-coaſts of the whole race, and have planted colonies of Chriſtians in all the ports, for the encouragement of commerce, and for the ſafety of all the European nations. But Francis I. king of France, his mortal and conſtant enemy, envied him the glory of the greateſt and beſt enterprize that was ever projected in Europe; an enterprize a thouſand times beyond all the cruſados and expeditions to the Holy Land, which, during a hundred and twenty years, coſt Europe, and to no purpoſe, a million of lives and immenſe treaſure. Though the emperor was aſſiſted by no one prince in Chriſtendom, the pope excepted, (and his artillery would not go far in battering down ſtone-walls) yet he took the fortreſs of Goletta, and afterwards the city, and the whole kingdom of Tunis; and, had he kept poſſeſſion, it might have proved a happy fore-runner of farther conqueſts; but, miſcarrying in his attempt againſt Algier, and a terrible ſtorm falling upon his fleet, any farther attempt was laid aſide, and the kingdom of Tunis returned to its former poſſeſſors, by which means their pyracies are ſtill continued.

There ſeems, therefore, to be a neceſſity, that all the powers of Europe, eſpecially the maritime, ſhould endea-

vour

vour to free themſelves from the inſolence of theſe rovers, that their ſubjects may thereby be protected in their perſons and goods from the hands of rapine and violence, their coaſts ſecured from inſults and deſcents, and their ſhips from capture on the ſea. The conqueſt could not be attended with any great difficulty, if the Engliſh, Dutch French, and Spaniards would unite, to join their forces and fleets, and fall upon them in ſeparate bodies, and in ſeveral places at the ſame time. The general benefit of commerce would immediately follow, by ſettling the government of the ſea-coaſt towns in the hands and poſſeſſion of the ſeveral united powers; ſo that every one ſhould poſſeſs them, in proportion to the forces employed in the conquering them; the conſequence of the ſucceſs would ſoon be ſenſibly felt by the intereſted parties? for if the quantity of productions fitted for the uſe of merchandize be ſo conſiderable as we find it to be, even now, under the indolence and ſloth of the moſt barbarous people in the world, how may we ſuppoſe all thoſe valuable things to be increaſed by the induſtry and application of the diligent Europeans, eſpecially the Engliſh, French, or Dutch? We might alſo reaſonably ſuppoſe, that the Moors, being in conſequence of ſuch a conqueſt driven up farther into the country, and being obliged to ſeek their ſubſiſtence by honeſt labour and application, would at length be induced to increaſe the product, and, as multitudes of Chriſtians would be encouraged, by the advantages of the place, to go over and ſettle upon it, the manufactures and merchandize of Europe muſt ſoon find a great additional conſumption; and the many new ports and harbors where thoſe Chriſtian nations might ſettle, would be ſo many new markets for the ſale of thoſe manufactures, where they had little or no ſale or conſumption before. Beſides, would not the ſucceſs be delivering Europe from the depredations of powerful thieves, and their commerce and navigation from the rapine of a mercileſs crew, who are the ruin of thouſands of families, and, in ſome ſenſe the reproach of Chriſtendom? Such meaſures as theſe are far from being impracticable; they are worthy of being undertaken by the princes and powers of Europe, and would therefore, bring infinitely more glory to the Chriſtian name, than all their inteſtine wars among each other, which are the ſcandal of Europe, and the only thing that, at firſt, let in the Turks and other barbarians among them.
